Abstract

A [4 + 4] annulation strategy for the synthesis of eight-membered carbocycles is reported that proceeds via a cascade involving two pericyclic processes. In the first step, the [4 + 2] cycloaddition of a conjugated enyne with an electron-deficient cyclobutene generates a strained six-membered cyclic allene that isomerizes to the corresponding 1,3-cyclohexadiene. In the second step, this bicyclo[4.2.0]octa-2,4-diene intermediate undergoes thermal or acid-promoted 6-electron electrocyclic ring opening to furnish a 2,4,6-cyclooctatrienone. The latter transformation represents the first example of the promotion of 6-electron electrocyclic ring opening reactions by acid.

Keywords

Conjugated enynes; Eight-membered rings; Cycloaddition; Electrocyclic ring opening; Cyclooctatrienones

1. Introduction

[4 + 2] Cycloadditions of conjugated enynes1–4 generate six-membered carbocycles that incorporate an additional element of unsaturation relative to the cycloadducts produced in conventional Diels-Alder reactions. When alkynes are employed as “enynophiles”, the cyclic allenes5 initially produced isomerize to form benzenoid aromatic compounds (Scheme 1).4 This version of the enyne cycloaddition provides an attractive alternative to benzannulations based on Diels-Alder reactions of specially designed diene substrates such as α-pyrones. In enyne cycloadditions where alkenes are employed as enynophiles, conjugated cyclohexadienes are generated that potentially can undergo in situ rearrangement leading to the formation of other useful cyclic systems. Herein we describe the application of this latter approach in a new [4 + 4] annulation strategy for the synthesis of eight-membered carbocyclic compounds.
Eight-membered carbocyclic rings are key features in the structures of several important classes of bioactive natural products and are relatively difficult to access using conventional methodology. Scheme 2 outlines our new [4 + 4] annulation strategy for the synthesis of eight-membered rings. Intramolecular [4 + 2] cycloaddition of a conjugated enyne with a cyclobutene derivative generates a cyclic allene of general type 3 that is expected to rapidly isomerize via either proton or hydrogen atom transfer pathways to afford the bicyclo[4.2.0]-2,4-octadiene intermediate 4. Electrocyclic ring opening then produces the desired eight-membered ring containing system. In principle, the conversion of enyne cycloaddition substrate 1 to cyclooctatriene 2 should be possible in a single synthetic operation as a cascade (“domino”) reaction process. Although the thermal interconversion of bicyclo[4.2.0]-2,4-octadienes and 1,3,5-cyclooctatrienes is an equilibrium process that often favors the bicyclic system, in this case we expected to be able to direct the reaction to favor the desired eight-membered ring isomer through the appropriate choice of substituents (vide infra).

2. Results and discussion

2.1. [4 + 4] Annulation with cyclobutenones

As in the case of Diels-Alder reactions and dipolar cycloadditions, the [4 + 2] cycloaddition of conjugated enynes proceeds with the greatest facility when electron-deficient \( \pi \) bonds are employed as reaction partners. We began our investigation of the proposed [4 + 4] annulation strategy by examining the cycloaddition of enyne 7 in which a cyclobutenone serves as the enynophile component. Eq 1 outlines the synthesis of cyclobutenone 7, which features the reaction of 3-ethoxycyclobutenone with an organolithium compound prepared beginning from the known enynyl alcohol 5.

\[
\text{[4 + 4] annulation with cyclobutenones}
\]

Cyclobutenones undergo 4-electron electrocyclic ring opening to form vinylketenes at elevated temperature, so we initially examined the [4 + 2] enyne cycloaddition of 7 in the presence of Lewis and Brønsted acids in the hope of achieving the desired transformation at room temperature or below. In the event, exposure of cyclobutenone 7 to MsOH or Lewis acids such as TiCl\(_4\), AlCl\(_3\), and Me\(_2\)AlCl produced complex mixtures, but we were pleased to find that reaction with BF\(_3\)-etherate at room temperature gave the desired cyclooctatriene 8 in 35% yield (eq 2).
Under these and related conditions, an aromatic ketone byproduct was also isolated in comparable amounts that was identified as the indan derivative 13. For example, reaction of 7 with 1.4 equiv of BF$_3$-etherate at 50 °C for 4 h afforded a mixture of cyclooctatetraene 8 (30%) and indan 13 (36%). Scheme 3 outlines a plausible mechanism for the formation of these two major products of the reaction. The electrocyclic cleavage of bicyclo[4.2.0]-2,4-octadienes usually requires elevated temperatures, typically in the range 60-100 °C. In many cases an equilibrium mixture of bicyclooctadiene and cyclooctatetraene is observed, with the ratio dependent on the nature of the substituents.\textsuperscript{17} In the case of the ketone-Lewis acid complex 9, we expected the ring opening to proceed under unusually mild conditions and to greatly favor 10 due to the increased delocalization of positive charge in the product of electrocyclic opening. Note that the transformation of 9 to 10 can also be viewed as a variant of the well known cyclobutyl to homoallyl carbocation rearrangement. In a similar fashion, the formation of the aromatic ketone byproduct 13 could be proceeding via cyclobutyl carboxylation rearrangement involving the alternate C2-C3 bond of the four-membered ring to generate the delocalized pentadienyl cation intermediate 11.

Two other cyclobutenone cycloaddition substrates (14 and 15) were next prepared and subjected to treatment with both Lewis and Brønsted acids under a variety of conditions. None of the desired [4 + 4] annulation products were detected in these reactions, which either returned unreacted starting material or led to the formation of complex mixtures of uncharacterizable products. We therefore next turned our attention to systems in which the carbonyl activating group is positioned exocyclic with respect to the cyclobutene ring. It was our expectation that these substrates would not be subject to the unproductive mode of fragmentation observed in the reactions of cyclobutenones, and might therefore undergo the desired [4 + 4] annulation more efficiently and in good yield.

### 2.2. [4 + 4] Annulation with acylcyclobutenes

Scheme 4 outlines our syntheses of acylcyclobutene cycloaddition substrates 20-23 which are based on an application of the Weinreb ketone synthesis.\textsuperscript{18,19} The requisite cyclobuteryl Weinreb amide building block (19) was prepared from cyclobutene carboxylic acid\textsuperscript{20} in 79% yield by treatment with oxalyl chloride (cat. DMF, CH$_2$Cl$_2$, rt, 1 h) followed by addition of 1.1 equiv of N,O-dimethylhydroxylamine hydrochloride and 2.2 equiv of Et$_3$N (rt, 1 h).
The [4 + 4] annulation with acylcyclobutene 21 was examined first. No reaction of this substrate was observed upon heating at 110 °C, while at higher temperatures the desired cyclooctatriene 26 was observed to form, but only as one component in a complex mixture of products. In the presence of BF$_3$-etherate only a small amount of 26 was detected upon reaction at −55 °C, and at higher temperatures significant polymerization took place. However, exposure of cyclobutenyl ketone 21 to 1 equiv of MsOH at −78 °C led to a relatively clean reaction to afford the desired intermediate tricyclic ketone 24. This compound could not be purified without partial decomposition, and therefore was best carried on in the electrocyclic ring opening step without prior purification.

In some trials the treatment of 21 with MsOH at −78 °C led to incomplete cycloaddition, and reaction at higher temperature resulted in the formation of numerous byproducts. After some experimentation, a more reproducible protocol was developed utilizing reaction with 2,4,6-trisopropylbenzenesulfonic acid ("TIPPSO$_3$H") at 0 °C. Thus, exposure of 21 to the action of 0.5 equiv of TIPPSO$_3$H in dichloromethane at 0 °C for 2 h cleanly furnished the desired tricyclic ketone 24 in good yield (Scheme 5). Other acids such as TsOH, camphorsulfonic acid, and trifluoroacetic acid were not effective promoters of the enyne cycloaddition and led to either sluggish reaction, or decomposition at higher temperatures. Interestingly, the related enyne substrate 20 was found to react slowly in the presence of TIPPSO$_3$H, and in this case the optimal protocol for the [4 + 2] cycloaddition involves reaction with MsOH at −30 to −15 °C.

Thermolysis of unpurified tricyclic ketone 24 at 90-95 °C overnight brought about the desired 6-electron electrocyclic opening reaction affording the cyclooctatriene 26 in 78% overall yield from 21 after purification by column chromatography. Surprisingly, some samples of 21 underwent rearrangement upon heating for several hours at only 70 °C. We hypothesized that adventitious acid might be promoting the rearrangement in these cases, and indeed, in the presence of added acid (camphorsulfonic acid, CSA) complete conversion to 26 was observed to take place at only 50 °C. Rearrangement of the tricyclic ketone 25 (with R = H) was slower, and in this case even at 100 °C no reaction was observed in the absence of acid, although the desired rearrangement did occur smoothly in the presence of 2 equiv of CSA.

The critical role of acid in promoting the rearrangement of 24 and 25 to 26 and 27 was confirmed by the observation that reaction is inhibited in the presence of an acid scavenger. For example, no electrocyclic ring opening was observed when the bicyclocyclooctadiene intermediate 25 was heated overnight at 100 °C in the presence of calcium carbonate, and the tricyclic ketone was recovered in 83% yield after column chromatography. We attribute the acceleration of the electrocyclic ring opening of intermediates of type 28 relative to the unprotonated ketones to the fact that significant delocalization of positive charge develops in the transition state leading to the eight-membered ring products 29 (eq 3). To our knowledge, these transformations represent the first examples of the acceleration of a 6-electrocylic ring opening reaction by acid. Note, however, that Bergman and Trauner have recently reported the acceleration of 6-electron electrocyclic ring closure reactions of hexatrienes by catalytic amounts of Me$_2$AlCl.$^{22}$
Efficient [4 + 4] annulation did not take place in the case of several related acyclobutenes, including enyne 30 (with a three-atom rather than four-atom “tether”24) and the ester derivatives 31 and 32 (eq 4). In each case, no reaction was observed in the presence of acid at room temperature or below, and complex mixtures of products were formed at elevated temperatures.

Finally, successful [4 + 4] annulation was achieved with acylcyclobutenes 22 and 23, providing access to the tricyclic eight-membered ring containing products 38 and 39 (Scheme 6). In the case of the [4 + 2] cycloaddition of enyne 22, reaction with MsOH generated the desired cyclohexadiene intermediate 36 accompanied by a significant amount of an isomeric diene 40.
Formation of the isomeric diene 40 could arise via the pathway outlined in eq 5. Under the acid-promoted enyne cycloaddition conditions, isomerization of the intermediate cyclic allene 41 proceeds via protonation to form an allylic carbocation of type 42. In this case, proton loss apparently produces 40 in addition to the desired endocyclic diene 36, possibly due to increased ring strain in this tetracyclic system. An analogous isomeric diene byproduct was also observed to form in the cycloaddition of the cyclohexenyl substrate 23.

3. Conclusions

A [4 + 4] annulation strategy for the construction of eight-membered carbocycles has been developed that involves a new variant of the enyne [4 + 2] cycloaddition in which cyclobutenones and acyclclobutenes serve as the 2π “enynophile” reaction partners. The [4 + 2] cycloaddition products are bicyclo[4.2.0]octadienes that undergo acid-promoted electrocyclic ring opening under mild conditions to afford the desired cyclooctatrienones. These transformations represent the first examples of the application of acid to promote a 6-electron electrocyclic ring opening reaction.

4. Experimental

4.1. General procedures

All reactions were performed in flame-dried or oven-dried glassware under a positive pressure of argon. Reaction mixtures were stirred magnetically unless otherwise indicated. Air- and moisture-sensitive liquids and solutions were transferred by syringe or cannula and introduced into reaction vessels through rubber septa. Reaction product solutions and chromatography fractions were concentrated by rotary evaporation at ca. 20 mmHg and then at 0.1 mmHg (vacuum pump) unless otherwise indicated. Thin layer chromatography was performed on EMD precoated glass-backed silica gel 60 F-254 0.25 mm plates.

4.2. Materials

Commercial grade reagents and solvents were used without further purification except as indicated below. Dichloromethane, diethyl ether, and tetrahydrofuran were purified by pressure filtration through activated alumina. Cul was purified by Soxhlet extraction with THF for 48 h followed by drying under vacuum (0.1 mmHg) over P₂O₅ for 24 h. Diisopropylamine, triethylamine, pentane, and boron trifluoride etherate were distilled under argon from calcium hydride. TFAA was distilled under argon. 2-Bromopropene was filtered through activated basic alumina before use. n-Butyllithium was titrated according to the method of Watson-Eastham using BHT in THF with 1,10-phenanthroline as an indicator. t-Butyllithium was titrated in pentane with menthol at 0 °C using 1,10-phenanthroline as the indicator. 3-Ethoxycyclobutanone, cyclobutenecarboxylic acid, cyclopentenyl trifluoromethanesulfonate, and 2,4,6-tri(iso-propyl)benzenesulfonic acid (TIPPSO₃H) were prepared according to the previously reported procedures. Cyclohexenyl trifluoromethanesulfonate was prepared via a minor modification of the published procedure in which LiHMDS was substituted for LDA. Column chromatography was
performed on Sorbent Technologies Standard Grade silica gel 60 (230-400 mesh) or on EMD Chromatographic Grade basic alumina (80-325 mesh). Chromatography with acetone-deactivated silica gel was carried out by mixing silica gel with acetone (ca. 10 mL/g) for 5 min, using this slurry to build a column, and then flushing the column with two column volumes of hexanes before applying the sample to be purified.

4.3. Instrumentation

Infrared spectra were obtained using a Perkin Elmer 2000 FT-IR spectrophotometer. $^1$H NMR spectra were recorded on a Bruker Avance-400 (400 MHz) spectrometer. $^1$H NMR chemical shifts are expressed in parts per million (δ) downfield from tetramethylsilane (with the CHCl$_3$ peak at 7.27 ppm used as a standard). $^{13}$C NMR spectra were recorded on a Bruker Avance-400 (100 MHz) spectrometer. $^{13}$C NMR chemical shifts are expressed in parts per million (δ) downfield from tetramethylsilane (with the central peak of CHCl$_3$ at 77.23 ppm used as a standard). High-resolution mass spectra (HRMS) were measured on a Bruker Daltonics APEXII 3 tesla Fourier transform mass spectrometer.

4.4. Synthesis of cycloaddition substrates

4.4.1. General procedure for conversion of alcohols to iodides—7-iodo-2-methylhept-1-en-3-yne (6). A 50-mL, three-necked, round-bottomed flask equipped with a stir bar, rubber septum, glass stopper, and argon inlet adapter was charged with the alcohol 5 (0.759 g, 6.12 mmol, 1.0 equiv) and 10 mL of THF. The solution was cooled to 0 °C, and triphenylphosphine (1.60 g, 6.12 mmol, 1.0 equiv), imidazole (0.624 g, 9.16 mmol, 1.5 equiv), and iodine (2.31 g, 9.10 mmol, 1.5 equiv) were each added in one portion. The reaction mixture became dark brown in color. The solution was stirred at 0 °C in the dark for 2.5 h, and then diluted with 100 mL of satd aq Na$_2$S$_2$O$_3$ solution and extracted with five 50-mL portions of pentane. The combined organic layers were washed with 50 mL of brine, dried over MgSO$_4$, filtered, and concentrated at 0 °C (20 mmHg). The colorless oil containing some white solid was filtered through a short plug of activated basic alumina using 80 mL of pentane and the filtrate was concentrated at 0 °C (20 mmHg) to give 1.369 g (96%) of iodide 6 as a colorless oil: IR (neat) 3094, 2950, 2919, 2229, 1796, 1614, 1427, 1221, and 895 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) δ 5.21-5.24 (m, 1 H), 5.17 (app quint, J = 1.6 Hz, 1 H), 3.32 (t, J = 6.8 Hz, 2 H), 2.46 (t, J = 6.7 Hz, 2 H), 2.03 (quint, J = 6.8 Hz, 2 H), 1.88 (dd, J = 1.5, 1.1 Hz, 3 H); $^{13}$C NMR (100 MHz, CDCl$_3$) δ 127.2, 121.1, 87.0, 83.1, 32.4, 24.0, 20.5, 5.6; HRMS-ESI (m/z) [M]+ calcd for C$_8$H$_{11}$I: 233.9900, found: 233.9904.

4.4.2. 3-(6-Methylhept-6-en-4-ynyl)cyclobut-2-enone (7)—A 100-mL, three-necked, round-bottomed flask equipped with a stir bar, rubber septum, thermocouple probe, argon inlet adapter, and 25-mL addition funnel fitted with a rubber septum was charged with the iodide 6 (1.20 g, 5.14 mmol, 1.3 equiv), 4.5 mL of pentane, and 11.4 mL of Et$_2$O. The solution was cooled at −78 °C while $t$-BuLi solution (1.63 M solution in pentane, 6.34 mL, 10.3 mmol, 2.7 equiv) was added dropwise via cannula over 15 min. The resulting mixture was stirred at −78 °C for 5 min, and then a solution of 3-ethoxycyclobutenone$^{12}$ (0.428 g, 3.81 mmol, 1.0 equiv) in 3 mL of Et$_2$O was added dropwise via cannula over 3 min (2-mL Et$_2$O rinse). The reaction mixture became dark orange. After 1 h, TFAA (0.92 mL, 1.4 g, 6.6 mmol, 1.7 equiv) was added dropwise via syringe over 30 sec. The reaction mixture was stirred at −78 °C for 6 h, and then 11 mL of satd aq NaHCO$_3$ solution was added dropwise via syringe over 5 min. The resulting mixture was allowed to warm to rt over 20 min and then diluted with 40 mL of Et$_2$O. The aqueous layer was separated and extracted with three 20-mL portions of Et$_2$O, and the combined organic layers were washed with 30 mL of brine, dried over MgSO$_4$, filtered, and concentrated at 5 °C (20 mmHg) to give 1.314 g of a red brown oil. Column chromatography on 255 g of silica gel (elution with 15-30% Et$_2$O-pentane) afforded 0.259 g

_Tetrahedron_. Author manuscript; available in PMC 2012 December 1.
(39%) of cyclobutenone 7 as a yellow-orange oil: IR (neat) 2223, 1767, 1614, 1585, 1452, 1434, 1415, 1051, 860, and 840 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.95 (s, 1 H), 5.21-5.24 (m, 1 H), 5.18 (t, J = 1.7 Hz, 1 H), 3.20 (s, 2 H), 2.71 (td, J = 7.6, 1.2 Hz, 2 H), 2.43 (t, J = 6.9 Hz, 2 H), 1.83-1.92 (m 5 H); ¹³C NMR (100 MHz, CDCl₃) δ 188.0, 180.3, 134.7, 127.1, 121.1, 87.6, 83.1, 51.0, 31.3, 25.3, 23.9, 19.1; HRMS-ESI (m/z) [M + Na]+ calcd for C₁₂H₁₄O: 197.0937, found: 197.0938.

4.4.3. Hept-6-en-4-yn-1-ol (17a)—A 100-mL, three-necked, round-bottomed flask equipped with a stir bar, argon inlet adapter, two rubber septa, and thermocouple probe was charged with PdCl₂(PPh₃)₂ (0.281 g, 0.401 mmol, 0.02 equiv), CuI (0.152 g, 0.797 mmol, 0.04 equiv), and Et₂N (4.2 mL, 30 mmol, 1.5 equiv). The orange reaction mixture was cooled to 0 °C and vinyl bromide (40 mL of a 1.0 M solution in THF, 40 mmol, 2.0 equiv) was added in one portion. A solution of 4-pentyn-1-ol (1.86 mL, 1.68 g, 20.0 mmol, 1.0 equiv) was added dropwise via cannula over 20 min (1.4-mL THF rinse), and the dark brown reaction mixture was allowed to warm to rt over 30 min. After 1.5 h, the reaction mixture was filtered through a plug of 2 g of silica gel with the aid of 300 mL of hexanes) afforded 0.654 g (88%) of alcohol 17a as a golden yellow oil: IR (neat) 3334, 2949, 2227, 1841, 1609, 1433, 1061, 975, and 920 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.78 (ddt, J = 17.5, 11.0, 2.1 Hz, 1 H), 5.57 (ddd, J = 17.5, 2.2, 0.5 Hz, 1 H), 5.41 (ddd, J = 11.0, 2.2, 0.4 Hz, 1 H), 3.78 (q, J = 5.9 Hz, 2 H), 2.45 (td, J = 6.9, 2.1 Hz, 2 H), 1.80 (quint, J = 6.5 Hz, 2 H), 1.43-1.51 (m, 1 H); ¹³C NMR (100 MHz, CDCl₃) δ 180.3, 134.7, 127.1, 121.1, 87.6, 83.1, 51.0, 31.3, 25.3, 23.9, 19.1; HRMS-ESI (m/z) [M + Na]+ calcd for C₁₂H₁₄O: 197.0937, found: 197.0938.

4.4.4. 5-(Cyclopent-1-en-1-yl)pent-4-yn-1-ol (17b)—A 100-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter and two rubber septa was charged with PdCl₂(PPh₃)₂ (0.069 g, 0.10 mmol, 0.02 equiv), CuI (0.038 g, 0.20 mmol, 0.04 equiv) and 2-MeOAc-toluenesulfonyl chloride (0.281 g, 0.401 mmol, 0.02 equiv), CuI (0.152 g, 0.797 mmol, 0.04 equiv), and Et₂N (4.2 mL, 30 mmol, 1.5 equiv). The orange reaction mixture was cooled to 0 °C and vinyl bromide (40 mL of a 1.0 M solution in THF, 40 mmol, 2.0 equiv) was added in one portion. A solution of 4-pentyn-1-ol (0.46 mL, 0.42 g, 5.0 mmol, 1.0 equiv) was added dropwise via cannula over 2 min (1.8-mL THF rinse). The reaction mixture was stirred at rt for 1 h, 10 mL of H₂O was added, and then a solution of 4-pentyn-1-ol (0.51 mL, 0.46 mmol, 1.0 equiv) in 2.8 mL of THF was added dropwise via cannula over 20 min (1.4-mL THF rinse), and the dark brown reaction mixture was allowed to warm to rt over 30 min. After 1.5 h, the reaction mixture was filtered through a plug of 2 g of silica gel with the aid of 300 mL of Et₂O. The filtrate was washed with two 100-mL portions of satd aq NaHCO₃ solution and 100 mL of brine, dried over MgSO₄, filtered, and concentrated to give 1.5 g of orange oil. Column chromatography on 91 g of silica gel (elution with 5-35% EtOAc-hexanes) gave 1.77 g (81%) of alcohol 17b as a yellow-orange oil: IR (neat) 3332, 2950, 2223, 1767, 1614, 1585, 1452, 1326, 1057, 950, and 809 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.69 (ddt, J = 15.7, 10.7, 2.1 Hz, 1 H), 5.41-5.45 (m, 1 H), 3.88 (q, J = 5.9 Hz, 2 H), 2.36-2.45 (m, 4 H), 1.89 (quint, J = 6.9 Hz, 2 H), 1.52 (t, J = 5.4 Hz, 1 H); ¹³C NMR (100 MHz, CDCl₃) δ 136.6, 124.8, 90.6, 78.6, 62.0, 36.7, 33.2, 31.6, 23.4, 16.2; HRMS-ESI (m/z) [M + H]+ calcd for C₁₀H₁₂O: 151.1113, found: 151.1113.

4.4.5. 5-(Cyclohex-1-en-1-yl)pent-4-yn-1-ol (17c)—A 100-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter and two rubber septa was charged with PdCl₂(PPh₃)₂ (0.077 g, 0.11 mmol, 0.02 equiv), CuI (0.04 g, 0.22 mmol, 0.04 equiv), and i-Pr₂NH (11.5 mL, 8.30 g, 82 mmol, 15 equiv). A solution of cyclohexenyl trifluoromethanesulfonate (1.64 g, 7.12 mmol, 1.3 equiv) in 11 mL of THF was added dropwise over 2 min (2-mL THF rinse), and then a solution of 4-pentyn-1-ol (0.51 mL, 0.46
g, 5.5 mmol, 1.0 equiv) in 20 mL of THF was added dropwise over 22 min. The reaction mixture was stirred at rt for 1 h, and then 75 mL of Et₂O and 10 mL of H₂O were added. The organic phase was separated and washed with 10 mL of H₂O and 25 mL of brine, dried over MgSO₄, filtered, and concentrated to give 2.54 g of red oil. Purification by column chromatography on 152 g of silica gel (elution with 5-30% EtOAc-hexanes) afforded 0.830 g (92%) of alcohol 17c as a dark red oil: IR (neat) 3334, 2930, 2220, 1631, 1435, 1347, 1136, 1052, 918, 842, 801, and 730 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.99-6.05 (m, 1 H), 3.78 (q, J = 5.8 Hz, 2 H), 2.43 (t, J = 6.9 Hz, 2 H), 2.02-2.16 (m, 4 H), 1.79 (quint, J = 6.3 Hz, 2 H), 1.52-1.66 (m, 5 H); ¹³C NMR (100 MHz, CDCl₃) δ 133.8, 121.0, 86.5, 83.2, 62.2, 31.7, 29.7, 25.7, 22.5, 21.7, 16.1; HRMS-DART (m/z) calcd for C₁₁H₁₆O [M + H]+: 165.1274, found: 165.1279.

4.4.6. 7-Iodohept-1-en-3-yne (18a)—Reaction of alcohol 17a (0.865 g, 7.85 mmol, 1.0 equiv) with imidazole (0.801 g, 11.8 mmol, 1.5 equiv), triphenylphosphine (2.06 g, 7.85 mmol, 1.0 equiv) and iodine (1.401 g, 5.52 mmol, 1.3 equiv) in 8.4 mL of THF for 1 h according to the general procedure afforded a pale yellow oil. This material was filtered through a short plug of basic alumina using 50 mL of pentane and the filtrate was concentrated at 0 °C (20 mmHg) to afford 1.625 g (94%) of iodide 18a as a colorless oil containing some white solid: IR (neat) 3097, 3007, 2938, 2905, 2837, 2227, 1611, 1441, 1346, 1267, 1220, 1166, 1150, 1076, 1048, 919, and 842 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.3 Hz, 2 H), 2.01 (quint, J = 6.7 Hz, 2 H), 1.89 (quint, J = 7.5 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 136.8, 124.8, 89.0, 80.6, 32.3, 32.4, 23.4, 20.7, 5.6; HRMS-ESI (m/z) calcd for C₁₀H₁₃I [M + H]+: 220.9827, found: 220.9825.

4.4.7. 1-(5-Iodopent-1-ynyl)cyclopent-1-ene (18b)—Reaction of alcohol 17b (0.865 g, 7.85 mmol, 1.0 equiv) with imidazole (0.801 g, 11.8 mmol, 1.5 equiv), triphenylphosphine (2.06 g, 7.85 mmol, 1.0 equiv), and iodine (1.401 g, 5.52 mmol, 1.3 equiv) in 8.4 mL of THF for 1 h according to the general procedure afforded a yellow oil containing some white solid: IR (neat) 3097, 3007, 2938, 2905, 2837, 2227, 1841, 1608, 1427, 1220, 1169, 973, and 919 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.78 (ddt, J = 17.5, 11.0, 2.1 Hz, 1 H), 5.58 (ddt, J = 17.5, 2.2, 0.6 Hz, 1 H), 5.42 (dd, J = 11.0, 1.1 Hz, 1 H), 3.32 (t, J = 6.8 Hz, 2 H), 2.47 (td, J = 6.7, 2.1 Hz, 2 H), 2.03 (quint, J = 6.7 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 126.4, 117.5, 88.8, 80.6, 32.3, 32.4, 20.7, 5.6; HRMS-ESI (m/z) calcd for C₁₀H₁₃I [M + H]+: 261.0135, found: 261.0144.

4.4.8. 1-(5-Iodopent-1-ynyl)cyclohex-1-ene (18c)—Reaction of alcohol 17c (0.654 g, 4.35 mmol, 1.0 equiv) with imidazole (1.13 g, 11.5 mmol, 1.0 equiv) and iodine (1.912 g, 7.53 mmol, 1.5 equiv) in 8.4 mL of THF for 1 h according to the general procedure afforded a pale yellow oil. This material was filtered through a plug of basic alumina using 50 mL of pentane. The filtrate was concentrated at 0 °C (20 mmHg) to afford 1.318 g (92%) of iodide 18c as a very pale yellow oil: IR (neat) 2954, 2844, 2221, 1611, 1441, 1427, 1347, 1220, 1167, 949, and 809 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.99-6.05 (m, 1 H), 3.32 (t, J = 6.8 Hz, 2 H), 2.48 (t, J = 6.7 Hz, 2 H), 2.37-2.45 (m, 4 H), 2.13 (quint, J = 6.8 Hz, 2 H), 1.89 (quint, J = 7.5 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 136.8, 124.8, 89.0, 79.1, 36.7, 33.2, 32.4, 23.4, 20.7, 5.6; HRMS-ESI (m/z) calcd for C₁₀H₁₃I [M + H]+: 275.0291, found: 275.0295.

4.4.9. N-Methoxy-N-methylcyclobut-1-enecarboxamide (19)—A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter and two rubber septa was charged with cyclobutenecarboxylic acid (0.825 g, 11.5 mmol, 1.0 equiv) and 70 mL of
CH₂Cl₂. Oxalyl chloride (1.02 mL, 1.53 g, 12.0 mmol, 1.0 equiv) and DMF (4 drops) were added, and the resulting mixture was stirred at rt for 1 h (gas evolution) and then cooled to 0 °C. A solution of N,N-dimethylhydroxylamine hydrochloride (1.23 g, 12.6 mmol, 1.1 equiv) and triethylamine (3.52 mL, 2.56 g, 25.3 mmol, 2.2 equiv) in 40 mL of CH₂Cl₂ was added dropwise via cannula over 5 min (5-mL CH₂Cl₂ rinse). The pale yellow reaction mixture was allowed to warm to rt and stirred for 1 h in the dark. Water (50 mL) was added and the aqueous layer was separated, neutralized with satd aq NaHCO₃ solution, and then extracted with two 125-mL portions of Et₂O. The combined organic layers were washed with 100 mL of brine, dried over MgSO₄, filtered, and concentrated to give 1.748 g of yellow oil.

Purification by column chromatography on 52 g of silica gel (elution with 25-35% EtOAc-hexanes) afforded 1.282 g (79%) of Weinreb amide (0.150 g, 50%) of enone 19 as a very pale yellow oil: IR (neat) 2968, 2936, 1643, 1589, 1416, 1382, and 992 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.66 (t, J = 1.2 Hz, 1 H), 3.70 (s, 3 H), 3.23 (s, 3 H), 2.79-2.83 (m, 2 H), 2.48 (td, J = 3.3, 1.2 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 163.0, 144.9, 139.6, 61.6, 32.7, 30.7, 27.8; HRMS-ESI (m/z) [M + H]⁺ calcd for C₇H₁₁NO₂: 142.0863, found: 142.0869.

4.4.10. General procedure for the synthesis of cyclobutenyl ketones: 1-cyclobutenyl-7-methyloct-7-en-5-yn-1-one (21)—A 50-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with iodide 18a (1.163 g, 3.58 mmol, 1.1 equiv) and then Weinreb amide (0.440 g, 3.12 mmol, 1.0 equiv) in 5.2 mL of THF at 78 °C for 20 min, and then a solution of Weinreb amide (0.140 g, 1.09 mmol, 1.2 equiv) with triethylamine (3.52 mL, 2.56 g, 25.3 mmol, 2.2 equiv) in 40 mL of CH₂Cl₂ was added dropwise over 8 min. The reaction mixture was allowed to warmed to 0 °C over 10 min and then diluted with 100 mL of brine and 25 mL of satd aq NH₄Cl solution. The aqueous phase was separated and then extracted with two 50-mL portions of Et₂O. The combined organic phases were washed with 50 mL of brine, dried over MgSO₄, filtered, and concentrated (5-10 °C, 20 mmHg) to give 1.04 g of yellow oil. Purification by column chromatography on 115 g of acetone-deactivated silica gel (elution with 0-5% EtOAc-hexanes) provided 0.300 g (55%) of enone 21 as a pale yellow oil: IR (neat) 2224, 1709, 1672, 1598, 1434, 1372, and 730 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.76 (t, J = 7.3 Hz, 2 H), 1.85 (quint, J = 1.0 Hz, 3 H), 1.84 (quint, J = 1.5 Hz, 3 H), 1.87 (dd, J = 1.0, 0.7 Hz, 3 H); ¹³C NMR (100 MHz, CDCl₃) δ 196.1, 147.2, 145.1, 125.9, 117.6, 90.2, 80.2, 36.2, 28.1, 26.7, 23.1, 19.0; HRMS-ESI (m/z) [M + H]⁺ calcd for C₁₂H₁₄O: 175.1117, found: 175.1126.

4.4.11. 1-Cyclobutenyl-7-methyloct-7-en-5-yn-1-one (21)—Reaction of iodide 6 (0.443 g, 1.89 mmol, 1.2 equiv) with t-BuLi solution (1.47 M in pentane, 2.57 mL, 3.78 mmol, 2.4 equiv) and then with Weinreb amide (0.224 g, 1.59 mmol, 1.0 equiv) according to the general procedure gave 0.456 g of pale yellow oil. Purification by column chromatography on 46 g of acetone-deactivated silica gel (elution with 0-7% EtOAc-hexanes) afforded 0.150 g (50%) of enone 21 as a yellow oil: IR (neat) 2224, 1709, 1672, 1614, 1598, 1434, 1372, and 895 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.78 (t, J = 1.3 Hz, 1 H), 5.19-5.22 (m, 2 H), 5.14-5.17 (m, 1 H), 2.69-2.71 (m, 2 H), 2.70 (t, J = 7.3 Hz, 2 H), 2.48-2.51 (m, 2 H), 2.37 (t, J = 6.9 Hz, 2 H), 1.87 (dd, J = 1.5, 1.0 Hz, 3 H), 1.85 (quint, J = 7.0 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 196.3, 147.3, 145.2, 127.3, 120.8, 88.5, 82.8, 36.3, 28.2, 26.8, 24.0, 23.3, 19.0; HRMS-ESI (m/z) [M + H]⁺ calcd for C₁₃H₁₆O: 211.1093, found: 211.1088.
4.4.12. 1-Cyclobutenyl-6-(cyclopent-1-en-1-yl)-hex-5-yn-1-one (22)—Reaction of iodide 18b (0.898 g, 3.45 mmol, 1.15 equiv) with t-BuLi solution (1.39 M in pentane, 5.00 mL, 6.95 mmol, 2.3 equiv) and then with Weinreb amide 19 (0.423 g, 3.00 mmol, 1.0 equiv) according to the general procedure gave 0.766 g of yellow oil. Purification by column chromatography on 115 g of acetone-deactivated silica gel (elution with 0-5% EtOAc-hexanes) afforded 0.410 g (64%) of enone 22 as a white solid, mp 30-32 °C. IR (thin film) 2932, 1671, 1589, 1441, 1373, 1231, 1071, and 949 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.74-6.79 (m, 1 H), 5.91-5.98 (m, 1 H), 2.67-2.74 (m, 4 H), 2.48-2.52 (m, 2 H), 2.36-2.46 (m, 6 H), 1.82-1.93 (m, 4 H); ¹³C NMR (100 MHz, CDCl₃) δ 196.2, 147.2, 145.1, 136.4, 124.9, 90.5, 78.8, 36.7, 36.3, 33.2, 28.1, 26.7, 23.4, 23.3, 19.2; HRMS-ESI (m/z) calcld for C₁₅H₁₈O [M + H]⁺: 215.1430, found: 215.1427.

4.4.13. 1-Cyclobutenyl-6-(cyclohex-1-en-1-yl)-hex-5-yn-1-one (23)—Reaction of iodide 18c (1.161 g, 4.23 mmol, 1.1 equiv) with t-BuLi solution (1.32 M in pentane, 6.45 mL, 8.51 mmol, 2.3 equiv) and then with Weinreb amide 19 (0.522 g, 3.70 mmol, 1.0 equiv) according to the general procedure gave 1.281 g of yellow oil. Purification by column chromatography on 152 g of acetone-deactivated silica gel (elution with 0-4% EtOAc-hexanes) afforded 0.469 g (56%) of enone 23 as a colorless oil: IR (neat) 2222, 1672, 1589, 1436, 1371, 1346, 1231, 1190, 1075, 996, 843, 800, and 734 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.74-6.79 (m, 1 H), 5.89-6.03 (m, 1 H), 2.66-2.72 (m, 4 H), 2.47-2.51 (m, 2 H), 2.35 (J = 6.9 Hz, 2 H), 2.12-2.22 (m, 4 H), 1.83 (quint, J = 7.0 Hz, 2 H), 1.53-1.66 (m, 4 H); ¹³C NMR (400 MHz, CDCl₃) δ 196.4, 147.3, 145.0, 133.6, 121.1, 86.5, 83.4, 36.4, 29.8, 28.1, 26.7, 25.7, 23.5, 22.6, 21.8, 19.0; HRMS-ESI (m/z) [M + Na]⁺ calcld for C₁₆H₂₀O: 229.1587, found: 229.1577.

4.5. [4 + 4] Annulation with cyclobutenones

4.5.1. (6Z,8Z)-8-Methyl-2,3-dihydro-1H-cyclopenta[8]annulen-5(4H)-one (8)—A threaded Pyrex tube (35 mm O.D., 30 mm I.D., 15-cm long) equipped with a stir bar, rubber septum, and argon inlet needle was charged with cyclobutene 7 (0.206 g, 1.18 mmol, 1.0 equiv), BHT (0.261 g, 1.18 mmol, 1.0 equiv), and 24 mL of CH₂Cl₂. The pale yellow solution was cooled to 0 °C and BF₃-etherate (0.20 mL, 0.23 g, 1.6 mmol, 1.4 equiv) was added dropwise via syringe over 30 sec. The reaction mixture was stirred at 0 °C for 20 min while the color changed to orange and then tan. The rubber septum was replaced with a Teflon cap, and the reaction mixture was heated at 50 °C. After 4 h, the solution was cooled to rt and the Teflon cap was replaced with a rubber septum and argon inlet needle. The reaction mixture was cooled to 0 °C and 3 mL of satd aq NaHCO₃ solution was added dropwise via syringe over 1 min. The resulting mixture was extracted with two 20-mL portions of CH₂Cl₂ and the combined organic layers were washed with 20 mL of brine, dried over MgSO₄, filtered, and concentrated at 10 °C (20 mmHg) to give 0.478 g of a brown oil. Column chromatography on 48 g of silica gel (elution with 5-20% Et₂O-pentane) afforded 0.061 g (30%) of cyclooctatriene 8 as a yellow oil and 0.075 g (36%) of indan 13 as a yellow oil. For cyclooctatriene 8: IR (neat) 3301, 2955, 2916, 2844, 1611, 1615, 1564, 1434, 1286, 1234, 1200, 1029, and 820 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 6.61 (d, J = 13.3 Hz, 1 H), 6.36-6.41 (m, 2 H), 2.91 (br s, 2 H), 2.49 (app q, J = 7.0 Hz, 2 H), 2.11 (s, 3 H), 1.93 (quint, J = 7.6 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 190.9, 141.4, 139.7, 139.4, 135.4, 132.9, 130.0, 44.4, 36.7, 35.8, 26.7, 23.1; HRMS-ESI (m/z) [M + Na]⁺ calcld for C₁₃H₁₄O: 197.0937, found: 197.0935. For indan 13, ²H NMR (400 MHz, CDCl₃) δ 7.47 (s, 1 H), 7.24 (s, 1 H), 3.21 (t, J = 7.4 Hz, 2 H), 2.88 (t, J = 7.6 Hz, 2 H), 2.58 (s, 3H), 2.37 (s, 3 H), 2.07 (quint, J = 7.5 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 200.3, 146.6, 142.6, 136.0, 133.9, 129.6, 128.3, 33.9, 32.4, 28.6, 25.5, 21.3.

4.6. [4 + 4] Annulations with acylcyclobutenes

4.6.1. (5Z,7Z)-6-Methyl-3,4,9,10-tetrahydrobenzo[8]annulen-1(2H)-one (26)

**Method A:** A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with enone 21 (0.107 g, 0.569 mmol, 1.0 equiv) and 57 mL of CH$_2$Cl$_2$. The reaction mixture was cooled to −78 °C and methanesulfonic acid solution (0.24 M in CH$_2$Cl$_2$, 2.35 mL, 0.57 mmol, 1.0 equiv) was added dropwise over 5 min. The yellow reaction mixture was stirred at −78 °C for 4 h, and then 10 mL of satd aq NaHCO$_3$ solution was added dropwise over 5 min. The resulting mixture was warmed to 0 °C and then diluted with 10 mL of brine. The organic phase was dried over Na$_2$SO$_4$ and filtered into a threaded Pyrex tube (28 mm I.D., 35 mm O.D., 20-cm long). The pale blue reaction mixture was deoxygenated with a stream of argon for 5 min, and then the tube was sealed with a threaded Teflon cap. The reaction mixture was heated at 70 °C for 5 h, and then cooled to rt and concentrated to give 0.125 g of brown oil. Purification by column chromatography on 16 g of silica gel (elution with 8% EtOAc-hexanes) afforded 0.074 g (69%) of cyclooctatriene 26 as a yellow oil: IR (neat) 3307, 2932, 1663, 1609, 1433, 1374, 1299, 1176, 1128, 819, 756, and 718 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) δ 5.72 (d, $J$ = 13.3 Hz, 1 H), 5.69 (s, 1 H), 5.60 (dt, $J$ = 13.3, 2.2 Hz, 1 H), 2.54 (t, $J$ = 6.0 Hz, 2 H), 2.43 (t, $J$ = 6.6 Hz, 2 H), 2.32-2.38 (m, 2 H), 2.30 (t, $J$ = 5.9 Hz, 2 H), 1.97 (quint, $J$ = 5.5 Hz, 2 H), 1.95 (d, $J$ = 1.2 Hz, 3 H); $^{13}$C NMR (100 MHz, CDCl$_3$) δ 199.2, 155.8, 138.0, 136.9, 132.7, 127.6, 125.4, 38.1, 36.8, 30.6, 26.2, 23.8, 23.0; HRMS-ESI (m/z) calcd for C$_{13}$H$_{16}$O [M + H]$^+$: 189.1279, found: 189.1277.

**Method B:** A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with enone 21 (0.136 g, 0.722 mmol, 1.0 equiv) and 72 mL of CH$_2$Cl$_2$. The reaction mixture was cooled to 0 °C and 2,4,6-triisopropylbenzenesulfonic acid (0.103 g, 0.362 mmol, 0.5 equiv) was added in one portion. The reaction mixture was stirred at 0 °C for 2 h during which time the color changed from colorless to purple. Satd aq NaHCO$_3$ solution (70 mL) was added in one portion and the organic phase was separated, washed with 50 mL of brine, dried over Na$_2$SO$_4$, filtered, and concentrated at 5-10 °C (20 mmHg). The resulting yellow oil was diluted with 75 mL of CH$_2$Cl$_2$ and transferred to a threaded Pyrex tube (28 mm I.D., 35 mm O.D., 20-cm long) equipped with a stir bar, rubber septum, and an argon inlet needle. The solution was deoxygenated with a stream of argon for 5 min and then sealed with a threaded Teflon cap. The reaction mixture was heated at 90-95 °C for 20 h and then cooled to rt and concentrated at 5-10 °C (20 mmHg) to give a brown oil. Purification by column chromatography on 12 g of silica gel (elution with 5% Et$_2$O-pentane) afforded 0.106 g (78%) of cyclooctatriene 26 as a yellow oil.

**Method C:** A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with enone 21 (0.160 g, 0.850 mmol, 1.0 equiv) and 72 mL of CH$_2$Cl$_2$. The reaction mixture was cooled to 0 °C and 2,4,6-trisopropylbenzenesulfonic acid (0.120 g, 0.362 mmol, 0.5 equiv) was added in one portion. The reaction mixture was stirred at 0 °C for 2 h during which time the color changed from colorless to purple. Satd aq NaHCO$_3$ solution (100 mL) was added in one portion and the organic phase was separated, washed with 50 mL of brine, dried over Na$_2$SO$_4$, filtered, and concentrated at 5-10 °C (20 mmHg). The resulting yellow oil was diluted with 75 mL of CH$_2$Cl$_2$ and transferred to a threaded Pyrex tube (28 mm I.D., 35 mm O.D., 20-cm long) equipped with a stir bar, rubber septum, and an argon inlet needle. Camphorsulfonic acid (0.400 g, 1.72 mmol, 2.0 equiv) was added and the solution was deoxygenated with a stream of argon for 5 min. The tube was sealed with a threaded Teflon cap, heated at 50 °C for 17 h, and then cooled to rt and concentrated at 5-10 °C (20 mmHg) to give a brown oil. Purification by column chromatography on 12 g of
silica gel (elution with 5% Et₂O-pentane) afforded 0.098 g (61%) of cyclooctatriene 26 as a yellow oil.

4.6.2. (5Z,7Z)-3,4,9,10-Tetrahydrobenzo[8]annulen-1(2H)-one (27)—A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with enone 20 (0.150 g, 0.861 mmol, 1.0 equiv) and 80 mL of CH₂Cl₂. The reaction mixture was cooled to −30 °C and methanesulfonic acid solution (0.24 M in CH₂Cl₂, 3.6 mL, 0.86 mmol, 1.0 equiv) was added over 4 min. The reaction mixture was stirred at −30 to −15 °C for 2.5 h and then 50 mL of satd aq NaHCO₃ solution was added in one portion. The organic layer was separated and washed with 50 mL of satd aq NaHCO₃, dried over Na₂SO₄, filtered, and concentrated to give a yellow oil. This material was dissolved in 80 mL of CH₂Cl₂ and transferred to a threaded Pyrex tube (28 mm I.D., 35 mm O.D., 20-cm long) equipped with a stir bar, rubber septum, and an argon inlet needle. Camphorsulfonic acid (0.400 g, 1.72 mmol, 2.0 equiv) was added and the solution was deoxygenated with a stream of argon for 5 min. The tube was sealed with a threaded Teflon cap. The reaction mixture was heated at 100 °C for 15 h and then cooled to rt and concentrated to give a brown oil. Purification by column chromatography on 15 g of silica gel (elution with 3% Et₂O-pentane) afforded 0.083 g (55%) of cyclooctatriene 27 as a yellow oil: IR (neat) 3001, 2932, 2875, 2832, 1661, 1432, 1176, 680 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.96 (dd, J = 12.2, 5.9 Hz, 1 H), 5.79-5.89 (m, 2 H), 5.68-5.76 (m, 1 H), 2.58 (t, J = 5.8 Hz, 2 H), 2.45 (t, J = 6.7 Hz, 2 H), 2.35-2.46 (m, 2 H), 2.00 (quint, J = 6.3 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 198.8, 154.2, 137.6, 135.2, 128.9, 128.3, 123.3, 37.9, 30.3, 30.0, 23.5, 22.8; HRMS-DART (m/z) calcd for [M + H]+: 175.1117, found: 175.1121.

4.6.3. (3aZ,11Z)-2,3,5,6,9,10-Hexahydro-1H-benzo[a]cyclopenta[d][8]annulen-7(8H)-one (38)—A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with enone 22 (0.095 g, 0.44 mmol, 1.0 equiv) and 44 mL of CH₂Cl₂. The reaction mixture was cooled to −78 °C and 1.82 mL of methanesulfonic acid solution (0.24 M in CH₂Cl₂, 0.44 mmol, 1.0 equiv) was added dropwise over 1 min. The pale yellow reaction mixture was stirred at −78 °C for 1 h, and then additional methanesulfonic acid solution (0.24 M in CH₂Cl₂, 0.90 mL, 0.22 mmol, 0.50 equiv) was added. After 30 min at −78 °C, the reaction mixture was warmed to −60 °C, stirred for 1 h, and then additional methanesulfonic acid solution (0.24 M in CH₂Cl₂, 0.90 mL, 0.22 mmol, 0.5 equiv) was added. The green reaction mixture was stirred at −60 °C for 3 h, and then 10 mL of satd aq NaHCO₃ solution was added and the resulting mixture was warmed to 0 °C over 10 min. The blue organic phase was separated, dried over Na₂SO₄, and then filtered into a threaded Pyrex tube (35 mm O.D.; 28 mm I.D.; 15-cm long) equipped with a stir bar, rubber septum, and an argon inlet needle. The solution was deoxygenated with a stream of argon for 5 min and then the tube was sealed with a threaded Teflon cap. The reaction mixture was heated at 70 °C for 3 h, and then cooled to rt and concentrated to give 0.124 g of green oil. Purification by column chromatography on 16 g of silica gel (elution with 3-8% EtOAc-hexanes) afforded 0.038 g (40%) of cyclooctatriene 38 as an orange oil: IR (neat) 2929, 1659, 1601, 1433, 1370, 1327, 1299, 1175, 1127, 920, 815, and 732 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 5.81-5.89 (m, 1 H), 5.76-5.80 (m, 1 H), 2.61 (td, J = 7.5, 1.6 Hz, 2 H), 2.51-2.57 (m, 2 H), 2.39-2.46 (m, 6 H), 2.34 (t, J = 6.0 Hz, 2 H), 1.90 (quint, J = 6.3 Hz, 2 H), 1.65 (quint, J = 7.4 Hz, 2 H); ¹³C NMR (100 MHz, CDCl₃) δ 199.1, 154.9, 145.2, 137.2, 136.5, 129.4, 122.8, 38.05, 38.04, 37.9, 32.0, 31.4, 23.6, 23.1, 21.9; HRMS-DART (m/z) calcd for C₁₅H₁₈O [M + H]+: 215.1430, found: 215.1423.
4.6.4. (7Z,11αZ)-2,3,5,6,8,9,10,11-Octahydrodibenzo[a,d][8]annulen-4(1H)-one (39)—A 250-mL, three-necked, round-bottomed flask equipped with an argon inlet adapter, two rubber septa, and a thermocouple probe was charged with enone 23 (0.017 g, 0.47 mmol, 1.0 equiv) and 47 mL of CH$_2$Cl$_2$. The reaction mixture was cooled to $-78$ °C and 2.02 mL of methanesulfonic acid solution (0.24 M in CH$_2$Cl$_2$, 0.489 mmol, 1.0 equiv) was added dropwise over 2 min. The reaction mixture was stirred at $-78$ °C for 3 h, and then 10 mL of satd aq NaHCO$_3$ solution was added dropwise over 5 min. The reaction mixture was warmed to 0 °C over 10 min, and then diluted with 10 mL of brine. The organic phase was separated and dried over Na$_2$SO$_4$ and then filtered into a threaded Pyrex tube (35 mm O.D.; 28 mm I.D.; 15-cm long) equipped with a stir bar, rubber septum, and an argon inlet needle. The solution was deoxygenated with a stream of argon for 5 min and then the tube was sealed with a threaded Teflon cap. The reaction mixture was heated at 70 °C for 14 h, and then cooled to rt and concentrated to give 0.112 g of brown oil. Purification by column chromatography on 17 g of silica gel (elution with 5% EtOAc-hexanes) provided 0.028 g (26%) of cyclooctatriene 39 as an orange oil: IR (neat) 2248, 1663, 1436, 1372, 1300, 1240, 1177, 1127, 1100, 1025, 956, 917, 854, 821, and 733 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 5.66 (s, 1 H), 5.42 (t, $J$ = 4.3 Hz, 1 H), 2.41 (t, $J$ = 6.7 Hz, 2 H), 2.52 (t, $J$ = 6.4 Hz, 2 H), 2.34 (t, $J$ = 5.9 Hz, 2 H), 2.29 (m, 2 H), 2.03-2.11 (m, 2 H), 1.95 (quint, $J$ = 6.4 Hz, 2 H), 1.60-1.74 (m, 4 H); $^{13}$C NMR (100 MHz, CDCl$_3$) $\delta$ 199.2, 155.6, 145.0, 137.0, 136.2, 124.0, 122.5, 41.6, 38.7, 38.2, 30.4, 28.5, 28.2, 23.8, 23.0; HRMS-DART (m/z) calcd for C$_{16}$H$_{20}$O [M + H]$^+$: 229.1592, found: 229.1590.

J.M.R. was supported in part by an AstraZeneca Graduate Fellowship and a David A. Johnson Summer Graduate Fellowship.

References and notes

4. The intermediacy of strained cyclic allenes in these reactions is supported by experimental observations and computational studies. See refs. 1, 2a, and Ananikov VP. J. Phys. Org. Chem. 2001; 14:109–121.

21. Prepared by hydrolysis of commercially available TIPPSOCl as described by Jautze S, Peters R. Angew. Chem. Int. Ed. 2008; 47: 9284–9288. The acid was dried over P2O5 under vaccum (0.1 mmHg) for 48 h prior to use.

23. Acylcyclobutene 30 was prepared beginning from 4-butyn-1-ol by a route analogous to that employed for the synthesis of the homologous substrates described in Scheme 4.

24. A similar difference is observed in the rate of intramolecular Diels-Alder reactions. Cycloaddition of 1,7,9-decatrien-3-one (four-atom tether) produces the expected octalone below room temperature, while reaction of 1,6,8-nonatrien-3-one (with a three-atom tether) requires 180 °C. The diminished rate of cycloaddition in the three-atom tether series has been attributed to increased steric interactions in the connecting chain and to diminished overlap of the carbonyl group with the dienophilic π-bond. See (a) Jung ME, Halweg KM. Tetrahedron Lett. 1981; 22: 3929–3932. (b) Smith DA, Sakon K, Houk KN. Tetrahedron Lett. 1986; 27: 4877–4880.

25. Esters 31 and 32 were prepared by reaction of cyclobutenecarboxylic acid with oxalyl chloride followed by addition of the appropriate enynyl alcohol.

29. Weinreb amide 19 is sparingly soluble in Et2O-pentane mixtures at −78 °C so THF was added to form a homogeneous reaction mixture.

30. In a separate run, the organic phase was concentrated to give 0.055 g of brown oil that was determined to be diene 24: IR (neat) 2936, 1707, 1442, 1365, 1333, 1195, 1020, 885, and 734 cm−1; 1H NMR (400 MHz, CDCl3) δ 6.07 (s, 1 H), 5.68 (dd, J = 6.9, 3.8 Hz, 1 H), 3.43 (q, J = 8.2
Hz, 1 H), 2.50-2.60 (m, 2 H), 2.30-2.38 (m, 2 H), 2.14-2.28 (m, 4 H), 1.82-1.88 (m, 2 H), 1.79 (s, 3 H); $^{13}$C NMR (400 MHz, CDCl$_3$) δ 212.9, 138.7, 134.4, 122.7, 120.9, 50.6, 35.1, 34.1, 33.1, 29.4, 24.5, 22.4, 21.4.

31. The product of a separate run was purified by silica gel using 3% Et$_2$O-hexane elution to afford the diene 25: IR (neat) 2226, 1707, 1432, 1330, 1193, 1072, 899, 821, and 736 cm$^{-1}$; $^1$H NMR (400 MHz, CDCl$_3$) δ 6.30 (td, $J = 10.0, 2.6$ Hz, 1 H), 5.79 (dd, $J = 6.6, 3.7$ Hz), 5.65-5.75 (m, 1 H), 3.44 (q, $J = 8.2$ Hz, 1 H), 2.50-2.62 (m, 2 H), 2.33-2.50 (m, 2 H), 2.09-2.33 (m, 2 H), 1.97-2.09 (m, 2 H) 1.77-1.87 (m, 2 H); $^{13}$C NMR (100 MHz, CDCl$_3$) δ 212.4, 138.0, 127.6, 125.9, 123.4, 51.5, 34.9, 34.3, 28.8, 28.0, 22.5, 21.3. HRMS-DART (m/z) calcd for [M + Na]$^+$: 197.0937, found: 197.0940.

32. This organic phase is presumed to contain diene 36. In a separate run, the organic phase was concentrated to afford 0.009 g of yellow oil that was shown to be a mixture of enyne 22 and diene 36. The diene is characterized by the $^1$H NMR resonances at 5.62 ppm (s, 1 H) corresponding to the alkenyl proton and 3.75-3.83 (m, 1 H) corresponding to the allylic methine proton. Diene 40 was observed in the mixture of products of another run and identified by characteristic $^1$H NMR alkene resonances at 5.90-5.98 (m, 1 H) and 5.70 ppm (s, 1 H).

33. The organic phase is presumed to contain diene 37. In a separate run, the organic phase was concentrated to afford 0.012 g of brown oil that was shown to be a mixture of diene 37 and other compounds. This diene is characterized by the $^1$H NMR resonances at 5.58 ppm corresponding to the alkenyl proton and 3.55 ppm corresponding to the allylic methine proton.
