Integral Method

Factorial defines a **product**:

$$n! ::= 1 \cdot 2 \cdot 3 \cdots (n-1) \cdot n = \prod_{i=1}^n i$$

Turn product into a **sum** taking logs:

$$\begin{aligned} \ln(n!) &= \ln(1 \cdot 2 \cdot 3 \cdots (n-1) \cdot n) \\ &= \ln 1 + \ln 2 + \cdots + \ln(n-1) + \ln(n) \\ &= \sum_{i=1}^n \ln(i) \end{aligned}$$

Integral Method

Bounds on $\ln(n!)$

$$\int_1^n \ln(x) \, dx \leq \sum_{i=1}^n \ln(i) \leq \int_0^n \ln(x+1) \, dx$$

$$n \ln\left(\frac{n}{e}\right) + 1 \leq \sum_{i=1}^n \ln(i) \leq (n+1) \cdot \ln\left(\frac{n+1}{e}\right) + 1$$

$$e \cdot \left(\frac{n}{e}\right)^n \leq n! \leq e \cdot \left(\frac{n+1}{e}\right)^{n+1}$$

Stirling's Formula

$$e \cdot \left(\frac{n}{e}\right)^n \leq n! \leq e \cdot \left(\frac{n+1}{e}\right)^{n+1}$$

So guess:

$$n! \approx \sqrt{n} \cdot \left(\frac{n}{e}\right)^n$$

Lemma: $x^a = o(x^b)$ for $a < b$

Proof: $\frac{x^a}{x^b} = \frac{1}{x^{b-a}}$ and $b - a > 0$.

So as $x \rightarrow \infty$,
 $x^{b-a} \rightarrow \infty$ and $\frac{1}{x^{b-a}} \rightarrow 0$.

Big Oh Mistakes

False Lemma: $\sum_{i=1}^n i = O(n)$

False Proof:

$$0 = O(1), 1 = O(1), 2 = O(1), \dots$$

So each $i = O(1)$. So

$$\begin{aligned} \sum_{i=1}^n i &= O(1) + O(1) + \dots + O(1) \\ &= n \cdot O(1) = O(n). \end{aligned}$$
