

## White Paper

---

---

Your goal in this assignment is to produce a white paper describing your criteria for the production of a simulation that you will contract out to a professional programmer. Free yourself from thinking about the code, but do think about what you have learned about the strengths, weaknesses and possibilities of simulations. The white paper should include the following:

- What purpose does the simulation serve?
- What does the simulation represent?
- Who is the audience for your simulation?
- What parameters will the simulation have and which of these will be adjustable by the user?
- What are the design constraints?
- What are the highest priority features of the model?
- How do you expect the simulation to provide usable feedback?

You should also provide some construction guidelines for the model.  
The paper should be 3-5 pages in length
