## **Preparation for Recitation 10**

Read *End-to-end Arguments in System Design*. As you read this paper, think about the following questions:

- How does the end-to-end argument apply to other systems you know about, for example, the X window system?
- How does the packet voice example make use of the end-to-end argument?
- Is it OK for lower levels to do a bad job? Why should they do error detection and correction?
