TOWARD A THEORY OF THE EVOLUTION OF BUSINESS ECOSYSTEMS: Enterprise Architectures, Competitive Dynamics, Firm Performance & Industrial Co-Evolution

by

THEODORE F. PIEPENBROCK

Submitted to the Engineering Systems Division on September 16, 2009 in partial fulfillment of the requirements for the degree of Doctor of Philosophy in Engineering Systems.

Abstract

This dissertation contributes toward the building of a theory of the evolution of business ecosystems. In the process, it addresses a question that has been posed by evolutionary theorists in the economics and sociology literatures for decades: "Why do firms in the same industry vary *systematically* in performance *over time*?" Seeking a *systematic* explanation of a *longitudinal* phenomenon inevitably requires characterizing the evolution of the industrial ecosystem, as both the organization (firm) and its environment (industry, markets and institutions) are co-evolving.

This question is therefore explored via a theoretical sample in three industrial ecosystems covering manufacturing and service sectors, with competitors from the US, Europe and Japan: commercial airplanes, motor vehicles and airlines. The research is based primarily on an indepth seven-year, multi-level, multi-method, field-based case study of both firms in the large commercial airplanes industry *mixed* duopoly as well as the key stakeholders in their extended enterprises (i.e. customers, suppliers, investors and employees). This field work is supplemented with historical comparative analysis in all three industries, as well as nonlinear dynamic simulation models developed to capture the essential mechanisms governing the evolution of business ecosystems.

A theoretical framework is developed which endogenously traces the co-evolution of firms and their industrial environments using their highest-level system properties of *form, function* and *fitness* (as reflected in the system sciences of *morphology, physiology* and *ecology*), and which embraces the evolutionary processes of *variation, selection* and *retention*. The framework captures the path-dependent evolution of heterogeneous populations of enterprise architectures engaged in *symbiotic inter-species competition* and posits the evolution of *dominant designs* in enterprise architectures that oscillate deterministically and chaotically between *modular* and *integral* states throughout an industry's life-cycle. Architectural innovation – at the extended enterprise level – is demonstrated to contribute to the failure of established firms, with causal mechanisms developed to explain tipping points.

Thesis Supervisor: Dr. Charles H. Fine, Professor of Management & Engineering Systems Thesis Member: Dr. Deborah J. Nightingale, Professor of the Practice of Engineering Systems Thesis Member: Dr. Yossi Sheffi, Professor of Engineering Systems, Director of ESD Thesis Member: Carolyn Corvi, Vice President/General Manager, *Boeing Commercial Airplanes* To Sophie and Garry

Acknowledgements

At one of the first public presentations of this research in 2003, I received a public critique from the late Dr. Michael Hammer, MIT professor, best-selling international author and management "guru". He colorfully exclaimed, "*This is either the work of a madman or a genius, and at this moment I am inclined to think that it is the latter.*" I would like to acknowledge at this point that if the ideas presented herein appear strange, unconvincing, illogical, or simply wrong, then I take full blame as the "madman" responsible for this work. However, if these insights – while unconventional – do seem to uncover some truths, then I must acknowledge the sources of any "genius" that may exist.

My thesis supervisor, Charlie Fine acknowledged in his book, *Clockspeed*, "if I have seen farther, it is by standing on the shoulders of giants". My "giants" are numerous in space and time, ranging from Charles Darwin to senior executives at *Boeing*, to my MIT classmates. I have merely served as a questioner, listener and integrator of their knowledge and points of view. I would therefore like to thank those whose contributions made this thesis possible. While I have faithfully tried to acknowledge the intellectual sources of this work through the traditional and formal process of citations, including over 1,000 footnotes and 600 references, the following acknowledgements are equally important as they inspired and enabled this research.

Academic Influences:

As I look back over the past seven years of this project, it becomes more and more clear that this work would simply have been impossible without the continued guidance and support from the exceptional people at exceptional institutions who served as my masters and doctoral thesis supervisors, my doctoral committee members, as well as my professional and personal mentors. They are equal peers with complementary talents. I have become convinced that if I had selected any other academics to lead me through this research, this project would simply not have been permitted to get off the ground. It is through their personal ambitions and extraordinary capabilities to solve the most complex socio-technical problems while simultaneously balancing the academic rigor – professional relevance tradeoff, that this work has been enabled.

- Professor Charles Fine, *MIT Sloan School of Management* and *Engineering Systems Division* and Director of the *International Motor Vehicle Program*, the original "business geneticist", who in *Clockspeed* taught me the power of Three-Dimensional Concurrent Engineering (of products, production systems, and global extended enterprises) and encouraged me to extract simple patterns amidst the dynamic complexity of value chains, industries, firms and technologies.
- Professor Deborah Nightingale, *MIT School of Engineering* and Director of the *MIT Lean Advancement Initiative (LAI)*, taught me the power of enterprise thinking, the complexity of multiple stakeholder integration and gave me the tools and encouragement to understand how such enterprises are architected and to begin to participate in the process of their architecting.

- Professor Yossi Sheffi, *MIT Engineering Systems* and *Civil & Environmental Engineering* and Director of the *MIT Engineering Systems Division (ESD)*, whose bold vision and leadership of an *integral* academic enterprise gives us the courage to take the intellectual risks to ask the big, complex unanswered questions. He has enabled, supported and challenged those of us who were foolish enough to aim high.
- Carolyn Corvi, MIT *Sloan Fellow* and VP and GM of Airplane Programs at *Boeing Commercial Airplanes*¹, an outstanding business leader² and enterprise architect, who taught me not only how modular and integral enterprises function, but crucially the challenging process of transforming modular to integral, a journey she began over 20 years ago, which she researched and documented in her MIT Sloan Fellows thesis.

In addition to my doctoral committee members associated with MIT, I would like to acknowledge and thank those how have supported and challenged me during my productive stay at the University of Oxford, and in particular:

- Professor Mari Sako, University of Oxford, *Saïd Business School* who introduced me to comparative international business systems, varieties of capitalism and the underlying organizational mechanics (e.g. inter-organizational trust) of enterprise architectures. I am grateful for her sponsorship of my status as a visiting scholar at Oxford and for the interactions that I have had with her over the years.
- Professor Sophie Marnette, University of Oxford, a specialist in linguistics and philology who greatly influenced my ability to analyze and transform qualitative discourse and textual data into quantitative models. She supported, pushed and challenged my thinking over many years durning which I have had the privilege of experiencing a truly "beautiful mind".

A number of academic groups and networks were also influential to this work. These included the faculty and students of:

- MIT Leaders for Manufacturing (LFM) / Leaders for Global Operations (LGO) program
- MIT Lean Aerospace Initiative / Lean Advancement Initiative (LAI)
- MIT Sloan School of Management System Dynamics Group (SDG)
- MIT Engineering Systems Division (ESD).³
- University of Oxford, Saïd Business School Masters in Management Research program
- University of Oxford, Saïd Business School Oxford Executive Education
- University of Oxford, *Templeton College*

¹ Carolyn retired from *Boeing* just before the end of this research project at the end of 2008, after 34 years of service.

² Fortune magazine's "50 Most Powerful Women in Business" (2005); Wall Street Journal's "50 Women to Watch" (2008).

³ ESD graduate students who have used their thesis work to further build and test the theory developed herein include: Sgourids (PhD) and Akshat Mathur (SDM).

Teaching Influences

In addition, my teaching of the material presented in this thesis over the years has had a significant impact on my own learning and the development of the thesis itself. I am grateful for the opportunities that I have been given to have presented, discussed and developed this material in academic and professional forums around the world in North America, South America and Europe (see below), as well as to the students and executives who asked thoughtful questions and gave me rich feedback and critiques.

- Senior Executives at *Embraer*, and the Brazilian Society of Automotive and Aerospace Engineers, Sao Paulo, Brazil (Summer, 2004).
- Executives at *The Boeing Company's* Lean Enterprise Conference in Costa Mesa, California (May, 2007).
- Senior Executives at *Spirit Aerosystems*:
 - Executive Council meeting in Wichita, Kansas on 17 June 2008
 - Board of Directors meeting in Williamsburg, Virginia on 7 September 2008.
- London Business School, *Conference on Innovation in Operations* (7-8 June 2009, London, UK), with Prof. Charlie Fine.
- 2nd International Symposium on Engineering Systems, MIT, (17 June 2009, Cambridge, MA), with Prof. Charles Fine, Prof. Deborah Nightingale and Prof. Yossi Sheffi.

Professional Influences:

With very rare exceptions, The *Boeing Company* served as the most encouraging and supportive teaching & learning laboratory that one could hope for. I am indebted to the hundreds of managers and executives at *Boeing Commercial Airplanes* with whom I have had the privilege to work over the years. Those whose intellectual and ethical leadership stand out were:

- Carolyn Corvi, VP and GM, Airplane Programs
- Sherry Carbary, VP, Strategic Management
 - Tim Meskill, Director, Business Strategy
 - Adam Kohorn, Director, Business Strategy
 - Rasheed El-Moslimany, strategy analyst
 - Rachel Portillo, strategy analyst
 - Linsey Rubenstein, strategy analyst
 - Mike Wargel, strategy analyst

Financial Support:

While conducting research for this dissertation, I received funding from the following organizations, for which I am grateful:

- The Boeing Company
- MIT Leaders for Manufacturing (LFM) / Leaders for Global Operations (LGO)
- MIT Lean Aerospace Initiative / Lean Advancement Initiative (LAI)
- MIT Communication Futures Program
- University of Oxford, Said Business School, Executive Education

While this funding has enabled the research, the contents of this thesis do not necessarily reflect the views of the above organizations, and any errors or omissions are the responsibility of the author.

Disclaimers:

In order to preserve an impartial and unbiased standing as an objective researcher, I make the following disclosures:

- I am a dual citizen of both home nations of the primary case study upon which this research is partially based: the US (*The Boeing Company*) and the Netherlands (*EADS*, parent of *Airbus*).
- I have never in the past owned, do not currently own, nor will I own shares of either companies in the primary case study upon which this research is partially based: *The Boeing Company* and *EADS* (parent of *Airbus*).

Personal Influences:

Finally, I would like to acknowledge the sources of my personal strength and inspiration: my precious wife, Sophie, our extraordinary son, Garry Georges, and our wonderful parents, Garry & Janice and Georges & Micheline.

"Papa, who is winning today – Blue or Red?"⁴

⁴ On June 11th 2003, the day our son Garry Georges Piepenbrock was born, I graduated from my masters program at MIT and embarked on my doctorate. My PhD journey concluded on Garry's 6th birthday. During those six wonderful years, we watched a beautiful baby grow into an extraordinary boy – the privilege of a lifetime. My work grew with Garry, who is both my greatest student (asking me the above question nearly every day) as well as my greatest teacher. This work – our work – is dedicated to those "over the rainbow".

Biographical Note

Ted Piepenbrock is an international lecturer in executive education and consultant in strategic leadership and macro-organizational change to corporate leaders in global *Fortune 100* companies. Throughout his career, he has traveled over one million miles, worked in over twenty countries, lectured on management and engineering in many of the world's leading universities (e.g. MIT, Harvard, Berkeley, Stanford, Princeton, Oxford, Cambridge, Imperial College, UCL, Tokyo Institute of Technology) and has appeared in various international news media (e.g. *CNN-TV, BBC-TV, ITV, SKY-TV, The Learning Channel, The Discovery Channel*).

He received a B.Sc. in engineering/humanities as a *Da Vinci scholar*, an M.Eng. in nonlinear structural dynamics from the University of California at Berkeley, and a dual M.B.A./M.Sc. from the Massachusetts Institute of Technology as a *Leaders for Global Operations* Fellow and researcher with the *Center for Technology*, *Policy and Industrial Development*. He went on to pursue an interdisciplinary doctorate in strategy, organization and system architecting at MIT's *Engineering Systems Division*, where his research focuses on inter-species competition and the development of a theory of the evolution of business ecosystems.

He spent the early part of his career designing high-rise buildings and long-span bridges as a director of *Ove Arup & Partners* in London, Tokyo and San Francisco. He then moved from "the business of building" to "the building of business" where he was a strategy consultant at *McKinsey & Company*. He currently teaches strategic leadership and macro-level organizational change in executive education programs and graduate courses at MIT's *Sloan School of Management*, the *Engineering Systems Division* and at the University of Oxford's *Saïd Business School*. He is a citizen of the USA and the Netherlands and currently resides in Oxford with his wife and son.

General Outline

Executive Summary

Expanded Executive Summary

Main Document:

Part I: RESEARCH DESIGN

Chapter 1: Introduction Chapter 2: Research Methodology

Part II: THEORETICAL CONSTRUCTS & PROPOSITIONS

Chapter 3: Firm Performance

Chapter 4: Enterprise Architectures

Chapter 5: Competitive Dynamics

Chapter 6: Industrial Co-evolution

Part III: INTEGRATING THE THEORY

Chapter 7: Mathematical Model Chapter 8: Summary & Conclusions

Part IV: APPENDICES

This dissertation is presented three successive times in a "telescoped structure", each re-telling representing approximately one order of magnitude more detail and richness than the previous.

First, I present a very brief, *high*-level executive summary of approximately 10 pages, which is intended to rapidly familiarize the reader with the theory developed herein. This is followed by a more detailed, *mid*-level expanded executive summary of approximately 100 pages, which is intended to communicate the research in a format and length suitable for academic journal publication. Finally, I present a more detailed, *low*-level dissertation document of approximately 1,000 pages, which serves as an extended outline that summarizes the empirical data and its analysis as well as the theoretical underpinnings and basis for the theory developed herein.

Whatever stage the reader chooses to engage this work, thoughtful and critical comments continue to be welcomed as this dissertation document (with all of its errors, omissions and inconsistensies) does not represent the end of my research journey, but merely the end of the beginning...

2.4.1.2.2 Time span	
2.4.1.2.3 "Critical Event" / Temporal Discontinuity	
2.4.1.3 Industrial idiosyncrasies	
2.4.1.3.1 "Wicked" problems	
2.4.1.3.1.1 Messy problems: high dynamic complexity	
2.4.1.3.1.2 Negotiated problems: high behavioral complexity	
2.4.1.3.1.3 Wicked problems: Examples	
2.4.1.3.2 Economies of Scale & Barriers to Entry	
2.4.1.3.3 Increasing Returns & Imperfect Competition	
2.4.1.3.4 Strategic Trade (Industrial) Policy	
2.4.2 Secondary Sample Selection: Counterfactuals	
2.4.2.1 Control for <i>Industry</i> effects	
2.4.2.2 Control for Environmental effects	
2.4.2.3 Control for Sector effects	
2.4.2.4 Control for International and Socio-Economic effects	
2.4.2.5 Selection Criteria for Incumbent and Challenger	
2.4.3 Tertiary Sample Selection	
2.4.4 Addressing Sample Selection Bias	
2.4.4.1 Survivor Bias	
2.4.4.2 Sampling on the Dependent Variable	
2.5 Data Sources	
2.5.1 Primary data sources	
2.5.2 Secondary data sources	
2.6 Data Collection Methods and Techniques	. 278
2.6.1 Executive Summary	
2.6.2 Methods	
2.6.2.1 Ethnographic Methods	
2.6.2.2 Action Research / Clinical Methods / Policy Research	
2.6.2.2.1 Focus on Strategy Process (not Content)	
2.6.2.2.2 Focus on Intervention and Change	
2.6.2.2.3 Focus on Theory Development	
2.6.3 Techniques	. 286
2.6.3.1 Temporal (longitudinal)	
2.6.3.2 Spatial (triangulation)	
2.6.3.2.1 Horizontal (Inter-firm) triangulation	
2.6.3.2.2 Vertical (Intra-firm) triangulation	
2.6.3.2.3 Political, Cultural and Temporal triangulation	
2.7 Data Analysis Methods and Techniques	
2.7.1 Qualitative Analysis Methods	
2.7.1.1 Grounded Theory	
2.7.1.2 Linguistic Theory	
2.7.1.2.1 Discourse Analysis	
2.7.1.2.1.1 Rhetorical Analysis	. 298

2.7.1.2.2 Textual Analysis	298
2.7.2 Quantitative Analysis Methods	
2.7.2.1 Simulation Modeling	
2.7.2.2 Philosophical Stance on Modeling Complex Enterprises	
2.7.2.3 Modeling Epistemology	
2.7.2.4 Developing Causal Structures form Empirical Data	
2.7.2.5 Model Complexity	
2.7.2.6 Proposed System Dynamics Modeling within Framework	
2.8 Research Dissertation Critique	
2.8.1 Research Tradeoffs	
2.8.1.1 Accuracy (internal validity)	
2.8.1.2 Generalizability (external validity)	
2.8.1.3 Simplicity (parsimony)	
2.8.2 Research Strengths and Limitations.	
2.8.2.1 Accuracy (internal validity)	
2.8.2.2 Generalizability (external validity)	
2.8.2.3 Simplicity (parsimony)	
2.8.3 Towards "Good" Theory	
2.8.4 Future Research	
Part II: THEORETICAL CONSTRUCTS & PROPOSITIONS	309
	310
Chapter 3 Firm Performance	
3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	
3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 314
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 314 315
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 314 315 316
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 314 315 316
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 314 315 316 316 317
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 313 314 315 316 316 317 318
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 313 314 315 316 316 317 318 319
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 313 314 316 316 316 317 318 319 319
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 313 314 315 316 316 316 317 318 319 320
 3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle	310 312 313 313 313 314 315 316 316 316 317 318 319 320 321

3.2.2.2 Explanations based on Dynamic Complexity	328
3.2.2.3 Example: International Trade Subsidies	328
3.2.3 Intra-species vs. Inter-species Explanations	330
3.3 Notes from the Field: On Observing a Rare Species	331
3.3.1 Common Characteristics, Traits and DNA	332
3.3.2 Defining and Measuring Each Species	
3.4 Chapter Summary	334
Chapter 4 Enterprise Architectures	335
4.1 Introduction	
4.1.1 Definition of Purpose, Precision and Accuracy	
4.1.2 Construct of Architectural Form	
4.1.2.1 Basic definition of "Enterprise Architecture": Genotypes	
4.1.2.2 <i>Contingent</i> definition of "Enterprise Architecture": <i>Phenotypes</i>	
4.1.3 Construct as Continuum.	
4.1.4 Construct as Mediator	
4.1.4.1 between <i>Firm</i> and <i>Environment</i>	
4.1.4.2 between <i>Determinism</i> and <i>Choice</i>	
4.1.5 Construct as Embedded Enabler of Strategic Change	
4.1.6 Heuristics associated with Architectural Form	
4.2 Theoretical Foundations.	
4.2.1 Economic theories.	
4.2.1.1 <i>Micro</i> -economics	
4.2.1.1.1 Specialization and the <i>Division</i> of Labor	
4.2.1.1.2 New Institutional Economics	
4.2.1.1.2.1 Theory of the Firm	
4.2.1.1.2.2 Transaction Cost Economics: Markets, Hierarchies & Hybrids	
4.2.1.1.2.3 Agency Theory.	
4.2.1.1.3 Economics of Profit-Maximizing and Labor-Managed Firms	
4.2.1.1.3.1 Terminology	
4.2.1.1.3.2 Objective Functions	
4.2.1.1.3.2.1 Profit Maximizing (PM)	
4.2.1.1.3.2.2 Labor Managed (LM)	
4.2.1.1.3.2.3 Mixed Objective Functions	
4.2.1.1.3.3 Homogeneous Duopoly competition	347
4.2.1.1.3.3.1 Cournot (Quantity) competition	
4.2.1.1.3.3.1.1 Stackleberg (sequential) competition	
4.2.1.1.3.4 Heterogeneous ("Mixed") Duopoly competition	350
4.2.1.1.3.4.1 Cournot (Quantity) competition	
4.2.1.1.3.4.2 Bertrand (Price) competition	
4.2.1.1.4 Strategic Complementarities	353
4.2.1.2 Macro-Economics and Political Economy	
4.2.1.2.1 Varieties of Capitalism	
4.2.1.2.1.1 Liberal Market Economies vs. Coordinated Market Economies	
4.2.1.2.1.2 Consumer vs. Producer Economics	
4.2.1.2.1.3 Profit maximization (Consumer economics)	
4.2.1.2.1.4 Market-Share maximization (Producer economics)	358

4.2.1.2.1.5	Economic (comparative) Statics vs. Economic Dynamics	. 359
4.2.1.2.1.6	National Examples: Anglo-Saxon vs. German-Japanese models	359
4.2.2 Sociology &	Organizational theories	360
4.2.2.1 Theories	of Bureaucracy	360
4.2.2.1.1 Divis	sion of Labor vs. Centralization of Authority (Weber)	360
4.2.2.1.2 Conf	flict vs. Order	360
4.2.2.1.3 Theo	ory X and Theory Y (McGregor)	361
4.2.2.2 Social Sy	stems Theories	362
	ctural Functionalism	
4.2.2.2.1.1	Cooperative Systems	362
4.2.2.2.1.2	Cooptation	362
4.2.2.2.2 Gene	eral Systems Theory	363
4.2.2.2.2.1	Open vs. Closed Systems	363
4.2.2.2.2.2	Open-Closed Systems vs. Open-Closed Causality	364
4.2.2.2.3 Struc	ctural Contingency Theory	365
4.2.2.3.1	Mechanistic vs. Organic (Burns & Stalker)	366
4.2.2.3.2	Small & Large Batch and Process Technologies (Woodward)	367
4.2.2.2.3.2.	.1 Craft, Mass and Lean Production	367
4.2.2.3.3	Uncertainty Reduction (Thompson)	368
4.2.2.3.4	Differentiation and Integration (Lawrence & Lorsch)	369
4.2.2.2.3.4	.1 Critiques	369
	3.4.1.1 Invalid & Inconsistent Claim	
4.2.2.2.3	3.4.1.2 Longitudinal Discontinuity	370
	tical Theories of the Firm	
	Resource Dependence Theory (Pfeffer & Salancik)	
	Stakeholder Theory of the Firm	
4.2.2.3 Ecologic	al View	373
4.2.2.3.1 Popu	ulation Ecology (Autecology)	374
4.2.2.3.1.1	Organizational Form	374
4.2.2.3.1.2	Organizational Niche	374
4.2.2.3.1.3	Structural Inertia	374
4.2.2.3.2 Com	munity Ecology (Synecology)	375
4.2.2.3.2.1	Verhulst Population Growth in Finite Environment	375
4.2.2.3.2.2	Species Archetypes: r-strategists and K-strategists	375
4.2.2.3.2.3	Lotka-Volterra (Predator-Prey) Inter-species Competition	375
4.2.2.4 Institutio	nal and Neo-Institutional Theory	376
4.2.2.4.1 Insti	tutional Theory	376
4.2.2.4.2 Neo-	-Institutional Theory	376
4.2.2.5 Social No	etwork Theory	377
4.2.2.5.1 Emb	beddedness	377
4.2.2.5.1.1	Under-embedded network	377
4.2.2.5.1.2	Over-embedded network	377
4.2.2.5.1.3	Hybrid network	378
	alization	
4.2.2.5.2.1	Under-socialization	379
	Over-socialization	

4.2.2.5.3 Keiretsu as Inter-firm Networks	379
4.2.2.6 Behavioral Decision Theory	379
4.2.2.6.1 Bounded Rationality	379
4.2.2.6.2 Exploitation vs. Exploration	379
4.2.2.6.3 Loose vs. Tight Coupling	379
4.2.2.7 Complexity / Complex Adaptive Systems Theory	380
4.2.2.7.1 NK Model of Interdependencies	380
4.2.2.7.2 Fitness Landscapes	381
4.2.2.7.2.1 Part-Whole Relationships	381
4.2.2.7.2.2 Rugged Landscapes	381
4.2.2.7.3 Competition vs. Cooperation	382
4.2.3 Strategic Management theories	383
4.2.3.1 SCP vs. RBV	
4.2.3.2 Flexibility vs. Comittment	383
4.2.3.3 Profit-Maximizers vs. Profit-Seekers	383
4.2.3.4 <i>M</i> -Form vs. <i>N</i> -Form	
4.2.3.5 Strategic Groups	384
4.2.4 Architectural theories	385
4.2.4.1 Civil Architecture	
4.2.4.1.1 Form (and Structure)	386
4.2.4.1.2 Function	
4.2.4.1.3 Fit	
4.2.4.2 Product Architecture	387
4.2.4.2.1 Building Blocks, Components, Chunks, Modules	387
4.2.4.2.2 Interfaces	387
4.2.4.2.3 Typology of Product Architectures	
4.2.4.2.3.1 Modular	
4.2.4.2.3.2 Integral	388
4.2.4.2.4 Design Rules	390
4.2.4.2.4.1 Three Types of Modularity	390
4.2.4.2.4.1.1 Modularity in Design	390
4.2.4.2.4.1.2 Modularity in Manufacturing	
4.2.4.2.4.1.3 Modularity in Use	390
4.2.4.2.5 Product Performance	391
4.2.4.2.5.1 Modular performance	391
4.2.4.2.5.2 Integral performance	
4.2.4.3 System Architecture	392
4.2.4.3.1 Top-down Deterministic Mechanistic Reductionism	
4.2.4.3.2 Bottom-up Emergent Organic Holism	
4.2.4.4 Organizational Architectures.	
Comparing Physical- and Organizational Architectures	394
4.2.4.4.1.1 Common Points	
4.2.4.4.1.1.1 Architecture <i>Enables</i> Function	
4.2.4.4.1.1.2 Architecture Constrains other Functions	
4.2.4.4.1.1.3 Architecture does not <i>Predetermine</i> Choice	
4.2.4.4.1.2 Differences	395

4.2.4.4.1.2.1 Visibility	. 395
4.2.4.4.1.2.2 Evolution	
4.2.4.4.1.2.3 Emergence	
4.2.4.4.2 Two Levels of Organizational Architecture	
4.2.4.4.2.1 Inter-firm (Enterprise) Architectures	
4.2.4.4.2.1.1 Concept Extended from Product Architecture	
4.2.4.4.2.1.2 Sub-case Example: Supply Chains	
4.2.4.4.2.2 Intra-firm Architectures	
4.2.4.5 Multi-Level <i>Nesting</i> : Product-Organizational Architecture Mapping 4.2.5 Summary of Theoretical Underpinnings of Construct	
4.2.5 Summary of Theoretical Underpinnings of Construct4.3 Enterprise Architecture: 3D-Functional Decomposition	
4.3 Enterprise Architecture. 3D-Functional Decomposition	
4.3.1.1 <i>Product / Service</i> markets (customers)	
4.3.1.2 Supplier markets (suppliers)	
4.3.1.3 Supplier "Push" vs. Customer "Pull"	
4.3.2 Factors of Production Axis	. 410
4.3.2.1 <i>Capital</i> markets (investors)	
4.3.2.1.1 Capital Structure: Debt vs. Equity	
4.3.2.1.1.1 Debt markets	
4.3.2.1.1.2 <i>Equity</i> markets	. 411
4.3.2.1.1.2.1 Quality of Equity Investors	. 411
4.3.2.1.1.2.1.1 Public vs. Private Equity	
4.3.2.1.1.2.1.2 "Patient" vs. "Impatient" capital	
4.3.2.1.1.2.1.3 Institutional vs. Individual Investors	
4.3.2.1.1.2.2 Managerial capitalism	
4.3.2.1.1.2.2.1 Principal-Agent problem: Agency vs. Stewardship	
4.3.2.1.1.2.2.2 Board of Directors: "Architectural" Gatekeeper	
4.3.2.2 Labor markets	
4.3.2.2.1 Boundaries (make vs. buy)	
4.3.2.2.2 Interfaces (arm's length vs. trust-based)	
4.3.2.3 Dominant Factor of Production (<i>capital</i> vs. <i>labor</i>)	
4.3.2.3.1 <i>Traditional</i> vs. <i>Human</i> capitalism	
4.3.2.3.1.2 <i>Human</i> capitalism (<i>labor</i> dominance)	
4.3.2.3.2 Enterprise Architectural tendencies	
4.3.2.3.3 Cultural / National tendencies	
4.3.3 Competitive Enablers and Constraints Axis	
4.3.3.1 <i>Regulatory</i> markets (governments)	
4.3.3.2 Profit markets (competitors)	
4.3.4 Functional Decomposition	
4.3.4.1 Functional Independence	
4.3.4.2 Functional Interdependence	
4.3.4.3 Enterprise Performance	
4.4 Enterprise Architecture: Objective Functions, Boundaries & Interfaces	. 423
4.4.1 Enterprise Objective Functions	. 423
4.4.1.1 Maximizing Shareholder Value	. 424

4.4.1.2 Maximizing Stakeholder Surplus	425
4.4.2 Enterprise Boundaries	426
4.4.2.1 Spatial	428
4.4.2.1.1 Vertical Integration (boundaries)	428
4.4.2.1.2 Virtual Integration (interfaces)	428
4.4.2.2 Temporal	429
4.4.2.3 Effect of Spatio-Temporal Boundaries on Strategy	429
4.4.3 Enterprise Interfaces	430
4.4.3.1 Quantity of Stakeholders	430
4.4.3.2 <i>Quality</i> of Stakeholder Relationships	430
4 4 3 2 1 Two Relationship Archetypes	430
4.4.3.2.1.1 Managing Contracts: Short-term, Arm's Length	430
4.4.3.2.1.2 Growing Relationships: Long-term, Trust-Based	430
4.4.3.2.2 Costs of Quality (of Stakeholder Relationships)	431
4.5 Enterprise Architectural Forms (Isomorphic Archetypes)	432
4.5.1 Modular Enterprise Architectures	432
4.5.2 Integral Enterprise Architectures	433
4.5.2.1 Intra-species Heterogeneity within the <i>Integral</i> Enterprise Isomorph	434
4.5.2.1.1 Institutional Exogenous Push vs. Individual Endogenous Pull	434
4.5.2.1.2 Examples and <i>Sustainability</i> of the Integral Enterprise Isomorph	435
4.5.2.2 Integral Architecture and "New" Organizational Forms	436
4.5.2.3 Integral Example: Japanese Keiretsu	437
4.5.2.3.1 <i>Horizontal</i> keiretsu	437
4.5.2.3.2 <i>Vertical</i> keiretsu	437
4.5.3 Orthogonality of Archetypes	438
4.6 The Process of Architecting Enterprises	439
4.6.1 Formal (self-conscious) design	439
4.6.2 Emergent (unself-conscious) design	439
4.7 Chapter Summary	440
1.7 Chapter Summary	
Chapter 5 Competitive Dynamics	441
5.1 Introductory Constructs and Propositions	441
5.2 Theoretical Foundations	
5.2.1 Economic Theories	441
5.2.1.1 Penrose and Firm Growth	441
5.2.1.2 Marris and Growth vs. Profitability	442
5.2.1.3 Goodwin and the Business Cycle	443
5.2.1.4 Kuznets and the Machine Investment Cycle	445
5.2.2 Sociology and Organizational Theories	446
5.2.2.1 Structural Functionalism	446
5.2.2.2 System Theory	446
5.2.2.2.1 System Goals: Growth and Stability	446
5.2.2.2.2 Open vs. Closed Causal Systems	446
5.2.2.2.3 Open – Closed Systems and Functional In(ter)dependence	447
5.2.2.2.4 Feedback Systems: Positive & Negative	447
5.2.2.2.5 Feedback Systems: System Dynamics and Cybernetics	
5.2.3 Strategic Management Theories	448

5.2.3.1 Dynamic Capabilities	448
5.2.3.2 Functional Configurations	
5.2.3.2.1 The Four Types	448
5.2.3.2.1.1 Prospectors	448
5.2.3.2.1.2 Analyzers	
5.2.3.2.1.3 Reactors	
5.2.3.2.1.4 Defenders	448
5.2.3.2.2 Empirical Examples	
5.3 Structural Mechanics	
5.3.1 Structural Building Blocks	450
5.3.2 Fundamental Reference Modes	
5.3.3 The "Physics" of Growth	
5.3.4 Enterprise Inertias	
5.3.4.1 Structural Inertia	
5.3.5 Time and the Causal Levels of Competition.	
5.4 Enterprise Architecture Form-Structure Mapping	
5.4.1 Quantity Growth (Operations Strategy)	
5.4.1.1 Optimum Rates of Growth	
5.4.2 Quality Growth (Marketing Strategy)	
5.4.2.1 Structural vs. Strategic variables	
5.4.2.2 Strategic Positioning: Differentiation vs. Cost-Leadership	
5.4.2.3 Strategic Investment: <i>Flexibility</i> vs. <i>Commitment</i>	
5.4.2.4 Enterprise Efficiency vs. Effectiveness	
5.4.2.5 Strategic Biases of Enterprise Architectures	
5.4.2.6 Case Studies: Product Strategy in Commercial Airplanes	
5.4.2.6.1 Boeing 787 vs. Airbus A380	405
5.4.2.6.2 The Evolution of Boeing 787 vs. the Evolution of the Airbus A350	400
5.5 Opposing Dynamic Behaviors	/60
	409
5.5.3 Opposing Assumptions of Demand Durability	
5.5.4 Opposing Assumptions on Forecasting (managerial cognitive inertia)	
5.5.5 Opposing Assumptions of Span of Enterprise Control	
5.5.6 Opposing Views of Speed: Short-term vs. Long-term	
5.5.7 Opposing Assumptions of Strategic Investment	
5.5.8 Opposing Financial Strategies	
5.6 Case Study: the Business Cycle (and other "Exogenous" Shocks)	
5.6.1 Cross-Industry Examples	
5.6.1.1 Appliance industry	
5.6.1.2 Automobile industry	
5.6.1.3 Airplane industry	
5.6.1.4 <i>Airline</i> industry	479
5.6.2 Exogenous vs. Endogenous Views	
5.6.3 Dominant Firm Behavior	
5.6.4 Signal-to-Noise Ratios	
5.7 Symbiotic Inter-species Competition and Mixed Duopoly	481

5.7.1 Inter-species Competition in Community Ecology	. 481
5.7.2 Example: Biological Ecosystem	
5.8 Modeling Inter-species Competition	
5.8.1 Biological Competition within the Mathematical Modeling Tradition	
5.8.1.1 Population Growth of Verhulst (1838)	. 485
5.8.1.2 Predator-Prey Ecosystem of Lotka-Voltera (1925-1926)	
5.8.2 Firm Competition within the System Dynamics Tradition	
5.8.2.1 Embracing Macro-Structures: Forrester (1960-1970)	
5.8.2.2 Embracing Micro-Behaviors: Sterman (1985-2005)	
5.8.2.3 Embracing the Meso-Interactions: Morecroft (2000-2005)	
5.8.3 Formal Models of Business Ecosystems	. 487
5.8.3.1 Bertrand Competition & "The Principle of Competitive Exclusion"	
5.8.3.2 Predator - Prey Ecosystem Revisited	
5.8.3.3 Classic System Dynamics Models of Enterprise Architectures	
5.8.3.4 Modeling the Enterprise Archetypes: Modular & Integral	
5.8.3.5 Modeling the Competitor subsystem	
5.8.3.5.1 Competition for <i>Customers</i>	
5.8.3.5.2 Competition for <i>Investors</i>	
5.8.3.5.3 Competition for <i>Employees</i>	
5.8.3.5.4 Competition for Suppliers	
5.9 Tying Structural Dynamics to Valuation and Firm Performance	
5.10 Chapter Summary	493
	40.4
Chapter 6 Industrial Co-Evolution	
	101
6.1 Introductory Constructs and Propositions	
6.1.1 Change from a System Perspective	. 494
6.1.1 Change from a System Perspective.6.1.1.1 Adaptation.	494 495
6.1.1 Change from a System Perspective.6.1.1.1 Adaptation.6.1.1.2 Self-Organization.	494 495 495
 6.1.1 Change from a System Perspective. 6.1.1.1 Adaptation. 6.1.1.2 Self-Organization. 6.1.1.3 Evolution. 	494 495 495 495
 6.1.1 Change from a System Perspective. 6.1.1.1 Adaptation. 6.1.1.2 Self-Organization. 6.1.1.3 Evolution. 6.1.2 Employing Multiple Views on Change Processes. 	494 495 495 495 496

6.2.2.1.2 Four Causal Textures (Emery & Trist)	508
6.2.2.1.2.1 Step #1: Placid, Randomized	508
6.2.2.1.2.2 Step #2: Placid, Clustered	508
6.2.2.1.2.3 Step #3: Disturbed-Reactive	
6.2.2.1.2.4 Step #4: Turbulent Fields	509
6.2.2.1.3 Three Dimensions (Dess & Beard)	
6.2.2.1.3.1 Munificence	510
6.2.2.1.3.2 Dynamism	510
6.2.2.1.3.3 Complexity	511
6.2.2.1.3.4 Discussion	
6.2.2.1.4 Two Dimensions (Burns & Stalker)	513
6.2.2.1.5 Three Dimensions (Chandler)	513
6.2.2.1.6 Two Dimensions (Lawrence & Lorsch)	513
6.2.2.1.6.1 Certainty (Dynamic-Stable)	513
6.2.2.1.6.2 Diversity (Diverse-Homogeneous)	514
6.2.2.1.6.3 Critique	514
6.2.2.1.7 Environmental Uncertainty	
6.2.2.1.8 Rates of Environmental Change	515
6.2.2.2 Theories of Firm Evolution.	
6.2.2.3 Open Systems Theory	516
6.2.2.4 Structural Contingency Theory	
6.2.2.5 Population (Organizational) Ecology	
6.2.2.5.1 Natural Selection	
6.2.2.5.2 Structural Inertia	
6.2.2.5.3 Co-Evolutionary Dynamics	517
6.2.2.6 Structuration	
6.2.3 Technology and Innovation Theories	
6.2.3.1 <i>Product</i> Life Cycle	
6.2.3.2 Industry Life Cycle	
6.2.3.3 Technological Discontinuities	518
6.2.3.4 Disruptive Technologies	
6.2.3.5 Dominant Designs (Products)	
6.3 Industrial Evolution	
6.3.1 Industry Maturity Assessment Metrics	
6.3.1.1 Environmental Capacity	
6.3.1.1.1 <i>Quantity</i> of Output	
6.3.1.1.2 Quality of Output	
6.4 Evolution of Population Density: Firm Entry and Exit	
6.5 Evolution of "Landscapes"	
6.6 Evolution of Dominant Factor of Production	
6.6.1 Traditional capitalism	
6.6.2 Human capitalism	
6.7 Evolution of Dominant <i>Production</i> Strategy	
6.7.1 Craft production	
6.7.2 Mass production	
6.7.3 Lean production	
	551

6.8 Evolution of Dominant Product Strategy (Position)	
6.9 Evolution of Dominant Economic Offering	. 539
6.9.1 Co-Existence of Complements	
6.9.2 Co-Existence of Substitutes	
6.10 Evolution of Dominant Levels of Cognitive Inertia	. 540
6.11 Evolution of Dominant Growth Strategy	
6.11.1 Organic Growth	
6.11.2 Inorganic Growth (M&A)	. 541
6.12 Evolution of Dominant Intra-firm Structure	
6.12.1 Mechanistic vs. Organic structure	
6.12.2 Functional vs. Project structure	
6.13 Evolution of Dominant Designs in Enterprise Architectures	. 545
6.14 Evolution of Ecosystem Entropy ("The Architect's Dilemma")	. 548
6.14.1 Example: Commercial Airplane Industry	. 549
6.14.1.1 Boeing (1916): Founding	. 549
6.14.1.2 Boeing (1925-27): Airplanes/Airlines (forward integration)	. 549
6.14.1.3 Boeing (1928): Public Flotation (owner-manager dis-integration)	. 550
6.14.1.4 Boeing (1928-31): Vertical Acquisitions (value chain integration)	. 550
6.14.1.5 Boeing (1934-35): Government Break-up (value chain dis-integration)	
6.14.1.6 Boeing (1936-48): Labor Unions Established (labor dis-integration)	. 550
6.14.1.7 Boeing (1970): Patient Finance (customer integration)	. 551
6.14.1.8 Boeing (1987): Hostile Takeover Bid (investment horizon shortened)	. 551
6.14.1.9 Boeing (1997): Horizontal Acquisition (inorganic growth)	
6.14.1.10 Boeing (2005): Risk-sharing Partners (value chain dis-integration)	
6.14.1.11 Boeing (2005-2009) 787: "The Game-Changer"	
6.14.1.12 Boeing (2008) Departure of "The Red Queen"	
6.14.1.13 Airbus (1970): Founding (enterprise co-option and integration)	
6.14.1.14 Airbus (1974-77): Strategy (low cost & financing, stable production)	
6.14.1.15 Airbus (2000-01): Public Flotation (owner-manager dis-integration)	
6.14.1.16 Airbus (2001): Shareholders and the Response to 9-11	
6.14.1.17 Airbus (2006): Evolutionary Diffusion of "Ownership"	
6.14.1.17.1 Russian State Banks buy EADS shares	
6.14.1.17.2 BAE Systems sells shares to EADS	
6.14.1.17.3 Dubai International buys EADS shares	
6.14.1.17.4 Future Posssible Diversification	
6.14.1.17.4.1 German Bank, KfW to buy half of Daimler/Chrysler's stake	. 559
6.14.1.17.4.2 French Government to buy half of Lagardère stake	
6.14.1.18 Airbus (2006): CEO transitions	
6.14.1.19 Airbus (2007): Supply Chain Restructuring	
6.14.2 Example: Automotive Industry	
6.14.2.1 General Motors (1916): Incorporation	. 564
6.14.2.2 General Motors (1926): Vertical Integration of Fisher Body	
6.14.2.3 General Motors (1999): Vertical Dis-integration of Delphi	
6.14.2.4 General Motors (2005): Vertical "Re-integration" of Delphi	
6.14.2.5 Daimler & BMW (1994-2007): Acquitision & Divestiture of Rivals	
6.14.2.6 General Motors (2008-9): Becomes No. 2 & Bankruptcy Protection	

6.14.2.7 Toyota (1937): Founding through Organic Diversification	566
6.14.2.8 Toyota (1949): Spin-off of Nippondenso (value chain dis-integration)	566
6.14.2.9 Toyota (1950): Recession, Lay-offs, Strikes, Bankruptcy & Bailout	566
6.14.2.10 Toyota (1982): Reintegration of Sales and Operations Companies	
6.14.2.11 Toyota (1988): Vertical Integration in Auto Electronics	566
6.14.2.12 Toyota (1995-99): Vertical Integration with Daihatsu	
6.14.2.13 Toyota (2008): First Annual Loss	
6.14.3 Example: Airline Industry	568
6.14.3.1 United Airlines (1928-30): Pre-founding (value chain integration)	568
6.14.3.2 United Airlines (1931): Founding (value chain dis-integration)	569
6.14.3.3 United Airlines (1931): Formation of Labor Unions	569
6.14.3.4 United Airlines (1975-85): Labor Strikes (labor dis-integration)	569
6.14.3.5 United Airlines (1994): ESOP (attempted re-integration)	569
6.14.3.6 United Airlines (2001): Bankruptcy (dis-integration)	
6.14.3.7 United Airlines (2003): Launch of Ted (inorganic diversification)	
6.14.3.8 Southwest Airlines (1971): Founding	
6.14.3.9 Southwest Airlines (2001): Response to 9-11	569
6.14.3.10 Southwest Airlines (2008): Quarterly Losses	569
6.15 Evolution of Architecting Processes	
6.15.1 Enterprise Architectural States (Fit) and Paths (Change)	
6.15.1.1 Enterprise Architectural <i>Fit</i>	571
6.15.1.2 Enterprise Architectural Change	
6.15.1.2.1 (Managerial) Adaptation	
6.15.1.2.1 (Multidgenui) nudpration	
6.15.1.2.1.2 Dis-integration to Fight or for Flight?	
6.15.1.2.2 (Environmental) Selection	
6.15.1.3 Enterprise Inertia Part II: Architectural Inertia	
6.15.1.4 Punctuated Architectural Change: <i>Exploration</i> and <i>Exploitation</i>	
6.15.2 Profiles in Courage: Why Re-Integration is Difficult	
6.16 Chapter Summary	
0.10 Chapter Summary	202
Part III: INTEGRATING THE THEORY	584
Chapter 7 Mathematical Model and Numerical Simulation	585
7.1 Competition in a Constant (Unchanging) Market Environment	
7.1.1 Single Firm Growth in an Infinite Market	587
7.1.2 Single Firm Growth in a Constant, Finfite Market	590
7.1.3 Intra-species Competition in a Constant Market	
7.1.3.1 Parametric Study: Initial Conditions	
7.1.3.2 Parametric Study: Fractional Acquisition Rates	
7.1.4 Inter-species Competition in a Constant Market	
7.2 Competition in a <i>Diffusing</i> Market (Quantity)	
7.2.1 Diffusing Market (Quantity)	
7.2.1.1 First-Order Two-Stock Logistic Growth	
7.2.1.2 Bass Industry Diffusion Model	
7.2.1.3 Bass Industry Diffusion Model with Replacements	
7.2.1.4 Industry Studies of Diffusing Markets	

7.2.1.5 Market Diffusion & Obsolescence	611
7.2.2 Single Firm Growth in a Diffusing Market	612
7.2.3 Intra-species Competition in a Diffusing Market	614
7.2.4 Inter-species Competition in a Diffusing Market	
7.3 Competition in a Commoditizing Market (Quality)	
7.3.1 Commoditizing Market (Quality)	
7.3.1.1 Single-Loop Exponential Decay	
7.3.1.2 Double-Loop Logistic Decay	
7.3.1.3 Bass Industry Commoditization Model	
7.3.2 Single Firm Growth in a Commoditizing Market	
7.3.3 Intra-species Competition in a Commoditizing Market	
7.3.4 Inter-species "Competition" in a Commoditizing Market	636
7.4 Competition in a Diffusing, Commoditizing Market (Quantity and Quality)	
7.4.1 Diffusing, Commoditizing Market (Quantity and Quality)	640
7.4.1.1 Comparing Single- vs. Double-loop Diffusing, Commoditizing Models	
7.4.1.2 Comparing Diffusion vs. Commoditization Rates	642
7.4.1.3 Parametric Study: Product Durability	644
7.4.2 Single Firm Growth in a Diffusing, Commoditizing Market	
7.4.3 Intra-species Competition in a Diffusing, Commoditizing Market	
7.4.4 Inter-species Competition in a Diffusing, Commoditizing Market	652
7.5 Advanced Topics	
7.5.1 Firm-sector Topics	
7.5.1.1 Oscillation: Demand and Supply Lags	
7.5.1.1.1 Single Firm Experiencing Undamped Oscillation	
7.5.1.1.1.1 Parametric Study of Goal-Setting	
7.5.1.1.1.2 Parametric Study of <i>Productivity</i>	
7.5.1.1.2 Single Firm Experiencing <i>Damped</i> Oscillation	666
7.5.1.1.3 Single Firm Experiencing Growth and Damped Oscillation	
7.5.2 Market-sector Topics	
7.5.2.1 Market Diffusion and Obsolescence	
7.5.2.1.1 Three-loop Representation (S-I-R)	
7.5.2.1.2 Four-loop Representation (Single Bass)	
7.5.2.1.3 Four-loop Representation (Double Bass)	
7.5.2.1.4 Summary of Parametric Study	677
7.5.2.2 Overshoot and Collapse: 200-year Global Market	679
7.5.3 Summary	680
Charter 9 Summary and Canalysians	601
Chapter 8 Summary and Conclusions	
8.1 Framework Summary8.2 Theory Evaluation	
8.2.1 The Halo Effect	
8.2.1 The Halo Effect. 8.2.2 The Delusion of Correlation and Causality	
8.2.2 The Delusion of Single Explanations	
• •	
5 5	
0	
8.2.6 The Delusion of Lasting Success	
8.2.7 The Delusion of Absolute Performance	007

8.2.8 The Delusion of the Wrong End of the Stick	
8.2.9 The Delusion of Organizational Physics	
8.3 Further Research	
8.3.1 Past Empirical Case Studies	690
8.3.2 Future Empirical Case Studies	691
8.4 Toward a Theory of the Evolution of <i>Research</i> Ecosystems	
8.5 Conclusions	
Part IV: APPENDICES	
A. References	
B. Sources of Profitability: Industry vs. Firm	
C. Placement of Research within the Strategic Management Field	
D. Literature Review of Mixed Duopoly Economics	
E. Literature Review of System Dynamics Modeling of Firm Competition	
F. Mathematical Equations of Numerical Model (Vensim)	
G. Interview Participants	
H. Selected Sample of Qualitative Data for Discourse & Textual Analysis	
I. Feedback on Research	
J. Subject Index	1323

Executive Summary

Intelligent Design:

Architecting World-class Enterprises and Evolving Business Ecosystems

As industries evolve, so do winning strategies, successful organizational forms and effective leadership styles.

Having the knowledge of "what, when and how" - coupled with the courage to act on this knowledge is key to generating and sustaining world-class performance.

⁵ Image: "The Ancient of Days (God as an Architect)" by William Blake, 1794.

Architecting World-class Enterprises

Recently, the business world has experienced a global downturn, the likes of which hasn't been seen in living memory. We have witnessed some of the world's most powerful incumbents like *General Motors, United Airlines* and even *Boeing* struggle to successfully launch new products and services, access capital reliably, manage global supply chains, avoid damaging labor strikes, maintain strong balance sheets and in some instances avoid bankruptcy.

In understanding these complex times, while the *devil* undoubtedly lies in the details, it is often enlightening to take a 100,000 ft. "god's-eye" view of our business ecosystems and how they are evolving. We propose an architectural view.

Shareholder vs. Stakeholder Focus

One common view of the objective of business firms is the maximization of shareholder value, where the residual cash flow is returned to the shareholders. This can be seen in many famous incumbent firms, who have built their respective industries, *General Motors* and *Ford* in the automotive industry, and *United Airlines* and *American Airlines* in the US Airline industry.

Toyota Motors and Southwest Airlines however appear to be maximizing a very different objective function, that of "stakeholder surplus", where the residual cash flows are shared among the firm's key stakeholders, and in the process, the firm's investors fare better than if their interests were pursued at the expense of the other stakeholders.

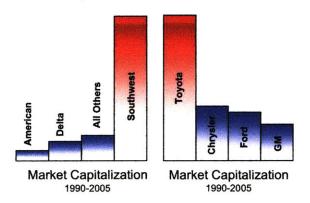

The extraordinarily high performance of these firms has been sustained for so long, that perhaps we are looking at a fundamentally different organizational species...

In diverse industries ranging from manufacturing to services, two world-class companies have monopolized the business press for decades now, holding numerous lessons for senior managers in recent decades: *Toyota Motors* and *Southwest Airways*. This article explores what the two firms have in common – what DNA are shared by this organizational "species"?

First and foremost, is how the "architects" (the senior leaders and leadership teams) of these world-class enterprises manage their environments, i.e. the things outside of their direct control or responsibility. How do they design their extended enterprise's objective function? How is power and wealth is created and shared? Examples of how the architects of these enterprises think and act are shown below:

"Under Japanese company law, shareholders are the owners of the corporation. But if corporations are run exclusively in the interests of shareholders, the business will be driven to pursue short-term profit at the expense of employment and spending on research and development. To be sustainable, corporations must nurture relationships with stakeholders such as suppliers, employees and the local community. So whatever the legal position, the corporation does not belong to its owners. It's not enough to serve shareholders." (Source: Mr. Okuda, Chairman, Toyota Motors; Financial Times, 1 August 2001).

"We can't let investors guide the company. That's not to say that investors aren't smart and don't have good ideas, because they do. They just have different motives. We've got to say true to who we are as a company and build for the long term." (Source: Gary Kelly, CEO, Southwest Airlines; The Dallas Morning News, 20 December 2007). As seen in the figure below, if those companies designed to maximize shareholder value are in fact delivering significantly less than those who are not trying to maximize that metric, then the question becomes, What on earth is going on here?

Such significant variance in the dependent variable would suggest that significant variance should reside in the explanation or the independent variable. In other words, the extraordinarily high performance of these firms has been sustained for so long, that perhaps we are looking at a fundamentally different organizational species - a fundamentally different enterprise architecture, which is better-suited to significantly different environmental conditions.

Theodore F. Piepenbrock, lectures at MIT's Engineering Systems Division & the Sloan School of Management and at the University of Oxford's Saïd Business School.ⁱ **Charles H. Fine** is a Professor at MIT's Sloan School of Management & Engineering Systems Division.

On the Origin of Corporate Species

Darwin's work has stirred controversy 150 years ago that, surprisingly is alive today: the confrontation between God and Science...

Within businesses, a "generation" can be thought of as a firm's product or service offering, each new launch, a birth whereby some of the "genes" of the family are carried forward. In this way, the lifecycle of the organization may represent many generations, and a collection of such similar organizations represent a "species".

Modular & Integral Enterprise Architectures

As summarized in the diagram below, a typology of enterprise architectures – a continuum spanning two polar opposites – can be developed which form the basis the DNA of each species.

Objective functions range from the modular enterprise architecture's narrow maximization of shareholder value (competition between stakeholders) to the integral enterprise architecture's broader maximization of stakeholder surplus (cooperation among stakeholders).

In biology and business, morphology trumps physiology – i.e. species type is more important than health of the beast. A weak cactus will outlive a strong oak... in a desert.

Organizational theorists, called ecologists define "species" as the goals, boundaries and activities of an organization. Similarly architectural theorists define "forms" as objective functions, boundaries, and interfaces. The form or species provides a first-order explanation of performance. In biology and business, whether in organisms or organizations, morphology trumps physiology – i.e. species type trumps the health of the beast. A weak cactus will typically outlive a strong oak... in a desert.

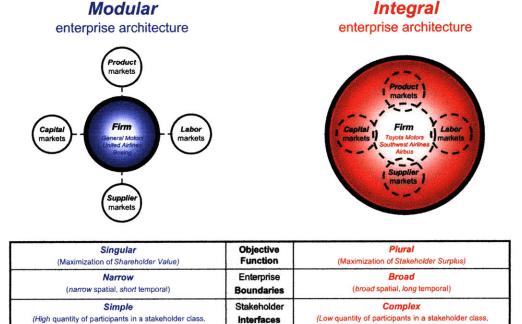

Architectures define how functions decomposed and divided among stakeholders. For simplicity we consider customers and suppliers (the value chain) and capital and labor (the factors of production).ⁱⁱ

Low quality of stakeholder relationships)

Boundaries define the extent of the stakeholder space and time horizon. Modular EAs have relatively narrow stakeholder interest and shorter time horizons. Integral EAs have relatively broad enterprise boundaries and longer time horizons.

Interfaces define the quantity and quality of the stakeholder relationships. Modular EAs have a large number of competing stakeholders in each class managed with short-term, arm's length contracts, while integral EAs have a small number of cooperating stakeholders in each class managed by long-term trust-based relationships. Modular EAs are therefore "positionally strong, while integral EAs are positionally weak.ⁱⁱⁱ

High quality of stakeholder relationships)

The Evolution of Business Ecosystems

Having defined a typology of enterprise architectural forms, we can now assemble a theory of how, why and when these forms grow and die. For this, we must describe the evolution of the environment, which puts pressure on enterprise architectures to either adapt to it, or to die under competitive pressures from new enterprise architectural forms – survival of the fittest, with "fit" crucially meaning in synch with what the environment demands, as opposed to "fit" meaning in good shape.

Inter-species Competition

But these two principles raise a perplexing puzzle for corporate leaders. If the ecosystem financially rewards dis-integration of the enterprise architecture in early part of an industry's evolution, but then rewards reintegration as the industry matures, is it easier for the incumbent to do this, or is it easier for a new integral enterprise architecture to be born? This is the crux of architectural leadership: the ability to adapt the boundaries of the enterprise architecture in stakeholder space and time horizons.

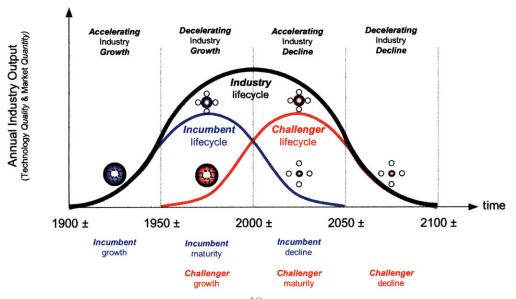

While enterprises seem to naturally disintegrate over time, reversing this process appears to require extraordinary (and extraordinarily rare) *architectural leadership*.

The environment and firm growth trajectories are characterized on two classical managerial dimensions: market growth rates (i.e. how much) and technology growth rates (i.e. what type). Many industries exhibit a classical S-shaped growth over time, with the annual rates of output therefore following a bell-shaped curve as shown below.^{iv}

Enterprise architectures early in the industry's evolution are integral, for radical *product* innovation. They then dis-integrate for speed to build a fast-growing market, and for greater cost-leadership and more modest product innovation. As the ecosystem begins to mature, integral enterprise architectures are required for radical *process* innovation.

The principle of *enterprise entropy* states that enterprise architectures tend to dis-integrate over time. The principle of *ecosystem dominance*, however states that winning enterprise architectures oscillate over the life-cycle of their industries from integral to modular and back to integral states. If such architectural leadership is in fact extraordinarily rare, then this raises the possibility for multiple species to occupy the same niche, incumbent firms having modular enterprise architectures, and late entrant challengers having integral enterprise architectures. Such competition between species is symbiotic, that is one species needs the other.

The market-making "r-strategists" are opportunists that attack markets with unlimited apparent growth potential. One the underlying growth opportunities begin to slow down, they are designed to exit that niche, leaving it to the market-taking "K-strategists", which are designed to thrive in environments with low resource availabilities. In the automotive and airline industries, GM & Ford, and American & United are market makers, while Toyota and Southwest are late entrant market makers.

Ironically, what works against competitors in one's own species, is precisely what doesn't work when competing against another species.

Evolution in the Airplane Ecosystem

Having described a theory of how business ecosystems evolve, we can now look at the empirical evidence in the ecosystem of commercial airplane design and manufacture – a rich dataset spanning 100 years of evolutionary data thus far, and including such famous r-strategists like *Douglas*, *Lockheed* and *Boeing*, who created and dominated the ecosystem for some half-century, before the emergence and eventual dominance over the subsequent half-century by the K-strategist, *Airbus* with its renewed integral form of enterprise architecture.

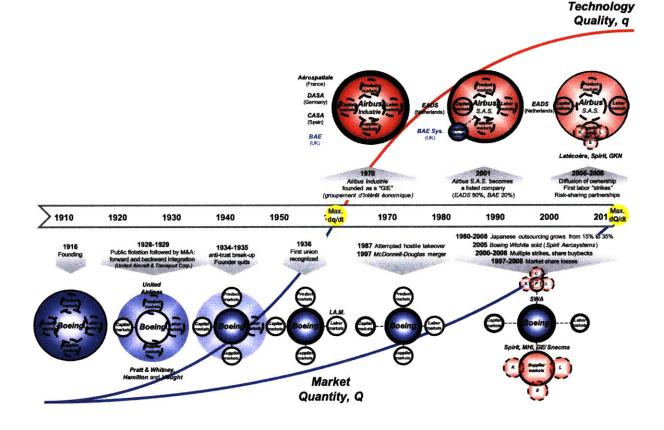

The Fossil Record

As can be seen in the diagram at the bottom, *Boeing* began its life, early in the industry's evolution as integral enterprise architecture – integral for radical product innovation. It then dis-integrated for speed to build a fast-growing market, and for greater cost-leadership and more modest product innovation. *Airbus* began its life late in the industry's evolution as an integral enterprise architecture – integral for radical process innovation. Both *Boeing* and *Airbus* are on similar trajectories, but *Airbus* is in a much less advanced state of dis-integration.

Boeing, the powerful racehorse, finds itself in a desert against Airbus, a fragile, young camel – but a camel nonetheless.

The ecosystem is now locked in an epic evolutionary battle between the strongest remaining survivor of the r-strategists (created from the merger of *Boeing* and *McDonnell Douglas*) and the only K-strategist, *Airbus*. This rare inter-species competition – a mixed duopoly – is one of the most fascinating and famous competitions in international business today. We will next examine the "fossil record" of each species to determine who was/is winning, how, when and why. *Boeing*, the powerful racehorse, finds itself in a desert against *Airbus*, a weak young camel – but a camel nonetheless. Recalling Collins' famous book, *Boeing* is evolving from "Good to Great"... to Gone.

Let us now turn our attention as business ecologists to the environment to see what types of forces have created and are destroying these enterprise architectural forms – these species.

Ecosystem Maturity: Quality

We characterize the maturity of the ecosystem using two dimensions: the rate of change of technology and the rate of change in market size. In other words we are interested in what is being demanded – the type or *quality* of goods and services, and how much is being demanded – the *quantity* of goods and services. Both dimensions have limits to growth in supply and demand. We begin by briefly exploring the maturity of the ecosystem in terms of technology quality.

Airplane Ecosystem Maturity: Quality

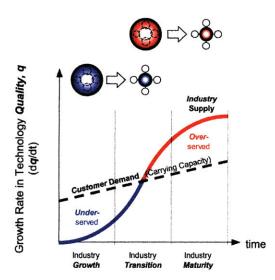

In order to illustrate ecosystem maturity in quality space, we turn briefly to the large commercial airplane industry.

As can be seen in the figures below, the number of major companies competing in this space appears to have risen gradually over the first fifty years of evolution, followed by a gradual fall of companies from this space either through exit or consolidation.^{vi}

"Once the dominant design emerges, the basis of competition changes radically, and firms are put to the test that very few will pass."

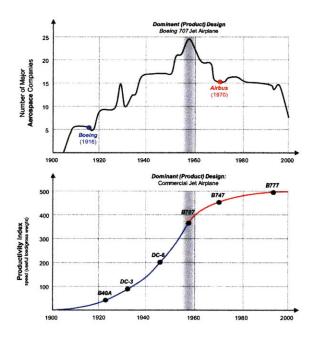

Researchers of the evolution of technological innovation have noted that significant technological events – called "dominant designs" can mark significant transformation of the competitive environment. James Utterback noted, "once the dominant design emerges, the basis of competition changes radically, and firms are put to the test that very few will pass."

Prior to the dominant product design, the environment is characterized by radical product innovation, with firms competing to establish a standard product, and for customers to accept this as the benchmark. Christensen referred to this as "under-served" markets. After the establishment of the dominant product design, the environment is characterized by incremental product innovation and the opportunity for radical process innovation, with firms competing to win customers on a quality, cost and delivery basis, as opposed to increasing product performance. Christensen referred to this as "overserved" markets with the conditions ripe for the emergence of a disruptive innovation.

As can also be seen in the figure at the bottom, the transition from firm proliferation towards consolidation occurred in the late 1950s at the emergence of the dominant design: the jet airplane.vii Prior to its arrival marked a period of significant uncertainty, experimentation and radical product innovation. After its arrival marked a period of diminishing returns from radical product innovation as technological saturation began to occur in terms of higher (40,000 ft cruising altitude), faster (just below the sound barrier) and farther (half-way around the world).

The basis of competition gradually switched from "higher, faster, farther" to "better, faster, cheaper" which is dominated by radical process innovation, best enabled by integral enterprise architectures – the same which launched the industry 50 years earlier, but this time focused on a radically different objective.

Ecosystem Maturity: Quantity

Having defined the first dimension of an ecosystem's maturity, the rate of change of technological growth – *quantity* space, we now turn to the complementary dimension of the rate of change of market growth – *quality* space.

Airplane Ecosystem Maturity: Quantity

One measure of the maturity of the global commercial airplane industry is to observe the maturity of its customers, the annual global airline industry's available seat kilometers (ASKs).

"Perhaps the most ubiquitous force leading to structural change is a change in the long-run industry growth rate."

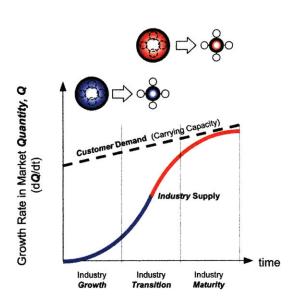

In Michael Porter's seminal book, *Competitive Strategy*, he noted: "Perhaps the most ubiquitous force leading to structural change is a change in the long-run industry growth rate."^{vuii}

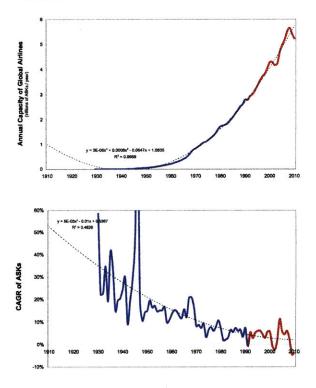

As all ecosystems have limits to growth or "carrying capacities", one would expect the rates of change of growth to begin to diminish. The carrying capacities could be defined by the penetration of an innovation into a constant population, or in addition it could capture the slowing of the growth of the population size representing the total market.

As can be seen in the figure below, the rates of change of environmental growth can impact the types of enterprise architectures which thrive in environments of rapid or slow growth. As can be seen in the figure below, global annual ASKs have grown exponentially since the industry began in the 1920's.

As the world's population is beginning to saturate, with ultimate size of around 10 billion people occurring between 2050 and 2100, one would expect this to impact the amount of air travel. Early indications are that this long-term rate of growth has started to inflect and will continue to grow, but at increasingly slower rates.

The implication of this slowing underlying growth rates is to continue to favor those enterprise architectures which are built to grow in environments that aren't. This will be discussed in the following sections.

Firm Strategies: Quality

While the "ecosystem" defines the broad industry where competition is taking place (e.g. automobiles, airlines, airplanes), "niches" define where these species chose to live and compete. In market strategy space this can be thought of as Michael Porter's generic strategies of differentiation and costleadership. We refer to these distinctions as either "Higher, Faster, Farther" (which refer to competition based on product performance) and "Better, Faster, Cheaper" (which refer to competition on the basis of quality, delivery and cost).

Differentiation vs. Cost-Leadership

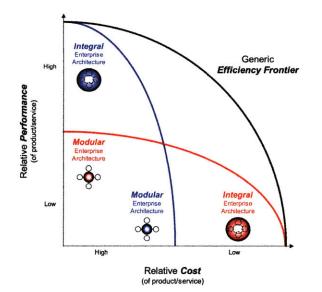

We now briefly look at the long-term trajectories of market strategies of each pair of species in our three ecosystems. As shown in the figure below, the respective incumbents *General Motors*, *United Airlines* and *Boeing* initially gained their dominance via *product* innovation which moved them initially from differentiation (enabled by an integral enterprise architecture) towards cost-leadership strategies (enabled by a modular enterprise architecture), which later constrained their ability for cost-leaderhip.

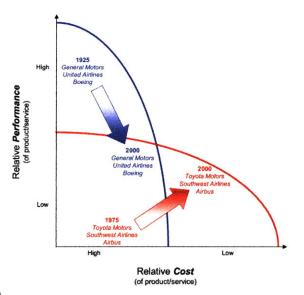

Enterprise architectures enable and constrain strategy. Integral EAs confer exploration advantages, while Modular EAs confer exploitation advantages.

As Porter popularized in his 1996 HBR article, firms have an *efficiency frontier* which conceptually demonstrates a tradeoff between the generic strategies of differentiation and cost-leadership.^{ix} What our research demonstrates is that a) enterprise architectures both enable and constrain choice of generic strategies, and b) each enterprise architecture has a skewed efficiency frontier which can bias its strategic choice.

As shown in the figure below, integral enterprise architectures confer *exploration* advantages in radical innovation of both products and processes, via patient capital investing in long-term physical or human capital, with rapid and frequent feedback between customers and suppliers. Modular enterprise architectures on the other hand confer *exploitation* advantages via impatient capital driving faster shortterm decisions, functional-specialization and marketbased competition between and among stakeholders. Conversely, the late-entrant challengers *Toyota Motors, Southwest Airlines*, and *Airbus* initiated their dominance competing in mass markets as costleaders via *process* innovation enabled by integral enterprise architectures. Examples from the early decades of each late-entrant include *Toyota's* cheap cars, *Southwest's* cheap seats, and *Airbus'* short-haul, high-volume airplanes. Over time, their enterprise architectures are disintegrating, enabling them to move from mass markets of cost-leadership into fragmented niches of differentiation. Examples of these new niches might include *Toyota's* Lexus, and *Airbus'* long-haul, low-volume A380 superjumbo.

Today, all the companies in our sample find themselves in maturing, commoditizing mass markets, and with the late entrants out-competing their powerful incumbents in the cost-leadership space, as their architectures enable them to do so.

Firm Strategies: Quantity

The level of vision or myopia appears to be a function of the enterprise architecture. That is, the more patient the capital, the more long-term the trust-based partnerships, the more complex the stakeholder tradeoffs, the slower the short-term speed, but the faster the long-term speed of integral enterprise architectures, like *Toyota, Southwest* and *Airbus*. Conversely, the less patient the capital, the more short-term and contractual the relationships, the more simple the inter-stakeholder objective function, the faster the short-term speed, but the slower the long-term speed of the modular enterprise architectures, like *GM*, *United* and *Boeing*. This is a classic "tortoise-hare" story, where the race does not always go to the swiftest.

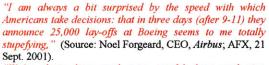

The Tortoise and The Hare

"Boeing quickly moved last week to cut commercial transport delivery in an announcement that surprised even some veteran Boeing-watchers by its swiftness and scope. At a hastily arranged news conference Sept. 18, one week after the terrorist attacks in the U.S., the company said it could also lay off up to nearly one-third of its commercial aircraft workforce. Alan R. Mulally, Boeing president and CEO of Boeing Commercial Airplanes, said When you order airplanes today, the lead time is anywhere from 10-14 months, so we need to make these decisions for production next year as soon as possible." (Source: Alan Mulally, President & CEO, Boeing Commercial Airplanes; Aviation Week, 24 Sept. 2001).

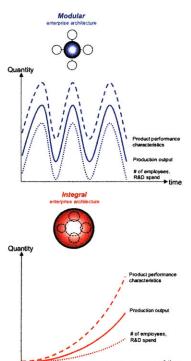

"History tells us that the quicker a company acts to counter adverse economic conditions, the better able it will be to work its way through a downturn and emerge stronger when the economy recovers." (Source: Jim McNerney, Chairman, President & CEO, The Boeing Company; memo to employees, 17 Feb. 2009).

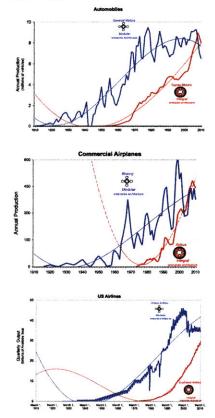

Modular enterprise architectures are built for *short-term* speed, while integral enterprise architectures are built for *long-term* speed. *This is a classic tortoise-hare story.*

Modular enterprise architectures, therefore create or amplify the instabilities that they are designed to serve - i.e. the boom-and-bust "business cycle". Integral enterprise architectures, on the other hand create or dampen the stabilities that they are designed to serve - i.e. *Toyota, Southwest* and *Airbus* do not see such a severe cycle. The principle of *optimum speed* states that in maturing environments, the optimum rate of growth is much slower than the maximum possible as summarized below.

"We've always been much more careful about production rates. We do see peaks and troughs but we've always managed to limit the highs and lows better than they do in the USA." (Source: Philippe Camus, EADS Co-Chairman; ATT, 20 Sept. 2001).

Financial Performance: Revenues

Corporate value – or at least expected value – comes from a company's ability to grow its top-line revenues, and ultimately convert this into bottom-line profits. The data seem to suggest that early entrant modular and late entrant integral enterprise architectures grow in different ways in different stages of an industry's life-cycle and therefore focus on different sides of this income statement equation.

Modular enterprise architectures, those which launch and exploit industries, attract investors who value top-line revenue growth potential. The conversion of this into bottom-line profits is taken as an article of faith.

Financial Performance: Profits

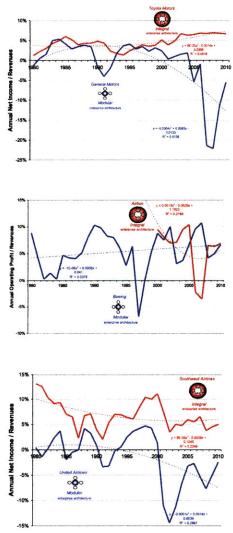

Conversely, where *growth* investors favor industries with inherently rapid top-line revenue growth, *value* investors tend to be more impressed with the conversion of top-line growth into bottom-line profits. This emphasis tends to be more prevalent in industries where top-line growth has diminished and focus has shifted towards companies that can grow profits in environments that aren't growing.

Integral enterprise architectures, those which overtake incumbents, attract investors who value bottom-line profit growth. Top line growth occurs inadvertently, as these companies take market share from incumbent modular enterprise architectures.

Modular enterprise architectures are focused on *top-line revenue growth*, while integral enterprise architectures are focused on *bottom-line profit growth*.

Agency Theory posits that the separation of ownership from management creates the principalagent problem, in which the managerial agents are incentivized to grow the top-line revenues, while the investors would prefer the growth of bottom-line profits.

As seen in the figures to the right, we combine the top –line and bottom-line revenues into a profitability or return on sales metric. Over the last 30 years, in industries that are in a maturing state, it appears that late entrant integral enterprise architectures are exhibiting profit margins that are not only higher than those in incumbent modular enterprise architectures, but their trajectories are increasing over time, while those of the modular enterprise architectures are falling.

The Power of Architecture

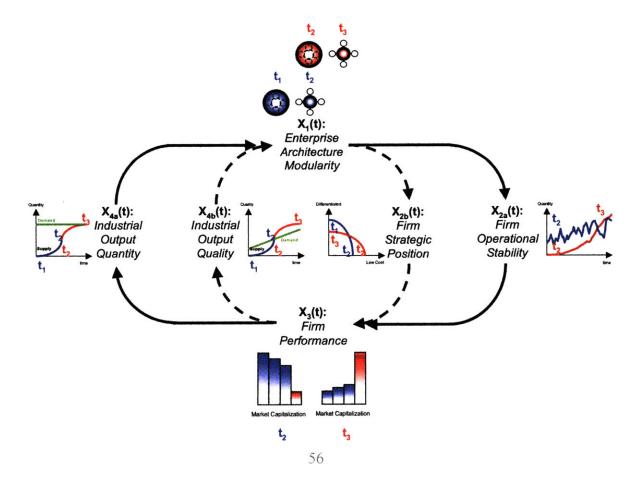

Let us now summarize the journey that we have been on. In order to explain the sources of long-term firm performance, we traced two concurrent causal loops in technology (quality) and market (quantity) space, through the macro-organizational architectural form, function and fit with the environment. These processes arise in the study of organisms as well as organizations: morphology and physiology and ecology – the definitions of species. The power of architecture is summarized in the figure below.

The Architecture of Power

What makes the design, operation and evolution of organizations many of orders of magnitude more complex than that of organisms, is that the functional "modules" of organisms (e.g. heart, brain, etc.) tend not to have different goals and objectives from the whole organism. The same is not necessarily true with macro-organizations or extended enterprises, where investors, unions, customers and suppliers can and often do have conflicting goals and objectives from that of the enterprise.

"The business firm is a political coalition and the executive is a political broker. The composition and goals are not given, they are negotiated and bargained."

The architecture of the extended enterprise is one of the most powerful concepts in determining long-term firm performance as it both enables and constrains choice of strategic position as well as growth rates. The entrepreneurial architect can seek to radically transform the environment by launching the next discontinuous innovations via integrality. S/he can dis-integrate the architecture to exploit the market growth, or s/he can either attempt to re-integrate the architecture to fit with the demands of a maturing ecosystem, or establish a new integral architecture. Many years ago, organizational theorist James March developed a theory of the firm as a political coalition, in which "The business firm is a political coalition, and the executive is a political broker. The composition of the firm is not given; it is negotiated. The goals of the firm is not given; they are bargained. Political scientist Robert Dahl defined "power" as "the ability to get things done when goals conflict". From these power and political perspectives, we begin to see the secrets of successful enterprise architecting, which we will summarize next.

Design Intelligence: Knowledge & Courage

The nervous system of the organization appears to be distributed vertically throughout the hierarchy as well horizontally throughout the extended enterprise like the nervous system of an organism. Within the macro-organizational "brain" lies the development and dissemination of system-level *knowledge* and *courage* – design intelligence. We must first learn the right things to do (before we can do things right), but often the bottleneck is having the courage to do what we have learned is the right thing to do.

Evolution by Intelligent Design

So which is it that drives the evolution of business ecosystems - Intelligent Design or Evolution by natural selection? Visionary and courageous architects create both the enterprises and the environment that their business will operate in. Both these will enable and later constrain what future leaders can do. After creating the environment, subsequent architects can match the environment's demands by disintegrating their enterprises. Further reintegration of the incumbents has (thus far) proven elusive, providing a new opportunity for new visionary and courageous architects to re-set the evolutionary clock back to integrality.

In the Intelligent Design vs. Evolution debate,

System-level *knowledge*, what do each set of stakeholders want? What is the optimum balanced tradeoff to maximize the enterprise's value over the time horizon that I am interested in. This is a raw intelligence exercise, both at the top and distributed vertically and horizontally.

System-level *courage*, how do I enact this decision? This is an emotional intelligence exercise, both at the top and distributed vertically and horizontally.

For *Southwest Airlines*, the source of integrality may be/have been it pull from the center by CEO Herb Kelleher. For *Airbus*, it may be pushed together from the outside social forces. For *Toyota*, it might be both push and pull.

Architectural Leadership Lessons:

From this research, we have seen that architectural leadership has the following characteristics:

- Architectural Leadership is a political process of making complex trade-offs with "external" stakeholders.
- It requires extremely high levels of intelligence or personal knowledge of the ecosystem and emotional intelligence to develop long-term, trust-based relationships, and the courage to enact complex decisions.
- This knowledge and courage, while often developed at an early age, is in fact strengthened via enterprise crucibles, in which key leaders of one's enterprise develop shared knowledge and courage together over time.

It appears therefore, that in the Intelligent Design vs. Evolution debate, dominant organizational species evolve through the intelligent design of their extended enterprises. *Variation* is not entirely random, and the *selection* forces directing such evolution are not supernatural. Instead such architectural direction is often superhuman, notwithstanding the fact that even the most powerful business "gods" appear to have their limits.

This research is "agnostic" over which enterprise architecture is better – there is no one best way that excels in all situations. Like evolution, it merely states that the state of the environment defines which "leadership genes" will be selected and which "organizational species" will dominate.

Expanded Executive Summary

Toward a Theory of the Evolution of Business Ecosystems: Enterprise Architectures, Competitive Dynamics, Firm Performance and Industrial Co-Evolution

Theodore F. Piepenbrock MIT, Engineering Systems Division

ABSTRACT

This paper contributes toward the building of a theory of the evolution of business ecosystems. In the process, it addresses a question that has been posed by evolutionary theorists in the economics and sociology literatures for decades: "Why do firms in the same industry vary *systematically* in performance *over time*?" Seeking a *systematic* explanation of a *longitudinal* phenomenon inevitably requires characterizing the evolution of the industrial ecosystem, as both the organization (firm) and its environment (industry, markets and institutions) are co-evolving. This question is therefore explored via a theoretical sample in three industrial ecosystems covering manufacturing and service sectors, with competitors from the US, Europe and Japan: commercial airplanes, motor vehicles and airlines. The research is based primarily on an in-depth seven-year, multi-level, multi-method, field-based case study of both firms in the large commercial airplanes industry *mixed* duopoly as well as the key stakeholders in their extended enterprises (i.e. customers, suppliers, investors and employees). This field work is supplemented with historical comparative analysis in all three industries, as well as nonlinear dynamic simulation models developed to capture the essential mechanisms governing the evolution of business ecosystems.

A theoretical framework is developed which endogenously traces the co-evolution of firms and their industrial environments using their highest-level system properties of *form, function* and *fitness* (as reflected in the system sciences of *morphology, physiology* and *ecology*), and which embraces the evolutionary processes of *variation, selection* and *retention*. The framework captures the path-dependent evolution of heterogeneous populations of enterprise architectures engaged in *symbiotic inter-species competition* and posits the evolution of *dominant designs* in enterprise architectures that oscillate deterministically and chaotically between *modular* and *integral* states throughout an industry's life-cycle. Architectural innovation – at the extended enterprise level – is demonstrated to contribute to the failure of established firms, with causal mechanisms developed to explain tipping points.

This research lies at the intersection of the intellectual domains of strategic management, organization science and complex systems theory. It aims to contribute to fundamental debates in these fields regarding the sources of superior long-term performance. Specifically, do the sources reside within the firm or in the firm's environment (i.e. industry structure)? What are the roles of managerial adaptation and environmental selection in the creation and sustainment of such performance? Furthermore, how does this shape our understanding of strategic leadership? Our empirical findings suggest that sources of superior firm performance lie neither exclusively within the firm, nor in its industrial environment, but in *how* the firm interacts with its environment – i.e. in the network *architecture* of the firm's extended enterprise. It appears that these enterprise architectures, which both enable and constrain managerial agency and adaptation through spatially and temporally bounded rationality, give rise to architectural inertia and the power of environmental selection. Finally, the data suggest that the qualities of strategic leadership, which maximize firm performance over the industry's evolution, are architectural: namely the definition and maintenance of enterprise objective functions, boundaries and interfaces.

INTRODUCTION

Research Question

At its most fundamental level, this paper addresses the following question that has been posed directly and indirectly by evolutionary theorists in both the economics (Nelson, 1991) and sociology (e.g. Hannan & Freeman, 1977; Carroll, 1993) literatures:

"Why do firms in the same industry vary systematically in performance over time?"

Although it is typical that the unit of analysis is the firm and the dependent variable is long-term performance, addressing this question more subtly requires a *systematic* explanation of *longitudinal* phenomena, which inevitably requires characterizing the evolution of the business ecosystem, as both firm and industry are co-evolving.⁶

Early in our research, intriguing empirical data began to be revealed: as firms and industries co-evolved, the dominant form of the firm's objective function and its resulting interaction with its environment appeared to change. This manifested itself in the counter-intuitive observation that firms which were not focused on exclusively maximizing shareholder value, were in fact delivering significantly more of it than firms who focused exclusively on maximizing it. This result appeared in a variety of industries ranging from manufacturing to services. The exploration of why, when and how this phenomenon happens became a driving impetus of the research. Thus a second question emerged which appears to lie at the heart of the first question which was originally posed fifty years ago by Edith Penrose (1959):

"How do firms that have a *stakeholder* approach differ in competitiveness from firms that maximize *stockholder* wealth?"

Proposed Theoretical Framework

Most research implicitly assumes that competing firms are of the same species, and thus focus on secondorder *efficiency*-based explanations. We propose an alternative first-order *effectiveness*-based explanation, namely that where significant sustained long-term variance in performance between firms exists (e.g. *Toyota Motors* vs. *General Motors*, or *Southwest Airlines* vs. *United Airlines*) it is more productive to classify such competition as *inter-species*. We therefore characterize a late-entrant "challenger" species of organization (driven to maximize *stakeholder surplus*) which has evolved to systematically out-compete over the long term, the traditional "incumbent" species (driven to maximize *shareholder value*).⁷

We will argue that firms adopting different objective functions, will have different enterprise architectural forms (Hannan and Freeman, 1977), and will present a typology of isomorphic (DiMaggio and Powell, 1983) organizational sets ranging from integral to modular enterprise architectures, and having different levels of fit with their environment (Lawrence and Lorsch, 1967). In addition, the greater the variance in architectural forms, the greater the potential variance in long-term firm performance, contingent upon the demands and opportunities provided by the competitive environment of the enterprise's ecosystem.

⁶ Wiggins & Ruefli (2002) empirically explore the sustainability of competitive advantage using a rare longitudinal sample comprising 6,772 firms in 40 industries over 25 years, demonstrating just how rare the phenomenon is.
⁷ Note: in order to assist the reader to easily and rapidly identify the various "species" throughout this paper, we highlight in blue, the early-entrant incumbent species and in red, the late-entrant challenger species.

LITERATURE REVIEW

Situating within the Literatures

While significant research has been undertaken to understand how firms compete and (separately) how environments evolve, little theoretical work has been undertaken to understand how organizations and environments interact and co-evolve, and even less empirical work exists to begin to ground such theoretical studies. In the following, we briefly summarize three broad literatures, situating our potential contribution within them.

Strategic Management. Research on competition between firms is mature, and captures a rich debate which spans exogenous industry-level explanations for firm performance (Mason, 1939; Bain, 1956; Porter, 1980 and 1985), as well as endogenous firm-level explanations (Penrose, 1959, Wernerfelt, 1984) known as the resource-based view.⁸ Relatively little work has been done to begin to endogenize the environment in order to provide a higher-level of analysis – that of competition between organizational sets (i.e. extended enterprises), and the resulting evolution of organizational fields (i.e. ecosystems) as shown in Figure 1 below. Importantly, this analysis of "how" the firm engages the environment begins to re-ingtegrate strategy *process* and strategy *content* schools (Petttigrew, 1992).

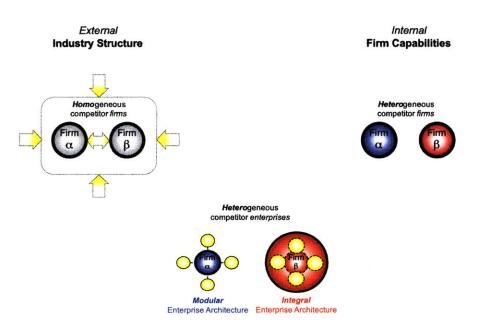

Figure 1: Contributing to the Debate in Strategic Management

The industrial organization literature characterizes the firm's environment as a locus of competition or "extended rivalry" (Porter, 1980), with the objective function of the firm being profit-maximization, usually for maximizing the objective function of one specific stakeholder: the shareholders, resulting in a zero-sum competition within the organizational set. Conversely, relatively little work has been done to characterize other forms of organizational set, where the objective function is a more plural maximization of stakeholder surplus (Freeman, 1984) and the interaction between the two in *mixed duopoly* (e.g. Lambertini & Rossini, 1998). The *strategic complementarities* literatures in economics and political science (e.g. Milgrom & Roberts, 1990 and 1995; Hall & Soskice, 2001) have produced the basis from which to build empirically.

⁸ We also aim to integrate the heretofore opposed literatures from organizational economics (e.g. transaction costs, agency theory, property rights and information economics) and organizational capabilities.

Organization Science. Within the broad field of open systems organization science, the past 30 years has seen the emergence and maturing of four major "schools" under the rubric of "organizations and environments" (Scott, 2003): organizational ecology (Hannan and Freeman, 1977 and 1984), neoinstitutionalism (Meyer and Rowan, 1977; DiMaggio and Powell, 1983; Uzzi, 1997), resource dependence (Pfeffer and Salancik, 1978) and transaction cost economics (Williamson, 1975 and 1985). While these schools tend to address the limitations inherent in the strategic management literature – namely exogenous treatment of the environment – each has its limitations in endogenizing the environment. Organizational ecology and neo-institutionalism tend to focus on populations of isomorphic organizational set; transaction cost economics tends to focus on efficiency as the primary driving mechanism defining firm boundaries. This paper attempts to address these limitations, namely: heterogeneous populations, competing dynamically, with effectiveness (not efficiency) being the governing performance mechanism (Brittain and Freeman, 1980; Brittain, 1994).

Finally, the theory that contributed significantly to the development of the aforementioned four schools over 40 years ago, *structural* contingency theory (Burns and Stalker, 1961; Lawrence and Lorsch, 1967; Thompson, 1967) proposed a similar framework to the *ecological* contingency theory presented herein with two noteworthy differences. First, their *intra*-organizational characterization of the processes of differentiation and integration has similarities to architectural modularity and integrality presented herein, but now with *inter*-organizational focus. Second, their contingency theoretic framework was essentially expressed as *variance* theory, with the environmental variable expressed as a moderator variable, and no explicit mediator variable. This paper attempts to build from Lawrence and Lorsch's (1967) classic by 1) moving from firm to organizational set as the unit of analysis, and in doing so, 2) endogenize the macro-level of the organizational set and included as mediator variables covering strategic and operations choices. The differences between the variance-based *structural* contingency theory and the proposed process-based *ecological* contingency theory are summarized in Figure 2 below.

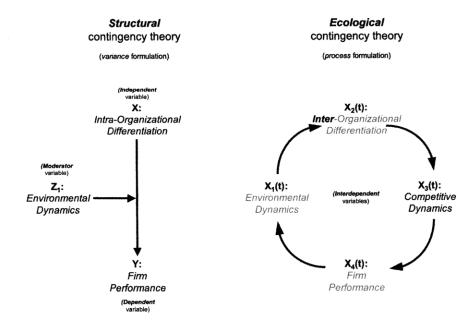

Figure 2: Comparing Structural Contingency Theory with Ecological Contingency Theory

Complex Systems Theory. While the two literatures mentioned above, each focus on organizational systems, the complex systems literature concentrates on the abstract principles governing general systems ranging from physical, to biological, to organizational. While general systems theory is a broad and mature literature (Von Bertalanffy, 1950 and 1962), we aim to focus this discussion on three primary threads of system science: system architecture, system dynamics, and ecosystem dynamics which theorize about complexity.

System architecture has its roots in managing *functional* complexity (Simon, 1962; Alexander 1964; Rechtin, 2000). It has impacted various socio-technical domains, including: product design (Ulrich, 1995) and more recently in *intra*-organization design (Anderson and Tushman, 1990; Henderson and Clark, 1990) and *inter*-organization design (Langlois, 1988; Sanchez and Mahoney, 1996; Fine, 1998; Schilling, 2000; Sako, 2003; Aoki and Jackson, 2008). While much of this work focuses on supply chain design, little of it focuses explicitly and more broadly on the architecture of entire organizational sets. This literature would therefore be an example of *progressive* intertextual coherence (Locke and Golden-Biddle, 1997).

System dynamics has its roots in defining and managing *dynamic* complexity in social systems (Forrester, 1961; Sterman, 2000), that is, where cause and effect are distant in space and time. Although it has been applied to various complex organizational settings (Forrester, 1958; Hall, 1976; Morecroft, 1985; Sastry, 1997; Repenning, 2002), it has only occasionally been used to explain how the competitive dynamics among firms interacts with the industry's evolution. Where such studies have been made (Paich and Sterman, 1993), inter-firm competition occurs between homogeneous enterprise architectures. System dynamics has yet to be combined with system architecture to develop a theory of how functional and dynamic complexity evolve in organizational settings. Again, this literature would be another example of *progressive* intertextual coherence.

Ecosystem dynamics has its roots in defining *competitive* complexity. While population growth models have a long history (Verhulst, 1938), and simple intra-species competition models have been proposed (Lotka, 1925; Volterra, 1931; Hannan and Freeman, 1977), only more recently have inter-species typologies been proposed in biology (MacArthur and Wilson, 1967) and subsequently in sociology (Brittain and Freeman, 1980). The science of ecosystem dynamics has yet to develop significant theoretical and empirical research on inter-species competition. Again, this literature would be another example of *progressive* intertextual coherence.

Problematizing the Literatures

Having situated this paper within the extant literatures, we would like to now note where this paper departs and where possible contributions may lie.

Incomplete. From the above discussion of a variety of literatures interested in explaining the dependent variable of organizational performance, it is clear that the literatures, while mature, are *incomplete*. A gap exists regarding how competition occurs at the organizational set level and how these co-evolve with the organizational fields within which they are embedded.

Inadequate. The extant literatures have not adequately addressed the question, by underemphasizing the role that complexity (functional, dynamic, behavioral, and competitive) plays in understanding the evolution of business ecosystems. System architecture and ecosystem dynamics serve as a set of organizing principles which characterize the evolution of a spectrum of system forms, functions and environmental fit.

Incommensurate. Finally, because these extant literatures have gaps that have not been filled, or have been filled with inadequate literatures, there are rare but noteworthy cases where the extant theories can

result in misleading characterizations of competition and industry evolution. Examples of such counterintuitive insights, which go against the received conventional wisdom - discussed later in this paper - are briefly summarized.

In the strategic management literature's industry structure school (Porter, 1980), the treatment of members of one's organizational set as "extended rivals", may not under certain conditions result in maximization of profits to the focal firm. Likewise, the objective function that seeks to maximize shareholder value, may not under certain conditions achieve its aim. Conversely, the objective function that seeks to maximize stakeholder surplus, may under certain circumstances achieve more shareholder value than firms who are expressly trying to maximize this metric.

In the organizational ecology literature (Hannan and Freeman, 1977), which assumes homogenous *intra*-species competition, late entrants exhibit higher mortality rates than early entrants. However, when competition involves heterogeneous *inter*-species competition, late entrants not only survive, they can end up dominating the industry.⁹

Contribution to the Literatures

Although the fields of strategic management and organization science, with their half-century old roots in economics and sociology are considered by many to be mature, there is clearly an opportunity to integrate prior streams of research from distant disciplines to produce a new framework in order to resolve its original unsolved debates of *internal* vs. *external* sources of firm performance and *adaptation* vs. *selection* processes of organizational change. A contribution might be made in bringing for the first time, a typology or configuration from the intellectual domains of system architecting and system dynamics (i.e. complexity science) formally and systematically to the study of organizations in order to explain their evolution, structure, function and performance.

Methodological Fit with the State of Literature

From this discussion of the extant literatures, it is clear that the strategic management field exists in a general state of maturity, particularly with respect to the establishment of *variance* theories that explain sources of competitive advantage and firm performance. Strong methodological fit exists, therefore with more quantitative methods to test and validate these existing theories (Edmondson and McManus, 2007).

However, as little empirical and theoretical research exists to describe *how* business ecosystems evolve, the state of the field with respect to *process* theory can be considered nascent. In this research environment, strong methodological fit exists for a more qualitative approach to the research design.¹⁰ In the following section, therefore we will describe the research methods that are designed to meet the challenges of this nascent literature.

⁹ Under the environmental conditions of industry maturity.

¹⁰ Edmondson and McManus (2007) note that the use of qualitative methods in a mature field represents an "offdiagonal" methods strategy, which may generate new opportunities for insights provided that a study's focus is reframed from the broad to the narrow. In this case, we are focusing from variance to process theory.

RESEARCH DESIGN

Empirical Sample

We build grounded theory from a comparative study of *inter*-species competition between pairs of firms possessing heterogeneous enterprise architectures¹¹ in three industries. The theoretical sample is summarized in Table 1 below.¹²

Sample Type	Research Methods	Sector	Industry	Focal Firm	Nat- ional Origin	Date of Birth	Current Enterprise Architecture	Firm Long-term Performance
Primary	Field-	Mfg. &	Large	Boeing	US	1916	Modular	Decreasing
	based case study	Services	Commercial Airplanes	Airbus	EU	1970	Integral	Increasing
Second-	Available	Mfg.	Automotive	GM	US	1908	Modular	Decreasing
ary	data analysis			Toyota	Japan	1937	Integral	Increasing
	-	Services	US Airlines	United	US	1926	Modular	Decreasing
				Southwest	US	1970	Integral	Increasing

Table 1: Summary of Research Sample

The theoretical sample was chosen to expose and explain variance in both the dependent variable (firm performance) and independent variable (enterprise architecture), while balancing the needs for generalizability and parsimony in this exploratory stage of grounded theory building. The cases succinctly demonstrate that the theoretical framework has the possibility of applying to industries ranging from manufacturing to services, and in socio-economic environments including the US, Japan and Europe. In addition, in order to gain and sustain access to executive-level informants of the competing firms in the primary sample, we used the secondary sample to stimulate action-learning via the exploration of acknowledged world-class firms in both manufacturing e.g. *Toyota Motors* (Womack, Jones and Roos, 1990) and services e.g. *Southwest Airlines* (Hoffer Gittell, 2003). This served as the basis of discussion around which the senior decision-makers of the primary sample revealed their cognitive frames regarding themselves and those of their competitor.¹³

Potential Limitations. This non-random, small-N, theoretical sample used for theory *building* necessarily draws critiques of theory *validation* using random, large-N, statistical sample. As we aim to build *process* (not *variance*) theory which links "dependent" and "independent" variables in endogenous closed-loop feedback, capturing longitudinal switching of high and low performers, we begin to mitigate the concerns of sampling on the dependent variable¹⁴ and survivorship bias.¹⁵

¹¹ Each firm is posited to be representative of a population of isomorphic organizational sets, giving the theoretical sample potential for increased external validity.

¹² This comparison of pairs of high- and low-performers in the same industries is similar to other theory building research in strategy *content* (e.g. Lawrence and Lorsch, 1967) and strategy *process* (e.g. Pettigrew and Whipp, 1990).

¹³ In order to protect the anonymity of the informants, evidence is reported based on generic enterprise architecture type, and not individual firm.

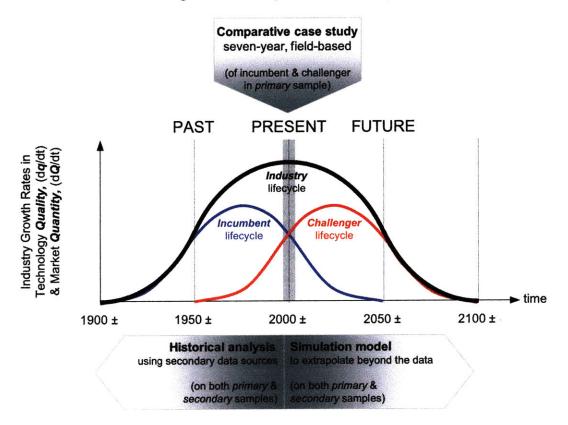

¹⁴ Where the criterion for selecting the sample of firms is based on the "dependent variable", firm performance.

¹⁵ Where the survivors are fallaciously compared with the historic average, despite having unusual properties.

Research Methods

As a theory of industrial evolution implies the study of a longitudinal or diachronic phenomenon, we employ a tripartite temporal logic to research methods: collecting and analyzing data from the past, present and projecting it into the future. The three methods used therefore are *historical comparative analysis, field-based case study* and *dynamic simulation model* as shown in Figure 3 and discussed below.¹⁶

Field-based Case Study. We build grounded theory (Glaser & Strauss, 1967; Eisenhardt, 1989) from an in-depth, seven-year, field-based case study of the primary sample, in which coding of observational, interview and archival data generated robust sets of constructs and propositions.

Historical Comparative Analysis. In order to verify and project the analysis of the above field-based case study back in time, analysis of past data followed methods of business history (Penrose, 1960; Chandler, 1962) using secondary data sources in both the primary and secondary samples.

Dynamic Simulation Model. In order to verify the historical analyses as well as project them forward in time, a dynamic simulation model (Davis, Eisenhardt and Bingham, 2007) was created to integrate the explicit causal structures and to explore the dynamic behavior generated by the model.¹⁷

¹⁶ While the three methods were used concurrently, data and analysis evolved from more qualitative to quantitative.

¹⁷ The purpose of this numerical simulation is not for quantitative calibration and prediction, but instead to gain qualitative understanding and insight into the posited governing "physics" of the underlying causal structures. This combination of case-based grounded theory and numerical simulation has been recently used in the management literature (Rudolph and Repenning, 2002) to induce theory both from data and other theories.

Data Collection

The data collection strategy utilized multiple methods and multiple sources as is briefly described in the following sections.

Primary Data Sources. For the primary case study, we constructed a macro-level model of the structure, function and evolution of the organizational set from the micro-level cognitive frames of senior decision makers within each stakeholder of the organizational set. These data came from over 100 senior level informants (e.g. CEOs, presidents, vice-presidents and directors) distributed both vertically within the organizations and horizontally across both organizational sets.

The field-based data for the primary sample are largely taken from over 3,500 hours of ethnography (Van Maanen, 1988) and clinical methods participant observation (Schein, 1987) spread longitudinally over seven years from January 2002 to January 2009. Three-month field visits occurred every summer for seven years, with additional two-week trips every winter and spring. This included over 150 in-depth, semi-structured interviews and interview-based surveys, totaling over 300 hours. My relationship to the informants in both organizational sets was as a doctoral student paid to teach strategy in executive education and workshop format to senior decision-makers.

This longitudinal design allowed for intensive triangulation of the data sources across endogenous and exogenous changes. For example, during the five years of the study informants occupied multiple positions and positions (such as CEO), were occupied by multiple informants. In addition, the longitudinal design allowed for observation of how the competing organizational sets responded to changing environmental conditions including the exogenous shock of the September 11, 2001 terrorist attacks, the normal rise and fall of the business cycle, as well as the change in market leadership, which for the first time shifted from the incumbent to the challenger during the time of this study.

Secondary Data Sources. In addition, in order to ascertain the structure, function and evolution of the organizational sets beyond the temporal scope of direct observation, access was acquired to historical available data sources, including public documents and official records (e.g. annual company reports and SEC filings), private documents (e.g. internal company memos) and mass media (e.g. historical interviews of leaders in the business press and trade journals). By way of example, in order to paint a historical record of the evolutionary trajectory of the firms in the primary sample, all of the annual company reports covering nearly 100 years of history, totaling over 3,500 pages were collected for analysis.

Data Smoothing for Trends. Finally, as this research aims to explain long-term trends (i.e. a "first-mode" *signal*), the transfer of data to theory requires a smoothing of short-term *noise*, manifested as local events.¹⁸ Such smoothing requires "empirical patience", which operationally implies a long data gestation time constant, before the stock of potential data, is drained by an outflow into the stock of theory-building data.

¹⁸ By analogy, in a theory of annual seasonal weather change (i.e. "due to the earth's tilt and its solar orbit, winter is colder than summer in the northern hemisphere") the fact that "noisy" daily temperature measurements might reveal local "inconsistencies" with the trend does not necessarily invalidate the theory.

THEORETICAL FRAMEWORK & EMPIRICAL EVIDENCE

Overview of Theoretical Framework

Definitions. Before specifying the unit of analysis and levels of analysis, we provide four definitions along the dimensions of competition-cooperation and substitutes-complements as continuous (not binary) variables. These definitions, given in both economics and sociology terminology, are summarized in Figure 4 below.

The type of *organization* under consideration is the *firm*, which is comprised of a collection of interacting internal functional organizations (e.g. marketing, R&D, manufacturing). These internal interactions tend toward the *cooperative* trading of *complementary* services.

The organizational *field* (DiMaggio and Powell, 1983) or *population* (Hannan and Freeman, 1977) or *industry* (Porter, 1980) is defined as an aggregate collection of externally interacting organizations or competing firms. These external interactions tend toward the *competitive* selling of *substitute* products and services.

The organizational *set* (Blau and Scott, 1962) or "extended *enterprise*" is defined as a focal firm and its key exchange actors (e.g. customers, suppliers, investors and employees). The set is therefore a collection of interacting internal functional organizations (or stakeholders). These internal interactions tend toward the *cooperative* selling of *complementary* products and services.

Finally, the organizational *community* (Aldrich, 1999) or *ecosystem* is defined as an aggregate collection of externally interacting heterogeneous organizations or competing enterprises. These external interactions tend toward the *competitive* selling of *substitute* products and services.

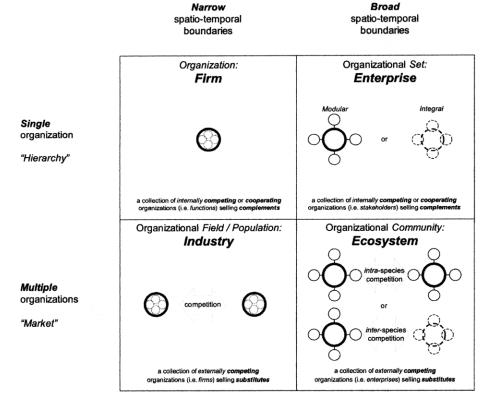

Figure 4: Summary of Primary Definitions

Units of Analysis. The theoretical framework utilizes multiple units of analysis operating at different levels. The formal unit of analysis that defines the dependent variable is that of the business *firm* and specifically the performance of the single product "strategic business unit" within the more general diversified corporation (Porter, 1980).

In order to understand and explain the sources of firm performance, this framework posits the construct of an *extended enterprise*¹⁹ that serves as the primary explanatory or independent variable of the framework.

Finally, in order to understand and explain the evolutionary forces that generate the primary explanatory variable, this framework posits the construct of an *ecosystem* of competing extended enterprises having different ecological forms or belonging to different ecological species (Hannan and Freeman, 1977).²⁰

Levels of Analysis. The levels of analysis occur both above and below the level of the firm. At a microlevel, the cognitive frames (Goffman, 1974) of the most senior leaders are mapped across the macro-level extended enterprise in order to determine and triangulate on the enterprise's architectural form and its function. In this dual micro- and macro-level of analysis, the enterprise architecture is analyzed as an enacted system that enables and constrains but does not determine managerial action (Giddens, 1979).

Variables. This paper however breaks with traditional strategic management research which strives to build and test *variance* theory - relating dependent and independent variables under strict necessary and sufficient conditions. Instead, this paper favors the building and testing of *process* theory, which seeks only necessary conditions plus a recipe for how they interact (Mohr, 1982; Van de Ven and Poole, 1995). In this way, the "dependent" and "independent" variables are linked via "moderating" and "mediating" variables to become a system of temporally and causally-linked "interdependent" variables. The entire system of causal relations therefore forms a closed feedback model whereby the evolution of business ecosystems is actually an endogenous theory, and the variables become antecedents (Richardson, 1991).

Despite this focus on process theory, we believe it useful to also characterize the four primary variables in familiar *variance* theoretic terms for illustrative purposes. In its simplest form, the dependent variable is long-term firm performance, and the independent variable is the enterprise architecture. We identify two types of intervening variables that relate the "dependent" and "independent" variables: *environmental maturity*, which describes the conditions that create and sustain different enterprise architectures, and *enterprise stability*, which describes how the enterprise functions or competes in strategic and operational terms.

¹⁹ Researchers using the organizational set level of analysis include: resource dependence theorist (Pfeffer and Salancik, 1978), transaction cost economists (Williamson, 1975 and 1985) and industry structural analysts in strategic management (Porter, 1980).

²⁰ Scott (2003) notes that "organizational field" has similar definitions within organization studies: "interorganizational community" (Hawley, 1950; Warren, 1967), "organizational community" (Aldrich, 1999), "industry system" (Hirsch, 1985), and "societal sector" (Scott and Meyer, 1991).

Framework Summary. The theoretical framework is comprised of four constitutive construct sets representing the highest-level industry system properties of environmental *fitness*, enterprise architectural *form*, firm *function* and *performance* (as reflected in the system sciences of *ecology*, *morphology*, and *physiology*). These are linked by proposition sets as shown proceeding clockwise in Figure 5 below. In addition, the theoretical framework captures the essential evolutionary processes of *variation*, *selection* and *retention*, as first expressed for organizations in evolutionary sociology (Aldrich, 1979) and evolutionary economics (Nelson & Winter, 1982).

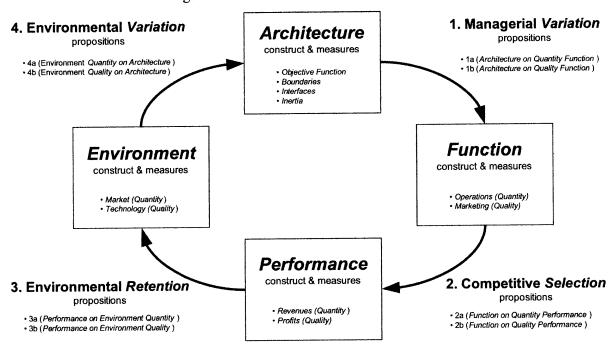

Figure 5: Overview of Theoretical Framework

The first construct set defines the construct of enterprise architecture, which describes how the focal firm interacts with its environment. A typology of ideal enterprise architectures will be defined along a continuum ranging from modular to integral network forms. In variance theory terms, this module captures the primary *explanatory* variables.

The second construct set describes the competitive dynamics between enterprise architectures. It describes how each type of enterprise architecture functions in terms of key high-level operations and marketing variables. A typology of ideal operations and marketing strategies will be mapped to the typology of enterprise architectures. In variance theory terms, this module captures the primary *mediating* variables.

The third construct set describes how the competitive dynamics of each type of enterprise architecture impacts long-term firm performance. A typology of ideal financial strategies will be mapped to the typology of enterprise architectures. In variance theory terms, this module captures the primary *dependent* variables.

The fourth construct set describes how long-term firm performance impacts the evolution of the industry, which in turn creates the conditions for future enterprise architectural development. In variance theory terms, this module captures the primary *moderating* variables.

Primary Construct: Enterprise Architecture

Theoretical Background. From the outset, we stated that seek a *systematic* explanation for long-term performance. We thus seek to characterize the firm-environment as a *system* of strategic complementarities (Milgrom and Roberts, 1990 & 1995), and as a typology of such complementarities (Hall and Soskice, 2001). The main construct of an *enterprise architecture* is introduced which originally emanates from architectural theory, which maps *form* to *function* (morphology to physiology) and specifies a typology of architectural forms ranging from *modular* to *integral*. Within design science, such an architectural typology has been developed for information (Simon, 1962), products (Ulrich, 1995; Baldwin and Clark, 2000), systems (Rechtin, 1991) and supply chains (Fine, 1998), but rarely to entire organizational sets.

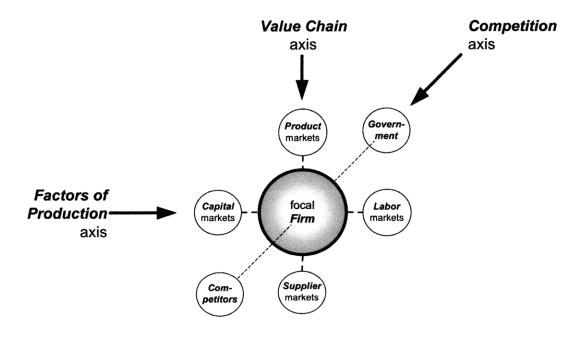

Within organization science, *intra*-organizational typologies have been posited (e.g. Burns & Stalker, 1961; Lawrence & Lorsch, 1967; Miles & Snow, 1978). In addition, *inter*-organizational interactions have been proposed including: "the firm as a political coalition" (March, 1962), "theory of the firm" / "transaction cost economics" (Coase, 1937; Williamson, 1975), "resource dependence theory" (Pfeffer and Salancik, 1978), "five-forces analysis" (Porter, 1980), "stakeholder theory of the firm" (Freeman, 1984), "social network analysis" (Granovetter, 1985; Uzzi, 1997) and "varieties of capitalism" (Hall and Soskice, 2001). Finally, the evolution of isomorphic organizational forms has been posited in both neo-institutional theories (Meyer & Rowan, 1977; DiMaggio & Powell, 1983) and organizational ecology at the population- (Hannan & Freeman, 1977) and community levels (Astley, 1985). Typologies of "species" of organisms and organizations have arisen in biological ecology (MacArthur & Wilson, 1967) and organizational ecology (Brittain and Freeman, 1980) respectively. These species range from *r*-strategists (opportunists) to *K*-strategists (equilibrium-based) species. Table 2 below summarizes the typologies and configuration theories that have bee proposed in disciplines ranging from economics to sociology.

Level	Typology (Disciplinary Basis)	Туре 1	Type 2	Source	
Micro	Organizational Structure (Structural Contingency Theory)	Mechanistic	Organic	Burns & Stalker (1961)	
	Organizational Structure (Structural Contingency Theory)	Differentiation	Integration	Lawrence & Lorsch (1967)	
	"Strategic Types" (Organizational Theory)	Prospector	Defender	Miles & Snow (1978)	
	Organizational "Forms" (Organizational Ecology)	r-strategist	K-strategist	Brittain & Freeman (1980)	
	Organizational Learning (Organizational Theory)	Exploitation	Exploration	March (1991)	
	"Generic Strategies" (Economics)	Differentiation	Cost Leadership	Porter (1980)	
	"Mixed Duopoly" (Economics)	Profit Maximizer	Labor Managed	Lambertini & Rossini, (1998)

	Inter-organizational "Architecture" (Complex Systems Theory)	Modular	Integral	Piepenbrock (2009)	
Macro	Varieties of Capitalism (Political Economy)	Liberal Market Economy	Coordinated Market Economy	Hall & Soskice (2001)	

Enterprise Architecture as *Organizational Set.* An enterprise architecture is defined as the *form* of the organizational set.²¹ An organizational set is a network comprising the firm and its key stakeholders. More specifically, the firm is seen to be the focal actor located at the center of a network of dyadic ties connecting the stakeholders to the firm. The extent of this network or enterprise is defined as including those stakeholders whose interactions with the firm significantly affect its performance (on a cost-benefit basis) over the time horizon of interest to the goals of the firm.

Before we can define an architectural typology of enterprises, we must first define the key modules or stakeholders of the organizational set, that is, we must first perform a functional decomposition or the enterprise. Each module is chosen for its relatively high internal interdependence and its relatively high external independence. For analytical simplicity, we decompose the enterprise along three dimensions or axes, with a pair of stakeholders associated with each axis: 1) the "value chain" of classical strategic management (Porter, 1985), which comprises customers and suppliers and captures classical demand and supply relationships; 2) the "factors of production" of classical economics which comprises providers of capital and labor²²; and 3) the competitive axis, i.e. those stakeholders which enable and constrain competition, (e.g. government and competitors). The primary modules of a generic enterprise architecture are summarized in Figure 6 below.²³

Figure 6: Constituent Modules (Stakeholders) in a Generic Enterprise Architecture

²¹ The architectural form of the organizational set (or morphology in organisms) represents an organization's "genotype", which may be common to both challenger (predators) and incumbent (prey). For example, the genotype of entrepreneurial radical innovators is an integral enterprise architecture – whether incumbent or late-entrant. A genotype's function and development within a specific environment, defines a richer concept of a "phenotype" or species, which is captured in the *ecology-morphology-physiology* framework.

²² Note, while stakeholders in the "value chain" axis tend to represent "firms", stakeholders in the "the factors of production" axis tend to represent investment and labor "institutions."

²³ Note, for parsimony, the remainder of this paper focuses primarily on the first two dimensions of the enterprise, namely on customers, suppliers, investors and employees. For a fuller discussion of the broader organizational set, please refer to Piepenbrock (2009).

Construct Definitions & Measures. As Nohria and Gulati (1994) point out, no single unified perspective on organizations is shared between most major open systems schools of thought. For example, while contingency theorists, organizational ecologists and institutional theorists focus broadly on determinants of organizational *form*, resource dependence and transaction cost theorists focus on determinants of organizational *boundaries*, while resource dependence and network theorists focus on determinants of inter-organizational *relationships*.

The primary construct presented herein attempts to synthesize these theories, by proposing an integrated construct set which combines organizational *form, boundaries* and *relationships* in the notion of an interorganizational or enterprise architecture.²⁴ These enterprise architectures are hypothesized to lie on a theoretical continuum ranging from *modular* to *integral* forms. These two extremes represent ideal types of architectures or archetypes, which can be defined in terms of three interrelated sets of properties: *objective functions*, enterprise *boundaries* and stakeholder *interfaces*.²⁵ Each will be briefly defined below.

Objective Functions: The objective function of the focal firm – within the classic corporate governance framework (Shleifer and Vishny, 1997) is defined by the way it appropriates residual profits to its enterprise, which ranges from maximization of *shareholder value* for the focal firm to maximization of *stakeholder surplus*. The former tends toward zero-sum *inter*-stakeholder competition, while the latter tends toward positive-sum *inter*-stakeholder cooperation. Intermediate objective functions are a weighted average of stakeholder claims.

Enterprise Boundaries. The objective function defines the spatio-temporal boundaries of the enterprise to be managed. "Spatial" refers to stakeholder space (not physical or geographic space), and "temporal" refers to the time horizon to which the enterprise is managed. For the shareholder value maximizer, the enterprise boundaries tend to be more *narrowly* defined both spatially around the firm, and temporally towards the short-term. For the stakeholder surplus maximizer, the enterprise boundaries tend to be more *narrowly* defined enterprise boundaries tend to be more *narrowly* defined both spatially around the firm, and temporally towards the short-term. For the stakeholder surplus maximizer, the enterprise boundaries tend to be more *broadly* defined both spatially around the entire extended enterprise, and temporally towards the long-term.²⁶

Stakeholder Interfaces. The firm-stakeholder interfaces define the degree of complexity or functional in(ter)dependence. High functional independence is associated with narrow spatio-temporal boundaries, while high functional interdependence is associated with broad spatio-temporal boundaries. Interfaces can be divided into dimensions of quantity and quality of stakeholder relationships.²⁷ The quantity defines the number of providers within a stakeholder class and the quality defines the type of firm-stakeholder relationships, ranging from arm's-length, contract-based, market transactions to trust-based, relational coordination. The former tends toward zero-sum intra-stakeholder competition, while the latter tends toward positive-sum intra-stakeholder cooperation.

²⁴ This new construct redirects emphasis from *formal* aspects of the organization towards more *informal* aspects. Schilling and Steensma (2001) employ different empirical measures for modular organizations.

²⁵ In organizational ecology, a similar definition of a "species" or "organizational form" consists of: *goals*, *boundaries* and *activities* (Aldrich, 1979, pg. 28.)

²⁶ The *spatial* and *temporal* dimensions are posited to be non-orthogonal, i.e., the broader the set of stakeholders, the longer the time frame that one must consider.

²⁷ The *quantity* and *quality* dimensions are posited to be non-orthogonal, i.e. with high quantity being coupled with low quality and low quantity being coupled with high quality.

Architectural Typology: *Modular-Integral*. The following three axioms, summarized in Figure 7 below, define the architectures of enterprises in terms of their *objective functions*, enterprise *boundaries* and stakeholder *interfaces*.

The first axiom relates architectural form to function. The form that an enterprise architecture assumes is driven to some extent by its *objective function*, which represents the weighted average of the interests of its constituent stakeholders.

Axiom 1: When modular enterprise architectures are observed empirically, the focal firm's objective function will tend toward singluar maximization of shareholder value. Conversely when integral enterprise architectures are observed empirically, the focal firm's objective function will tend toward pluralistic maximization of stakeholder surplus.

The second axiom relates architectural form to spatio-temporal boundaries. The form that an enterprise architecture assumes is driven to some extent by the boundaries within which the leader(s) of the focal firm manage(s) toward.

Axiom 2: When modular enterprise architectures are observed empirically, the spatiotemporal boundaries of the focal firm will be relatively narrow and coincident with the boundaries of the firm and the time expectations of its shareholders. Conversely when integral enterprise architectures are observed empirically, the spatio-temporal boundaries of the focal firm will be relatively broad and beyond the boundaries of the firm and its shareholders.

The third axiom relates architectural form to the level of complexity of the stakeholder interfaces with the focal firm. The form that an enterprise architecture assumes is driven to some extent by the quantity and quality of stakeholder relationships with the focal firm.

Axiom 3: When modular enterprise architectures are observed empirically, the focal firm will tend to have a higher quantity of lower quality (i.e. contract-based) interactions within each stakeholder group. Conversely when integral enterprise architectures are observed empirically, the focal firm will tend to have a lower quantity of higher quality (i.e. relationship-based) interactions within each stakeholder group.

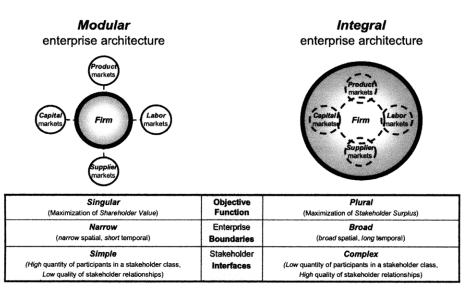

Figure 7: Typology of Enterprise Architectures

Empirical Data. The following representative qualitative data summarized in Table 3 below begins to support the above axioms of modular and integral enterprise architectural forms.

Industry	Firm	Quotation (Source)			
Large	Boeing	"[Union President] Blondin recalls asking: 'I just don't understand why you always			
Com-	(Modular)	fight us.' Blondin says [Boeing HR VP] Calhoun replied: 'You just don't get it. V			
mercial		represent Corporate America. You represent labor. We are always going to b			
Air-		adversaries."" (Source: BusinessWeek, 26 Sept. 2005).			
planes	Airbus	"I am always a bit surprised by the speed with which Americans take decisions: that in			
	(Integral)	three days (after 9-11) they announce 25,000 lay-offs at Boeing seems to me to			
		stupefying," (Source: Noel Forgeard, CEO, Airbus; AFX, 21 Sept. 2001).			
Auto-	General	"When the Japanese producers encounter these gigantic market waves, they will quickly			
mobiles	Motors	become as mediocre as we are. They will have to start hiring and firing workers			
	(Modular)	along with suppliers and will end up as mass-producers in short order." (Source: GM			
		Executive; Womack, Jones & Roos, 1990).			
	Toyota	"Under Japanese company law, shareholders are the owners of the corporation. But if			
	Motors	corporations are run exclusively in the interests of shareholders, the business will be			
	(Integral)	driven to pursue short-term profit at the expense of employment and spending on			
		research and development. To be sustainable, corporations must nurture			
		relationships with stakeholders such as suppliers, employees and the local			
		community. So whatever the legal position, the corporation does not belong to its			
		owners. It's not enough to serve shareholders." (Source: Mr. Okuda, Chairman,			
		Toyota Motor Corporation; Financial Times, 1 Aug. 2001).			
		"Toyota's business philosophy is to realize stable, long-term growth by working hard			
		to strike a balance between the requirements of people and society, the global			
		environment and the world economy. Our goal is to grow with all our stakeholders,			
		including customers, shareholders, employees and business partners." (Source: Toyota			
		Motors Corporation Annual Report, 2003).

Table 3: Sample Qualitative Data Indicating Architectural Forms

1. Managerial Variation: Architecture-Function Relationship

Construct Definitions & Measures

Having defined a typology of enterprise architectures, the next step is to describe how these constructs function and interact over time in a competitive environment. Two primary variables are used which consider competition in terms of both *quality* or "what to offer?" and *quantity* or "how to offer it"? Porter (1980) frames this *quality* decision as a strategic position choice, which is broadly either *differentiation* or *cost-leadership*. Forrester (1961) frames this *quantity* decision as an operational stability choice, which is broadly either *unstable* or *stable* growth.

While organizational scholars have posited relationships between organizational form and competitive variables, for example that *intra*-organizational structure follows strategy (Chandler, 1962; Miles and Snow, 1978; Arthur, 1992; Delery and Doty, 1996), little research has shown which *inter*-organizational form delivers these strategic and operational choices the most effectively. Neither do they explain the conditions under which the converse is true, namely, when strategy follows structure.

Similarly, while organizational scholars have posited a tradeoff between the activities of exploration and exploitation (March, 1991), few have specified the *inter*-organizational forms that best deliver each activity.

Enterprise architectures can enable and constrain choice in competitive variables. The following two propositions serve to define the relationship between enterprise architectures and choices in strategic and operational variables.²⁸

Proposition 1a: *Quantity* of Firm Growth. The first proposition relates enterprise architecture to *quantity*-type variables or operational stability choices. The choices that leaders of focal firms make are driven to some extent by their enterprise architecture.

Operations management scholars have advanced the construct of "stability" in the context of growth strategies (Forrester, 1961). Growth can be characterized either as *unstable* exponential growth which emphasizes reinforcing feedback, while de-emphasizing system carrying capacities or limits to growth²⁹; or conversely as *stable* goal-seeking growth which emphasizes balancing feedback and emphasizing system carrying capacities and limits to growth.³⁰

Proposition 1a: When modular enterprise architectures are observed empirically, the focal firm's operational strategy will tend toward unstable growth; it will have relatively high short-term speed, but relatively low long-term speed. Conversely when integral enterprise architectures are observed empirically, the focal firm's operational strategy will tend toward stable growth; it will have relatively low short-term speed, but relatively high long-term speed.

²⁸ For a discussion of how strategic and operational variables interact, see Piepenbrock (2009).

²⁹ The presence of delays in balancing shorter-term demand with supply causes "boom and bust" oscillation, often associated with unstable growth.

³⁰ Recent research (Piepenbrock, 2004) has theorized that enterprise stability is an "enabling constraint" that allows a slow enterprise to grow the capabilities to move quickly. Ironically, limiting the maximum short-term rate of growth, can maximize the long-term rate of growth.

As shown in Figure 8 below, the time histories of input variables (like number of employees or amount of R&D spend) and output variables (like number of units produced) reveal very different dynamic behaviors. Note that the rate of change of the inputs or outputs (i.e. the slope of the time histories) determines the "speed" of growth.

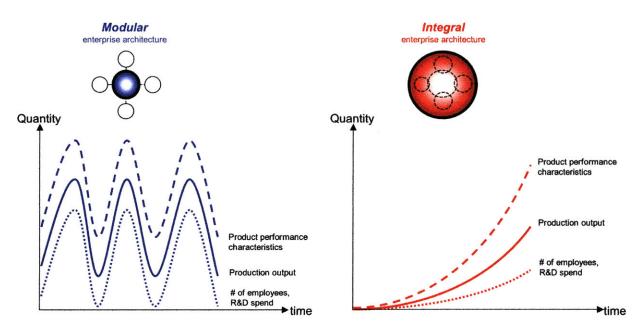

Figure 8: Comparison of Unstable vs. Stable Growth

For *short* time horizons, the absolute value of the rate of change of output of the modular enterprises tends to always exceed the rate of change of output of integral enterprises. Mathematically, this can be expressed as:

$$|dQ_m/dt| > |dQ_i/dt|$$
 (for small dt)

For *longer* time horizons, the absolute value of the rate of change of output of the integral enterprises tends to always exceed the rate of change of output of long enterprises. Mathematically, this can be expressed as:

$$|dQ_m/dt| < |dQ_i/dt|$$
 (for large dt)

In addition, it appears that rate of change of output of integral enterprises tends to not go negative. In other words, integral enterprises are designed to grow at such a rate that they will not have to significantly shrink output. Mathematically, this can be expressed as:

$$dQ_i/dt < 0$$

Qualitative Empirical Data. Before presenting select quantitative date, we begin by reviewing select qualitative data as summarized in Table 4 below.

Industry	Focal Firm (Architecture)	Quotation (Source)		
Large Com- mercial Airplanes	Boeing (Modular)	"Boeing quickly moved last week to cut commercial transport delivery estimates through 2002 in an announcement that surprised even some veteran Boeing-watchers by its swiftness and scope. At a hastily arranged news conference Sept. 18, one week after the terrorist attacks in the U.S., the company said it could also lay off up to nearly one-third of its commercial aircraft workforce. Alan R. Mulally, Boeing president and CEO of Boeing Commercial Airplanes, said the layoffs would begin during the last quarter of this year. 'When you order airplanes today, depending on the model, the lead time is anywhere from 10-14 months, so we need to make these decisions for production next year as soon as possible.'" (Source: Alan Mulally, President & CEO, Boeing Commercial Airplanes; Aviation Week, 24 Sept. 2001). "History tells us that the quicker a company acts to counter adverse economic conditions, the better able it will be to work its way through a downturn and emerge stronger when the economy recovers." (Source: Jim McNerney, Chairman, President & CEO, The Boeing Company; memo to employees, 17 Feb. 2009).		
	Airbus (Integral)	"Airbus has continually increased its market share. This performance highlights Airbus's ability to meet sustained growth targets by steadily increasing production output." (Source: EADS Annual Report 2000). "We've always been much more careful about production rates. We do see peaks and troughs but we've always managed to limit the highs and lows better than they do in the USA." (Source: Philippe Camus, EADS Co-Chairman; ATI, 20 Sept. 2001).		
Auto- mobiles	General Motors (Modular)	"When the Japanese producers encounter these gigantic market waves, they will quickly become as mediocre as we are. They will have to start hiring and firing workers along with suppliers and will end us as mass-producers in short order." (Source: <i>GM</i> Executive; Womack, Jones & Roos, 1990).		
	Toyota Motors (Integral)	"In a high-growth period, productivity can be raised by anyone. But how many can attain it during the more difficult circumstances induced by low-growth rate? This is the deciding factor in the success or failure of an enterprise." (Source: Taiichi Ohno, <i>Toyota Motors Company</i> Executive Vice President; Ohno, T. 1978, pg 114). "The Toyota Production System can be realized only when all the workers become tortoises. Speed is meaningless without continuity. Just remember the tortoise and the hare." (Source: Taiichi Ohno, <i>Toyota Motor Company</i> Executive Vice President; Ohno, T. 1978, pg. 63).		
U.S. Airlines	United Airlines (Modular)	"I don't' want to take advantage of the situation, but we have to do what is right for the company and events of September 11 have opened certain doors for the company that were pretty much closed before." (Source: Rakesh Gangwal, US Airways President; Hoffer-Gittell, 2003).		
	Southwest Airlines (Integral)	"The 'experts' always think we need to expand at a more rapid pace . What these so-called experts express is their desire for <i>Southwest</i> to jump at opportunities at a more rapid clip . Apparently growth excites investors. [But] nobody is pushing us. That could never happen." (Source: Matt Hafner, Director, <i>Southwest Airlines;</i> Jody Hoffer Gittell, (2003), pg. 246).		

Table 4: Sample Qualitative Data Supporting Proposition 1a

Quantitative Empirical Data. Proposition 1a describes the rates of growth and associated enterprise stability in enterprise architectures within an ecosystem. One would expect *Boeing's* more modular enterprise architecture to grow at higher short-term rates, while lower long-term rates (i.e. with less stability). Conversely, one would expect *Airbus'* more integral enterprise architecture to grow at lower short-term rates, while higher long-term rates (i.e. with greater stability). Figure 9 summarizes the output quantities for the competing focal firms in the primary sample, after the emergence of the dominant product design.

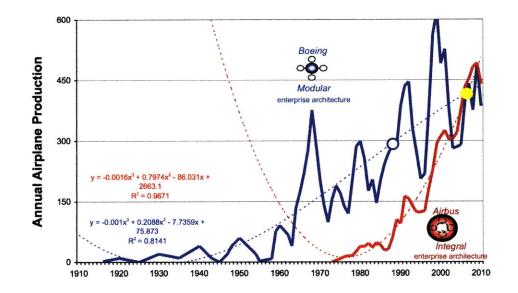

Figure 9: Quantity Growth of Competing Enterprise Architectures in the Airplane Industry

Qualitatively, after nearly 100 years of dominance, the market share-leading incumbent, Boeing is eventually overtaken by the late-entrant challenger, Airbus. Note that the late-entrant exhibits smoother growth (i.e. slow short-term growth, with fast long-term growth). Three observations can be made regarding quantity outputs: 1) during an upturn, the rate of change of output growth of a modular enterprise architecture generally exceeds that of an integral enterprise architecture; 2) during a downturn, the rate of change of output decline of a modular enterprise architecture generally exceeds that of an integral enterprise architecture; and 3) negative growth of an integral enterprise architecture is rare. These three observations combine to state that the long-term growth rates of integral enterprise architectures exceed those of modular enterprise architecture. Finally, note that the late-entrant appears to experience a prolonged incubation period of relatively low production, while capabilities are presumably built. This behavior might imply the need for patient capital.

Quantitatively, over the long-term since *Airbus* began production in 1974, its output CAGR is 12.5%, which is approximately seven times *Boeing's* output CAGR of only 1.8% over the same time period. A simple least squares fit regression analysis³¹ using logistic, third order cubic polynomial trend lines, demonstrates both *Airbus'* higher long-term growth rate, as well as continued exponential growth. *Boeing* on the other hand has a lower long-term growth rate, and has begun to inflect towards downward concavity (i.e. industry exit).

³¹ Note that for simplicity, the regression analyses shown use Ordinary Least Squares method. However, as the longitudinal time-series data are not independent, but autocorrelated, they require more advanced regression methods like Auto Regressive Moving Average (ARMA) models.

As illustrated in Figure 10 below, similar trajectories can be seen in the automotive industry.

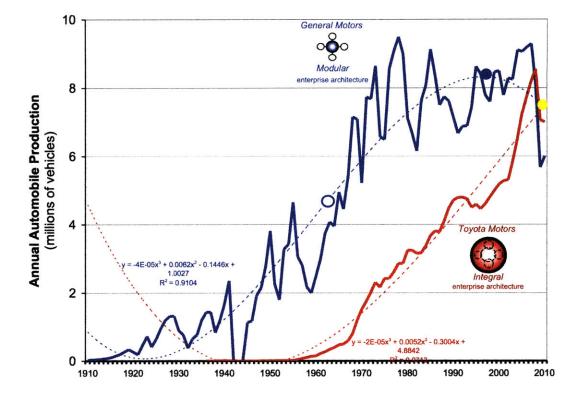

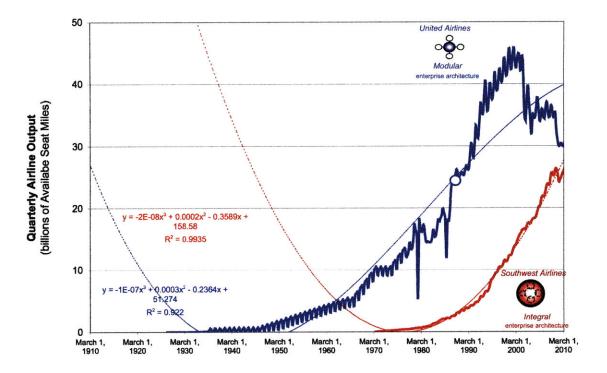

Figure 10: Quantity Growth of Competing Enterprise Architectures in the Automotive Industry

Qualitatively, after nearly 100 years of dominance, the market share-leading incumbent, General Motors is eventually overtaken by the late-entrant challenger, Toyota Motors. Note that the late-entrant exhibits smoother growth (i.e. slow short-term growth, with fast long-term growth). Note also that while GM's output is beginning to resemble an S-curve, with the inflection point occurring in the mid-1960s, Toyota's output is best described as exponential growth, with an inflection point not yet attained. Finally, again note that the late-entrant appears to experience a prolonged incubation period of relatively low production, while capabilities are presumably built. This behavior might imply the need for patient capital.

Quantitatively, over the long-term since Toyota began production in 1937, its output CAGR is 11.8%, which is approximately five times GM's output CAGR of only 2.6% over the same time period. A simple least squares fit regression analysis using logistic, third order cubic polynomial trend lines, demonstrates both Toyota's higher long-term growth rate, as well as continued exponential growth. GM on the other hand has a lower long-term growth rate, and has begun to inflect towards downward concavity (i.e. industry exit). Note also that the polynomials cross – i.e. competitive dominance switches – after the incumbent species has peaked in output growth rates, while before the challenger species has inflected.

As illustrated in Figure 11 below, similar trajectories can be seen in the airline industry.

Figure 11: Quantity Growth of Competing Enterprise Architectures in the US Airline Industry

Qualitatively, after nearly 100 years of dominance, the market share-leading incumbent, United Airlines is being overtaken by the late-entrant challenger, Southwest Airlines. Note that the late-entrant exhibits smoother growth (i.e. slow short-term growth, with fast long-term growth). The integral enterprise architecture's relative stability is evidenced by an absence of downward labor strikes, upward acquisitions and its ability general to dampen significant exogenous events like 9-11 terrorist attacks on the US, as well as the "noise" of minor seasonal fluctuation. Finally, again note that the late-entrant appears to experience a prolonged incubation period of relatively low production, while capabilities are presumably built. This behavior might imply the need for patient capital.

Quantitatively, over the long-term since Southwest Airlines began operation in 1970, its output CAGR is 20%, which is approximately six times United Airline's output CAGR of only 3% over the same time period. A simple least squares fit regression analysis using logistic, third order cubic polynomial trend lines, demonstrates both Southwest's higher long-term growth rate, as well as continued exponential growth. United on the other hand has a lower long-term growth rate, and has begun to inflect towards downward concavity (i.e. industry exit).

Table 5 below summarizes the empirical data supporting proposition 1a which captures the relationship between enterprise architectures and their function in *quantity* space.

Industry	Focal Firm	Enterprise Architecture	Quantity Growth During Intra-Species Competition	Quantity Growth During Inter-Species Competition
Large Commercial Airplanes	Boeing	Modular	1916-1970 CAGR = 2%	1970-2010 CAGR = 3%
	Airbus	Integral		1970-2010 CAGR = 13%
Auto- mobiles	General Motors	Modular	1908-1937 CAGR = 15 %	1937-2010 CAGR = 3 %
	Toyota Motors	Integral		1937-2010 CAGR = 12%
Airlines	United Airlines	Modular	1926-1970 CAGR = 23 %	1970-2010 CAGR = 3%
	Southwest Airlines	Integral		1970-2010 CAGR = 20%

Table 5: Summary of Data Supporting Proposition 1a

The question of how profitable this growth is will be covered in the next proposition set.

Proposition 1b: *Quality* of Firm Growth. Strategic management scholars have advanced the construct of an "efficiency frontier" in the strategic positioning space (Porter, 1996), which is defined by the orthogonal axes of differentiation and cost-leadership, or as specialist and generalists in ecological niche theory (Brittain & Freeman, 1980). As shown in Figure 12 below, a tradeoff between the two strategic positioning choices is posited to exist. *Efficiency* is defined as the distance of the firm from the frontier. Conversely, *effectiveness* is defined as the distance of the frontier from the origin. As the enterprise architecture enables and constrains performance, it defines the effectiveness potential of the enterprise (Pfeffer and Salancik, 1978). The shape of this efficiency frontier, while conceptually symmetrical at the industry level, is not symmetrical at a firm level. Firms that choose to focus on one strategy, develop capabilities and inertia around that choice, which makes switching to another strategy, while possible, lower in potential performance than a firm which chose to focus on it.

The second proposition relates enterprise architecture to *quality*-type variables or strategic positioning choices. The choices that leaders of focal firms make are driven to some extent by their enterprise architecture. When firms want to *explore* (March, 1991) or innovate radically in either products for differentiation or processes for cost-leadership, they will emphasize integration (Lawrence and Lorsch, 1967). Conversely, when firms want to *exploit* or innovate incrementally³² in either products for differentiation or processes for cost-leadership, they will emphasize modularity³³ as shown in Figure 12 below.

Proposition 1b: When integral enterprise architectures are observed empirically, the focal firm will be engaged in exploration (or radical innovation in either products or processes) of niche markets. Conversely, when modular enterprise architectures are observed empirically, the focal firm will be engaged in exploitation of mass markets.

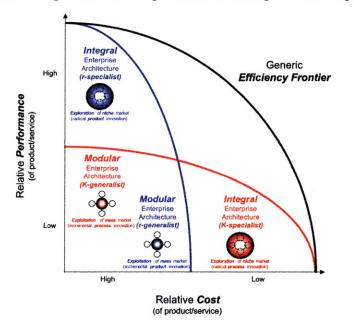

Figure 12: Exploration and Exploitation in Strategic Position Space

³² Often modular enterprise architectures will continue (unsuccessfully) to achieve radical product innovation.

³³ When the theory of modularity is applied to physical products (Ulrich, 1995) or even supply chains (Fine, 1998), the opposite conclusion is reached: namely that modularity leads to lower cost. This conclusion appears not to consider dynamic capabilities (Teece, Pisano and Shuen, 1997).

Qualitative Empirical Data. Before presenting select quantitative date, we begin by reviewing select qualitative data as summarized in Table 6 below.

Industry	Focal Firm	Quotation	
and the second	(Architecture)	(Source)	
Large Com- mercial Airplanes	Boeing (Modular)	"In 1966 The Boeing Company will observe its fiftieth anniversary. It is difficult to conceive any other half century in man's history more stimulating, challenging and more rewarding. In those fifty years man's scientific and technological progress has surpassed the total of such advancement in all previous history, and Boeing is proud to have played a leading role in that fantastic acceleration. There is a moment now for a rededication to the next fifty years, and the next, and the next" (Source: The Boeing Company, Annual Report, 1965). "Our products bring better value to our customers, and our pricing reflects that value. We also have a responsibility to our shareholders, and that means pricing that allows us to make our financial goals. Do I think that we will ever be the lower-price option? No. Do I think that should keep us from gaining more than 50 percent market share? I answer "no" to that as well. (Source: Scott Carson, Vice President of Sales, Boeing Commercial Airplanes, Boeing Frontiers, April 2005). "Fundamental, game-changing innovation like that we're pursuing on the 787 usually has a 'bleeding-edge' quality to it – meaning it goes beyond 'leading edge' into a realm where both the risks and the potential returns are high." "We're on the bleeding edge of taking a big, big step that was just a quarter step too far." (Sources: Jim McNerney, Chairman & CEO, The Boeing Company; BusinessWeek, 23 April 2008; The Chicago Tribune, 22 May 2008).	
	Airbus (Integral)	"When we set up 30 years ago, <i>Airbus</i> ' goal was to pool European capabilities and technological resources to build an aircraft that would reliably and cost- effectively carry passengers in true wide-body comfort. The name <i>Airbus</i> is synonymous with lower operating costs for airlines. <i>Airbus</i> has continually increased its market share. Why? Operational efficiency is the first and last word in analyzing <i>Airbus's</i> unique market success." (Source: <i>EADS</i> Annual Report 2000).	
Auto- mobiles	General Motors (Modular)	"Here's what's new about GM's strategy this year: Nothing." "GM brought brand differentiation to the world in the 1920s. As the decades passed, and our product portfolio expanded, we slowly drifted away from that simple but effective strategy. Today the GM product revolution again is strengthening our brands." (Source: General Motors Annual Report, 2003, pp. 3 and 8).	
	Toyota Motors (Integral)	"Cost Reduction is the Goal: At <i>Toyota</i> , as in all manufacturing industries, profit can be obtained only by reducing costs. Cost reduction must be the goal of consumer products manufacturers trying to survive in today's marketplace." (Source: Taiichi Ohno 1978).	
U.S. Airlines	United Airlines (Modular)	"We have chosen to close our discount subsidiary, <i>Ted</i> in order to focus on our strengths in serving our premium customers – the historic source of our competitive advantage."	
	Southwest Airlines (Integral)	"Southwest's business model, like that of Toyota, is to provide a low-cost product by utilizing its resources efficiently, while providing record levels of reliable service." (Source: Jody Hoffer Gittell, 2003 pp. 3-4.)	

Table 6: Sample Qualitative Data Supporting Proposition 1b

Quantitative Empirical Data. Proposition 1b describes the strategic position taken by enterprise architectures within an ecosystem. One would expect *Boeing's* more modular enterprise architecture (as well as that of its dominant competitive predecessor) to compete via a *differentiated* product strategy that stresses product capabilities based on product innovation. Conversely, one would expect *Airbus'* more integral enterprise architecture to compete via a *cost-leadership* product strategy based on process innovation.

Figure 13, Figure 14 and Figure 15 below summarizes the quality of output for the firms in the airplane, automotive and airlines industries respectively.

Figure 13: Quality Space of Competing Enterprise Architectures in Airplane Industry

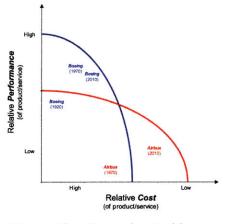

Figure 14: Quality Space of Competing Enterprise Architectures in Automotive Industry

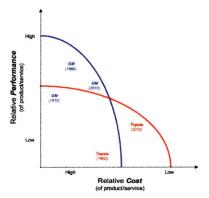

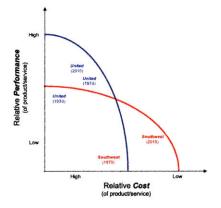

Figure 15: Quality Space of Competing Enterprise Architectures in Airline Industry

2. Competitive Selection: Function-Performance Relationship

Construct Definitions & Measures

The dependent variable used in this research – which is typical for most research in strategic management – is long-term firm performance, defined specifically as *economic* or *financial* performance. As such, there are a vast number of measures and metrics upon which to base the research (McGrahan and Porter, 1997). This is made even more complicated given the fact that the spectrum of enterprise architectures represents a range of performance objective functions, making a direct comparison of performance difficult.

In order to reconcile this dilemma, the common performance metric that will be used for all enterprise architectures will be maximization of shareholder value as represented by market capitalization. Although this is the explicit goal of the *shareholder*-based enterprise architecture, and only an indirect and implicit goal of the *stakeholder*-based enterprise architecture, it allows crucial comparison of zero-sum vs. positive-sum outcomes, which reveal the conditions under which an integrated approach outperforms a modular approach to enterprise architectures.

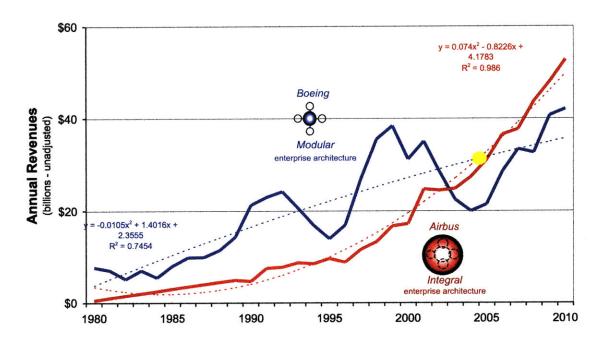

Shareholder value has been demonstrated to be dependent upon both *past* financial performance and *future* growth prospects (Dobbs and Koller, 2005). These sub-variables will be important in understanding the distinction between enterprise architectures and their underlying mechanics. Past performance is reflected on the firm's income statement, and can be decomposed into *top-line* revenues and *bottom-line* net income or profits. Longitudinal time-histories of these two variables can help explain longitudinal trajectories of shareholder value.

Modular enterprise architectures assign a functional decomposition resulting in a clear separation and of ownership (by principals, typically shareholders) and management (their agents). This "efficiency" results in the classic principal-agent problem (Jensen and Meckling, 1976). *Agency Theory* posits that managers are typically interested in maximization of top-line revenues, as their pay and influence is tied to expanding the size of the firm, while investors are typically interested in maximization of bottom-line profits. Integral enterprise architectures on the other hand assign a less clear functional separation of ownership and management, alleviating some of the problems and costs of agency. Resolution of these functional conflicts occurs above at the enterprise architectural level. Researchers have referred to this as *Stewardship Theory* (Donaldson and Davis, 1990).

Proposition 2a: *Quantity* of Firm Performance (Revenues). Enterprise architectures, by enabling and constraining choice in key competitive variables, ultimately lead to firm performance. The following two propositions serve to define the relationship between enterprise architectures and key performance variables of growth in revenues, profits and shareholder value.

The first proposition relates enterprise function to firm performance expressed as long-term quantity growth or revenues.

Proposition 2a: When competing modular and integral enterprise architectures are observed empirically, the focal firm of the modular enterprise architecture will tend to have lower longterm rates of revenue growth, relative to the focal firm of the integral enterprise architecture. **Empirical data.** Proposition 2a describes the rates of growth of revenues in enterprise architectures within an ecosystem. One would expect *Boeing's* more modular enterprise architecture to grow at higher short-term rates, while lower long-term rates (i.e. with less stability). Conversely, one would expect *Airbus'* more integral enterprise architecture to grow at lower short-term rates, while higher long-term rates (i.e. with greater stability). Figure 16 summarizes the revenue quantities for the competing focal firms in the primary sample.

Note that over the long-term since *Airbus*'s founding (1974-2006), *Boeing*'s revenue CAGR (unadjusted for inflation) was only 7.3%, while for *Airbus* it was more than double at 18.6%. While *Boeing* grows its revenues more quickly than *Airbus* during an upturn, it shrinks its revenues much more rapidly than *Airbus* during a downturn, with the net result being that the long-term revenue growth rates of *Airbus* are significantly higher than *Boeing*. The question of whether *Airbus*' higher long-term revenue growth is associated with higher profitability will be considered next.

As illustrated in Figure 17 and Figure 18 below, similar trajectories can be seen in both the automotive and airline industries respectively. Quantitatively, over the long-term (1980-2010), *Toyota's* revenue CAGR is 10%, which is approximately two times *GM's* revenue CAGR of only 4%. Similarly, *Southwest Airlines'* revenue CAGR is 14%, which is nearly three times *United Airlines'* revenue CAGR of only 5%.

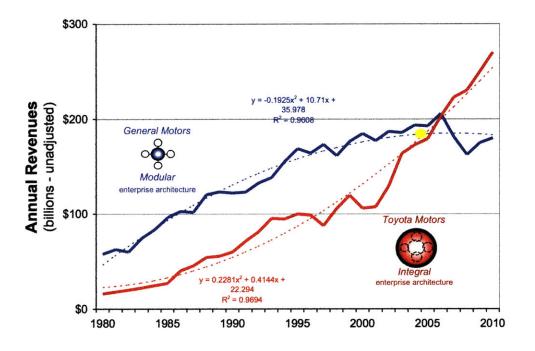

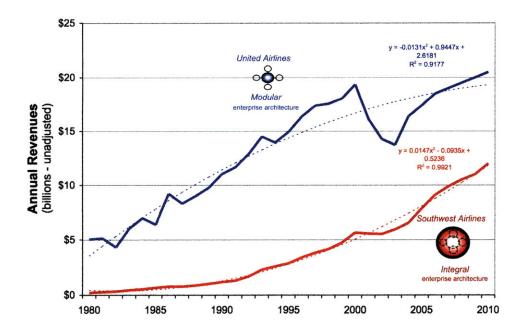

Figure 17: Quantity (Revenue) Growth in the Automotive Industry

Figure 18: Quantity (Revenue) Growth in the US Airline Industry

Proposition 2b: *Quality* of Firm Performance (Profitability). The second proposition relates enterprise function to firm performance expressed as long-term *quality* growth or *profits*.

Proposition 2b: When competing modular and integral enterprise architectures are observed empirically, the focal firm of the modular enterprise architecture will tend to have lower longterm rates of profit growth, relative to the focal firm of the integral enterprise architecture.

Empirical Data. While the firm may be growing in terms of quantity of revenues, this does not speak about the quality of growth or the efficiency of converting such growth into residual cash flows or profits. Proposition 2b describes the rates of growth of profitability in enterprise architectures within an ecosystem. One would expect *Boeing's* more modular enterprise architecture to grow at higher short-term rates, while lower long-term rates (i.e. with less stability). Conversely, one would expect *Airbus'* more integral enterprise architecture to grow at lower short-term rates, while higher long-term rates (i.e. with greater stability). Figure 19 summarizes the profitability quantities for the competing focal firms in the primary sample, over periods for which data is publicly available.

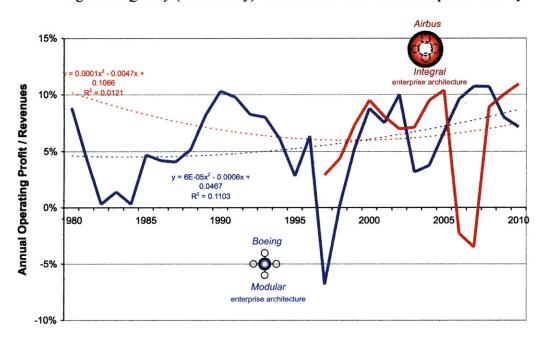

Figure 19: *Quality* (Profitability) Growth in the *Commercial Airplane* Industry

Qualitatively, while *Boeing* grows its profitability more quickly than *Airbus* during an upturn, it shrinks its profitability much more rapidly than *Airbus* during a downturn, with the net result being that the long-term profitability growth rates of *Airbus* are significantly higher than *Boeing*. There is some evidence to support the proposition that high long-term revenue growth rates can be coupled with high long-term profitability rates by integral enterprise architectures.

Quantitatively, as both data sets show large variation, resulting in low R^2 values, only the most basic descriptive statistic is reliable. Over the period for which comparative data exists (1997-2008), both *Boeing* and *Airbus* have averaged 6% annual operating profits. This amount is in line with *Boeing's* longer term (1980-2008) average of 6%.

As illustrated in Figure 20 and Figure 21 below, similar trajectories can be seen in both the automotive and airline industries respectively. Quantitatively, over the long-term (1980-2010), *Toyota's* average profitability is 5% and increasing, while *GM's* average profitability is only -1% and decreasing. Similarly, *Southwest Airlines'* average profitability is 7% and stabilizing, while *United Airlines'* average profitability is only -1% and decreasing.

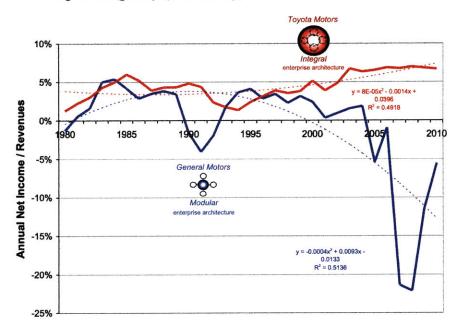

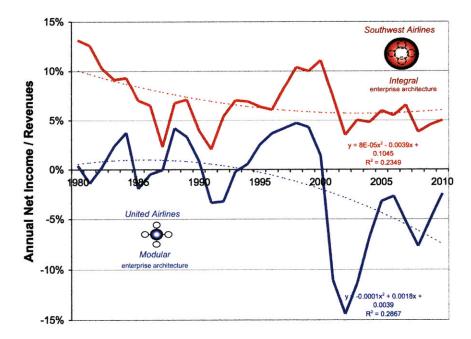

Figure 20: Quality (Profitability) Growth in the Automotive Industry

Figure 21: Quality (Profitability) Growth in the US Airline Industry

3. Competitive Retention: Performance-Environment Relationship

Construct Definitions & Measures

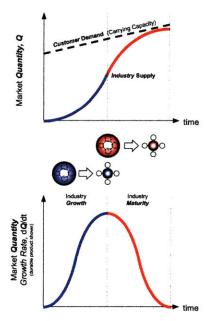

Both strategy (Porter, 1980, pg. 164) and organization (Lawrence and Lorsch, 1967, pg. 19) researchers have long recognized the importance rates of environmental change on competition and organizational forms. As far back as 1838, Cournot postulated a profit-maximizing firm which was subject to the constraints of *demand* and *technology*. This framework similarly distinguishes between two types of industrial evolution: *quantity* and *quality*, each possessing its own growth trajectories, which can be expressed stylistically as life cycle or S-curves. Just as the Architecture-Function relationship distinguished between quantity and quality at the firm level, the same distinction is made at the ecosystem level.

Proposition 3a: *Quantity* of Environmental Growth. The first proposition relates firm performance to environmental maturity in *quantity* terms, as summarized in Figure 22 below.³⁴

Quantity space refers to the *amount* of products and services supplied and demanded in an ecosystem, which is influenced by such variables as population size, GDP growth, etc. This characterization of the environment is well-known in marketing research and has been modeled using Bass diffusion processes (Bass, 1969).

Proposition 3a: When considering the industry's rates of growth in customer demand, emerging industries, i.e. those that exhibit slow but increasing rates of quantity growth tend to be built by / reward integral enterprise architectures, which specialize in slow (equilibrium) behavior. Transitioning industries, i.e. those that exhibit high rates of quantity growth tend to be built by / reward modular enterprise architectures, which specialize in fast (opportunistic) behavior. Maturing industries, i.e. those that exhibit fast but decreasing rates of quantity growth tend to be built by / reward integral enterprise architectures, which specialize in slow (equilibrium) behavior.

Figure 22: Co-Evolution of Firm Performance and Environment (Quantity)

³⁴ This "quantity" formulation captures organizational ecologists' construct of "mass dependence" (Barron, 1999).

Empirical data. The carrying capacity of the ecosystem in *quantity* space can be defined by the underlying availability of critical environmental resources from any of the stakeholders in the organizational set. The data presented below³⁵ takes customer demand as the key ecosystem variable, which for the primary sample is the underlying market growth in the global airline industry. As can be seen in Figure 23 below, the exponential growth trajectory appears to be following the logistic S-curve.

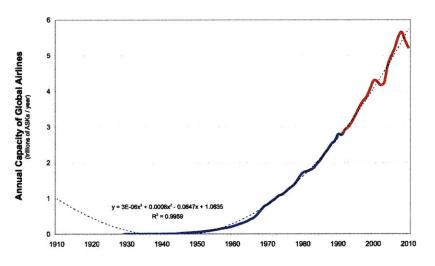

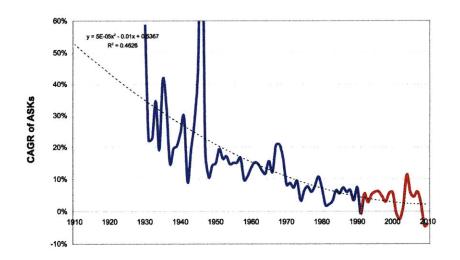

Figure 23: Market Carrying Capacity of the Global Airline Industry

The critical question rate of change of this growth will reveal whether or not the market is beginning to saturate, creating the environmental conditions for re-integration of the dominant enterprise architecture. In order to determine if this ecosystem growth is speeding up or slowing down, Figure 24 below shows the compound annual growth rate (CAGR). While the industry is growing, the annual rate of change of this growth has been diminishing over time - signaling a "maturing" market – and is asymptotically approaching the CAGR of global GDP.

Figure 24: CAGR of Market Carrying Capacity of the Global Airline Industry

³⁵ Data source: Air Transport Association (ATA). Excludes data from the USSR prior to 1970.

As illustrated in Figure 25 and Figure 26 below, similar trajectories can be seen in both the global automotive³⁶ and US airline³⁷ industries respectively.

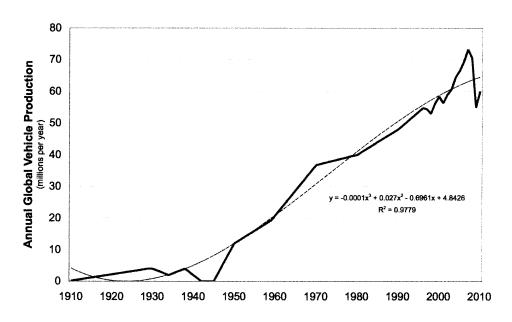

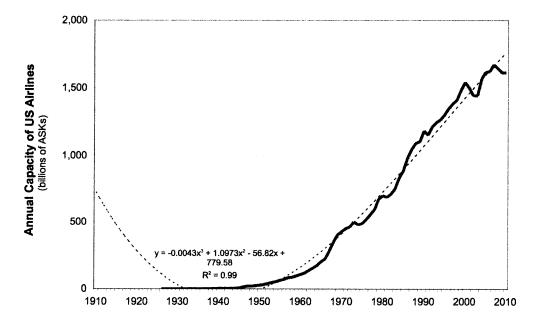

Figure 25: Market Carrying Capacity of the Global Automotive Industry

Figure 26: Market Carrying Capacity of the U.S. Airline Industry

³⁶ Automotive data source:s Organisation Internationale des Constructeurs d'Automobiles (<u>www.oica.net</u>) and Hirooka (2006), pg. 73.

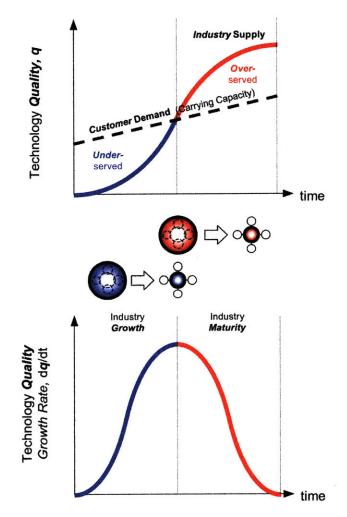

³⁷ Note, the data come from the Air Transport Association (ATA), and includes all US airlines passenger and cargo traffic for both domestic and international operations.

Proposition 3b: *Quality* of Environmental Growth. The second proposition relates firm performance to environmental maturity in *quality* terms and is summarized in Figure 27 below.

Quality space refers to the type of products and services supplied and demanded in an ecosystem, which is influenced by such variables as technological innovation, etc. This characterization of the environment is well-known in technology and innovation research (Christensen and Bower, 1996).

Proposition 3b: When considering the industry's rates of growth in technological innovation, emerging industries, i.e. those that exhibit slow but increasing rates of quality growth (i.e. under-served markets) tend to be built by and reward integral enterprise architectures, which specialize in radical product innovation (i.e. exploration). Transitioning industries, i.e. those that exhibit high rates of quality growth tend to be built by and reward modular enterprise architectures, which specialize in incremental product and process innovation (i.e. exploitation). Maturing industries, i.e. those that exhibit fast but decreasing rates of quality growth (i.e. over-served markets) tend to be built by and reward integral enterprise architectures, which specialize in radical process innovation (i.e. exploration).

Empirical Data. The carrying capacity of the ecosystem in *quality* space can be defined by the underlying availability of critical environmental resources from any of the stakeholders in the organizational set. The data presented below takes supplier capability as the key ecosystem variable, which for the primary sample is the underlying growth in technological carrying capacity of the global airline industry as measured by an industry standard of airplane productivity (McMasters and Cummings, 2002). As can be seen in Figure 28 below, the growth trajectory appears to have followed the logistic S-curve, with the inflection point having occurred in the late 1950's with the emergence of the dominant product design of jet aircraft. Prior to this, competition existed in improving product performance, where rates of change in performance were increasing. After the emergence of the dominant design, when the rates of change in product performance began to diminish, competition is hypothesized to move toward other dimensions of cost, quality and delivery. The current state of technological carrying capacity is saturating around the asymptotic physical limits of speed, range, etc.³⁸

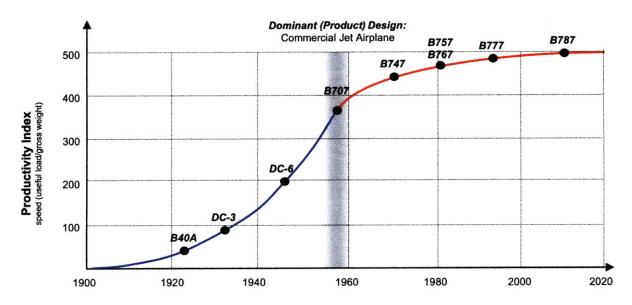

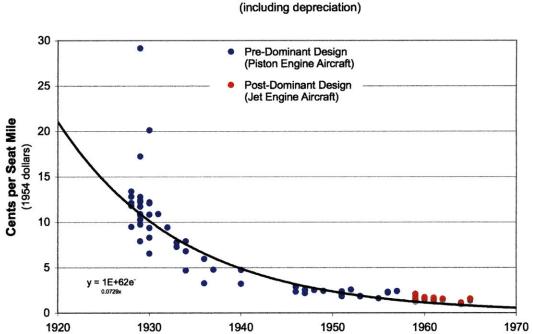

Figure 28: Technological Carrying Capacity of the Global Airplane Industry

In addition to saturation of product performance, the long-term trends in product operating costs have dropped asymptotically toward zero (Philips, 1971), as shown in Figure 29 below.

³⁸ Since the inception of the jet age, maximum speed (in economical mass transport) has been constrained to remain just below the drag divergence Mach number to avoid excessive fuel consumption. In addition, maximum range is confined to approximately half the earth's circumference.

New Airplane Operating Costs (including depreciation)

4. Environmental Variation: Environment-Architecture Relationship

Construct Definitions & Measures

Enterprise architectures, through their competitive interactions, reflexively shape and are crucially shaped by their environment. It is through this interaction between organization and environment, or more precisely between organizational set and organizational field (Scott, 2003), that both co-evolve.

Organizational ecologists (e.g. Hannan and Freeman, 1977) focus on macro-level constructs of organizational founding (entry) rates, failure (exit) rates, and inertial (change) rates. In particular, they observe that while organizational change does in fact occurs it tends to unfold at rates that are lower than change demanded by the environment. This organizational momentum is captured by the construct of structural inertia, which helps explain failure rates and founding rates.

Structural contingency theorists (e.g. Burns and Stalker, 1961; Lawrence and Lorsch, 1967), have long postulated that the environment is an important factor in defining the organizations within it. In particular, they have pointed to rates of change of key environmental factors like technology and customer demand as driving the optimum structure of organizations operating within these environment. For them, however, the environment is considered as a static exogenous variable moderating organizational structure and successful performance.

Technology and innovation theorists (e.g. Abernathy and Utterback, 1978) and affiliated organizational theorists (e.g. Anderson and Tushman, 1990; Henderson and Clark, 1990) have taken steps to advance structural contingency theory by endogenizing technological evolution and its effect on organizational evolution. These researchers posit the existence of "dominant designs" in products, which fundamentally change the nature of competition from pre-dominant design focus on *product* innovation, to the post-dominant design focus on *process* innovation. Later theorists (Suarez and Utterback, 1995; Klepper, 1996) in this vein have posited ecological firm entry/exit relationships to the evolution of industries.

This framework, by co-opting more of the environment (i.e. the organizational set) into the causal explanation of organizational performance can begin to endogenize the dynamics of the evolution of the environment and the enterprises within it. In this sense it is contingency theory at a higher level of analysis than the organization, namely that of the organizational set, or *ecological* contingency theory. In addition, by formalizing "dominant designs" in an architectural framework, one can begin to integrate the organizational and environmental or technological evolution.

Proposition 4a: *Dominant Designs* in Enterprise Architectures. The first proposition relates environmental maturity to required levels of integration in enterprise architectures, which is summarized in Figure 30 below.

Proposition 4a: Dominant designs in enterprise architectures at the ecosystem level tend to oscillate between integral and modular states throughout the lifecycle of the industry.

As the environment initially demands radical product innovation and patience, the dominant enterprise architectures tend to be integral. Subsequently, as the environment demands incremental product innovation, coupled with impatience, the dominant enterprise architectures tend to be modular. Then, as the environment demands radical process innovation and patience, the dominant enterprise architectures again tend to be integral. Finally, as the environment demands incremental process innovation, coupled with impatience, the dominant enterprise architectures again tend to be integral. Finally, as the environment demands incremental process innovation, coupled with impatience, the dominant enterprise architectures tend to be integral.

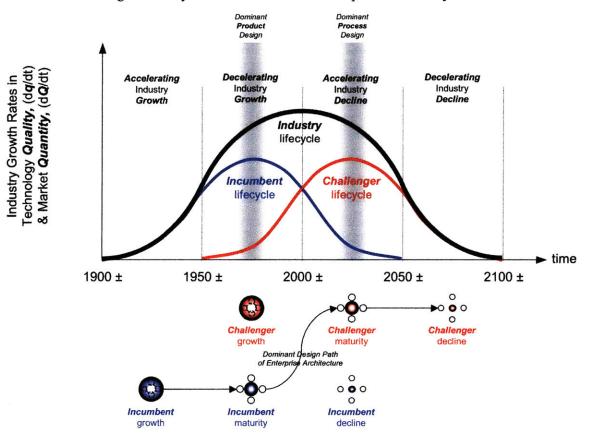

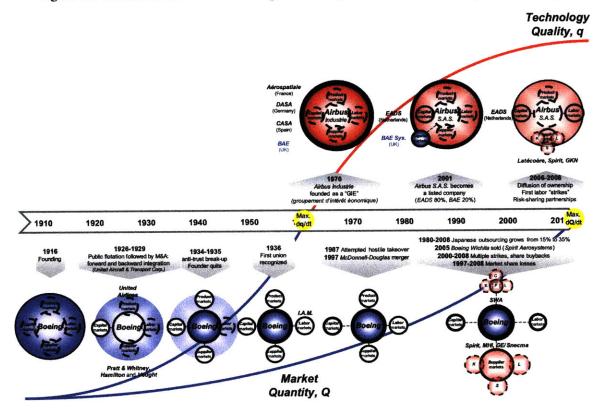

Figure 30: Stylized Co-Evolution of Enterprises and Ecosystem

Empirical Data. Having established the birth dates and associated and founding conditions (e.g. population densities) of the two firms in the primary sample, Figure 31 below summarizes the qualitative evolutionary trajectories of the enterprise architectures of these firms.

Figure 31: Evolution of Dominant Designs in Enterprise Architectures: Airplane Industry:

The organizational *sets* appear to initially begin with an integral enterprise architectural form and subsequently disintegrate monotonically into a modular form over time. Note that this phenomenon appears to apply to both incumbent and challenger enterprises and be independent of the founding date of the enterprise.

At the ecosystem (or organizational *field*) level however, the dominant design in enterprise architecture appears to oscillate from integral to modular and back to integral forms. While re-integration of the incumbent enterprise architecture in order to achieve fit with the demands of the ecosystem is not theoretically precluded, empirically it is not observed. This suggests that in the theoretical sample analyzed, the incumbents reach a tipping point, whereby their reinforcing behavior tips from virtuous to vicious – that is, it is more efficient for the environment to *select* a new species, than for the existing species to be *retained* via managerial adaptation.

Superimposed on the evolutionary trajectories of the enterprise architectures, is a notional S-curve, representing the industry growth in both quantity and quality. One may begin to posit a relationship between the state of these key environmental variables and the states of the incumbent and challenger enterprise architectures. Empirical data will be offered in the following sections to refine this conceptual relationship.

As illustrated in Figure 32 and Figure 33 below illustrate similar trajectories in both the automotive and airline industries respectively.

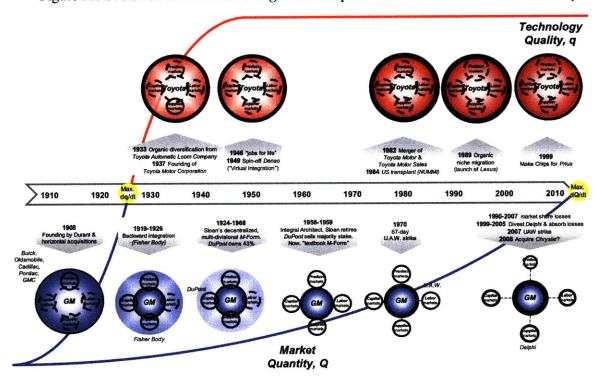

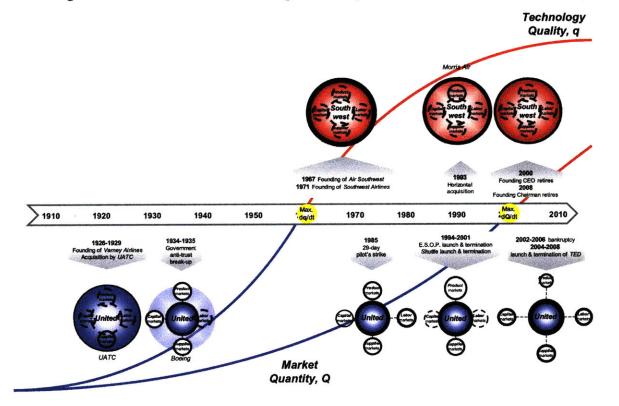

Figure 32: Evolution of Dominant Designs in Enterprise Architectures: Automotive Industry

Figure 33: Evolution of Dominant Designs in Enterprise Architectures: US Airline Industry

Proposition 4b: Entry and Exit of Enterprise Architectures. The second proposition relates environmental maturity to entry and exit of dominant enterprise architectures.³⁹

Proposition 4b: Early entrant (incumbent) enterprise architectures tend toward monotonic disintegration, with increasing levels of architectural inertia inhibiting their reintegration. Thus it is easier for the environment to produce a new species of late entrant (challenger) enterprise architectures.

Empirical Data. Figure 34 below summarizes the birth dates within the population densities for the firms in the primary sample.⁴⁰

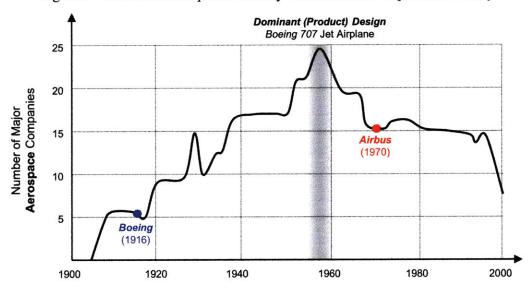

Figure 34: Commercial Airplane Industry Concentration / Population Density

Soon after the invention of the airplane at the turn of the century, the number of firms in the aerospace industry grew for approximately fifty years during an era of ferment (Abernathy & Utterback, 1978) which was dominated by increasing product innovation resulting in improved product performance characteristics (i.e. "higher, faster, farther"). A "dominant design" in the product occurred in the late 1950's with the emergence of the commercial jet airplane⁴¹, followed by a shake-out and consolidation of the industry, which continued for the next fifty years. Following the merger of Boeing with McDonnell Douglas in 1997, the large commercial airplane industry effectively became a global duopoly between Boeing & Airbus.42

The founding dates of the two firms in the primary sample are also plotted in the figure above. Boeing, the incumbent was founded in 1916, well before the dominant product design and Airbus the challenger was founded in 1970, well after the dominant product design.

³⁹ Note: this "quantity" formulation captures the organizational ecologists' construct of "density dependence" (Barron, 1999). ⁴⁰ Based on Weiss and Amir (1999).

⁴¹ The Boeing 707 is considered representative of the "dominant design". Note however that other scholars (e.g. Tushman and Murmann, 1998) have cited an earlier "dominant design" in the Douglas DC-3 in 1936. See Piepenbrock (2008) for further discussion.

⁴² As the market segment, "large commercial airplanes" is broadly defined as airplanes having over 100 seats. smaller airplane manufacturers (e.g. Embraer) have recently begun to enter this space.

As illustrated in Figure 35 and Figure 36 below, similar phenomena in the trajectories in both the automotive and airline industries respectively are observed.

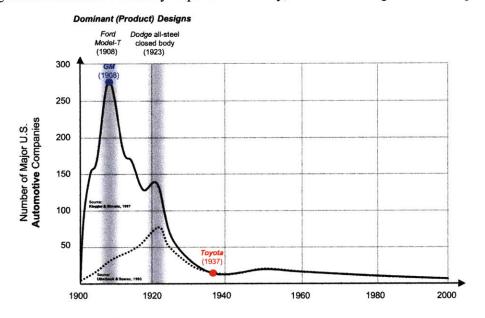

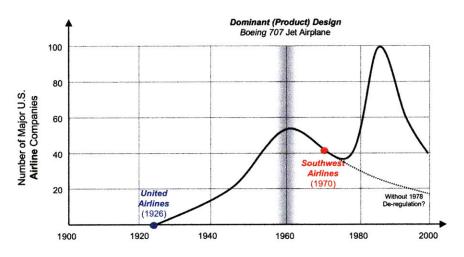

Figure 35: Automotive Industry Population Density, Dominant Design & Founding Dates

In the automotive industry, the dominant design was established in 1908 with Ford's Model T.⁴³ General Motors, the incumbent was founded in 1908, when the dominant design arrived and Toyota the challenger was founded in 1937, after the establishment of the dominant design.

Figure 36: US Airline Industry Population Density, Dominant Design & Founding Dates

In the airline industry, the dominant design was established around 1960 with *Boeing's* 707 jet airplane.⁴⁴ *United Airlines*, the incumbent was founded in 1926, well before the dominant design and *Southwest Airlines* the challenger was founded in 1970, after the dominant design.

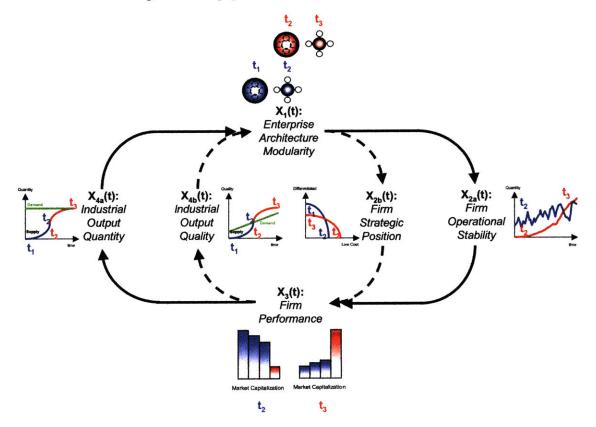

⁴³ Recent scholars (e.g. Klepper, 1997) argue that the US auto industry shakeout occurred in 1908, coincident with the arrival of the Ford Model-T as a candidate for dominant design. Utterback & Suarez (1993), citing a different data set possessing a more coarse filter, demonstrate shakeout in 1923 arguing that *Dodge's* all-steel, closed body automobile is the dominant design. See Piepenbrock (2009) for further discussion.

⁴⁴ See Tushman and Anderson (1986) and Kelly and Amburgey (1991).

Summary of Theoretical Framework

The theoretical framework, which traces the dynamic evolution of a generic business ecosystem is summarized in Figure 37 below.⁴⁵ Two main causal loops describe the co-evolution of the ecosystem and its constituent enterprises in terms of both product quantity (solid outer loop) and quality (dashed inner loop) that is demanded and supplied. Beginning with the industrial output variables $X_{4a}(t)$ and $X_{4b}(t)$ shown on the left of the figure, we will trace out two clockwise revolutions of the causal loop diagram to describe how the ecosystem grows and eventually matures⁴⁶, and how concurrently incumbent firms' enterprises build the industry and are ultimately overtaken by late-entrant challenger firms' enterprises.

Industry *Growth* **Phase.** At time t_1 , when an industry is born, a significant gap exists between the quantity and quality of a new product or service's supply and demand potential (shown in green). Firms (like *General Motors, United Airlines* and *Boeing*) that can bring higher performing products to market will gain early competitive advantage. In this phase of product innovation, integration is required in the product, firm and enterprise architectures. Such integral enterprise architectures have relatively low rates of growth due to their relatively "patient" capital, labor, customers and suppliers. Spatio-temporal boundaries begin as relatively broad, with the firm's relationship with its stakeholders being long-term, using trust-based relational contracts, and the resulting enterprise value being divided in a positive-sum cooperative game among stakeholders.

⁴⁵ A more detailed summary of the theoretical framework including the major balancing loops is discussed in Piepenbrock (2009).

⁴⁶ This framework traces the evolution of the business ecosystem from growth to maturity phases. For simplicity, it does not play out the evolution beyond maturity into the decline phase.

As the industry approaches time t₂, the gap between the quantity and quality of a new product's supply and demand potential diminishes at a faster rate as the rates of change of industry growth are rising. In order to meet the demands of the rapidly growing mass market, firms that can rapidly build capacity reap economies of scale. High rates of radical product innovation diminish, and are replaced by efficiencies of functional specialization. In this phase, disintegration (or modularization) of product, firm and enterprise architectures provide competitive advantage. Such modular enterprise architectures (like *General Motors, United Airlines* and *Boeing*) have relatively high rates of growth due to their relatively "impatient" capital, labor, customers, and suppliers. Spatio-temporal boundaries of the enterprise diminish, with the firm's relationship with its stakeholders becoming short-term, using arm's length contracts, and the resulting enterprise value being divided in a zero-sum competitive game among stakeholders.

Industry *Maturity* **Phase.** At time t_2 , the industrial output S-curves are near their inflection points. After the industry reaches time t_2 , the gap between the quantity and quality of a new product or service's supply and demand potential begins to diminish at a slower rate as the rates of change of industry growth begin to slow down. New customers are being added at slowing rates, and the appetite for higher performance products is now being dominated by a demand for cheaper products. At this inflection point in the industry's quantity and quality S-curves, two scenarios now occur.

Incumbent firms (like *General Motors, United Airlines* and *Boeing*) continue to over-serve the market by chasing smaller and smaller market segments consisting of higher and higher profit-margin customers (Christensen, 1997). Under new cost pressures, they continue to outsource, compete suppliers and unions harder and continue to attract more and more impatient capital. Although the industry is slowing down, the incumbent enterprise architectures continue to speed up, with their stocks of structural inertia and their impatient capital growing.

Challenger firms (like *Toyota Motors, Southwest Airlines* and *Airbus*), having a different enterprise architecture can enter and take advantage of the industry's changing characteristics. Now, the rates of technological innovation begin to slow down, as the dominant product design has been established by the dominant enterprise architecture, which is now in a modular form. This slowing down of the industry, both in quantity and quality terms, provides the conditions for a new firm with a different enterprise architecture to enter and to bring supply and demand back in balance both in quantity terms (i.e. slower) and quality terms (i.e. *process* innovation for higher quality, lower cost, faster delivery). As in the birth of the industry, innovation requires integration of product, firm and enterprise architectures. Such integral enterprise architectures have relatively low rates of growth due to their relatively "patient" capital, labor, customers, and suppliers. Spatio-temporal boundaries of the enterprise increase, with the firm's relationship with its stakeholders becoming long-term, using trust-based contracts, and the resulting enterprise value being divided in a positive-sum cooperative game among stakeholders.

The competition to establish the dominant product architecture by the now-modular incumbent enterprise architectures has sown the seeds of their own destruction. The emergence of a dominant design in product architecture has established the conditions for the emergence of a new dominant design in enterprise architecture. The dominant enterprise architecture oscillated throughout the industry's lifecycle from integral to modular to integral.

MATHEMATICAL MODEL and NUMERICAL SIMULATION

Generic Equations of Motion. The evolution of business ecosystems will be expressed formally by a system of simultaneous differential equations,⁴⁷ where the state variables, X_n are stocks which accumulate net flows (dX_n/dt) over time.

$$dX_{1}/dt = f_{1}(X_{1}, X_{2}, ..., X_{n})$$

$$dX_{2}/dt = f_{2}(X_{1}, X_{2}, ..., X_{n})$$

.

$$dX_{n}/dt = f_{n}(X_{1}, X_{2}, ..., X_{n})$$

Note that such equations form a feedback system that generates system dynamics endogenously, via information from the various state variables, which feed back to influence their own rates of change.

Model Build-Up. In the following subsections, the model will be constructed progressively, each time adding a higher level of sophistication in order to more clearly understand the underlying assumptions, parameters, structure and behavior of the model at each stage of complexity. The following stages will be discussed sequentially:

- Single Firm Growth in an *Infinite* Market
- Single Firm Growth in a Constant Market
- Intra-species Competition in a Constant Market⁴⁸
- *Diffusing* Market (Quantity)
- Intra-species Competition in a Diffusing Market
- Inter-species Competition in a Diffusing Market
- *Commoditizing* Market (Quality)
- Intra-species Competition in a Commoditizing Market
- Inter-species "Competition" in a Commoditizing Market
- Diffusing, Commoditizing Market (Quantity and Quality)
- Intra-species Competition in a Diffusing, Commoditizing Market
- Inter-species Competition in a Diffusing, Commoditizing Market

⁴⁷ In the traditions of the general system theory (e.g. Von Bertalanffy, 1950), cybernetics (e.g. Ashby, 1952), system dynamics (e.g. Forrester, 1961); as well as organizational ecology (e.g. Hannan and Freeman, 1977).

⁴⁸ We will not cover the case of *inter*-species competition in an unchanging environment here, because theoretically, significant sustained environmental variation is required in order to produce and sustain significant variation in organizational species. Inter-species competition in a constant market would be a special parametric study when exploring inter-species competition in a logistic growth market, in which the market diffusion rate is much greater than the competitor growth rates.

Single Firm Growth in an Infinite Market. First, we assume a monopolist operating under increasing returns to scale. This assumption captures a variety of business phenomena including economies of scale, learning curve effects, etc. Under this reinforcing feedback, the more market the firm accumulates, the faster it continues to be accumulated.

Second, we assume initially that the firm exists in a market of unlimited growth potential – unlimited carrying capacity. The firm then is able to grow at its maximum fractional rate, r which is assumed to be constant and is determined by a number of goals and constraints which might include the rate of return on residual cash flows promised to risk bearers.⁴⁹

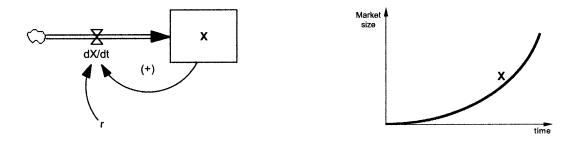

Most models in organizational ecology focus on population size or density - expressed as number of organizations - as the primary state variable, which accumulates net flows of organizational entries and exits (e.g. Hannan and Freeman, 1977). Population size is of lower importance in these formulations. This paper however focuses instead on organizational size as approximated by the amount of environmental resources an organization accumulates, or more specifically in the case of business ecosystems, the amount of a market a firm possesses. In this way, a population could consist of a spectrum of organizations ranging from a large number of equally sized firms, each possessing the same percentage of the total market; to a single firm operating as a monopolist possessing the entire market. We will derive equations of motion for a firm accumulating sales, X over time.⁵⁰

The following differential equation captures this simple reinforcing feedback:

$$dX/dt = rX \tag{1}$$

Figure 38 below illustrates the causal structure⁵¹ and resulting behavior of this *linear* first-order formulation, which results in unrestrained exponential growth of the firm's market acquisition.

Figure 38: Structure and Behavior of Single Firm Growth in an Infinite Market

This equation also describes the early growth of a firm in a finite market, when its accumulated quantity of market, X is far from the carrying capacity of the market. This will be covered in the subsequent section.

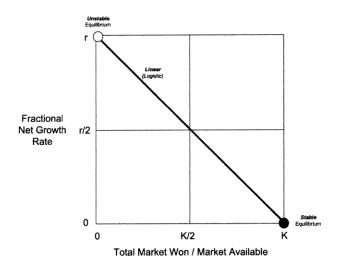

⁴⁹ This is actually the fractional net growth rate, and has the units of percent of market growth per unit of time.

⁵⁰ For the present discussion, we assume that the firm converts demand into supply instantaneously or without any delays associated with order backlogs, inventory backlogs etc. Such delays in a balancing loop can account for cyclical oscillatory behavior. As the time horizon of interest in this evolutionary research is measured in centuries, the oscillations which manifest themselves over timeframes of decades are of secondary importance.

⁵¹ In the diagrammatic representations of the differential equations, the variables within "boxes" represent stocks or accumulations, while the variables below the "valves" represent rates or flows in and out of the stocks.

Single Firm Growth in a *Constant* **Market.** As no firm exists in an infinitely rich resource environment, we next constrain the model by imposing finite but constant market carrying capacity, K, which might represent the size of population of potential customers or sales. The assumption here is that, as the firm acquires more of the finite market, K, the rate of firm growth, r begins to reduce linearly⁵², making the organization's rate of growth dependent upon the proportion of the carrying capacity that remains unexploited⁵³, as shown in Figure 39.

Figure 39: Fractional Net Growth Rate Assumption

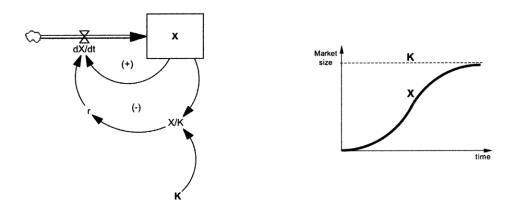

We therefore extend the previous differential equation (1) to capture the mode-switching from reinforcing to balancing feedback as the firm approaches the carrying capacity of the market. This new logistic equation is shown below:⁵⁴

$$dX/dt = rX - rX^2/K$$
⁽²⁾

Figure 40 below illustrates the causal structure and resulting behavior of this *nonlinear* first-order formulation, which results in sigmoid or S-shaped growth of the firm's market capture.

Figure 40: Structure and Behavior of Single Firm Growth in a Constant Market

⁵² This linear relationship, which produces logistic growth, will be relaxed in subsequent sections which explore interspecies competition.

⁵³ This is called "mass dependence" in the organizational ecology literature.

⁵⁴ This was first formulated in social systems by Verhulst (1838) in his logistic population growth model.

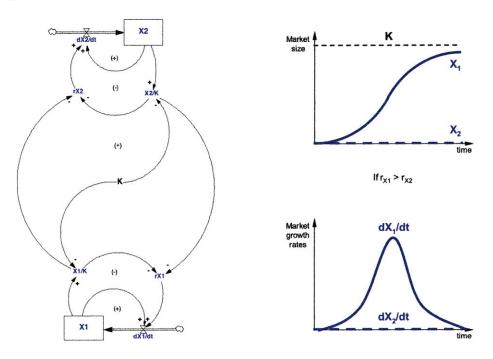

Intra-species Competition in a Constant Market. In most markets, no firm exists without competition; we therefore need to next introduce competition between firms for customers in a common market. At this point, we assume two identical isomorphic competitors, X_1 and X_2 having homogeneous enterprise architectures occupying the same mathematical point niche. We therefore extend the previous differential equation (2) to account for the simple fact that the addition of sales to either competitor decreases the rate of growth of the other competitor.⁵⁵ Both competitors are now connected via a reinforcing loop that amplifies differences in market share resulting in an unstable equilibrium.⁵⁶ The new, coupled system of differential equations is shown below:⁵⁷

$$dX_{1}/dt = r_{X1}X_{1} - r_{X1}X_{1}^{2}/K - r_{X1}X_{1}X_{2}\alpha_{12}/K$$
(3a)

$$dX_2/dt = r_{X2}X_2 - r_{X2}X_2^2/K - r_{X2}X_2X_1\alpha_{21}/K$$
(3b)

Figure 41 below illustrates the causal structure and resulting behavior of this nonlinear *second*-order formulation, which results in sigmoid or S-shaped growth of each competitor's market capture. Provided that both firms have identical forms and occupy the same market niche, no two-firm (or more generally, two-population) equilibrium can be stable – any exogenous shock to the system will result in the elimination of one of the firms (or populations).⁵⁸

⁵⁵ In ecology, this is called "exploitation" (vs. "interference") competition (Brian, 1956). Other dynamic models formulate competition using more operational variables (Sterman, Henderson, Beinhocker and Newman, 2007).

⁵⁶ This severe "winner-takes-all" competitive assumption is akin to Bertrand (price) competition, rather than the weaker form of Cournot (quantity) competition where the market is shared in proportion to relative firm growth rates. Under this assumption, the "competition coefficients", α_{12} and α_{21} equal 1.

⁵⁷ This system of equations formed the basis for modeling competition within the seminal organizational ecology framework (Hannan and Freeman, 1977: 942). It is based on the classic Lotka-Volterra equations for *competing* populations, after Lotka (1925) and Volterra (1931). Note that this is different from the classic Lotka-Volterra equations for *predator-prey* populations which generate chaotic oscillation due to a central *balancing* loop.

⁵⁸ This is known in ecosystem theory as the "principle of competitive exclusion" (Gause, 1934).

Diffusing Market (Quantity). Next, we relax the assumption of a constant carrying capacity of the resource environment, K (Brittain, 1994). Instead, we permit sigmoid growth as it approaches its own inherent carrying capacity.⁵⁹ This assumption captures the scenario of a new product/service that either: 1) diffuses logistically throughout a constant population of potential consumers (Bass, 1969), or 2) diffuses instantaneously through a logistically-growing population of potential consumers (Verhulst, 1838), or 3) some combination of the two.⁶⁰

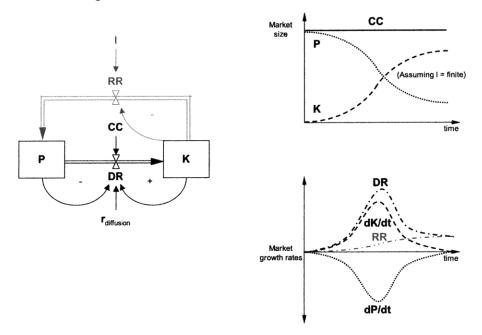

The new, coupled system of differential equations is shown in its most simple form below:

$$dP/dt = RR - DR = K/l - r_d PK/CC$$
(4a)

$$dK/dt = DR - RR = r_d PK/CC - K/l$$
(4b)

Here, P denotes the *potential* market; K denotes the *adopting* market; CC denotes the carrying capacity of the system; DR denotes the *diffusion* rate; r_d denotes the fractional *diffusion* rate; RR denotes the *replacement* or *repurchase* rate; I denotes the average product life. Figure 42 below illustrates the causal structure and resulting behavior of this nonlinear *first*-order formulation, which again results in sigmoid or S-shaped growth for the resource environment.

Figure 42: Structure and Behavior of a Diffusing Market

For simplicity, we will assume that the average product life, 1 approaches infinity (i.e. the market consists of durable goods)⁶¹, making the replacement rate, RR approach zero. Noting that P = CC - K, the new differential equation which captures the dynamics of *diffusion* is:

$$dK/dt = r_d K (1 - K/CC)$$
(4c)

⁵⁹ For simplicity, we model a linear relationship between the diffusion rate and available carrying capacity, which results in logistic growth.

⁶⁰ The more general formulation of a resource environment comprising an interaction of logistic consumer population growth with logistic diffusion of an innovation is discussed in Piepenbrock (2009).

⁶¹ This assumption is not an unreasonable approximation for the primary case study of large commercial airplanes, with average product lives ranging from 25-50 years.

Intra-species Competition in a *Diffusing* Market. Next, we reintroduce two members of the same species, competing for the logistically growing market. The new, coupled system of differential equations is shown in its most simple form below:

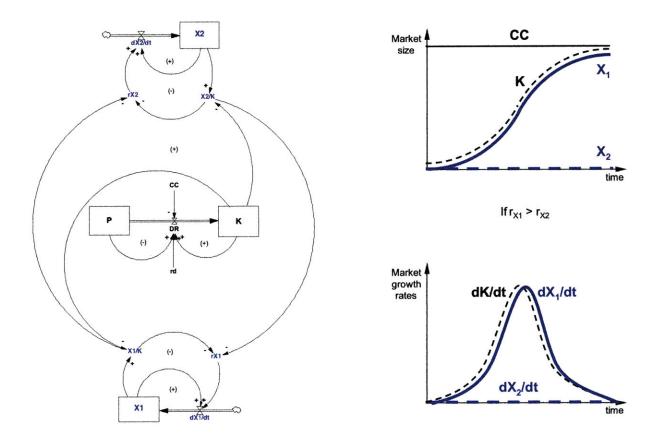

$$dX_1/dt = r_{X1}X_1 - r_{X1}X_1^2/K - r_{X1}X_1X_2\alpha_{12}/K$$
(5a)

$$dX_2/dt = r_{X2}X_2 - r_{X2}X_2^2/K - r_{X2}X_2X_1\alpha_{21}/K$$
(5b)

$$dK/dt = r_K K - r_K K^2/CC$$
(5c)

Figure 43 below illustrates the causal structure and resulting behavior of this nonlinear *third*-order formulation, which again results in sigmoid or S-shaped growth for both the resource environment and the dominant firm (or population of firms) that created it.

Figure 43: Structure and Behavior of Intra-species Competition in a Diffusing Market

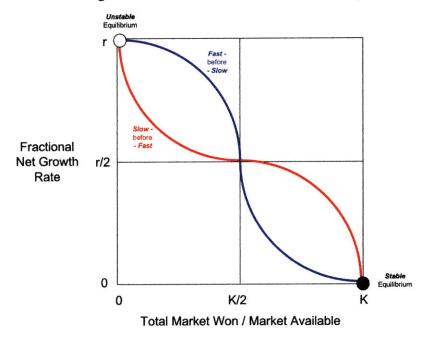

Although this refinement of Hannan and Freeman's (1977) classic does not itself add new insights into the behavior of competing organizations or populations, it is a necessary building block for the next step of the formulation of the evolution of business ecosystems, namely, it establishes the condition necessary for the establishment of interspecies competition, resulting in an extension of the theory of competitive exclusion (Gause, 1934).

Inter-species Competition in a Diffusing Market. Since in the previous stage, we have allowed the environment to grow logistically, we can now acknowledge the possibility of variation in organizational forms as a consequence of variation in environmental rates of growth. This gives rise to the potential for dominance switching: i.e. the late entry of a new species of organization, and the associated early exit of the incumbent species. The two types of competing organizational species modeled therefore reflect either increasing rates or decreasing rates of environmental growth.

The incumbent species, X which builds the market is known in bio-ecology as an *r-strategist*, and the late-entrant challenger species, Y which takes the market is known as a *K-strategist* (MacArthur and Wilson, 1967). The primary difference between this formulation and the previous, is that each competitor's fractional net growth rates are no longer linearly density-dependent, with the (*Modular*) *r-strategist* growing faster when the environment is experiencing rapid growth, and the (*Integral*) *K-strategist* growing faster when the environment's rate of growth is slowing down, as shown in Figure 44 below.

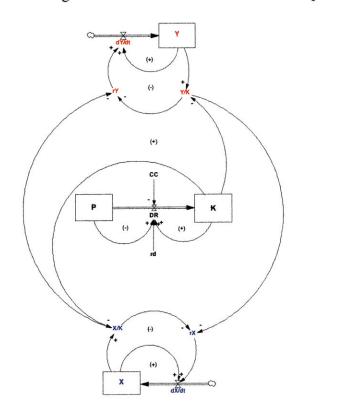

The new, coupled system of differential equations is shown below:

 $r_X > r_Y$ when (X+Y) < K/2 $r_X < r_Y$ when (X+Y) > K/2 $dX/dt = r_X X - r_X X^2/K - r_X X Y \alpha_{XY}/K$ (6a)

$$dY/dt = r_y Y - r_y Y^2/K - r_y X Y \alpha_{yy}/K$$
(6b)

$$dK/dt = r_d K - r_d K^2/CC$$
(6c)

Figure 45 below summarizes the causal structure and resulting behavior of this nonlinear *third*-order formulation which results in S-shaped (but no longer logistic) growth for the competitor's state variables. Crucially note that the r-strategist tends to exit when the growth rate of the market begins to drop below its own growth objectives. Environmental variance therefore produces variance in the architectures of the organizational sets, which creates symbiotic inter-species competition, with a more complex theory of competitive exclusion.

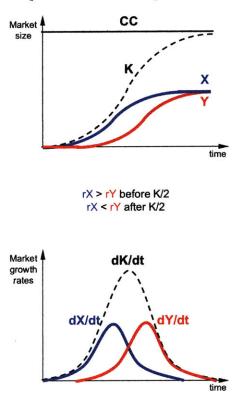

Figure 45: Structure and Behavior of Inter-species Competition in a Diffusing Market

Commoditizing Market (Quality). Having permitted the carrying capacity of the market, K to grow logistically, we now go back to a constant market assumption, but instead allow the *quality* of the market customer preferences to diffuse from high-performance *differentiated* products and services towards *low-cost* products and services (Abernathy and Utterback, 1978; Christensen, 1997). This in effect allows market niches to evolve, which has the potential to shape the entry and exit of different species of organizational sets.

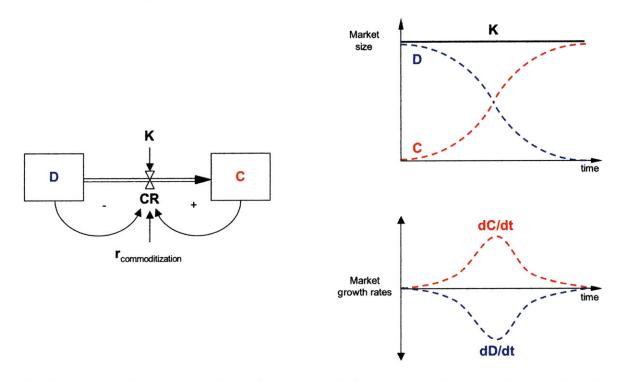

The new, coupled system of differential equations is shown in its most simple form below:

$$\frac{dD}{dt} = -CR = -r_c DC/K$$

$$\frac{dC}{dt} = CR = r_c DC/K$$
(7a)
(7b)

Here, C denotes the *cost-based* market; D denotes the *differentiation-based* market; K denotes the adopting market's *capacity*; CR denotes the *commoditization* rate; r_c denotes the fractional *commoditization* rate. Figure 46 below illustrates the causal structure and resulting behavior of this nonlinear *first*-order formulation, which again results in sigmoid or S-shaped growth for the transforming resource environment.⁶²

Figure 46: Structure and Behavior of a Commoditizing Market

Noting that D + C = K, the new differential equations which capture the dynamics of *commoditization* is shown below:

$$dD/dt = r_c D (1 - D/K)$$
(7c)

$$\frac{dC}{dt} = r_{c}C(1 - C/K)$$
(7d)

⁶² Again, as in the characterization of the diffusing market, the commoditizing market's sigmoid growth is assumed to proceed logistically, for analytical simplicity.

Intra-species Competition in a Commoditizing Market. In the previous stage, the resource environment was characterized as existing in one dimension: the rate of change of market growth, dK/dt. This formulation extends the model to include a second dimension: the rate of change of technology commoditization, dC/dt. This captures the construct of a dominant design in the product offering (Abernathy and Utterback, 1978), which marks the shift in market demand from increasing rates of change of improvement in product performance, where competition is based on product innovation, to increasing rates of change of improvement in product cost, where competition is based on process innovation.⁶³ In order to control for the previous effects of market growth, we hold the market size, K constant.⁶⁴ The new coupled system of differential equations is shown below:

$$dX_1/dt = r_{X1}X_1 - r_{X1}X_1^2/D - r_{X1}X_1X_2\alpha_{12}/(D + C)$$
(8a)

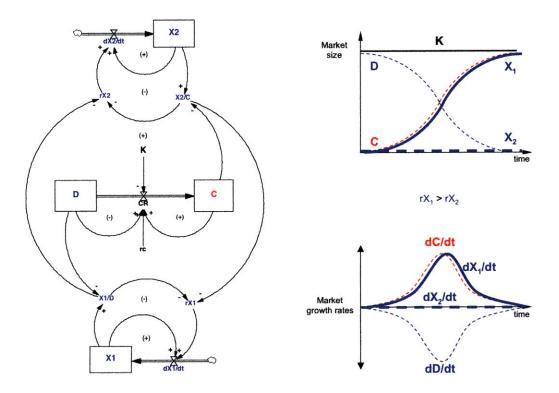

$$\frac{dX_1/dt = r_{X1}X_1 - r_{X1}X_1^2/D - r_{X1}X_1X_2\alpha_{12}/(D + C)}{dX_2/dt = r_{X2}X_2 - r_{X2}X_2^2/C - r_{X2}X_2X_1\alpha_{21}/(D + C)}$$
(8a)
$$\frac{dD}{dt} = r_c D (1 - D/K)$$
(8c)

$$|D/dt = r_c D (1 - D/K)$$
(8c)

$$\frac{1}{C/dt} = r_c C \left(1 - C/K\right)$$
(8d)

Figure 47 below summarizes the causal structure and resulting behavior of this nonlinear third order formulation⁶⁵ which results in sigmoid or S-shaped transition from a market dominated by sales of products/services based on differentiation, D to a market dominated by sales of products/services based on cost, C. Note that this formulation represents direct competition between organizations within the environment.

Figure 47: Structure and Behavior of Intra-species Competition in a Commoditizing Market

⁶³ Although a "dominant design" is often seen as a *discrete* event, the market is modeled as a *continuously* evolving.

⁶⁴ This control will relaxed in the next section, where both market size, K and type, C will grow logistically.

⁶⁵ The addition of two state variables is only a first-order addition as one is completely determined by the other.

Inter-species "Competition" in a Commoditizing Market. In the previous stage, both competitors were assumed to be of the same species, and therefore broadly able to compete in both the differentiation-based and cost-based niches (i.e. the competition coefficients α were at or near 1) – for example both intraspecies competitors, GM and Ford can transition from a differentiated product focus towards a cost focus. However, the emergence of a new species, having an integral enterprise architecture (like Toyota) is much better suited towards cost-leadership, making their competition coefficient a approach zero. In this extreme case of interspecies competition, each species focuses on the niche that they are best suited to, and "competition" takes on a symbiotic nature, due to the presence of architectural inertia. The new coupled system of differential equations is shown below:

> $dX/dt = r_X X - r_X X^2/D \qquad r_X X + r_X X^2/D \qquad r_X X + r_X X^2/D \qquad (D - C)$ (9a)

$$\frac{dY}{dt} = r_Y Y - r_Y Y^2 / C \quad (9b)$$
(9b)
(9c)
(9c)

$$\frac{d\Gamma}{dt} = r_{c} D (1 - D/K)$$
(9c)

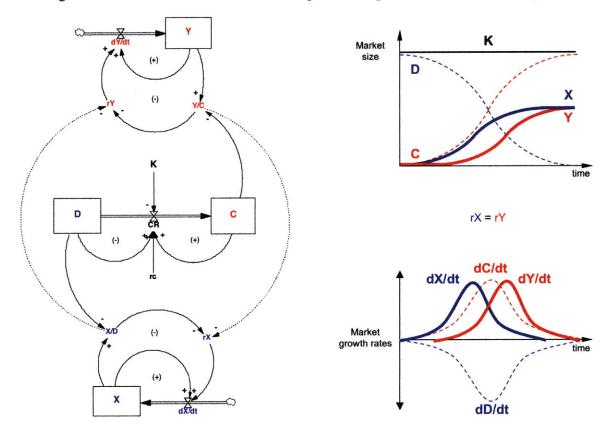

$$\frac{dD}{dt} = r_{c} D (1 - D/K)$$
(9c)

$$\frac{dC}{dt} = r_{c} O (1 - O/K)$$
(9d)

$$\frac{dC}{dt} = r_c C \left(1 - C/K\right) \tag{90}$$

Figure 48 below summarizes the causal structure and resulting behavior of this nonlinear third order formulation⁶⁶ which results in sigmoid or S-shaped transition from a market dominated by sales of products/services based on differentiation, D to a market dominated by sales of products/services based on cost, C. Note that this formulation represents indirect competition between organizations occupying different niches within the environment.

Figure 48: Structure and Behavior of Inter-species Competition in a Commoditizing Market

⁶⁶ The addition of two state variables is only a first-order addition as one is completely determined by the other.

Diffusing, Commoditizing Market (Quantity and Quality). We now combine the previous two descriptions of the market environment, where the *quantity* of the market, K grows logistically (Bass, 1969), while simultaneously, the *quality* of the market customer preferences diffuses from high-performance *differentiated* products and services towards *low-cost* products and services (Abernathy and Utterback, 1978). This allows the entry and exit of different species of organizational sets for two reasons: the rate of change in market *quantity* and the rate of change in technological *quality* enable market niches to evolve. The new, coupled system of differential equations is shown below:

$$\frac{dP}{dt} = -r_{d}P(1 - P/CC)$$
(10a)

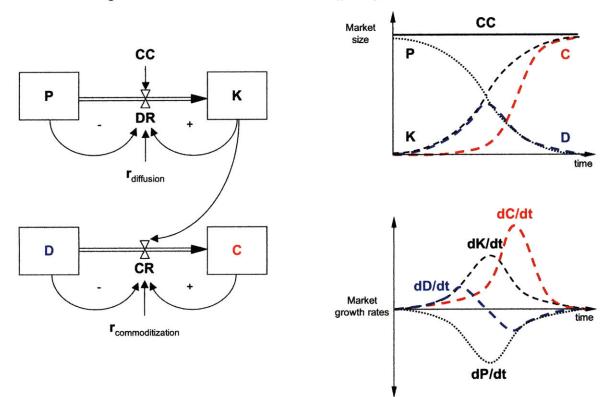

$$\frac{dK}{dt} = r_d K \left(1 - K/CC \right) \tag{100}$$

$$\frac{dC}{dt} = r_{c}C(1 - C/K)$$
(10d)

$$\mathbf{I}_{\mathbf{C}}^{\mathsf{I}}\mathbf{U}_{\mathbf{C}}^{\mathsf{I}}=\mathbf{I}_{\mathbf{C}}^{\mathsf{C}}\left(\mathbf{I}-\mathbf{C}/\mathbf{K}\right)$$

Figure 49 below illustrates the causal structure and resulting behavior of this nonlinear *second*-order formulation. Although the total market, K again results in logistic sigmoid or S-shaped growth, niches D rises and falls, while niche C rises in S-shaped growth to eventually characterize the entire market. Note, however that if the fractional diffusion rate, $r_d >>$ than the fractional commoditization rate, r_c , then the behavior approaches that shown in Figure 43.

Figure 49: Structure and Behavior of a Diffusing, Commoditizing Market

Intra-species Competition in a Diffusing, Commoditizing Market. The model now has two different ways of defining the state of evolutionary maturity of the environment: *quantity* and *quality* – that is, *how much* product is produced/consumed, and *what type* of product is produced/consumed. This section therefore combines these two characterizations of the market environment into one model, where two firms of the same species (characterized by the architectures of their respective extended enterprises) compete. The extent of competitive intensity is defined by the ability of each firm to overcome architectural inertia and transition from niche D to niche C as the market evolves. A summary of the coupled system of differential equations is shown below.

$$dX_{1}/dt = r_{X1}X_{1} - r_{X1}X_{1}^{2}/D - r_{X1}X_{1}X_{2}\alpha_{12}/K - r_{X1}X_{1}X_{2}\alpha_{12}/(D + C)$$
(11a)

$$dX_{2}/dt = r_{X2}X_{2} - r_{X2}X_{2}^{2}/C - r_{X2}X_{1}X_{2}\alpha_{21}/K - r_{X2}X_{2}X_{1}\alpha_{21}/(D + C)$$
(11b)

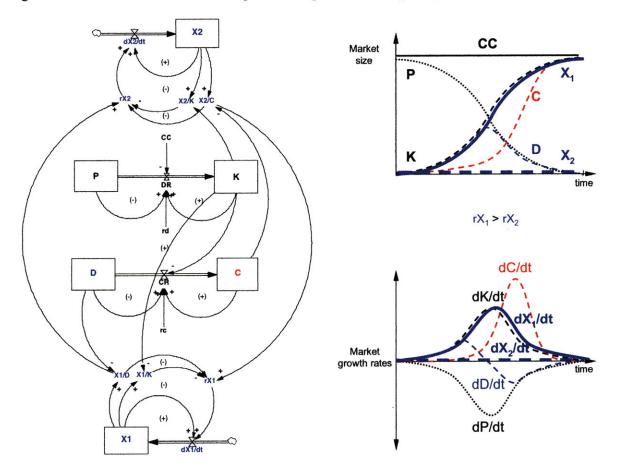

$$dK/dt = r_d K (1 - K/CC)$$
 (11c)

$$dD/dt = -r_c D (1 - D/K)$$
(11d)

$$\frac{dC}{dt} = r_c C \left(1 - C/K\right) \tag{11e}$$

Figure 50 below summarizes the causal structure and resulting behavior of this nonlinear *fourth*-order formulation which results in S-shaped growth of the general market K, and the niche, C. Due to architectural inertia, each species is constrained to its own niche resulting in early exit, late entry and dominance-switching throughout the life-cycle of the industry.

Figure 50: Structure/Behavior of Intra-species Competition in a Diffusing, Commoditizing Market

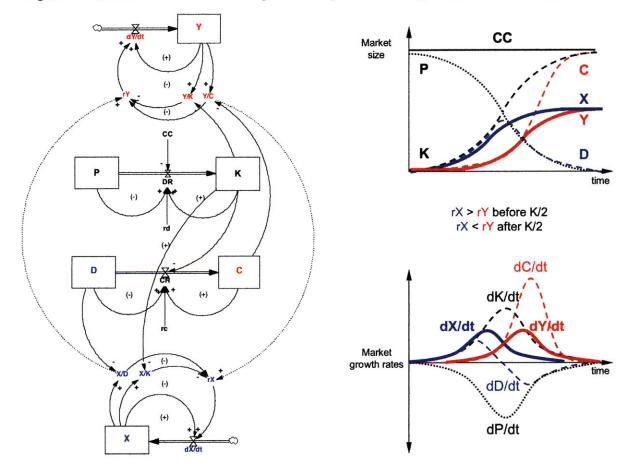

Inter-species Competition in a Diffusing, Commoditizing Market. The model now has two different ways of defining the state of evolutionary maturity of the environment: *quantity* and *quality* – that is, *how much* product is produced/consumed, and *what type* of product is produced/consumed. This final section therefore combines these two characterizations of the market environment into one model, where two different species of firms (characterized by the architectures of their respective extended enterprises) compete. The extent of competitive intensity is defined by the ability of each firm to overcome architectural inertia and transition from niche D to niche C as the market evolves. A summary of the coupled system of differential equations is shown below.

$r_X > r_Y$ when $(X+Y) < K/2$	$dX/dt = r_X X - r_X X^2/D - r_X X Y \alpha_{XY}/K - T \in X Y \alpha_{XY}(D - C)$	(12a)
$r_X < r_Y$ when $(X+Y) > K/2$	$\frac{dY}{dt} = r_Y Y - r_Y Y^2 / C - r_Y X Y \alpha_{YX} / K = r_Y N Y \alpha_{YC} (D - C)$	(12b)
	$dK/dt = r_d K (1 - K/CC)$	(12c)
	$dD/dt = -r_c D (1 - D/K)$	(12d)
	$\frac{dC}{dt} = r_{c}C(1 - C/K)$	(12e)

Figure 51 below summarizes the causal structure and resulting behavior of this nonlinear *fourth*-order formulation which results in S-shaped growth of the general market K, and the niche, C. Due to architectural inertia, each species is constrained to its own niche resulting in early exit, late entry and dominance-switching throughout the life-cycle of the industry.

Figure 51: Structure/Behavior of Inter-species Competition in a Diffusing, Commoditizing Market

DISCUSSION and CONCLUSIONS

Summary of Findings and Results

Industry-leading firms like Airbus, Toyota Motors, and Southwest Airlines in the manufacturing and services sectors respectively while not trying to solely maximize shareholder value have ironically delivered significantly more of it than their competitors who are trying to maximize this metric. In the process, these late-entrant challengers have displaced significant market-making incumbents – in fact, the dominant competitors of their species – in Boeing, General Motors and United Airlines respectively. The key to this puzzle lies in understanding the how such firms interact with their environments – that is, in the architecture of their organizational sets. The theoretical sample revealed the integral enterprise architectures (or K-strategists) can be successfully grown in socio-economic environments as diverse as Europe, Japan and the United States.

Discussion of Plausible Rival Hypotheses

At the outset of the is paper, we clearly stated that the objective of the research was to begin to answer a fundamental question in strategy and organization:

"Why do firms in the same industry vary systematically in performance over time?"

The theory presented herein attempted to explicitly pose a *systematic* explanation for a *longitudinal* phenomenon: namely, how does a firm interact with its external stakeholders as a system, and how does this interaction evolve over time. Most plausible rival hypotheses concerning the explanation of long-term firm performance, however seem to be non-systemic and focused on short-term "noisy" data. Another way of stating this is that they tend not to focus on the evolution of the environment and the subsequent evolution of the competing species of competitors. Such explanations implicitly assume intraspecies competition, which relies on explanations of *exogenous* events, simple *execution* problems or even *legitimacy*.

Exogenous Events. One of the most common non-systemic explanations is that *GM*, *United* or *Boeing* are experiencing events beyond their control, whether they are labor strikes, oil shocks or global credit crunches. This overlooks that their competitors *Toyota*, *Southwest* and *Airbus* experience the same events with fewer consequences, as their enterprise architectures endogenize or co-opt (Selznick, 1948) environmental constraints more effectively, for example by offering employment stability in return for year-on-year productivity improvements, thus avoiding labor strikes; by using a conservative hedging strategies to minimize the effects of high oil prices; or by maintaining conservative balance sheets with reserve cash to assist customers with financing of their products and services.

Execution. Another common non-systemic explanation frequently put forward by the leaders of their organizations is that *GM*, *United* or *Boeing* are simply experiencing execution problems. This class of plausible rival hypothesis, which focuses on poor execution of strategy, rather than on poor strategy itself or even more fundamentally, enterprise architectural misfit with environmental conditions is embedded in the focus on increasing *efficiency*, given a fixed strategy or enterprise architecture. A problem with this hypothesis may develop if longitudinal evidence demonstrates that such execution problems are persistent. Clearly, if a firm consistently and persistently is unable to execute its strategy successfully over the long term, then perhaps it has the "wrong" strategy, or an enterprise architecture which constrains its ability to pursue the most effective strategy.

Legitimacy. Another more ideologically-based non-systemic explanation is that *Toyota, Southwest* and *Airbus* are "cheating" due to their unusually close relationships with capital, labor and supplier markets or government and are therefore "illegitimate" forms of business systems. This is manifested by their competition referring to them as "Japan Inc.", Texas Inc.", or "Europe Inc." respectively. This

explanation may in fact be defensible, provided that an external refereeing organization had the power to declare their illegitimacy and enforce rules systematically and longitudinally against their existence. The fact that such refereeing organizations do not exist, or are not able to enforce rules legitimating only one enterprise architecture, might seem to imply that a plurality of architectures may in fact exist and thrive empirically in real business ecosystems.

Liability of Maturity. One of the most common plausible rival hypotheses which attempts to explain firm success is that the younger the challenger firm, the lower its costs, and the easier it is to be the cost-leader; or conversely, the older the incumbent firm, the higher its costs (e.g. due to pensions for an aging work-force), and the harder it is to be the cost-leader.

This can be questioned for example by looking at the evolution of the US airline industry, which is currently populated by a collection of expensive "legacy" carriers who created the industry and the relative late arrival of the challenger, *Southwest Airlines. Southwest's* long-term cost leadership has sustained a thirty-year attack from a series of newer and therefore (potentially) less expensive competitors, who arrived nearly a decade after *Southwest's* founding, due to deregulation of the US market.⁶⁷ What distinguishes *Southwest*, is the relative integrality of its enterprise architecture relative to younger challengers. This supports the claims of the organizational ecologists, who contend that mortality rates should be high for late entrants.

It is interesting to note that organizational ecologists have determined across a broad range of industries that in populations of isomorphic organizations, late entrants have statistically higher mortality rates than early entrants. In these cases however, the late entrant not only survives, but it overtakes the incumbent. In other words, the explanation for *integral* enterprise architectures' success as late entrants is that the form of its enterprise architecture is more adapted to a maturing environment – it is a new species in an evolving environmental niche.

⁶⁷ See Kelly and Amburgey (1991, pg. 603) for their analysis of entry and exit in the US airline industry.

Interest, Importance and Contributions

As business ecosystems continually evolve, a framework exploring the co-evolution of organizations and their environment would be of theoretical interest to strategic management, organization science and complex systems researchers, as well as of practical interest to senior executives in industry, particularly those facing significant environmental change and potential lack of organization-environment fit, and those engaged in "inter-species" competition. By adapting organizational ecology's focus on multiple organization *density* to strategic management's focus on single organizations, we attempt to bridge the two domains.

Firm-Industry Debate in Strategic Management

It was from this open-ended intensive, in-depth, longitudinal inductive study of both focal firms, that the data revealed something that the literature had not allowed for: a different species of organizational set which possessed fundamentally different architectural form, function, structure and behavior from its competitor. This allowed us to revisit and shed new light on Porter's (1996) classic construct of an *efficiency frontier* in light of heterogeneous enterprise architectures. Later analysis of the environment revealed fundamentally different conditions at the founding of each organizational set, which promoted their growth and development. In addition, the data revealed that both organizational sets served a symbiotic function for the other. While both were locked in conventional competition, one created the environmental conditions that enabled the other to grow and ultimately dominate. Concurrent analysis of the secondary samples confirmed that the same evolutionary processes and symbiotic inter-species competition occurred in a variety of settings ranging from manufacturing to services and across national boundaries from the US to Japan to Europe.

Adaptation-Determinism Debate in Organization Science

The framework acknowledges the concurrent roles of managerial adaptation and environmental selection in the co-evolution of firms and industries through the construct of organizational set architecture, which simultaneously enables and constrains agency. Rather than diminishing the role of agency, the framework identifies an enhanced role of top management, namely CEO not as chief executive, but as "chief architect" who defines and maintains the objective function, boundaries and interfaces of the organizational set. These findings contribute to the understanding of *strategic leadership* as an architecting activity which focuses upward and outward of the organization (Durbin, 1979), as opposed to downward and inward. As such, these findings refocus the attention of strategic management scholars from their traditional focus on *efficiency* (i.e. doing things right) to a focus on *effectiveness* (i.e. doing the right things) for a broader set of stakeholders than just customers or investors. This in turn implies that new models firms and their leaders, may focus again on power (Pfeffer and Salancik, 1978) and politics (March, 1962).

Although the theoretical framework developed herein was constructed inductively from multiple case studies, it does confirm and support both theoretical propositions from the literature's illustrious past (e.g. Burns and Stalker, 1961 and Lawrence and Lorsch, 1967), as well as from its more recent cutting edge. For example, Lenox, Rockart and Lewin (2006 & 2007) recently developed numerical simulations of Kaufmann's (1993) NK model to demonstrate theoretically that for industries with high interdependency among activities, there will be only a few high performers earning profits well above the industry average and a relatively large number of laggards. The three pairs of case studies presented herein support not only this claim, but also present a theoretical model which describes how such interdependencies evolve at both the ecosystem and organizational levels.

Modular-Integral Debates in Complex Systems

Simultaneity. This research attempts to shed more light on the classic intra-organizational architectural forms implied in Lawrence and Lorsch's 1967 classic: *Organization and Environment: Managing Differentiation and Integration.* From the title, we can see clear references to modularity and integrality within organizations as reflected in the demands of their environments. Their proposition that when the environment demands increasing intra-organizational differentiation, this must be accompanies with associated increasing intra-organizational integration (no matter how difficult combining these two may be). The research presented in this paper however, demonstrates how such apparent difficulties of matching these two opposing activities actually occur in modular enterprise architectures, and how and why this can both lead to competitive advantage and competitive disadvantage.

Functional Performance. The framework also begins to expose an apparent contradiction regarding the relative *functional performance* of modular vs. integral systems, depending upon the underlying ontological underpinnings of the phenomena under observation. When viewing systems as mechanistic e.g. in products (Ulrich, 1995) or even supply chains (Fine, 1998), a set of architectural propositions emerge which may in fact differ from those which emerge from a more complex organic point of view of organisms – and crucially – organizations, where dynamic capabilities (Teece, Pisano and Shuen, 1997) may exist.⁶⁸

Architectural theorists have posited that modular (or loosely-coupled) systems exhibit relative lower-cost. This may in fact be true for products or organizations viewed mechanistically, however for those organizations exhibiting integral architectures which enable the development of dynamic capabilities, the converse appears to be true.

Conversely, the same architectural theorists have posited that integral (or tightly-coupled) systems exhibit efficiency due to function-sharing, resulting in relatively higher performance system architecture. Our theory however demonstrates that "high-performance" is a relative property which is contingent upon the demands of the environment, whereby modular (or loosely-coupled) enterprise architectures can exhibit higher performance than integral, provided that the environment demands and rewards short-term speed and flexibility.

Evolvability. Finally, the framework also engages the classic premises of theories of systems architecture, and in doing so, begins to expose an apparent contradiction regarding the relative *"evolvability"* of modular vs. integral systems. Architectural theorists from Simon (1962) to Baldwin and Clark (2000), have posited that modular (or loosely-coupled) systems create an "option value" which copes well with future environmental design uncertainties, resulting in a more adaptable system architecture.

However, this research begins to demonstrate that by applying the same principles of system architecture to the more complex settings of organisms - and crucially - organizations, one can begin to observe empirically from the case studies discussed herein, that integral (or tightly-coupled) systems may in fact have higher evolutionary capabilities than modular systems – the key being the time horizon over which design evolution occurs. If the environment is relatively stable and certain, requiring only continuous albeit incremental design changes, then wholesale system-wide change is possible, and it is the integrality of the architecture of the enterprise that creates the setting for such organizational learning. If, however,

⁶⁸ As an aside, the dynamic capabilities theorists (Teece, Pisano and Shuen, 1997) define these capabilities as "the firm's ability to integrate, build, and reconfigure internal and external competences to address *rapidly* changing environments". We note that such capabilities appear apply also to firms in less rapidly changing environments, like *Toyota Motors* and *Southwest Airlines* (which ironically, Teece et al. name in their seminal paper).

the environment is relatively unstable and uncertain, the potential for radical design changes over a relatively short period of time is beneficial, and it is the modular architecture that enables such short-term flexibility.

The establishment of a universal "design rule" of architectural evolvability, appears to be contingent therefore in the epistemological characterization of the system under consideration, with modularity apparently conferring adaptability in mechanistic systems in turbulent environments, while integrality appears to confer adaptability in organic systems in stable environments.

Varieties of Capitalism & Mixed Duopoly Research

While most of the recent research in applying theories of the political economy to the firm (Hall and Soskice, 2000) has focused on descriptive models of macro-organizational forms, few have focused on firm performance as the dependent variable, explaining the environmental contingencies (e.g. market maturity) under which firms embedded in each of the national institutional archetypes (Liberal Market Economies vs. Coordinated Market Economies) tend to dominate.

This research empirically identifies a significant outlier (i.e. *Southwest Airline's* integral enterprise architecture), a Coordinated Market Economy-based firm, which is embedded within the archetypal US Liberal Market Economy. It has not only survived, but has grown to dominate the US airline industry comprising a population of incumbent LME firms. This case appears to offer significant counter-intuitive insights for both managers and a rich data set for researchers on how to create an inter-organizational architecture which does not utilize the apparent "natural" strengths of a national institutional archetype.

Similarly, in recent micro-economic research about mixed duopolies (e.g. Lambertini & Rossini, 1998), much has focused on theoretical models which determining equilibrium states, whereas this research attempts to demonstrate dis-equilibrium dominance-switching dynamics, and presents empirical evidence for such preliminary claims.

Limitations of Theoretical Framework

The framework presented herein aspires to initiate a theoretical basis for explaining the evolution of business ecosystems, by building from the foundations of the intellectual domains of strategic management and ecological-level organizational theory, and bridging across them with system architecture theory. Inevitably, such an endeavor will fall far short of its aims, some of the limitations of which are briefly discussed below.

External (Spatial) Validity. While the framework possesses reasonably strong internal validity, it is clearly limited in its external validity, i.e. in its generalizability or the scope of its applicability. This is due both to the small N theoretical sample size inherent in this initial exploratory study, as well as due to the rather narrow boundary around the environmental conditions for applicability: i.e. industries which exhibit product & process innovation (Klepper, 1996, pg. 565.). Such limited generalizability is likely to limit the utility of the framework, provided that the pursuit of greater generalizability is possible with such dynamically and functionally complex systems.

External (Temporal) Validity. The framework is limited temporally in its ability to explain the evolution of business ecosystems only from growth through maturity phases. Empirical data, upon which the framework was founded does not yet exist for industrial decline phases.

Future Research

As such a framework undoubtedly raises more questions than it answers, a rich research agenda can be developed which seeks to characterize the structure, function, and evolution of various species of organizational sets and their ecosystems. Some examples of this research might include the following:

Increase External Validity. The most important next steps would include additional longitudinal fieldbased case studies of competitors in other industries, exhibiting significant long-term variance in dependent and independent variables, enterprise architecture and firm performance respectively. This is needed not only to improve the external validity of the existing theoretical framework, but more importantly to begin to map out the key parameter ranges, which might alter the structure and behavior of the industry's evolution. For example, what is the effect of rapid changes to the exogenous variables like technology supply? Would *environmental selection* create a new enterprise architecture in such an environment, or would *managerial adaptation* evolve the incumbent firm due to the perpetually low levels of structural inertia?

Expand Temporal Scope of Framework. Additional empirical work is required in the case studies involved in this paper to determine what happens as industries evolve into later stages of maturity and eventually decline. Do all enterprise architectures begin as integral for exploration and eventually disintegrate for exploitation, creating a law of enterprise entropy? Conversely, do late entrants with integral architectures increase their integrality as the industry matures and declines, as the mathematical formalism would suggest?

Part I: RESEARCH DESIGN

Chapter 1 Introduction

1.1 Setting

This chapter will briefly answer the key "what?" and "why" questions regarding the research design. Chapter 2 will then go on to answer the "how?", "where?" and "when?" questions.

"It is not the strongest of the species that survive, nor the most intelligent, but the one that is **most** responsive to change."⁶⁹

"In the natural world, species evolve – that is, they change to meet new challenges – or they die. The same genetic imperative operates in business."⁷⁰

At its fundamental level, this research is about explaining long-term organization performance, at an architectural or morphological level – namely how do organizational species evolve, via managerial action or via environmental selection?

1.1.1 Research Abstract

"This is a comparative study of six organizations [three pairs, each] operating in the same industrial environment. The subsystems in each organization were differentiated from each other in terms of subsystem formal structures, the member's goal orientation, member's time orientations and member's interpersonal orientations. A relationship was found between the extent to which the states of differentiation and integration in each organization met the requirements of the environment and the relative economic performance of the organizations."⁷¹

This research aims to contribute to a fundamental debate in the field of strategic management regarding the source of long-term firm performance – namely does it reside within the firm or in the firm's environment? The answer is hypothesized to lie neither exclusively within the firm, nor in its environment, but in *how the firm interacts with its environment* – i.e. in the nature of the *architecture* of the firm's *extended enterprise*⁷².

"One of the enduring problems facing the field of strategic management is the lack of theoretical tools available to describe and predict the behavior of firms and industries. The fundamental problem is that industries evolve dynamically over time as a result of complex interactions among firms, government, labor, consumers, financial institutions, and other elements of the environment. Not only does industry structure influence firm behavior, but firm behavior in turn can alter the structure of an industry and the contours of competition."⁷³

Using concepts from the emerging field of *engineering systems* taken from the intellectual domains of *system architecture* and *system dynamics*, a framework is developed which traces the co-evolution of firms and their environments using their most abstract system properties of *form*, *function*, *structure*, *behavior* and *environmental fit*. The framework, which is rooted in the

intellectual traditions of contingency and configuration theories, posits the evolution of "dominant designs" in enterprise architectures throughout an industry's life-cycle, which oscillate deterministically and chaotically between *modular* and *integral* states.

"From a complexity perspective, research will have to focus on hypotheses about whole systems, their dynamics and the relationship between the dynamic and success."⁷⁴

The research builds grounded theory based initially on a seven-year, multi-level, multi-method, longitudinal case study of the enterprises of *Boeing* vs. *Airbus*, the global duopoly in the commercial airplane industry. The theory is further tested and generalized across a theoretical sample of firms in manufacturing and service sectors, with nonlinear dynamic simulation models developed to capture the governing dynamics of long-term firm performance. The developed framework is grounded empirically, analytically as well as theoretically by synthesizing a broad literature of enquiry ranging from economics to organizational theory.

"A fundamental understanding of **industry evolution** is critical to **strategy research**. The mechanisms that impart advantage for some firms over others should be evident in their effects on industry dynamics, and their efficacy will likely be altered with the course of industry evolution. The study of the effects of **interdependency** on industry evolution provides a very useful mechanism for strengthening the connections between both past and future strategy research at the firm and industry levels."⁷⁵

1.1.2 Rhetorical Style

This dissertation is written in the style of "scholarly dialogues". As opposed to merely citing relevant references, original quotations from prominent researchers are used throughout in order to capture the richness and clarity of their original arguments.⁷⁶

As one of the central points of this research is the identification and characterization of interspecies competition, where relevant, any quotation referring to growing market environments, or incumbent species, which manifest themselves today as having modular enterprise architectures will be shown in blue. Conversely, any quotation referring to maturing market environments, or challenger species, which manifest themselves today as having integral enterprise architectures will be shown in red.

⁷⁶ Bold has been added *ex post* by this author in order to emphasize points made in this dissertation.

1.1.3 International Academic Collaboration

As shown in Figure 52 below, this work is the product of a series of both collaborative and competitive and yet integrative partnerships between the following world-class institutions:

- The academic institutions of MIT and The University of Oxford: ٠
 - Within MIT:
 - Engineering Systems Division
 - Sloan School of Management
 - Within Oxford: 0
 - Templeton College⁷⁷
 - Saïd Business School .
- The academic / industrial partnerships:
 - Within MIT:
 - Leaders for Manufacturing (LFM)⁷⁸
 Lean Aerospace Initiative (LAI)⁷⁹
 - Within Oxford:
 - Oxford Executive Education (OEE)
- The industrial competitors engaged with these academic institutions:
 - o Boeing
 - o Airbus

1.1.4 Doctoral Committee

The doctoral committee is designed to meet the overall logic inherent in the research plan. Its composition is an integral part of the research design supporting the research question and methodology. The committee, shown in Figure 53 below, represents the academic institutions upon which this research is based: the MIT *Engineering Systems Division*, the *MIT Sloan School of Management*.

The committee individually and collectively has functional, epistemological and industry-based domain expertise. In support of the international case study upon which this research is based (which will be outlined in detail in this document), the committee is based out of the following geographical centers:

- Dr. Charles Fine Professor, *Sloan School of Management* and *Engineering Systems Division* Massachusetts Institute of Technology, USA
- Dr. Deborah Nightingale Professor, *Engineering Systems Division* and *Aeronautics & Astronautics* Massachusetts Institute of Technology, USA
- Dr. Yossi Sheffi Professor, Engineering Systems Division and Civil & Environmental Engineering Massachusetts Institute of Technology, USA
- Carolyn Corvi Vice-President / General Manager of Airplane Programs Boeing Commercial Airplanes⁸⁰

1.1.4.1 Informal Committee

In addition to my core committee at MIT in the US, I was priviledged to have intellectual support during the European phase of my research, at the University of Oxford in the UK, the base from which I studied *Airbus*. The primary faculty with whom I worked were:

- Dr. Mari Sako
 Professor, International Business
 Saïd Business School, The University of Oxford, UK
- Dr. Sophie Marnette Professor, Linguistics & Philology The University of Oxford, UK

⁸⁰ Recently retired.

1.2 Research Questions

"Hinnings and Greenwood (2002) bemoan the fact that organizational scholars have stopped asking big, important questions and instead have devoted an increased focus on technical precision and manageable research projects."⁸¹

This research dissertation is driven to answer some of the most fundamental academic questions within the field of strategic management as well as some of the most pressing questions facing senior leaders in some of the most competitive environments in industry. In this sense, theory and empiricism are tightly coupled and are the driving impetus behind this research endeavor.

"Often by definition, truly important research questions do not have clear solutions until after the research has been conducted. If solutions are well known in advance of the research, the question may be appropriate for consulting practice, but clearly not for basic scientific research... At issue here is not that strategic management research incorporates elements of consulting practice. The issue is one of formulating and addressing important research questions that capture the attention and motivation of scholars and practitioners alike in the merits for studying them."⁸²

⁸¹ Pfeffer (2005), pg. 99.

⁸² Van de Ven, A.H. (1992), pp. 181-182.

1.2.1 Primary Research Questions

This research attempts to answer a set of *primary* questions seeking explanations for firm performance and the nature of competition as well as a set of *secondary* questions regarding the origins of firm performance and the nature of strategic choice. The *primary* set of research questions focus on "what" is the relative explanatory power of different determinants of firm performance. The *secondary* set of research questions focus on "bow" the different determinants of firm performance are formed.⁸³ Each set of questions will be discussed briefly in the following sections.

1.2.1.1 High-level question

In its highest, most abstract form, this research plan focuses on the following question:

"Why do firms in the same industry vary systematically in performance over time?"⁸⁴

Seeking a *systematic* explanation of a *longitudinal* phenomenon inevitably requires characterizing the evolution of the industrial ecosystem, as both the organization (firm) and its environment (industry, markets and institutions) are co-evolving. This question is therefore explored *systematically* and *longitudinally* through the lens of Engineering Systems: 1) within the *domain* of Extended Enterprises, where architectural competition is examined in a theoretical sample of three classic engineering systems: aerospace, automotive and airlines; and 2) using the *approaches* of Design and Dynamics, by analyzing enterprise architectures and their change management processes and by modeling their competitive dynamics.

This fundamental question, which lies at the center of an ongoing debate in the strategic management research community, is the most generalized form of the research question posed by the doctoral plan described herein.⁸⁵ The debate in question is between those who assert that the sources of differential firm performance and competitive advantage lies in firm positioning within the *external* environment of the industry versus those who assert that advantage lies in a firm's *internal* resources.

The industry structure proponents argue that in a competitive environment, firm heterogeneity is a short-lived phenomenon, and that any internal advantage would be quickly discovered and competed away. The resource-based theorists argue that such sustainable advantages arise from rare and inimitable capabilities.⁸⁶

While recent empirical studies (Hansen and Wernerfelt, 1989; Rumelt, 1991; Powell, 1996; Roquebert et al., 1996; McGrahan and Porter, 1997; Wiggins and Ruefli, 2002; Hawawini et al.,

⁸³ Farjoun, M. (2002), pp. 565.

⁸⁴ This question has been posed by numerous researchers, including Nelson, R. (1991) and Hoopes, D.G. et al. (2003). I am indebted to Prof. Mari Sako for pointing this out to me.

⁸⁵ Population ecologists are interested in the general question on why firms differ in disequilibrium as well as equilibrium states, while strategic management researchers are implicitly interested in a subset of firm heterogeneity: namely why firms differ in equilibrium or, why successful firms differ (Carroll, G., 1993).

⁸⁶ Wiggins and Ruefli (2002) explore the sustainability of competitive advantage using a rare longitudinal sample comprising 6,772 firms in 40 industries over 25 years, demonstrating just how rare the phenomenon is.

2003)⁸⁷ have in fact begun to quantify the relative importance of each point of view, other researchers have noted that this debate in fact misses the point:

"The debate as to which of the resource-based or the industry structure perspectives on firm strategy is the more valid is not a particularly useful one as **both** organizational capabilities and the firm's environment drive strategy and performance."⁸⁸

Noted economist Alfred Marshall characterized the irony of choosing in this external-internal debate via analogy:

"Context and capability provide two blades of strategic scissors that come together in the creation of a corporately value-added output."⁸⁹

This research therefore attempts to discover the deep underlying foundational nature of longterm firm competitive performance as the dependent variable, and the evolutionary systemic interactions between the firm's capabilities and its environment. This research therefore attempts to:

"...respond to the lack of understanding about co-evolutionary processes within the field of strategic management and to calls for more studies that synthesize firm- and industry-level perspectives in strategy and organization research."⁹⁰

"The interplay between organizational processes and industry dynamics in determining the firm's 'capability trajectory'... [as] an open systems perspective is clearly not new. However, the strategy field has not been terribly effective at bridging such levels of analysis and perspectives."⁹¹

In particular, the notion of *enterprise architecture* is developed to provide a guiding causal explanation for the observed phenomena, as shown in Figure 54 below.⁹² It is hypothesized that this meso-level *enterprise architecture* reflexively shapes and is shaped by the firm's internal capabilities as well as simultaneously shapes and is shaped by the external environment. In the spirit of *structuration* theory (Giddens, 1979), an enterprise's architecture simultaneously enables and constrains managerial action, but does not necessarily determine it.

Various "species" of enterprise architectures will be described which have varying degrees of designed environmental fit. Instead of the environmental determinism defining managerial action or vice versa, we will investigate the conditions under which managers reflexively "define how the environment defines my organization." This theory therefore attempts to build on theories of influential scholars like Edith Penrose:

"Firms not only alter the environmental conditions necessary for the success of their actions, but, even more important, they know that they can alter them and that the **environment is not independent** of their own activities."⁹³

⁹² The original pilot research study which explored these concepts is Piepenbrock T.F. (2004).

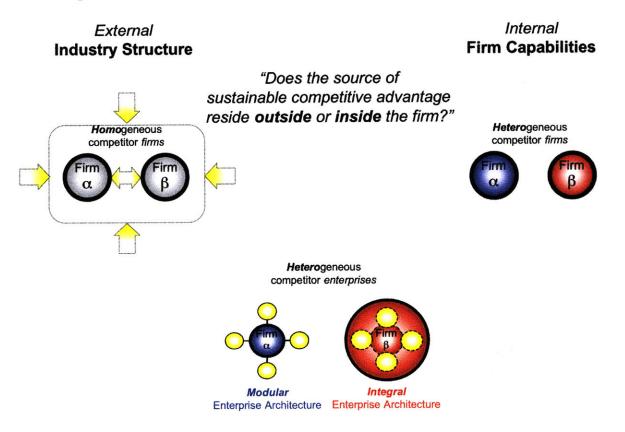

Figure 54: Enterprise Architecture as a synthesis of External-Internal Theories

In addition to merely describing enterprise architectures as static phenomena, this research also aims to explore how they compete diachronically, and finally how this diachronic competition shapes the evolution of the enterprise architectures themselves over time.

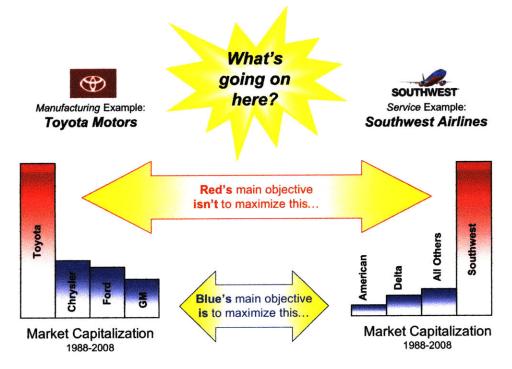

1.2.1.2 Mid-level question

Embedded in the preceding discussion lies a slightly lower-level, less abstract, and more specific question which derives from Penrose's (1959) original research:

"How do firms that have a stakeholder approach differ in competitiveness, commitment, and strategic flexibility from firms that maximize stockholder wealth?"⁹⁴

This question actually forms the central focus of the research. In fact, as will be demonstrated in Chapter 3, the question will be stated more provocatively as "How do firms whose primary objective is to maximize shareholder value, deliver significantly less of it than those firms who are not trying to maximize shareholder value?" Figure 55 below summarizes the question as applied to two world-class companies, *Toyota Motors* in the manufacturing sector, and *Southwest Airlines* in the services sector.

The answer will be hypothesized to lie in how firms manage their firm-environment ecosystems; in whether or not cause and effect are perceived to be close or distant in space and time. Such a complex and counterintuitive question will drive the need for a research design that embraces both dynamic and behavioral complexity, as will be discussed in Chapter 2.

⁹⁴ Rugman, A.M. and Verbeke A. (2002).

Although clearly a subset of the original abstract, high-level firm performance question, this question focuses the problem more clearly on those firms that have different objective functions. It is important to note that this question therefore focuses the research away from the more generalized question of competition among firms regardless of their objective functions, whether they be the same or different.

It will be hypothesized later in this research, that the firm's objective *function* drives the firm's relationship with its immediate environment or extended enterprise – both spatially and temporally. More explicitly, enterprise architectural *form follows function*.

1.2.1.3 Low-level question

Finally, the above high- and mid-level questions ultimately derive from the idiosyncratic, context-specific, low-level question that arose from industry:

"How did Airbus emerge from obscurity in the commercial aircraft industry and unseat Boeing as the premier commercial aircraft company in the world?" $p^{0.95}$

This question is interesting given previous research studies (Collins and Porras, 1994) have classified *Boeing* as "built to last" - that is "visionary", "successful" and "enduring" compared to its lifelong rival, *McDonnell Douglas* (which it ultimately acquired).

"How did **Boeing** emerge from obscurity in the commercial aircraft industry and unseat **McDonnell Douglas** as the premier commercial aircraft company in the world?"⁹⁶

Again, this form of the question is clearly a subset of the original abstract, high-level firm performance question. In addition, is can be demonstrated to be a form of the more specific mid-level question regarding the stakeholder-shareholder dichotomy.

In attempting to provide an answer to this low-level question, this research plan will in addition attempt to move back up in abstraction to provide a more general, mid-level theory explaining systematic long-term performance differences between competing enterprise architectures. While no explicit claims will be made for a higher-level theory, this research attempts to incrementally contribute to the original debate of firm performance in the field of strategic management.

⁹⁵ This question, which originated from *Boeing* senior executive committee during the initial two-year pilot study is an example of other industry and firm-specific questions like explaining *Toyota & Southwest Airlines* success over their dominant rivals *GM & Ford* and *American & United Airlines* respectively.

⁹⁶ Collins and Porras (1994), pg. 17.

1.2.2 Secondary Research Questions

While the *primary* research questions come from the applied field of strategic management, a second set of questions arose as the research progressed from strategic management's foundational disciplines: economics and sociology as shown in Figure 56 below. These surrounded the fundamental nature of firms (vs. markets) as well as the epistemological nature of strategic choice (vs. determinism).

"I advance two related theses. First, economic theory predicts that organizations will be a mess but not a mystery. Second, classic case studies conducted by organizational sociologists support this prediction. Fully defending and articulating these theses will require a book...""⁹⁷

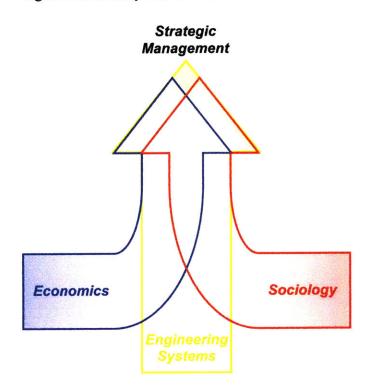

Figure 56: Primary Intellectual Social Science Fields

"I suspect that there is an enduring reason that the neoclassical 'economic man' theories seem to have more reach, resonance, and staying power than people-centered stakeholder relations theories. They are easier to teach, easier to do. Economic theories are neat. People are messy. Analytics are crisp, emotions are messy.""⁹⁸

⁹⁷ Gibbons, R. (1999), pg. 145.

⁹⁸ Kanter (2005), pg. 94.

1.2.2.1 Debates in *Economics*

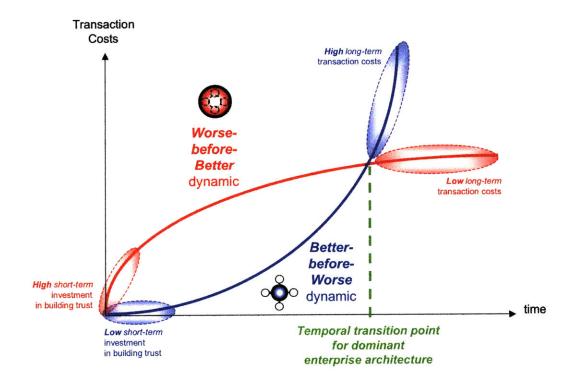

1.2.2.1.1 Markets vs. Hierarchies

A fundamental question in the field of economics surrounds the very nature of the firm (Coase, 1937; Williamson, 1975, 1985), positing their existence is due to the failure of markets.

The fundamental construct posited by this research dissertation – enterprise architecture – attempts to engage this market-hierarchy debate by challenging the boundaries of the firm as a unit of competitive advantage via such mechanisms as transaction costs and relational contracting.

1.2.2.1.2 Firm Boundaries and Minimization of Transaction Costs

Williamson's (1975, 1985) transaction cost economics (TCE) proposed that firms should organize their spatial boundaries to minimize transaction costs. This proposed research attempts to enrich the TCE dialogue by exploring the nonlinear dynamic relationships governing which time horizons do Williamson's prescriptions apply. As shown in Figure 57 below, do temporal boundaries affect the spatial boundaries? Does short-term minimization of transaction costs?

1.2.2.2 Debates in Sociology

1.2.2.2.1 Debates in Organizational Theory

This firm-environment interaction forms a central and ongoing debate in strategic management and organization theory. The richness and complexity of this debate is captured through the following two "diagonal" questions of Astley and Van de Ven's (1983) integrative meta-theoretical framework and shown in Figure 58 below.⁹⁹ Namely, the northwest-southeast diagonal:

"Is organizational life determined by **intractable environmental constraints**, or is it actively created through **strategic managerial choices**?"

and the equally challenging southwest-northeast diagonal:

"Are organizations neutral technical instruments engineered to achieve a goal, or are they institutionalized manifestations of the vested interests and power structure of the wider society?"

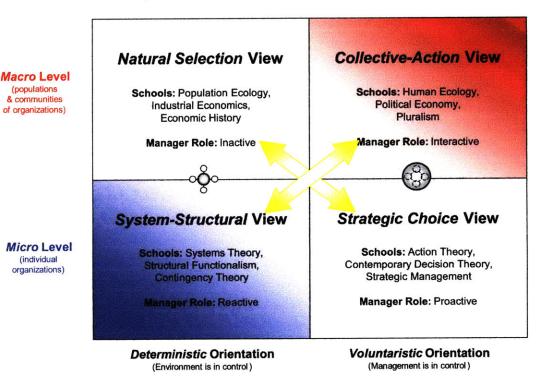

Figure 58: Central Debates in Organization Theory¹⁰⁰

⁹⁹ Astley and van de Ven (1983), pp. 245-273.

¹⁰⁰ Astley and van de Ven (1983).

1.2.2.2.1.1 Social Determinism vs. Human Choice

In the first question, the enterprise architecture is either defined by the environment - leaving no room for managerial action, or it is built endogenously by powerful proactive leaders.¹⁰¹

1.2.2.2.1.2 Macro-Industry vs. Micro-firm

In the second question, the firm is seen as being either overwhelmed by the exogenous forces of the environment, or as being an integral part of an endogenized extended enterprise. The implications are that managers should either *react* to the contingent demands of the environment, or they should *interact* with their extended enterprise.

What these two questions clarify is that long-term firm performance is a complex interaction played out on at least two dimensions: the macro- (industry) vs. micro- (firm) level, and the social determinism vs. free will duality of human nature.

"As far as 'choice vs. determinism' is concerned, the alternative perspective focuses on the possibility of open-ended choices available to agents made possible by chaotic dynamics, but constrained by the feedback structure of the system. Even though the system may be deterministic with regard to structure, it is open-ended with regard to outcome."¹⁰²

As will be discussed in subsequent chapters, this research proposes an intermediate vehicle for explanation between the choice-determinism debate. The enterprise architecture construct simultaneously enables and constrains, but does not determine the outcomes.

1.2.2.2.1.3 Differentiation vs. Integration

Organizational theorists – and most notably structural contingency theorists (Lawrence and Lorsch, 1967) – noted that tasks tended to be differentiated and then reintegrated. This research dissertation empirically clarifies that *successful* firms match appropriate levels of differentiation with integration, while in less successful firms, levels of differentiation tend to exceed levels of integration.

¹⁰¹ Empirically, this question arises when examining the origin of integral enterprise architectures like *Southwest Airlines* and *Airbus Industrie*. In the *Southwest* example, it is hypothesized that the enterprise architecture is built proactively and internally (or endogenously) by the visionary founder and chairman, Herb Kelleher. Conversely, in the *Airbus* example, it is hypothesized that the enterprise architecture is built inactively and externally (or exogenously) by the founding European nations.

¹⁰² Stacey, R.D. (1995), pg. 490.

1.2.2.2.2 Debates in Population Ecology

1.2.2.2.2.1 High Mortality Rates of Late Entrants

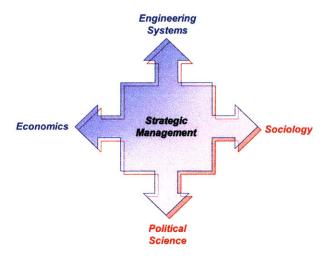

The sociological sub-field of population ecology has long observed that late entrants in an industry's evolution (e.g. those arriving post-dominant design) tend to have higher mortality rates (Hannan and Freeman, 1984). Plausible hypotheses and explanations have focused on firm age and inertia, both as a strength and a weakness in determining firm mortality.

This research dissertation however identifies a special "species" of late entrant, who not only survive against the odds, but in fact thrive and go on to dominate the industry. This research further moves beyond the traditional theories of inertia and explores the hypothesis of firm-environment co-evolutionary fit.

1.2.3 Tertiary Research Questions

While the *primary* research questions centered on the field of strategic management, and the *secondary* research questions centered on its constituent fields of economics and sociology, the *tertiary* research questions focus on the fields at the core of the primary explanatory variable of this research: the architecture of the extended enterprise. As will be discussed later, this builds from well-established theory in engineering systsms (i.e. theories of systems, complexity and architecture), as well as from well-established theory in political science (i.e. theories of power and politics), as shown in Figure 59 below.

While the above are the broad scientific disciplines embraced with this research, it would be helpful to narrow down the intellectual space so that I might point out a few notable interactions which this work attempts to contribute. As shown in Figure 60 below, this research is effectively about the intersection of strategy, leadership and macro-organizational design and change. The intersections most relevant to this research are: Strategic Leadership, Strategic Organization, and Leadership of (not in) Organizations (Hooijberg et al., 2007).

Figure 60: Research at the Intersection of Strategy, Organization and Leadership

1.3 Research Objectives

The purpose and objectives of the research are three-fold: First to *describe* empirically the evolutionary trajectory of internal capabilities of selected competing firms and the evolutionary characteristics of the external environment within which they compete. Second, to *explore* the evolutionary trajectories of the strategies employed by these firms, and finally to *explain* how the external environment and internal capabilities interact over time to produce performance trajectories - that is how, when and why these firms dominate their industry.

"The final product of building theory from case studies may be concepts, a conceptual framework, propositions, or possibly mid-range theory."¹⁰³

Although admittedly ambitious, the intended output of this research is a meta-theoretical framework or model whose purpose is to organize and advance existing mid-range theoretical models.¹⁰⁴

1.3.1 The Rigor-Relevance Dialectic

The dialectic between the thesis (rigor) and antithesis (relevance) is well-known in the academic and practitioner literatures.

"Academic fights are more brutal than fights in the real world because the stakes are so low."¹⁰⁵

"Organizations have become the dominant institution on the social landscape. Yet the body of knowledge published in academic journals has practically no audience in business."¹⁰⁶

"Cooperation between academics and managers is so rare that when it happens, it makes national newspaper headlines. It is hard to be both rigorous and relevant. This dilemma occurs because the set of skills, values, mind-sets, and attitudes that are needed to conduct rigorous academic research are fundamentally different from the set of skills, values and attitudes needed to conduct managerial research. The two skill sets also conflict. By trying to do both, an academic researcher runs the risk of paying a huge straddling cost... one has the trade-offs that arise from inconsistencies in an academic's image or reputation... Although great ideas are always welcome, the truth of the matter is that most good managerial research is not of this kind... One type of managerially relevant research is the one intended to develop grand new theories without the necessary empirical evidence to support them. The idea is to develop these theories and then have future researchers empirically test them for accuracy and validity (think of Darwin's theory of evolution). This type of research requires a writer to take creative leaps an offer ideas and insights not immediately supported by available data. This is risky business, and we should enourage young colleagues to avoid this type of research. It is better suited to academics who can afford to take such risks – perhaps academics who have already received tenure in the system. "¹⁰⁷

¹⁰³ Eisenhardt, K. (1989), pg. 545.

¹⁰⁴ This ambition was similarly stated by Farjoun, M. (2002), pp. 572.

¹⁰⁵ This quote is most recently from an interview with Dr. Henry Kissinger (Summer 2003 issue of *Bulletin*, the American Association of Neurological Surgeons). He embraced both sides of the relevance-rigor debate as a professor for nearly 20 years at Harvard University, US national security advisor, secretary of state under two US presidents, and Nobel laureate. He playfully highlights both sides by acknowledging the importance of rigor, but evaluates it within the relevance frame.

¹⁰⁶Daft & Lewin (1990), pg. 1, in their paper launching the new academic journal, Organization Science.

¹⁰⁷ Markides, C. (2007), pp. 762, 764 and 766.

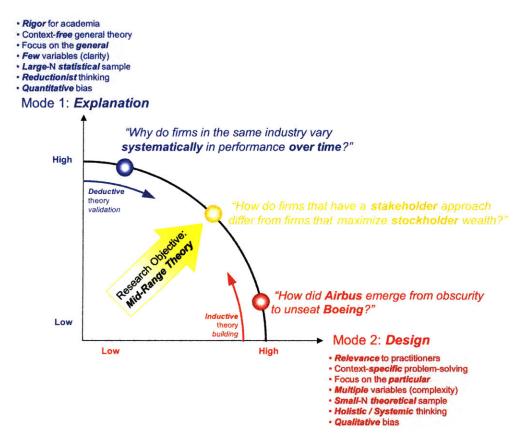

"Analyzed are 32 established organizational science theories in terms of their rated importance, validity, and usefulness. Little evidence of any relationships among these variables is found."¹⁰⁸

The resolution of this dialectic between thesis and antithesis into a workable synthesis - while difficult - requires a higher level of abstraction.

"I have striven in these writings of mine, without defacing the truth, to satisfy **everybody**; and perhaps I have not satisfied **anybody**, and if this should be so, I shall not be astonished by it, because I judge it impossible, without angering **many**, to write of the affairs of their own times."¹⁰⁹

As shown in Figure 61 below, these complementary objectives refer to the classic 'rigorrelevance' debate in management (Argyris and Schon, 1991), which are distinguished as 'mode 1' knowledge production which is primarily driven by academic concerns, and 'mode 2' which is primarily an intense interaction between knowledge production and knowledge dissemination and application (Gibbons et al., 1994).

"Somewhere between the specific that has no meaning and the general that has no content there must be, for each purpose and each level of abstraction, an **optimum degree of generality**".¹¹⁰

¹⁰⁸ Miner, J. (1984), pg. 296. The relevance-rigor dialectic is posed by Vermeulen, F. (2005).

 ¹⁰⁹ From Niccolo Machiavelli's *The History of Florence*, quoted in Feaver, G. (1984), pg. 564.
 ¹¹⁰ Boulding, K.

1.3.2 Multi-modal Objectives

"To predict requires that we posit a correlation between present and future events; to explain we posit a correlation between present and past events."¹¹¹

The objectives of this research are divided in the following subsections into the primary objectives rooted in the *explanatory* sciences, and the secondary objectives rooted in the *design* sciences (van Aken, 2004) or *policy* sciences (Etzioni, 2006).

1.3.2.1 Mode 1 objective: Explanation / "Prediction"

"Evolutionary explanations are scientifically legitimate, even if they can't be used to predict the exact nature of changes."¹¹²

Due to the inherently complex, highly nonlinear and potentially chaotic nature of the phenomenon being studied, long-term prediction is not feasible in a *deterministic* sense. However, as the theory developed herein is evolutionary, processes of variation, selection and retention act to make *probabilistic* predictions.

"Hypothetical probability predictions do not have any value for actual prediction except insofar as the conditions mentioned in the hypothesis are predictable or experimentally producible; hence there will be cases where we can explain why certain animals and plants survived even when we could not have predicted that they would."¹¹³

The research does however aspire toward understanding and explanation by uncovering the underlying causal structure which drives behavior. While the establishment of the causal structure is possible, the variety of parameters in the form of decision rules, ultimately makes behavior impossible to predict. It is the pursuit of this "generic" causal structure that is "universal" and that allows for "generalization" of the theory, not in the prediction of the resulting behavior.

"The complexity, situation specificity, and changing nature of the firm and its environment strains conventional approaches to theory-building and hypothesis testing."¹¹⁴

"From a complexity perspective research will be unable to yield predictors of or prescriptions for long-term success – research will have to focus on explanation instead, on hypotheses about whole systems, their dynamics, the conditions under which they will display different kinds of dynamic, and the relationship between the dynamic and success."¹¹⁵

Figure 62 below summarzes the objectives of explanation and "prediction" superimposed on the phenomena of interest – namely, interspecies competition and the co-evolution of business ecosystems. These objectives will be matched by a research method as discussed in chapter 2.

¹¹⁴ Porter, M.E. (1991), pg. 97.

¹¹⁵ Stacey, R. (1995).

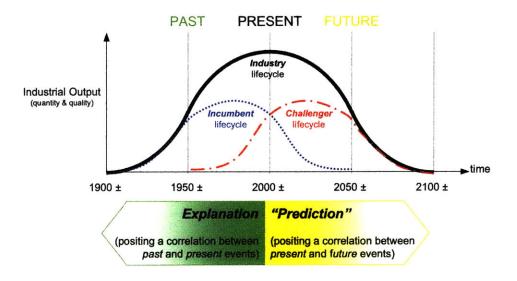

Figure 62: Research Objectives of Explanation and "Prediction"

1.3.2.2 Mode 2 objective: Design

"The scientist discovers that which exists, the engineer creates that which never was.""16

"Policy research is always dedicated to changing the world while basic research seeks to understand it as it is."¹¹⁷

The difference between the objective of the scientist and the engineer is vast. In fact social "scientists" (like Jay Forrester) who came to management from an engineering background, tended to transport a design objective for organizations.

"The goal is 'enterprise design' to create more successful management policies and organizational structures...which influence growth and stability."¹¹⁸

However, it was Nobel prize laureate, Herbert Simon (1988) who noted that the design objective was not private domain of engineers:

"Engineers are not the only professional designers. Everyone designs who devises courses of action aimed at changing existing situations into preferred ones. The intellectual activity that produces material artifacts is no different fundamentally from the one that... devises a new sales plan for a company. Design, so construed, is the core of all professional training: it is the principal mark that distinguishes the professions from the sciences. Schools of Engineering as well as schools of architecture and business... are all centrally concerned with the process of design."¹¹⁹

¹¹⁶ From aerodynamicist, Theodore von Karman (1881-1963).

¹¹⁷ Etzioni, A. (2006), pg. 833.

¹¹⁸ Forrester, J.W. (1961).

¹¹⁹ Simon, H. (1988), pg. 67.

Unlike engineering in the physical sciences or medicine in the biological sciences, management did not evolve from administrative sciences. In the field of organization studies, the design objective languished.

"Social scientists are trained to do good empirical research and descriptive theory building without being overly concerned with implications for organization design or performance outcomes. Researchers try to develop parsimonious theories based on a small number of variables that can explain phenomena across a range of organizations. Prescriptive research, however, requires comprehensive understanding of a specific situation that is not often generalizable to other settings. Most scientific journals do not encourage publication of papers whose objective is prescription or design application. Scientific journals typically favor manuscripts that provide generalizable theories from comparative empirical studies, which frequently are not sufficiently concrete or detailed enough to yield design suggestions."

With regard to the field of strategic management, Porter (1991) notes that the two primary approaches to theory building in strategy include rigorous, situation-specific, mathematical *models* of limited complexity vs. multivariate *frameworks* like the "competitive forces" approach, which capture the complexity.¹²¹

"The need to inform practice has demanded that strategy researchers ... pursue the building of frameworks rather than restrict research only to theories that can be formally modeled."¹²²

For these reasons, while this research ultimately aims for mid-range theory, it simultaneously strives for building a conceptual framework, generating rich propositions and ultimately testable hypotheses.

Although much strategy research has progressed quickly from the descriptive to the normative as it has transitioned from theory to practice, this work aims to cautiously engage the normative debate. Due to the relative immaturity of the theories developed from this research, much more confirmatory work is needed before confident normative recommendations can be made.

"The field of strategic management is avowedly **normative**. It seeks to guide those aspects of... management that have material effects on the survival and success of the business enterprise."¹²³

Normative prescription limitations notwithstanding, this research plan does not aim to stop with a rich, complex description of the case study. Rather, it adopts a *positivist* view of research, in which the goal is to develop testable hypotheses and theory which are generalizable across different settings (Eisenhardt, 1989).

"A more ambitious result would be an effective partnership of descriptive-driven and prescriptive-driven research."¹²⁴

¹²⁰ Daft and Lewin (1990), pg. 4.

¹²¹ Porter, M.E. (1991, pg. 98) notes that the use of frameworks can be challenged because their complexity makes it difficult to falsify arguments.

¹²² Porter, M.E. (1991), pg. 98.

¹²³ Teece, D. J., Pisano, G., and Shuen A. (1997).

¹²⁴ van Aken (2004), pg. 242.

This research plan therefore takes its queues from Forrester (1961), Simon (1969, 1988), van Aken (2004) and Etzioni (2006) for the development of *design* knowledge, which occupies the middle ground between descriptive theory and actual application.

1.3.3 Four Types of Scholarship

"In his book Scholarship Reconsidered, Ernst Boyer (1990) described four different kinds of scholarship: the scholarship of discovery (research), the scholarship of integration (synthesis), the scholarship of practice (application), and the scholarship of teaching (pedagogy). Historically, business schools have celebrated and accommodated as equals the practitioners of all four kinds of scholarship. Over the last 30 years, we have lost this taste for pluralism. Those with primary interests in synthesis, application, or pedagogy have been eliminated from our milieu or, at best, accommodated at the periphery and insulated from the academic high table that is now only reserved for the scientists."¹²⁵

It is important at the outset to set the expectations of the reader of this research. While by the very definition of doctoral *research*, this work intends to focus on the scholarship of discovery, it moreover attempts to embrace the pluralism of the other three forms of scholarship: integration, practice and teaching (Boyer, 1990). One of the primary reasons for such attempted plurality of scholarship is that it is in the process of engaging these "lesser" three (integration, practice and teaching) that the "primary" research form emerged. In fact, stated in a more counter-intuitive way, although the desired *end* is "good" research, the *means* employed is clearly the pursuit of the other three forms of scholarship.

"We need to temper the pretense of knowledge and re-engage with the scholarships of integration, application, and pedagogy to build management theories that are broader and richer than the reductionist and partial theories we have been developing over the last 30 years."¹²⁶

"More and more business schools are currently embarking on campaigns to hire significant numbers of clinical professors (sometimes called 'professors of practice'). These clinical professors typically excel at what Boyer called the scholarships of practice, synthesis and pedagogy."¹²⁷

¹²⁵ Ghoshal, S. (2005), pg. 80.

¹²⁶ Ghoshal, S. (2005), pg. 87.

¹²⁷ Hambrick, D.C. (2005), pg. 105.

1.3.3.1 The Scholarship of *Integration* (Synthesis)

As will be discussed in more detail in chapter 2, much of the value of this research lies in its integration of a variety of disparate intellectual traditions, ranging from economics to sociology in the social sciences to engineering and architecture in the physical sciences.

1.3.3.2 The Scholarship of *Practice* (Application)

As was discussed briefly in this chapter, much of the impetus for the development of this research was grounded in the application of real problems rooted in practice.

1.3.3.3 The Scholarship of *Teaching* (Pedagogy)

As was alluded to in the acknowledgements section, much of the actual content of this research framework was derived from the teaching and learning from research participants in the spirit of knowledge "co-creation". This included the opportunities to "teach" graduate students, faculty and senior executives at MIT and the University of Oxford, as well as executives in numerous companies within *Boeing* and *Airbus*' ecosystem.

1.3.3.4 The Scholarship of *Discovery* (Research)

Finally, although the ultimate aim of this project is to pursue the process of academic discovery within the bounds of "normal science," it must be said that any success or lack thereof will be largely constrained by the trade-offs inherent in the active pursuit of the other three forms of scholarship.

1.4 Research Framework

1.4.1 Unit of Analysis

The unit of analysis will be presented using both economics and sociological terminology, which while not identical in meaning, convey a richness of constuct unavailable with only one convention.

1.4.1.1 *Economics*-based terminology

While the dependent variable focuses on the long-term *firm* performance, this research hypothesizes that a source of this performance lies in the firm's relationship with its *environment*, therefore the unit of analysis is the firm's *extended enterprise*.

"The importance of the concepts of **differentiation** and **integration** to the analytic scheme developed here can best be indicated by the definition of the **primary unit of analysis** in this study – the **organizational system**. An organization is defined as a system of interrelated behaviors of people who are performing a task that has been differentiated into several distinct subsystems, each subsystem performing a portion of the task, and the efforts of each being integrated to achieve **effective performance of the system**."¹²⁸

The above definition of "organization" taken from Lawrence and Lorsch's classic 1967 work was used to describe *intra*-firm subsystems or functional divisions. In this research, the same definition of "organization" can be applied, only this time, defining *inter*-firm subsystems or stakeholder groups.

"By these definitions, the **boundaries of organizations** will not always coincide with their legal boundaries: some institutions, such as large corporations, encompass a number of organizations by our definition; while others, such as certain subcontractors, do not constitute a single complete organization."¹²⁹

The following definitions briefly draw distinctions among the various levels of analysis.

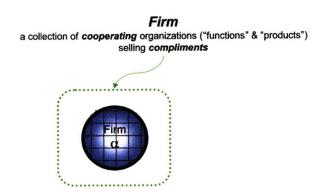

¹²⁸ Lawrence, P.R. and Lorsch, J.W. (1967), pg. 3.

¹²⁹ Lawrence, P.R. and Lorsch, J.W. (1967), pg. 4.

1.4.1.1.1 Firm

Within the firm, this research more specifically aims to focus on a subset of the firm, namely the "strategic business unit" (or SBU) as shown in Figure 63 below. This research thereby focuses on long-term firm performance in the realm of *business* strategy, as opposed to *corporate* strategy.

Figure 63: Working Definition of Firm

One of the reasons that the strategic business unit was selected as the unit of analysis is its relative importance in determining variance in profitability. Researchers (Rumelt, 1991; Powell, 1996; Roquebert et al., 1996; McGrahan and Porter, 1997; Hawawini et al., 2003) have demonstrated that 32%-45% of variance in firm profitability is directly attributed to SBU effects while only 1%-18% is attributed to corporate effects, and 10%-20% attributed to industry effects.¹³⁰

1.4.1.1.2 Industry

In ecomonics, an *industry* is the supply side of a *market*. For clarity, this research uses Porter's (1980) definition of "industry" as a collection of firms selling substitute goods or services as shown in Figure 64 below.

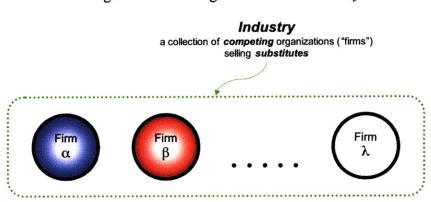

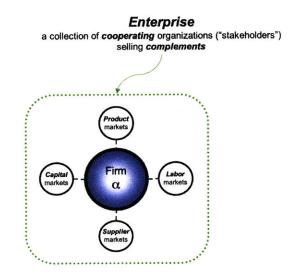

Figure 64: Working Definition of Industry

1.4.1.1.3 Extended Enterprise

"The battlefront in today's competitive wars, and the ultimate core competency of a business organization, is the design of the ... extended enterprise."131

Instead of taking an "engineering" perspective, by looking downwards and inwards into the firm itself for answers, this research takes an "architectural" perspective, by looking upwards and outwards into the firm's ecosystem¹³² or extended enterprise¹³³ as shown in Figure 65 below. The enterprise is defined as those organizations which impact the firm's success. In this sense, the enterprise can be thought of as the "environment" in traditional organizational theory.

This definition of an enterprise draws upon Barnard's (1938) concept of organizations as cooperative systems. Note that the stakeholder axes and constituent stakeholders will be discussed in detail in essay #1, as will a discussion of the firm as a "nexus of contracts" / "nexus of relationships".

The name of the firm at the center of the extended enterprise will be the "keystone" firm, borrowed from biological ecosystem theory.¹³⁴

"In strategy courses, we have presented the 'five forces' framework (Porter, 1980) to suggest that companies must compete not only with their competitors but also with their suppliers, customers, employees and regulators. "135

¹³⁰ See Appendix B.

¹³¹ Fine, C.H. (1998).

¹³² In the biological ecology literature, the organism, whose presence in the ecosystem drives the behavior and performance of many others is known as the "keystone" organism. ¹³³ As a diversified firm's SBU is the unit of analysis, one cannot ignore the parent firm's relationship to the SBU

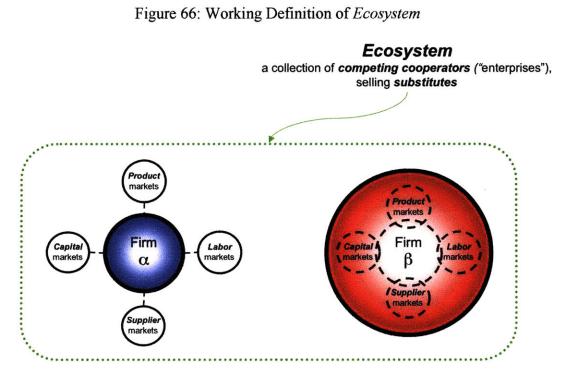

when taking an architectural perspective of the extended enterprise.

¹³⁴ Recently, Iansiti, M. and Levien. R. (2004) applied this metaphor to business ecosystems.

¹³⁵ Ghoshal, S. (2005), pg. 75.

1.4.1.1.4 Ecosystem

Finally, if an *industry* is defined as a collection of competing organizations (firms), and an *enterprise* is defined as a collection of cooperating organizations (stakeholders), then as shown in Figure 66 below, an *ecosystem* is defined as a collection of competing enterprises or "competing cooperators".

From above it should be noted that in theory, competing enterprises can be coupled through any or all stakeholders, the most common of which can be customers (i.e. product markets).

As will be discussed in the next chapter, this research dissertation will focus on the competitive dynamics of a *duopoly ecosystem*, that is, not just two competing firms, but two competing enterprises. We will also begin to explore when such "competing cooperators" become "cooperating competitors".

1.4.1.2 Sociology-based terminology

1.4.1.2.1 Organization

"Organization is the arrangement of personnel for facilitating the accomplishment of some agreed **purpose** through the allocation of **functions** and responsibilities"¹³⁶

Although the definition of an organization varies, I use a classic definition from Selznick (1948) which emphasizes *goal* or *purpose* and *functional decomposition* as important aspects. Given this research project's interest in business ecosystems, this would be similar to *firm* (or more colloquially, *company*) using economics terminology.

1.4.1.2.2 Organizational Set

Moving up one level of analysis is the organizational set, that is the organizational unit that consists of the focal organization and its interdependent organizations (or stakeholders). Again, using economics terminology, this would be similar to *enterprise* or *extended enterprise*.

"A crucial defining characteristic of the concept of **organization set** is that it views the environment from the standpoint of a specific (focal) organization."¹³⁷

The organization set level of analysis is typically used by a variety of disciplines focused on studying organizational-environment interactions, like resource dependence (Pfeffer and Salancik, 1978) and transaction cost economics (Williamson, 1975)

"Analysts employing the resource dependence approach, typically work at the level of the organization set as do many of those utilizing transaction cost approaches."¹³⁸

This research will posit a typology of organizational sets which range from internally competitive to internally cooperative (like an *interorganizational community* – see below).

1.4.1.2.3 Organizational Population

"[Populations consist of...] all the organizations within a particular boundary that have a common form."¹³⁹

Although population ecologists define a *population* of organizations as those organizations having a common *form*, the precise definition of what constitutes form is rather elusive – sometimes purposefully so.

"Hannan & Freeman (1977, 1989) explicitly refrained from proposing any fixed rules or typology for identifying organizational forms. They argued that form may be generally inferred from an

¹³⁶ Selznick, 1949, pg. 114.

¹³⁹ Hannan and Freeman, 1977, pg. 936.

organization's formal structure or normative order, and that the classification of an organization as one form or another may be specified according to the interests of the investigator."¹⁴⁰

Having noted the plurality in the current literatures, this research tends to focus on the systemic properties inherent in both architectural as well as biological definitions, namely: goals, boundaries and activities.

"Organizational forms – the specific configurations of goals, boundaries, and activities – are the elements selected by environmental criteria, and change may occur through new forms eliminating old ones or through the modification of existing forms."¹⁴¹

Organizational populations are collections of isomorphic organizations, competing within the same niche. Thus, an economist's "industry" may be comprised of one or more populations.

"Ecologists define populations as organizations exhibiting the same structural form while economists define industries as including all organizations serving the same demand or function, which could include quite diverse types of providers of substitutable products."¹⁴²

In light of the primary construct of this research – the enterprise architecture – an organizational population refers to those enterprise architectures (organizational sets) having similar architectural forms, this is modular or integral.

1.4.1.2.4 Organizational Community/Field

"Interorganizational communities and organizational fields... focus attention on a collection of diverse types of organizations engaged in competitive and cooperative relations."¹⁴³

"An organizational community is a set of co-evolving organizational populations joined by ties of commensalism and symbiosis through their orientation to a common technology, normative order, or legal-regulatory regime."¹⁴⁴

An organizational *community* or *field* transcends the level of analysis of an organizational *population* by encompassing both similar and dissimilar organizations, which allows for the potential for birth and death of organizational populations.

"A number of advantages are associated with this level of analysis. First, we can examine the interdependence and coevolution of organizations of differing types. Organizations that both compete and cooperate with similar and diverse organizations. Second, a community or field-level perspective allows us to observe not only the waxing and waning of a particular type of organization but also the disappearance of some types and the emergence of new forms (Astley, 1985). Third, the organizational field can be viewed as encompassing the other levels: the individual organization, the organizational set, and two or more populations of interdependent organizations. "¹⁴⁵

1.4.1.3 Comparision of Terminologies

Table 7 below summarizes the terminology used for the analyses in both economics and sociological terms.

 Table 7: Terminology Comparision in Economics and Sociology

Notes	Economics	Sociology
Focal unit of Enterprise	Firm	Organization
Primary construct	Enterprise	Organizational Set
Homogenous collection of competing Firms	Industry	Organizational Population
Heterogenous collection of competing Firms		Organizational Community/Field
Homogeneous collection of competing Enterprises	Ecosystem	Population of Organizational Sets
Heterogeneous collection of competing Enterprises		Community/Field of Organizational Sets

Figure 67 below summarizes the definitions in both economics and sociological terms.

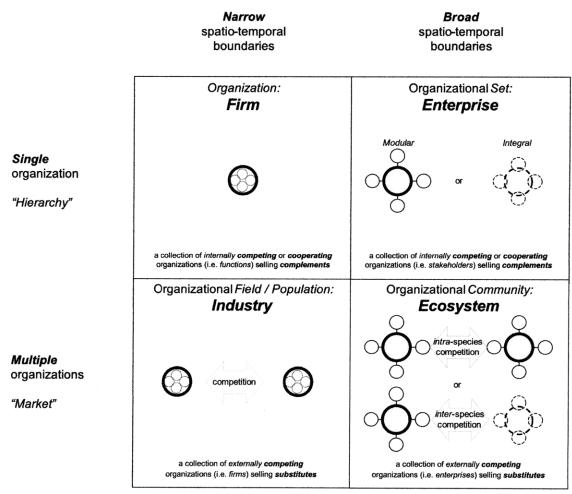

Figure 67: Summary of Working Definitions

Figure 68 below summarizes conceptually the how the unit(s) of analysis are applied to the proposed framework. Note that the primary construct of "enterprise architecture" is at the level of organizational *set*, while the overarching unit of analysis is the level of organizational *community* (of organizational *sets*).

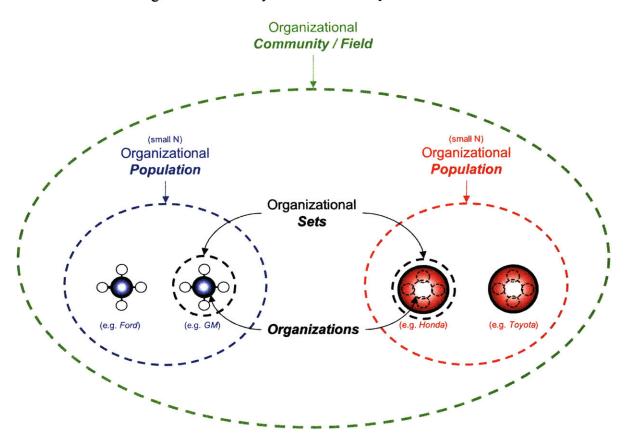

Figure 68: Summary of Units of Analysis in Framework

One final clarification of definitions is needed. This framework holds constant and focuses its investigative lens on the environment or market. For example, this may be "the design and manufacture of large commercial airplanes." This market may evolve over time in both quantity and quality spaces, and it in fact may support differing species of competitors. When one of the propositions states that dominant designs oscillate over time from integral to modular to integral, it is referring to the enterprise architectures of the dominant species, which could theoretically be the same species which evolves, or it could be the emergence and exit of multiple species. This is illustrated in Figure 69 below.

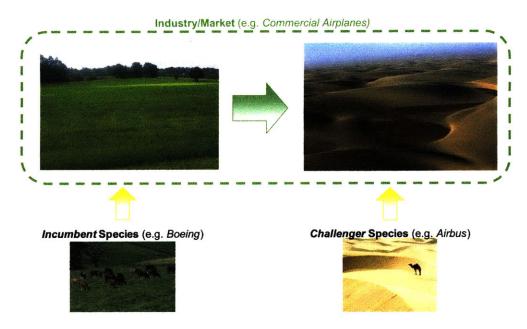

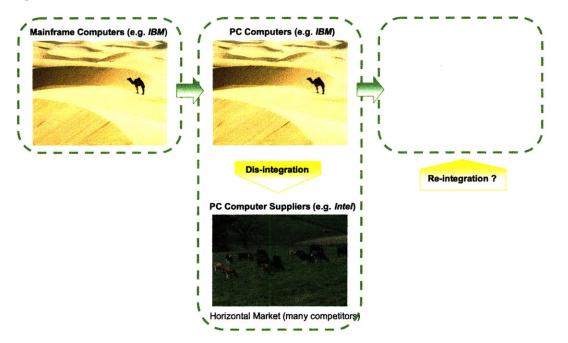

Figure 69: Focus is on the Evolution of Dominant Species within a Fixed Environment

This is in contrast with a body of resesearch (e.g. Fine, 1998) which aims to postulate theories concerning the evolution of market niches within a changing environment as illustrated in Figure 70 below. Here, the firm-supplier make-buy interface is posited to oscillate over time from integral to modular to integral.

Figure 70: Focus is on the Evolution of Market Niches in a Changing Environment

1.4.2 Variables

The following subsections briefly discuss the relevant variables used in the research dissertation. The dissertation is initially introduced in terms of the familiar and traditional correlative terms of *dependent* and *independent* variables.

"The scope of variables that basic research encompasses can be quite legitimate and effective but also rather narrow. Policy researchers must be more eclectic and include at least all the variables that account for a significant degree of variance in the phenomenon that the policy aims to change."¹⁴⁶

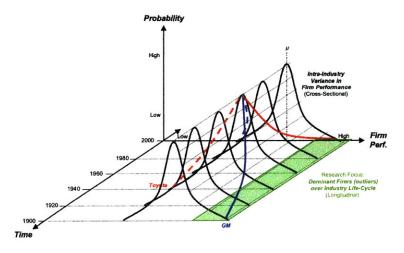

As the goal of this research is to develop complex causal mechanisms, the dissertation then proceeds to clarify the variables as *interdependent*.

1.4.2.1 "Dependent" variable: Long-term Firm Performance¹⁴⁷

At the highest, most abstract level, this research seeks to explain the variable of performance – and specifically long-term firm performance. The following subsections will decompose this variable into the definitions used for the purpose of the research.

Explanations of sustained superior firm performance in the industrial organization-based "barriers" or resource-based "inimitability" frameworks, tend to focus on cross-sectional distributions either between or within industries. This research however focuses on *longitudinal* data of *intra*-industry sustained long-term firm performance. As such, we are interested in tracking the performance of dominant firms as they grow and die throughout the industry's life-cycle, as illustrated in Figure 71 below.

Figure 71: Longitudinal Trajectories of Dominant Firms within an Industry's Evolution

¹⁴⁶ Etzioni, A. (2006), pg. 838-839.

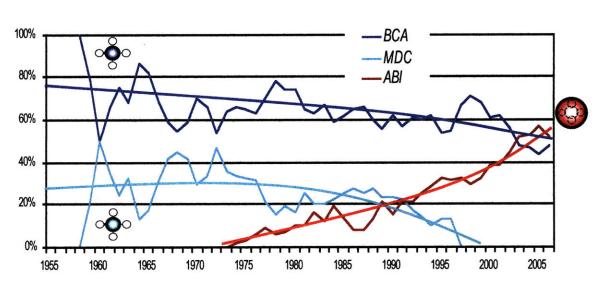

¹⁴⁷ It should be pointed out that this research attempts to explain the circular causal interactions of competencecompetition using feedback principles, therefore the explicit acknowledgement of "dependent" and "independent" variables can be misleading.

1.4.2.1.1 Defining "Long-term"

As this research seeks underlying mechanisms for how the external competitive environment shapes and is shaped by firms' internal capabilities, long-term trends must be observed. This research therefore seeks systemic "first mode" explanations of long-term trends and performance trajectories. As this research also seeks to explain co-evolution of firm performance with industrial evolution, the definition of "long-term" will correspond to the development of the industrial life-cycle S-curve. While this period will vary from industry to industry, it is observed to take from 10 to 50 years depending on the speed of industrial development.

As shown in Figure 72 below, "long-term" performance will therefore exceed the length of the typical 3-5 year business cycle. In doing so, local "non-systemic" (or higher mode) explanations for firm performance will be "filtered out". Examples of such non-systemic causal explanations include various *endogenous functional* explanations: e.g. a better/worse product design, a more/less effective marketing campaign, a labor strike, or various *exogenous environmental* explanations: e.g. the oil-crisis, 9-11 terrorist attacks, etc. This research is interested in those enabling and constraining "structures" (or enterprise architectures) which consistently and systematically create better product designs, more effective marketing campaigns, no expensive labor strikes or which consistently and systematically control exogenous events .

Figure 72: Explaining Long-Term (1st Mode) Trajectories of Firm Performance

1.4.2.1.2 Defining "Firm Performance"

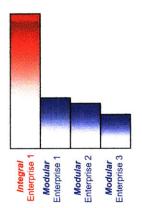

Such performance can be measured in a number of ways¹⁴⁸, including survival/longevity, market share or profitability.

"Profit is an opinion ... "

The continuous dependent variable used in this research (as is typical for most research in competitive strategy) is long-term firm competitive performance, defined specifically as *economic* or *financial* performance.¹⁴⁹ As such, there are a vast number of measures and metrics upon which to base the research.¹⁵⁰ This is made even more complicated given the fact that the theory constructed herein identifies a spectrum of *enterprise architectures* each having diametrically-opposed performance objective functions (as characterized by Penrose's question above). This makes a direct comparison of performance difficult, as each architecture purports to achieve different objectives.

In order to reconcile this dilemma, the common performance metric that will be used for all enterprise architectures will be maximization of shareholder value as represented schematically in Figure 73 below as market capitalization, even though this is the explicit goal of the shareholder-based architecture, while it is an indirect and implicit goal of the stakeholder-based architecture.

Market Capitalization

The research will demonstrate the circumstances under which shareholder value is maximized by those architectures actively attempting to do so, and when it is maximized by those architectures that are not solely focused on this objective.

¹⁴⁸ Ford and Schellenberg (1982) identify three different frameworks: the goal approach, the systems recource approach and the constituency approach.

¹⁴⁹ It is well-known in strategic management literature (Powell), that performance based on financial measures is sensitive to the financial measures chosen, and moreover, the notion of performance, is actually a socially-constructed phenomenon (Fligstein).

¹⁵⁰ A common financial performance metric used within the strategic management literature is "accounting profit" (McGrahan and Porter, 1997).

1.4.2.1.2.1 Sub-variables: profitability and growth

"Growth might be the lifeblood of a business, but it isn't always the best or most sustainable way to create value for shareholders. Return on invested capital (ROIC) is often just as important a measure of value creation and can be easier to sustain at a high level."¹⁵¹

The notion of shareholder value (or market value) has been demonstrated to be mediated by the effects of *growth* and *profitability*, which have direct linkages to the *exploitation* and *exploration* tendencies of different enterprise architectures (Cho and Pucik, 2005). The firm's growth performance will be measured by the three compound annual growth rates of total assets (inputs), total revenues (outputs) and economic and market value added, EVA & MVA (value).¹⁵² The firm's profitability performance is measured by three profitability ratios of ROA, ROE and ROI.¹⁵³

As will be argued later, the different enterprise architectures tend to have objective functions based on either profitability or growth (Thurow, 1992). For this reason, both will be tracked.

1.4.2.1.2.2 Sub-variables: past performance and future health

"Managing companies for success across a range of time frames – a requisite for achieving both performance and health – is one of the toughest challenges in business." 154

In addition, the notion of shareholder value has been demonstrated to be dependent upon *past* financial performance and *future* growth prospects.¹⁵⁵ These sub-variables will be important in understanding the distinction between enterprise architectures and their underlying mechanics.

"It's common corporate-finance knowledge that something on the order of 60 to 80 percent of the value of a business lies in its long-term cash flows. And if you're investing with a short-term horizon you're giving up the value creation of a business."¹⁵⁶

¹⁵¹ Cao, B. Jiang, B. and Koller, T. (2006), pg. 12.

¹⁵² Note that there is an inherent conflict embedded in strategy research between the typical unit of analysis, and the metric used as the dependent variable. Desirable market-based financial variables like MVA are typically reported for the corporate entity in a diversified conglomerate, while those for the disaggregated strategic business unit are more difficult to determine.

¹⁵³ It should be noted for the *Boeing–Airbus* duopoly that the notions of returns on assets, equity and investment are difficult to measure and not necessarily reliable measures of profitability (Dess and Robinson, 1984). As each firm embarks on different strategic make-buy paths for example, the boundaries of the firm change, as does the ownership of assets and therefore the meaning of ROA. In addition, each firm is on a different trajectory of equity offerings and ownership, the notion of ROE is difficult to compare. In this instance, a more transparent and meaningful measure in a capital-intensive duopoly with large economies of scale would be used like market share. ¹⁵⁴ Dobbs, Leslie and Mendonca (2005), pg. 63.

¹⁵⁵ Dobbs and Koller (2005).

¹⁵⁶ David Blood, Managing Partner of Generation Investment Management, in Mendonca and Oppenheim (2007), pg. 4.

1.4.2.2 "Independent" variables

1.4.2.2.1 Primary variable: Enterprise Architecture

"A proposed theory may posit that construct A leads to outcome B, but since A is a 'consruct,' the reader often wonders what A is in real life. How would one measure A? How would one know that the empirical variable that one has obtained really captures A? By seeing a concrete example of every construct that is employed in a conceptual argument, the reader has a much easier time imagining how the conceptual argument might actually be applied to one or more empirical settings."¹⁵⁷

The primary construct developed to explain the dependent variable of long-term firm performance is the enterprise architecture, that is the firm and is relationships with its key stakeholders, as is shown in Figure 74 below. As was addressed earlier, this construct attempts to resolve a key debate in the field of strategic management between the source of competitive advantage as residing internally within the firm or externally in the environment.

Figure 74: Primary "Independent" Variable: Enterprise Architecture

"Independent" Variable: Enterprise Architecture

"Dependent" Variable: Long-Term Firm Performance

¹⁵⁷ Siggelkow, N. (2007), pg. 22.

1.4.2.2.2 Intervening variables: Firm Function & Environment Evolution

"The ability to get closer to theoretical constructs is particularly important in the context of longitudinal research that tries to unravel the underlying dynamics of phenomena that play out over time. As scholars have increasingly begun to appreciate the role of dynamic processes (e.g., path dependency or evolutionary processes), rich longitudinal research is needed to provide the details of how these processes actually play out."¹⁵⁸

In addition to explaining the source of long-term firm performance, the research seeks to explain where the "independent" variable itself comes from. In order to do this, the research proposes two other mechanisms or variables for this purpose: enterprise function as a *mediating* variable between enterprise architecture and long-term firm performance, and environmental evolution as a *moderating* variable between long-term firm performance and enterprise architectures as shown in Figure 75 below.

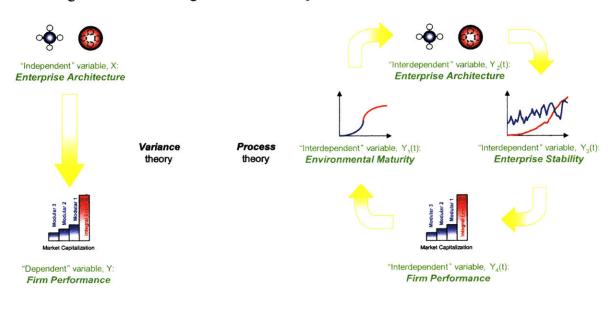

Figure 75: Intervening Variables: Enterprise Function & Environment Evolution

¹⁵⁸ Siggelkow, N. (2007), pg. 22.

1.4.2.3 Interdependent variables

"The only meaningful way to study organization is to study it as a system. As Henderson [1935] put it, the study of a system must rely on a method of analysis, '...involving the simultaneous variations of mutually dependent variables."¹⁵⁹

Modern organizational theory has long recognized the organization as a system of mutually dependent variables (Scott, 1961). Such mutually dependent variables has been referred to by noted organizational studies scholar, Karl Weick (1979) as "interdependent" variables.

"The cause-effect relationships that exist in organizations are dense and often circular."¹⁶⁰

Such interdependent variables can be thought of as arranged in a system of causal feedbacks (Forrester, 1961; Weick, 1979) generating both positive and negative feedback loops operating in complex organizations (Richardson, 1991).

"Modern organization theory asks a range of interrelated questions: (1) What are the strategic parts of the system? (2) What is the nature of their **mutual dependency**? (3) What are the main processes in the system which **link** the parts together? (4) What are the **goals** sought by systems? [5] What **research tools** should be used for the study of the system?"¹⁶¹

This research dissertation therefore embraces the underlying systemic nature of the organizational phenomena under consideration and its highly interdependent variables. The operational questions being answered reflect those of a systems-theoretic approach applied to the study of organizations.

"The utility of the notions of 'mechanistic' and 'organic' management systems resides largely in their being related as dependent variables to the rate of environmental change.

There are other 'independent variables' which directly affect the form taken by any management system (although, even conceptually, their independence from each other as well as from the management system, is not to be insisted upon; causal relationships in this, as in other social fields, are not one-way affairs)."¹⁶²

1.4.2.3.1 Correlative vs. Causal approaches

Although the preceding discussion of the *dependent* and *independent* variables implies that the research dissertation will focus on traditional large sample statistical regression analyses to establish correlation among variables, in fact due to the nature of the question, data and epistemology, a feedback causal approach will be undertaken as shown in Figure 76 below.¹⁶³

¹⁵⁹ Scott, W.G. (1961), pg. 15.

¹⁶⁰ Weick, K. (1979), pg. 7.

¹⁶¹ Scott, W.G. (1961), pg. 16.

¹⁶² Burns, T. and Stalker, G.M. (1961), pp. vii and 96.

¹⁶³ Sterman (2000), pg. 141 warns about the importance and difficulty in establishing causal not correlative relationships between variables in system dynamics.

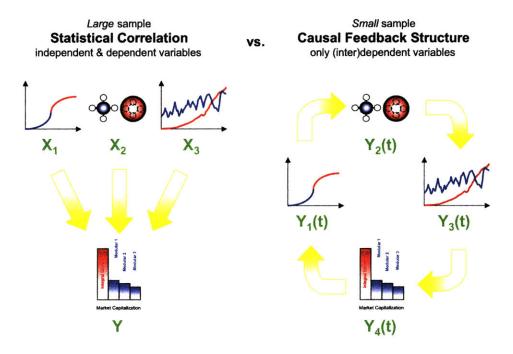

Figure 76: Correlative vs. Causal approaches

"We must wait until theories have been much better developed before we can highlight the relatively few variables which can be measured and rigorously examined statistically."¹⁶⁴

As mentioned earlier, the theory generated from this research intends to identify the fundamental macro-variables that drive long-term trends and trajectories in firm performance. It is hoped that further future theory development and refinement will lead to the justification for the use of more rigorous statistical methods needed to fully validate and extend the theory. For the purposes of this research program, the establishment of underlying causality takes precedence over correlation. This focus on seeking underlying causality takes its queue from the pragmatic design-oriented tradition of architectural theory, upon which much of the grounded theory of this research is based:

"Instead of just looking for statistical connections between variables, we may try to find causal relations between them... The search for causal relations of this sort cannot be mechanically experimental or statistical; it requires interpretation: to practice it we must adopt the same kind of common sense that we have to make use of all the time in the inductive part of science. The data of scientific method never go further than to display irregularities. We put structure in them only by inference and interpretation. In just the same way, the structural facts about a system of variables in an ensemble will come only from the thoughtful interpretation of observations. We shall say that two variables interact if and only if the designer can find some reason (or conceptual model) which makes sense to him and tells him why they should do so."¹⁶⁵

¹⁶⁴ Porter, M.E. (1991).

¹⁶⁵ Alexander, C. (1964), pp. 108-109.

1.4.2.3.2 Variance vs. Process approaches

"Process research is concerned with understanding how things evolve over time and why they evolve in this way. Whereas variance theories provide explanations for phenomena in terms of dependent and independent variables, process theories provide explanations in terms of the sequence of events leading to an outcome."¹⁶⁶

Variance theories attempt to point toward correlation in the constructs. They are concerned with *what* the relative explanatory power of different constructs are (e.g. external competition vs. internal capability in determining firm performance).

Process theories, conversely attempt to uncover plausible causality in the system. They are concerned with *how* the constructs are formed (Van de Ven, 1992).

As will be described in more detail in chapter 2, this research dissertation will attempt to build theory primarily from *process* data, although the aim of using *variance* data is recognized and will ultimately be recommended (Markus and Robey, 1988; Langley, 1999).

"Although process explanations featuring the role of history and learning were central in the founding of the main [strategy] theories (e.g. Selznick, 1957; Penrose, 1959; Chandler, 1962), they have been largely neglected by subsequent research."¹⁶⁷

Over the past 40 years since the establishment of some of the most significant strategic management theories, much research in the strategic management field has drifted away from a *process* approach towards a *variance* approach, as would be expected. This research dissertation however attempts to join the recent calls in the strategic management literature to restart the cycle of knowledge creation by focusing again on *process* explanations, due to the observation that over the past 40 years there have been significantly new phenomena which need to be understood and explained. In this research, it is the nature of competition between two radically different architectural forms or "species", which heretofore have not come into "contact" that is unique and therefore requires a new approach.

¹⁶⁶ Langley, A. (1999).

¹⁶⁷ Farjoun, M. (2002), pg. 565.

1.4.2.3.3 Randomness and Indeterminacy

"The model suggests that the relationship between environments and organizations is not random but is indeterminate, and that the very indeterminacy of environmental effects on organizations is potentially explainable."¹⁶⁸

The emphasis of this research on *process* theory, with *interdependent* variables attempts to reveal that the firm's relationship with its environment is not fully random, yet neither is it fully determinate. The same situation of theory drove the research agendas of other scholars (Pfeffer and Salancik, 1978).

"Given this causal sequence, one may not observe a perfect relationship between organizational actions and structures and the environment for several reasons. First, since each intermediate variable undoubtedly has other causes besides those specified, the relationship between between environments and organizational actions and structures may be attenuated by these other factors. Second, because of the linked nature of the causal process, any indeterminacy or error in the process will be magnified because of the intermediate steps that link environments with organizations. For instance, even if each of the causal links were as strong as a .8 correlation, the overall correlation between environmental dimensions and organizational characteristics would be only .51. It is not surprising, therefore, that researchers often fail to find strong relationships between environmental characteristics and organizational outcomes."

¹⁶⁸ Pfeffer, J. and Salancik, G.R. (1978), pg. 228.

¹⁶⁹ Pfeffer, J. and Salancik, G.R. (1978), pg. 229.

1.4.3 Boundary Assumptions

1.4.3.1 Spatial

The framework developed herein has boundaries of application, and assumptions embedded in the boundaries. They will be addressed in terms of the market (demand) environment and the technological (supply) environment.

1.4.3.1.1 Market

The product and service offerings of the firms and industries studied are relatively homogeneous and stable. That is, competitors in the automobile industry are largely competing on the production of cars and competitors in the airline industry are largely competing on the delivery of seat miles. The complex fracturing and fragmentation of markets into niches or the evolution into services is not the primary focus of the research.¹⁷⁰

1.4.3.1.2 Technological

Technological development is assumed to progress smoothly between discontinuities.

¹⁷⁰ I am indebted to Prof. Mari Sako for helping to identify this, and for challenging my thinking in this set of assumptions.

1.4.3.2 Temporal

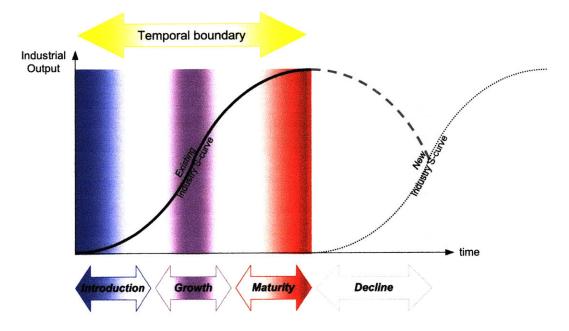

This dissertation aims to develop a theory of the evolution of business ecosystems. By definition therefore, it aims to analyze the evolution temporally (that is diachronically) from the "birth" to "death" of an industry (and its associated ecosystem), as well as between "life-spans" of successive industries.

1.4.3.2.1 Long-term Trends

"The model is not intended to account for short-run changes, which are temporary responses to local conditions, but rather for long-run transformations in the form of social organization."¹⁷¹

1.4.3.2.2 Truncated Life-Cycle

In order to bound the analysis and more importantly to bring parsimony to the developed theory, this dissertation will focus on a truncated version of the classical industry lifecycle (Porter, 1980, pg. 158.), namely from the *introduction* phase through the *growth* phase, and finally through the *maturity* phase. This research will therefore give less emphasis to the *decline* phase. As shown in Figure 77 below, the dissertation therefore effectively maps out the classic "S-curve". An implicit assumption is that the evolution of a new industry will occur near the peak of industry sales.

¹⁷¹ Aldrich, H.E. (2006), pg. 27.

1.4.3.2.3 Bi- vs. Tri-phase Industry S-Curve

Finally, this dissertation initially sets out to describe a theory of the evolution of business ecosystems in terms of a *bi*-phase temporal discretization of the industrial S-curve. This is done to present the competing generic environmental regimes of *exponential growth* vs. that of *goalseeking stability* characterized by *emerging* and *maturing* markets respectively.

Once simplification is established, then a further refinement is made in which the environment is characterized into a *tri*-phase temporal discretization of the industrial S-curve as shown in Figure 78 below.

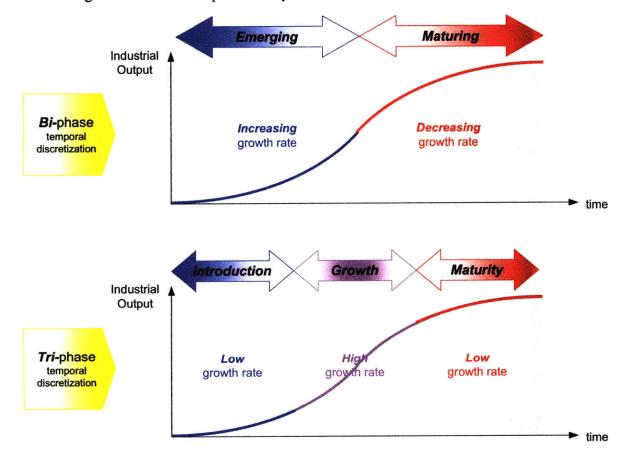

Figure 78: Bi- vs. Tri-phase Temporal Discretization of the Industrial S-Curve

1.4.4 Summary of Research Framework

The following section briefly summarizes the three main a priori constructs used for the research. In addition, some of the fundamental propositions are developed. The mid-range theory that is derived from these constructs and propositions, can be seen as an *architectural* design *heuristic*.

As the research develops, the intent is the development of testable proposition-derived hypotheses that are based on measurable data. The low-level substantive theory that is derived from these hypotheses and data can be seen as an *engineering* design *law*. The structure of the mid-range theory is illustrated below in Figure 79.

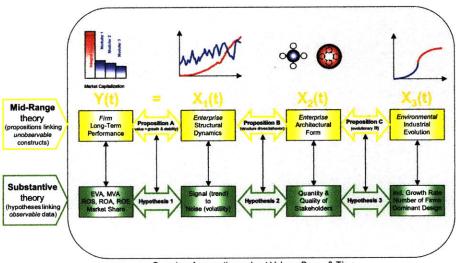

Figure 79: Structure of Proposed Mid-Range Theory

The theory attempts to show how long-term firm performance is ultimately caused by enterprise architectural form, and how it causes the evolutionary environmental conditions which create the architectural forms. Given the unit of analysis, the dependent and independent variables, the equation that this research will attempt to derive, constrain (bound), and ultimately prove is the following:

$$Performance = f(form, structure, environment)$$

or more explicitly:

Long-Term Firm Performance = $f(enterprise \ architectural \ form, \ input-output \ structural \ dynamics, \ industrial \ evolutionary \ dynamics)^{172}$

Boundary Assumptions about Values, Space & Time

¹⁷² I am indebted to Prof. Charlie Fine for clarifying these relationships. Note that over the long term, each "independent" variable is itself time-dependent, as well as dependent upon the other "independent" variables.

1.4.4.1 Framework Summary

1.4.4.1.1 High Level Summary

The primary "independent" variables are derived from the propositions and constructs developed in this research and are summarized in Part II. These include the construct of an *enterprise architecture*, and the proposition that it drives the enterprise's *structural dynamic* behavior, (i.e. its growth and profitability), which ultimately drives the *industrial evolution*. These constructs and their propositional relationships are briefly summarized in Figure 80 below:

Firm Output Integral Modular Enterprises Enterprises 15 Short-term Speed & Flexibility 10 **Competitive Dynamics** 5 ong-term Sp & Stability Maximization of Maximization of 1990 1950 1960 1970 1980 Shareholder Value Stakeholder Surplus Enterprise Firm Architectures Performance Industry Output Stable Markets Aodular lodular nies of Scope Industrial **Co-Evolution Growing Markets** (Economies of Scale Market Capitalization 2000 1900 1950 1975 1925

Figure 80: Summary of Proposed Co-Evolutionary, Meta-Strategic Framework

"Key dimensions at the firm and environmental levels have reciprocal relationships so that firms develop capabilities either through choice or selection, that then shape the environment which, in turn, further shapes capabilities. Thus firm strategy and performance fundamentally arise from interactions between organizational and competitive factors at several levels of analysis."¹⁷³

¹⁷³ Henderson, R. and Mitchell, W. (1997), pg. 12.

1.4.4.1.2 Detailed Summary

"Critical to understanding contemporary differences in market share and profitability among firms within an industry is systematic knowledge of how those differences arose in the first place. Understanding the structural evolution of industries – the rate of change in output and prices, the rates of entry and exit (turnover), and the growth and decline of individual firms (mobility) and industry participation – is widely recognized as fundamental to identifyling the origins of profitable market leaders who can sustain performance over time. Industry evolution provides important important contingencies that affect the viability of various firm strategies. Without a keen grasp of the underlying mechanisms driving industry evolution and the resulting changes that occur at the industry level over time, we are less able to identify why certain firms in an industry are the winners and other losers (Agarwal and Gort 2002)."¹⁷⁴

As shown in Figure 81 below, the aforementioned high-level summary will be further developed into a more detailed framework consisting of an endogenous causal model.

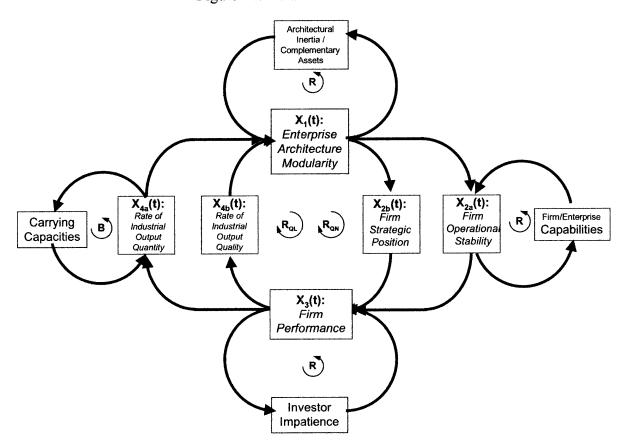

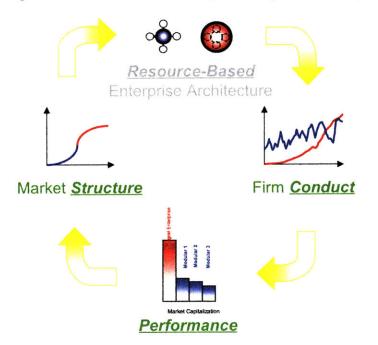

Figure 81: Detailed Causal Model

¹⁷⁴ Lenox, M.J., Rockart, S.F. and Lewin, A.Y. (2007), pg. 599.

1.4.4.2 Framework as Strategic Management Theory

The framework can be summarized as shown in Figure 82 below in terms of the classic industrial organization / strategic management paradigms of "structure-conduct-performance" (Mason, 1939; Bain, 1956) and "the resource-based view" (Penrose, 1959; Wernerfelt, 1984).

1.4.4.2.1 Market Structure

"The rate of growth of the market can serve as an important trait of market structure. Fast growth, for instance, reduces the payout of short-run collusive strategies relative to strategies aimed at raising the firm's sustainable market share."¹⁷⁵

1.4.4.2.2 Firm Conduct

"Market conduct comprises the processes whereby firms choose their preferred price and product outcomes and reconcile their divergent offers in the market place. It also covers predatory or exclusionary conduct."¹⁷⁶

1.4.4.2.3 Performance

"A chief test of market performance is the rate of return."¹⁷⁷

¹⁷⁵ McGugan, V.J. and Caves, R.E. (1974), pg. 391.

¹⁷⁶ McGugan, V.J. and Caves, R.E. (1974), pg. 392.

¹⁷⁷ McGugan, V.J. and Caves, R.E. (1974), pg. 394.

1.4.4.3 Framework as Social System Theory

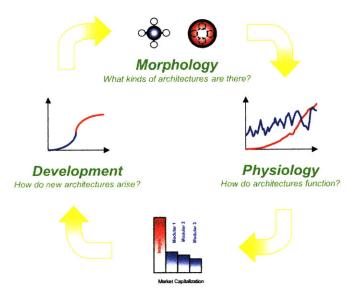

Much of the early work on social systems in the 1950s and 1960s can be discussed within two influential paradigms, *structural functionalism* and *general system theory* (Burrell and Morgan, 1979).¹⁷⁸ Later, social system theory "evolved" into an evolutionary theory as put forth by the organizational ecologists (Hannan & Freeman, 1977) among others. The following three subsections briefly discuss the proposed framework within these paradigms.

1.4.4.3.1 Framework as Structural Functionalist Theory

"The concept of **function** as defined thus involves the notion of **structure** consisting of a set of **relations** amongst unit entities, the continuity of the structure being maintained by a **life-process** made up of the activities of the constituent units."¹⁷⁹

Each of the three independent variables of the framework corresponds with the structural functionalist problems of: *social morphology* (i.e. what kinds of social structure are there?), *social physiology* (i.e. how do social structures function?) and *social development* (i.e. how do new types of social structure come into existence?). As shown in Figure 83 below, the theory presented within this dissertation can be expressed within the structural functionalist paradigm.¹⁸⁰

¹⁷⁸ Note that *structural functionalism* makes explicit use of a biological metaphor, while *systems theory* does not (Burrell and Morgan, 1979, pg. 49).

¹⁷⁹ Radcliffe-Brown (1952), pg. 180. Note that Radcliffe-Brown cautions that social structures can only be observed through their function.

¹⁸⁰ As will be discussed later in this chapter, a "structural functional" explanation differs from the "causal" explanation.

1.4.4.3.1.1 Social Morphology

"Morphology: The branch of biology that deals with the form and structure of organisms without consideration of function."¹⁸¹

"Anatomy: The science of the shape and structure of organisms and their parts."¹⁸²

To begin with, the architecture (i.e. form and structure) of the enterprise will be defined independent of the strategic and operational functions they fulfill.

1.4.4.3.1.2 Social Physiology

"Physiology: The biological study of the functions of living organisms and their parts."¹⁸³

In particular, having defined the architecture (i.e. the form and structure) of the enterprise, the framework will attempt to tie causal arguments to the strategic position (i.e. physiological function) of the architecture. Specifically that integral enterprise architectures, born into mature industries tend to have a cost-leadership posture or strategic function.

1.4.4.3.1.3 Social Development

Finally, having defined the architectural form, structure and strategic function of the enterprise, the framework will endeavor to explain how these structures and functions evolve over time, for example, how integral enterprise architectures, born into mature industries begin with a cost-leadership posture or strategic function and later evolve into a differentiated strategic function.

1.4.4.3.2 Framework as General System Theory

"Certain methods of studying behavior apply to all organized systems, namely structure, function and evolution. Any organized system can be seen from these three perspectives which encompass the broadest scope of a general system theory."¹⁸⁴

In addition, each of the four interdependent variables of the framework corresponds with the system concepts of *General System Theory* (Rapoport, 1968): *evolution, function, structure* and *behavior* (or performance - to use a variable pertinent to strategic management) as shown in Figure 84 below.

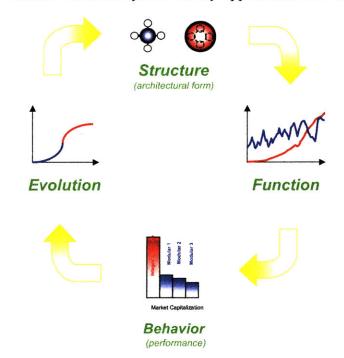

Figure 84: Toward a *General System Theory* approach to the Framework

1.4.4.3.2.1 System Goals: Stability, Growth and Interaction

Unlike traditional research in the strategic management literature which focuses on the isolation of a few isolated low-level variables to explain firm performance, this work attempts to aggregate many confounded variables into three high-level, aggregate, system variables.

In Essays #1 and #2, we will discuss the enterprise objective functions or goals, which in terms of general systems theory, can be stated as *stability*, *growth* and *interaction* (Henderson, 1935, pg. 86).

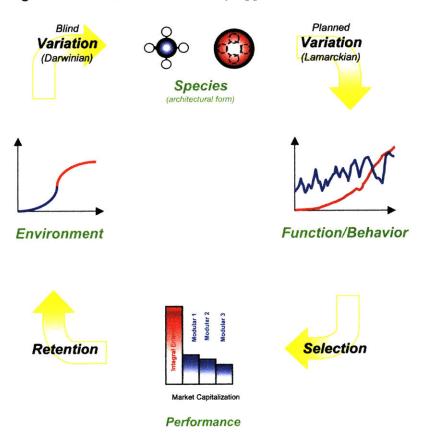

¹⁸⁴ Rapoport, A. (1968), pg. xx.

1.4.4.3.3 Framework as Evolutionary Theory

"Evolutionary theory explains how particular forms of organizations come to exist in specific kinds of environments. Variation, selection, retention and struggle occur simultaneously rather than sequentially. Analytically, the process may be separated into discrete phases, but in practice they are linked in continuous feedback loops and cycles."¹⁸⁵

Each of the four proposition sets of the framework corresponds with the evolutionary mechanisms of: *variation* (i.e. how do new types of social structure come into being?), *selection* (i.e. how do social structures compete successfully?) and *retention* (i.e. how do new types of social structure become perpetuated?). Note that the *variation* mechanism is further subdivided into "blind" or Darwinian variation, whereby the environment dictates organizational form, and "semi-blind" or Lamarckian variation, whereby management dictates organizational activities like market and production strategy. As shown in Figure 85 below, the theory presented within this dissertation can be expressed within the evolutionary paradigm, with the proposition sets shown below as the connecting yellow arrows.

Figure 85: Toward an Evolutionary approach to the Framework

¹⁸⁵ Aldrich, H.E. and Ruef, M. (2006), pg. 26.

1.4.4.4 Framework as Temporal Theory

The independent variables associated with function, structure and evolution each take on a different *temporal* perspective as shown in Figure 86 below. The function-related variable takes a (small dt) "*static*" view, defining the properties and characteristics of the architectures. The structure-related variable takes a (medium dt) "*dynamic*" view of how the static structures interact to drive dynamic behavior. Finally, the evolution-related variable takes a (large dt) "*evolutionary*" view of how the environment evolves dominant architectural "species" which oscillate nonlinearly. The evolutionary trajectories of enterprise architectures are seen from the lenses of *adaptation* and *selection*.

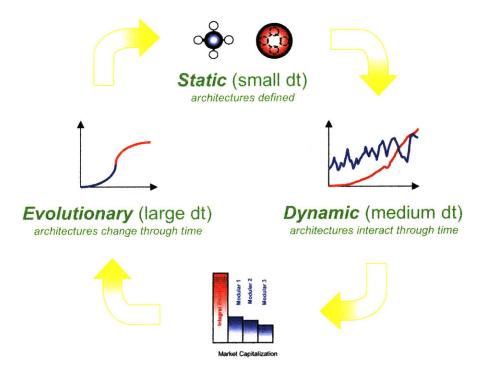

Figure 86: The Framework viewed through a Temporal perspective

Note that for *very* large dt, that is, after firms and industries cycle around the above loop numerous times, the random processes of variation, selection and retention begin to take hold and evolve the architectural characteristics of species. The scope of this research does excludes such long-term evolutionary pressures.

1.4.4.5 Framework as Architectural Design Theory

"A quest for field-tested and grounded technological rules, which in the field of management will be predominantly qualitative and heuristic by nature, means trading the priestly beauty of truth for the soldiery glory of performance."¹⁸⁶

The objective of building a rigorous and relevant conceptual framework, which aims to contribute to the explanation and delivery of long-term firm performance, will be met using a high level of abstraction. As such, the conceptual *form* of the firm and its relationship with its environment will provide fundamental answers to the question of performance, whereas more detailed, operational explanations using a lower level of abstraction will provide more precise explanations, *given* an architectural-level explanation. In this sense, the architectural form is a solution-neutral restatement of the problem¹⁸⁷, and as such the architecture enables and constrains (but does not determine) what the enterprise can do.

"Architectural insights are worth far more that ill-structured engineering analyses."¹⁸⁸

As shown in Figure 87 below, the framework can be demonstrated to follow the architectural design process, as in the process used to design and build artifacts of civil architecture.

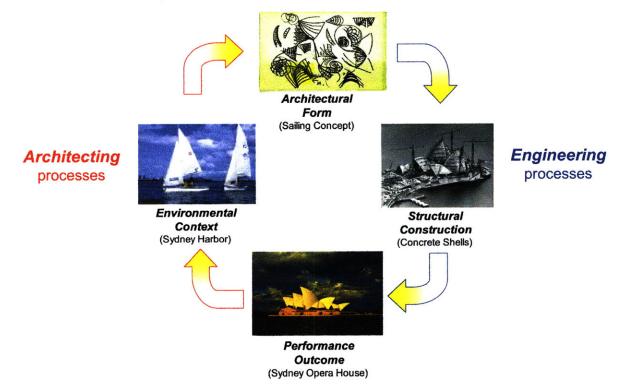

Figure 87: Framework as Architectural Design Theory

1.4.4.5.1 Trends & Trajectories via Architectural Abstraction & Aggregation

Although the proposed framework is being derived empirically from the field-based data of observing and developing the phenomena of business competition, it also (upon reflection) can be seen to have its roots in the abstractions and aggregations of architectural design theory. The act of architecting a social structure progresses (both linearly as well as iteratively) from the intense study of the environment in the abstract, to the induction of a high-level form or concept, to the deduction of lower-level structures (from well-tested laws), finally to the creation or delivery of a high-performing entity (Piepenbrock, 2004).

As shown in Figure 88 below, this research will therefore attempt to explain the high-level *abstract* architectural forms and their *aggregate* behaviors that firms and their extended enterprises will need to exhibit long-term high-performance in different environmental conditions. In this sense, this research dissertation is seeking underlying long-term *trends* and performance *trajectories* – the "signals" through the "noise" of lower levels of abstraction.

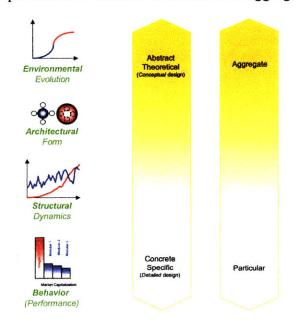

Figure 88: Framework presented as "Ladder of Abstraction/Aggregation"

Of more relevance to the performance objectives as stated in this research dissertation, another analogy of the framework can be developed as shown in Figure 89 below. An analogy of architectural abstraction might be to explain or design a high-performance solution in a motor sport race. Instead of immediately launching into low-level detailed explanations of engine power and torque or design for aerodynamics, an architectural approach would ensure the high-level abstract *form* achieves *fit* with its environmental demands and its overall *function*. Therefore observing that the race will take place in a mud bog as opposed to a slick racetrack gives the abstract solution that a crude "tractor" form will dominate any race car, now matter how powerful its engine or low its drag coefficients.

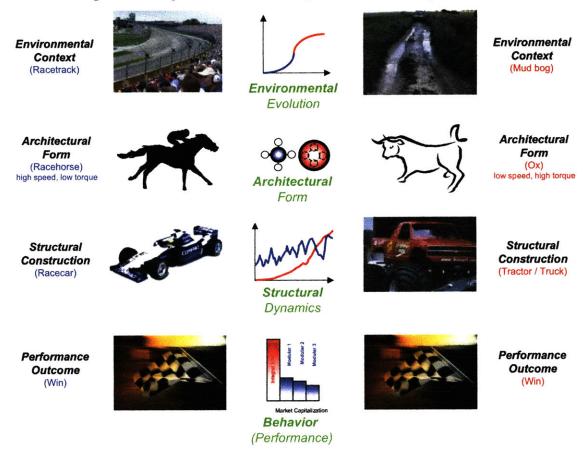

Figure 89: Proposed Framework expressed as a Motorsport Race

1.4.4.5.2 "Resolution" Limitations of an Architecture-based Framework

The framework presented herein attempts to contribute towards a general theory of the evolution of business ecosystems, which in the process explains long-term firm performance. It is however, by its very design, a conceptual framework with a low degree of "resolution". That is, it predicts *generally* under which *aggregate* conditions, a firm *should* outperform its rivals over the *long term*. For example: "the greater the maturity of the market, the more enterprise architectures with greater integrality should dominate."

As such, it will be demonstrated that the high-level enterprise architecture transcends the firm's strategy and its operational efficiency. Due to its low resolution, there will be "noisy" exceptions, which will play out over the short term, where for example, excellent strategy coupled with excellent execution trumps poor architecture in a near-transition environment.

1.4.4.5.3 Ontological Primacy Embedded within Framework

"Of all the manifestos concerning the relationship of form and function, "form follows function" is surely the most famous, as well as being the most sweetly succinct. It is also one of the most misinterpreted. It is not a statement of importance, granting function a greater stature than form, but one of process: function must be discerned before form can be fashioned and, implicitly, to do otherwise would be nonsensical."¹⁸⁹

Finally, a note should be made regarding the assumptions on *ontological primacy* embedded within the framework presented. Although the framework appears to be presented as following the ideals of *institutional* as opposed to *neoclassical economic* approaches to strategy¹⁹⁰; as following the ideals of *holism* as opposed to *reductionism*; as being led from the front by Aristotle's "*causa finalis*" (final cause) as opposed to being pushed from behind by the "*causa efficiens*" (efficient cause); as following the teleological notions that:

- form follows function
- structure follows form
- *performance* follows *structure*
- *environment* follows *performance*
- function follows environment
- (repeat...)

In reality, the framework is intended to acknowledge the cyclic interdependence of these variables, such that *emergence* is made possible.¹⁹¹ In addition, the framework is intended to acknowledge the richness of multiple causality of the "product-producer" relationship, as opposed to the cause-effect relationship.¹⁹²

1.4.4.6 Framework as *Contingency* and *Configuration* Theories

"Contingency and configuration theories have received considerable attention, both in organizational theory and in strategic management research."¹⁹³

The framework attempts to re-engage and moderate the internal-external debate within the strategic management field by re-asserting the *contingency* and *configuration* theories as described in the following subsections.

"For many years, contingency and configuration theorists have asserted a connection between organizational alignments and performance (Burns and Stalker, 1961; Woodward, 1965; Lawrence and Lorsch, 1967; Miles and Snow, 1978; Mintzberg, 1979; Miller and Friesen, 1984.)"¹⁹⁴

Over the past 50 years, strategic management researchers have identified a range of factors that have been demonstrated to be influential in determining superior firm performance. These have progressed chronologically from the external factors of industrial organization economics (Bain, 1956) to the external-internal fit of contingency theory (Lawrence and Lorsch, 1967) to the internal factors of the resource-based view (Wernerfelt, 1984),

"[the] move from external factors, to 'fit' perspectives, to internal elements... highlight the range of factors important to superior performance."¹⁹⁵

The shift away from contingency theory took place as theorists rediscovered the resource-based view, which manifested itself in practice as the "core competencies" movement of the 1980s and 1990s. This movement tended to focus on benchmarking dissected best practices from worldclass companies, and attempting to copy them non-systemically, which was a noted departure from the holistic thinking of contingency theory. Recently, an number of notable academics at reputable institutions have called for a revisiting of the classical theories:

"Its one of the oldest, most fundamental ideas in management theory: that executives should understand how the many distinct functional components of a firm interrelate to achieve the proper fit. It is time to resurrect the idea of addressing the part-whole relationship of the firm. Without this systemic way of looking at companies, firms run the risk of engaging in compartmentalized thinking that can lead to the adoption of practices that are a poor fit and work to a firm's disadvantage."¹⁹⁶

While this research dissertation will appear to take the debate back along the intellectual pendulum towards environmental fit, as shown in Figure 90 below, it is hoped that a new light will be shed on contingency theory – particularly how and when external and internal factors interact via the enterprise architecture construct.

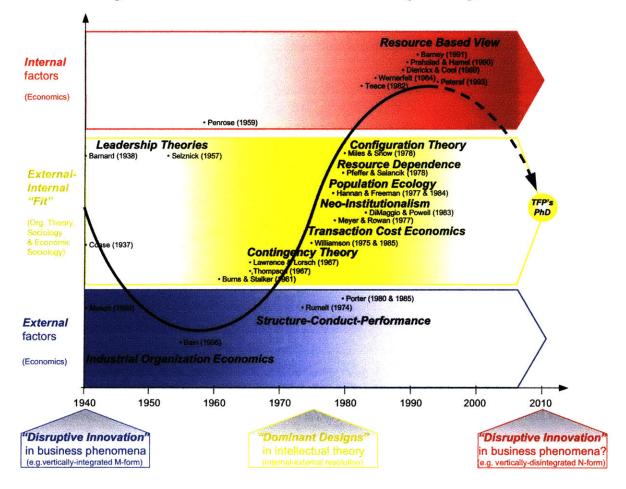

Figure 90: Intellectual "Double-Helix" in Strategic Management

Note that this research attempts to re-engage the sociological literatures which tend to focus on environmental "fit". While both contingency theory and population ecology tend to both agree on this feature, each differs as to the level at which change or adaptation takes place, with the contingency theorists focusing more on the organizational level in the form of "top-down" leadership and choice, and the population ecologists focusing more on the population level and the "bottom-up" leadership embedded in DNA (Levinthal, 1997).

1.4.4.6.1 Framework as *Contingency* Theory

"This is a comparative study of six organizations operating in the same industrial environment. The subsystems in each organization were differentiated from each other in terms of subsystem formal structures, the member's goal orientation, member's time orientations and member's interpersonal orientations. A relationship was found between the extent to which the states of differentiation and integration in each organization met the requirements of the environment and the relative economic performance of the organizations."¹⁹⁷

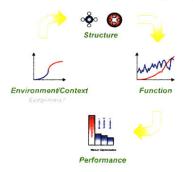

The above quotation, taken from the abstract of one of the most cited and influential pieces of research in the fields of strategic management and organizational theory, Lawrence and Lorsch's 1967 classic, "Differentiation and Integration in Complex Organizations," offers a close description of the research proposed herein.¹⁹⁸

Like Lawrence and Lorsch's original work, this research also proposes a comparative study of six organizations, albeit in three pairs of organizations each operating in the same environments. In addition, this work proposes to identify differing member properties (e.g. goal- and time orientations) as characteristic of different architectural forms.

As will be discussed later in Chapter 2, although this research dissertation is founded on the basis of building grounded theory (in the same way as the original Lawrence and Lorsch work), it also serves to validate, refine and extend their original findings.

1.4.4.6.1.1 Endogenizing Lawrence and Lorsch

The proposed framework makes assertions (in the vein of contingency theory) that firm performance results from the alignment of *endogenous* organizational "design" variables with *exogenous* environment or context variables.¹⁹⁹ In fact, one of the aims of this research is to begin to endogenize the claims of contingency theory, in that contingent exogenous environmental variables can be endogenized causally, as shown in Figure 91 below.

¹⁹⁷ Lawrence and Lorsch (1967), pg. 1.

¹⁹⁸ Lawrence and Lorsch (1967) was among the top 20 most influential works in the field of strategic management as determined in a bibliometric study by Ramos-Rodriguez & Ruiz-Navarro, (2004).

¹⁹⁹ The noted "problems" with contingency theory (Schoonhoven, 1981) will be addressed in the research.

On of the major differences of this research relative to classical contingency theory lies in its positing how firm performance endogenously shapes the environmental context, which in turn defines organizational form. Classical contingency theory (e.g. Lawrence and Lorsch, 1967) is essentially *variance* theory, in which the environment is a variable which moderates between the independent variable of firm structure and the dependent variable of firm performance.

As shown in Figure 92 below, the framework proposed herein explicitly endogenizes more of the environment, and in this sense is now an *inter*-organizational or "ecological contingency theory" as opposed to an *intra*-organizational "structural contingency theory." In this way, the framework is essentially *process* theory, whereby environment is not a moderating variable, but an interdependent variable. Crucially, classical contingency theory characterizes the environment using discontinuous states, whereby for example, environmental instability may or may not precede environmental stability. The framework presented herein however posits that states of environmental instability (i.e. increasing rates of quantity and quality growth), under conditions of logistic growth.

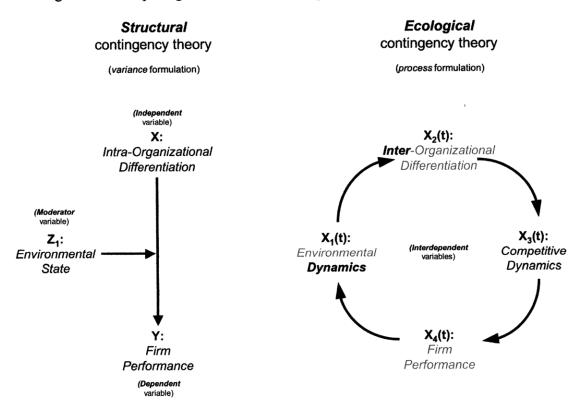

Figure 92: Comparing Structural vs. Ecological Contingency Theories

1.4.4.6.1.2 Differentiation and Integration in Inter-Firm Organizations

This research proposes to extend Lawrence and Lorsch's original ground-breaking research from the analysis of *firms* as "complex organizations" to the analysis of firms and their *extended enterprises* as "complex organizations". In this sense, this proposed extension of Lawrence and Lorsch's research searches for a contingent explanation for differentiation and integration as *inter*-firm as opposed to *intra*-firm phenomena, as shown in Figure 93 below.

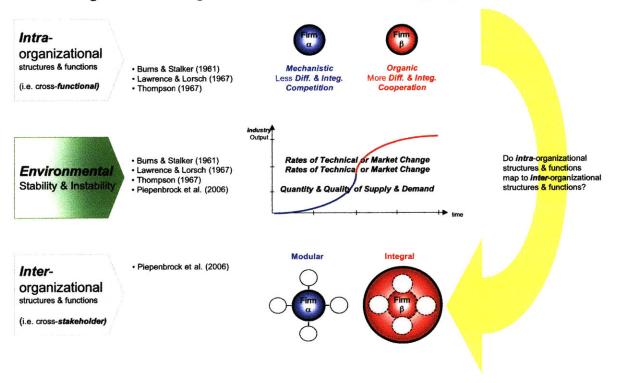

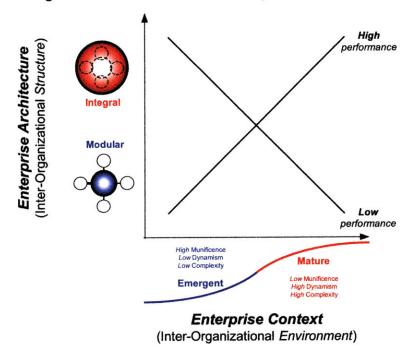

Figure 93: Situating the Framework within the Contingency Literature

1.4.4.6.1.3 Architecture-Context-Performance

At is simplest and most abstract level, this research points to a new form of the traditional *context-structure performance* relationships in contingency theory (Drazin and Van de Ven, 1985). As shown in Figure 94 below, this *architecture-context performance* relationship is hypothesized.²⁰⁰

As will be discussed in greater detail in Part II, an "architect's dilemma" arises from this relationship. To summarize, there appears to be a general trend over time towards increasing pressure on enterprise architectures to "dis-integrate" as well as on environments to become more dynamically complex and thus requiring greater integration. This implies that there is a trend towards lower performance of incumbents, and towards greater opportunity for new firms (late entrants) to become dominant.

²⁰⁰ Note: a more sophisticated version of this matrix discretizes context into three phases instead of two, whereby high performance is associated initially with integral architectures, then modular architectures, and finally integral architectures.

1.4.4.6.2 Framework as Configuration Theory

"People in [the configuration] school, in seeking to be integrative, cluster the various elements of our beast – the strategy-making process, the content of strategies, organizational structures and their contexts – into distinct stages or episodes, for example, of entrepreneurial growth or stable maturity, sometimes sequenced over time to describe the life cycles of organizations."²⁰¹

Configuration theory embraces rich, complex, holistic (not reductionistic) desciptions of organizations and their supporting environments.

"A configuration represents a number of specific and separate attributes which are meaningful collectively rather than individually. [It] represents a unique, tightly integrated, and therefore relatively long-lived set of dynamics."²⁰²

From the previous brief description of the proposed meta-strategic framework, it is clear that our research attempts to build and test archetype or "configuration" theories in strategic management. The proposed archetypes include the enterprise architectures, their structural dynamics and competitive outcomes as well as the environmental characteristics which "grow" them.

"The use of configurations in studies of organizations allows researchers to express complicated and interrelated relationships among many variables without resorting to artificial oversimplification of the phenomenon of interest. Configurations are a means of achieving parsimony while presenting rich, complex descriptions of organizations."²⁰³

Dess et al. (1993) note that strategic management researchers often present their constructs as *gestalts, configurations or archetypes.* This is similar to the way architects present their constructs – with architects defined as "specialists in the simplification of complexity" (Rechtin, 1999).

"Charles Darwin (1887:105) once distinguished 'splitters' from 'lumpers'. Configuration school people are unabashed lumpers: they see the world in terms of nice, neat categories. Nuanced variability is assumed away in favor of overall clustering; statistically speaking, outliers are ignored in favor of central tendencies."²⁰⁴

Such a "lumped" architectural approach is important in the early "fuzzy front end" of theory development, but whose use must be bounded by an appreciation for value and the corresponding limits of parsimony.

"Everything should be made as simple as possible, but no simpler."205

Some researchers also link organizational *transformation* as the logical complement to *configuration* (Mintzberg et al., 1998).

²⁰⁵ Albert Einstein, The Evolution of Physics.

1.4.4.6.2.1 Configuration Theory: beyond Contingency Theory

"The configurational approach makes a clean break from the contingency mainstream, within which researchers have been preoccupied with abstracting a limited set of structural concepts and measuring their relationships with a limited set of abstracted situational concepts."²⁰⁶

At first glance, the multi-domain aspect of configuration theory appears to sound like contingency theory. However a closer inspection reveals that configuration theory is an intellectual advancement beyond contingency theory as it embraces the nonlinear dynamic and evolutionary nature of organizations.

"Our comparison of the assumptions underlying contingency and configuration theories can be likened to [the] distinction between the assumptions of Newtonian physics and those of emerging chaos theories. Like contingency theorists, those taking the Newtonian perspective envision a world where stability, order, uniformity, and equilibrium predominate. The important relationships are linear. In contrast, the configurational approach shares chaos theory's acknowledgement of 'disorder, instability, diversity, disequilibrium, nonlinear relationships, and temporality – a heightened sensitivity to the flows of time' (Prigogine and Stengers, 1984, pp. xvi-xv). A central insight of chaos theory is that patterns lurk beneath systems' seemingly random behaviors. Chaos theorists call these patterns 'strange attractors'; organizational theorists call them configurations."²⁰⁷

1.4.4.6.2.2 Classifications of Organizations

"Naming something," said Alice to the Red Queen, "isn't the same thing as explaining it."208

One of the more important roles of configuration research is to classify organizations, which aides in the development of theories in organization, and especially normative theories in strategic management.

"Classification systems provide a means for defining sets of **homogenous organizations** which should significantly **increase levels of explained variance of key variables** across organizations... By **aggregating** and organizing a large body of facts and data into a meaningful set, propositions and **theories may be developed**."²⁰⁹

The constructs of enterprise architectures developed in this research dissertation are essentially configurations used for the aggregation of attributes and for the classification of homogenous organization types, in order to aid in the development of theories of their long-term competitive performance.

²⁰⁶ Meyer, A.D. et al. (1993), pp. 1176-1177.

²⁰⁷ Meyer, A.D. et al. (1993), pp. 1178-1179.

²⁰⁸ Lewis Carroll's Alice's Adventures in Wonderland, cited in Meyer, A.D. et al. (1993), pg. 1180.

²⁰⁹ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

1.4.4.6.2.2.1 Single Domain Taxonomies and Typologies

In order to distinguish configurations from their "classification cousins" *taxonomies* (empirically-driven) and *typologies* (theoretically-driven), this research dissertation uses the definitions proposed by Dess et al., 1993).

"A typology or taxonomy contains elements or items that represent a single domain or an aspect of organizations, such as environment, structure, or strategy... A configuration contains relationships among elements or items representing multiple domains."²¹⁰

Well-known typologies within the field of organization science include Burns and Stalker's (1961) mechanistic and organic forms, while Woodward (1958, 1965) and Thompson (1967) distinguished organizations based on the technologies they used. Additionally, Miles and Snow (1978) distinguished among four organization types based on their strategies: defenders, analyzers, prospectors and reactors.

1.4.4.6.2.2.2 Multiple Domain Configurations

"The multidimensionality of constructs used to describe strategy phenomena has always posed a challenge for researchers."²¹¹

Although the definition of appropriate *domains* in strategic management is not exact, researchers (Miller, 1987) have offered theoretical justification for the four "imperatives" of: *environment*, *structure*, *strategy*, and *leadership*.

"Configurations exhibit great stability because of their internal logic, integrity, and evolutionary momentum."²¹²

Given these definitions of appropriate domains in strategic management, it will become clear throughout this dissertation that the enterprise architectural configurations will embrace these and others.

1.4.4.6.2.3 Theoretical Issues

When developing configuration theory, Dess et al. (1993) highlight three important theoretical issues which will be addressed in this research dissertation.

1.4.4.6.2.3.1 Dimensional Complexity

"As the number of dimensions of a construct increases arithmetically, the number of combinations increases geometrically... The theorist is forced to simplify by restricting each variable to a dichotomy."²¹³

²¹⁰ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²¹¹ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²¹² Miller, D. (1987).

²¹³ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

However, such configuration research is not without its tradeoffs, particularly the costs of parsimony. As will be discussed in essay #1, the construct of enterprise architectures will have many possible variable combinations and therefore a multitude of possible forms. For simplicity, however, the construct will be presented as a continuous spectrum of possibilities, with the dichotomy of modular vs. integral being covered in great detail.

1.4.4.6.2.3.2 Causal Ambiguity

"When additional domains are added to the research question, the difficulty in establishing causal relationships is exacerbated. Typically, however, in the context of configuration research, such causal relationships among multiple variables are stipulated as reciprocal and mutually reinforcing."²¹⁴

As was illustrated previously in the framework summary, the enterprise architecture configuration was shown to ultimately and reflexively cause its own evolution in closed-loop feedback. This will be discussed further in essay #3.

1.4.4.6.2.3.3 Temporal Stability

"Configurations, because of the enduring themes that unify and organize them, are characterized by considerable **temporal stability**... In order to cause a change in a configuration, a 'revolution' would be necessary."²¹⁵

Although it has been posited that configurations are stable through time, this does not mean they are in a state of static equilibrium. In fact, in essay #3, we will contend that they are in a state of dynamic equilibrium.

"Since it is theoretically possible to have more than one successful organizational configuration, even within an industry, an interesting research issue would be: Are certain types of transitions easier for organizations to accomplish than others? In other words, longitudinal studies may reveal certain patterns or favored paths that organizations follow as part of their evolutionary dynamics."²¹⁶

Essay #3 will discuss ecological diversity in which multiple competing enterprise architectures can co-exist, however at any given time, they will not be equally successful.

1.4.4.6.2.4 Methodological Issues

When developing configuration theory, Dess et al. (1993) highlight three important methodological issues which will be addressed in this research dissertation.

1.4.4.6.2.4.1 Construct Specification

"Configurations are inherently multidimensional entities in which key attributes are tightly interrelated and mutually reinforcing. The researcher's prime task involves disentangling these complex relationships and isolation key constructs."²¹⁷

²¹⁴ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²¹⁵ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²¹⁶ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²¹⁷ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

As configurations are made up of component constructs, Dess et al. (1993) identified four major classification of constructs used in the strategy literature:

- environment (e.g. munificence, dynamism and complexity)
- structure (e.g. integration and differentiation)
- strategy process (e.g. rational and consensus)
- strategy content (e.g. differentiation and cost leadership)

"In empirical studies of configurations [researchers] use cross-validation of responses by comparisons between different groups of executives and comparisons with alternate measures derived from secondary data sources."²¹⁸

As will be discussed in Chapter 2, the research methodology will clearly be rooted in a multimethod approach which targets executives of multiple stakeholders within a given enterprise architecture.

1.4.4.6.2.4.2 Data Aggregation

"With the exception of fine-grained research methodologies such as single case studies, the analysis and interpretation of research is dependent upon the aggregation of data collected from many participants across firms. When such data are aggregated, the uniqueness or richness of each firm is compromised."²¹⁹

Again, as will be discussed in Chapter 2, the research dissertation is based on fine-grained research methodologies based on a small theoretical sample of case studies in order to preserve the richness of each firm.

1.4.4.6.2.4.3 Unit of Analysis

"Choices regarding the unit of analysis...could lead to what is often referred to as "ecological fallacy", i.e. attempting to make inferences at a specific level on the basis of data obtained and analyzed at a different level of aggregation."²²⁰

As described in this chapter, the unit of analysis is the firm and its extended enterprise, in order to arrive at the dependent variable of firm performance. In order to mitigate the possibility of ecological fallacy (Datta, 1980), the research methodology described in chapter 2 collects and analyzes data from the firm and it primary stakeholders.

1.4.4.6.2.4.4 Research Methodologies

"Longitudinal research designs or causal modeling techniques...can be helpful in providing insights into multivariate relationships... Longitudinal qualitative analysis of organizations can provide meaningful insights about the evolution of configurations as well as the specific relationships among the construct within a configuration. Through careful comparison of in-depth case studies, it is

²¹⁸ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²¹⁹ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²²⁰ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

possible to arrive **inductively** at relationships among environment, strategy, structure, processes and outcomes... Qualitative studies are extremely **labor intensive** and subject to potential problems such as **researcher bias** and **non-replicability**. "221

As described in chapter 2, the research methodology will embrace longitudinal qualitative methods as well as causal modeling techniques in order to capture the relationships between constructs within the enterprise architectural configuration as well as the evolution of the enterprise architectural configurations themselves.

1.4.4.6.2.4.4.1 Inductive development

Ketchen Jr. et al. (1993). Ketchen Jr. et al. (1997).

"Others have deplored the prevalence in the literature of 'armchair typologies' and 'fuzzy frameworks,' which are characterized as 'pseudotheories' formed by causal induction instead of rigorous deduction from theory."²²²

1.4.4.6.2.4.4.2 Deductive development

Ketchen Jr. et al. (1993). Ketchen Jr. et al. (1997).

²²¹ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

²²² Meyer, A.D. et al. (1993), pg. 1179.

1.4.4.7 Framework as Three Essays

The main body of this dissertation consists of three essays, each of which is devoted to the independent variables associated with function, structure and evolution as shown in Figure 95 below. Essay #1 defines a typology/taxonomy of enterprise architectural forms and functions. Essay #2 translates the static architectural properties into a deterministic structure which drives behavior. Finally, essay #3 defines the environmental events and processes which ultimately shape or "grow" the enterprise architectures.

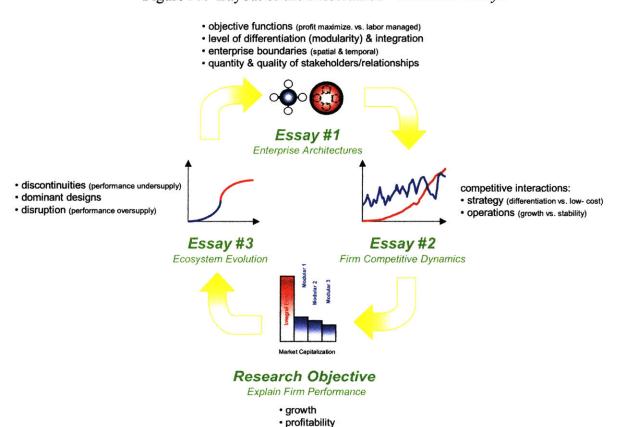

Figure 95: Layout of the Dissertation - the Three Essays

1.4.5 Aspects of Theory

The following discussion briefly discusses the five aspects of theory (Neuman, 2006, pp. 58-77) with respect to the framework proposed. The summary of the five aspects of the proposed theory is shown in Figure 96 below

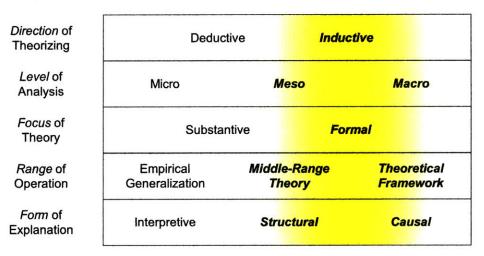

Figure 96: Summary of the Five Aspects of the Proposed Framework

1.4.5.1 Direction of Theorizing

While the theorizing iterates both inductively and deductively, it clearly has an initial strong emphasis on *induction*, whereby concrete empirical evidence was gathered and molded into more abstratct concepts and theoretical relationships. The particular type of inductive social research used, was *grounded theory* (Glaser & Strauss, 1967; Eisenhardt, 1989) which emphasizes *comparison* in empirical observations.

1.4.5.2 *Level* of Analysis

Although much of the research gathers and analyzes data on a *micro*-level, which focuses on the face-to-face interactions among individuals or small groups over short time horizons (measured in days and months)²²³, the primary level of analysis takes place on meso-and macro-levels.

1.4.5.2.1 Meso-level

The analysis is *meso*-level as it focuses on the relations, processes and structures of mid-leveel social phenomena (like organizations and extended enterprises) operating over moderate durations (measured in years, decades).

²²³ One of the more important *micro-level* case studies that this research has uncovered is the process by which individual (or small teams of) leaders endeavored to transform a modular enterprise architecture into an integral enterprise architecture. This work is the subject of later publications.

1.4.5.2.2 Macro-level

Finally, the analysis also approaches *macro*-level as it focuses on social institutions (e.g. international capital and labor markets) operating over long durations (measured in decades and centuries).

1.4.5.3 *Focus* of Theory

The focus of the theory is clearly *substantive*, as it aims to builds theory focused on a particular topic area of social phenomena: competition in business (firm-industry) ecosystems. The theory does begins to reach toward more *formal* theory, which focuses on more general processes or structures that operate across multiple areas of social phenomena: like competition in educational (university) ecosystems or competition in political (party) ecosystems.

Therefore, if the research domain is defined relatively narrowly as "business ecosystems", then the focus of the theory is *formal*, as it extends across mutiple industries (airplane, airline and automotive) and multiple sectors (manufacturing and services). If the research domain is defined more broadly as "social ecosystems", then the focus of the theory is *substantive*, as it explicitly covers business ecosystems but not explicitly educational or political ecosystems.

1.4.5.4 *Range* of Operation

The range at which the theory operates beyond the rather narrow confines of *empirical* generalization and lies between *middle-range theory* and *theoretical frameworks*.

1.4.5.4.1 Middle-Range Theory

The research can be seen as middle-range theory (or more precisely, four middle-range theories). Within each "theory", the research has limited abstraction/range and is in the form of empirically verifyable statements. This is manifested in the linking of the construct sets (e.g. environmental fit, architectural forms, firm functions, and performance) to proposition sets.

1.4.5.4.2 Theoretical Framework

As an integrated theoretical framework, this research is a very general theoretical system with assumptions, concepts and social theories. Like, for example "structural functionalism" which purports that society is a system of interdependent parts that is in equilibrium, and over time it has evolved from a simple to a more complex form, with highly specialized parts, the theory of the evolution of business ecosystems purports that without limits to growth, similar evolutionary processes occur.

1.4.5.5 Form or Explanation

The explanation includes both *causal* and *structural* forms of explanation, and less *interpretative*. Due to the nature of the research as *theoretical framework*, a structural form of explanation is deemed most effective, with attempts at causal explanation also offered.

As the theory of the evolution of business ecosystems is ultimately a theory of evolution (based on Darwin's theory of evolution), it offers high-level process explanations (ased on variation, selection and retention) while not negating the need for individual causal explanations, it merely acknowledges the diffuculty in basing its theoretical explanation on traditional causal means.

"Darwin did not only proclaim that species had evolved, but also pointed to the causal mechanisms of evolution. Darwinism invokes both a theory of natural selection and a universal commitment to causal explanations. Darwin upheld that complex outcomes could be explained in terms of a detailed succession and accumulation of step-by-step causal mechanisms. In a paper of 1874, Huxley elaborated and generalized Darwin's argument as the 'doctrine of continuity'. Under specific conditions, a broad and general version of Darwinism may apply to all complex, open and evolving systems. The possibility of Universal Darwinism suggests that such principles might apply to the social sciences, as well as to biology."²²⁴

Such complex systems can be modeled deterimistically, yet exhibit chaotic or unpredictable outcomes. The theory herein (like Darwinism) is such a deterministic model, in that behavior is not pre-determined (i.e. it can not necessarily be predicted ex-ante), but it can be explained expost, without recourse to stochastic explanations.

"Statistical determination, as expressed in probabilities, does not imply the absense of a cause. As Bertold Brecht [said] 'Their movements are difficult to predict, or cannot be predicted, only because there are too many determinations, not because there are none.' .We now know that non-lineaer systems addressed by chaos theory can simulate stochastic behavior. There are non-linear systems with such a high degree of sensitivity to initial conditions that no amount of accurate measurement of the appropriate parameter values can provide a sufficiently accurate prediction. It does not imply that events are necessarily predictable, or that any one set of events will always lead to the same, regular outcome. Furthermore the principle of determinacy does not imply a 'mechanistic' view... it upholds that intentions are caused."²²⁵

²²⁴ Hodgson, G.M. (2004), pp. 1-7.

²²⁵ Hodgson, G.M. (2004), pp. 3-10.

1.4.5.5.1 Structural Explanations

Structural explanations differ from causal explanations in that they merely note where certain aspects of social life fit within a larger structure. Such *fit* can take the form of temporal fit or "sequential" theories, spatial fit or "network" theories, or "functional" theories.

"A structural explanation is a type of theoretical explanation about why events occur an how things work expressed by outlining an overall structure and emphasizing locations, interdependencies, distances, or relations among positions in that structure."²²⁶

1.4.5.5.1.1 Sequential

Sequential theories communicate *temporal* structure and establish the order that events or stages occur, as in for example an organization's growth and death. It is not a causal explanation, as being in an earlier stage does not cause movement along the trajectory to the next stage.

This theoretical framework therefore goes beyond structural-sequential explanations that "maturity follows emergence" in an industry's life-cycle. Instead it offers causal explanations for the causal mechanisms driving the logistic S-curve (e.g. carrying capacities, reinforcing and balancing feedbacks).

1.4.5.5.1.2 Network

Network theories communicate *positional* structure, which are less central to the theoretical framework proposed herein.

1.4.5.5.1.3 Functional

Stinchcombe (1968, pg. 80) noted that a functional explanation is:

"one in which the **consequences** of some behavior or social arrangement are essential elements to the **causes** of that behavior."²²⁷

Such closed-loop causality sounds like feedback in system dynamics, in which the analyst must identify the causal feedback loops by which the forces maintaining the structure are themselves activated by forces threating the equilibrium (Stinchcombe, 1968, pp. 88). The framework presented herein therefore can be expressed in the structural-functional format where structure (i.e. enterprise architecture) causes function (competitive dynamics), which in turn causes evolution.

"Functional theories often assume long-term system survival or continuity over time, with a need for balance or equilibrium for a system to continue smooth operation."²²⁸

²²⁶ Neuman, W.L. (2006), pg. 69.

²²⁷ Neuman, W.L. (2006), pg. 72.

²²⁸ Neuman, W.L. (2006), pg. 72.

"A functional theory of social change says that, over time, a social system moves through developmental stages, becoming increasingly differentiated and more complex. It evolves a specialized divison of labor and develops greater individualism. These developments create greater efficiency for the system as a whole."²²⁹

1.4.5.5.2 Causal Explanation

In order to establish a causal explanation, three things must be established: temporal order, association, and the elimination of plausible alternatives. This dissertation aims to meet as many of these three as possible, but recognizes that full causal explanation will not be possible. Each will be briefly discussed in turn.

1.4.5.5.2.1 Temporal Order

While most causal relations are unidirectional in terms of cause and effect, the type of causality invoked in this research is recursive or reciprocal, as in the feedback rich models of system dynamics (Forrester, 1961).

"More complex theories specify reciprocal-effect causal relations – that is, a mutual causal relationship or simultaneous causality...or feedback relationships, but these are difficult to test."²³⁰

1.4.5.5.2.2 Association

"Two phenomena are associated if **they occur together in a patterned way** or appear to act together. People sometime confuse correlation with association. Correlation has a specific technical meaning, whereas association hais a more general idea."²³¹

1.4.5.5.2.3 Elimination of Plausible Alternatives (Spuriousness)

"Eliminating all possible alternatives is **impossible**."²³²

²²⁹ Neuman, W.L. (2006), pg. 72.

²³⁰ Neuman, W.L. (2006), pg. 65.

²³¹ Neuman, W.L. (2006), pg. 66.

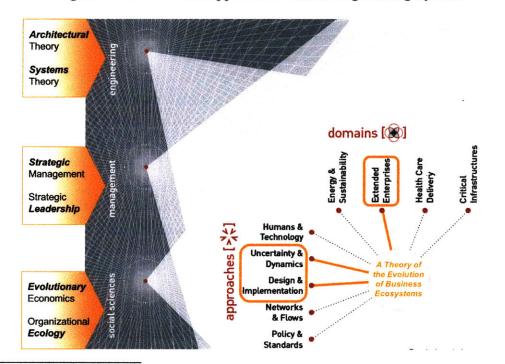

²³² Neuman, W.L. (2006), pg. 66.

1.5 Bridging Intellectual Traditions: Engineering Systems & Strategic Management

1.5.1 Engineering Systems

While the research is designed to engage the academic field of *strategic management*, the intellectual bridges will be drawn from developed as well as emerging disciplines of *engineering systems*. This section therefore briefly outlines the research agenda for a bold new academic division at MIT - the *Engineering Systems Division*, and places this research plan within the context of ESD. It briefly explains why the ESD is uniquely placed to be the natural academic "home" to sponsor and supervise this research.²³³

As the MIT Engineering Systems Division is explicitly set up to embrace the disciplines of Engineering, Management and Social Sciences, this research embraces the respective subfields of Architectural Theory and Systems Theory, Strategic Management and Strategic Leadership, Evolutionary Economics and Organizational Ecology. Within the Engineering Systems Division, the *domain* that this research engages is "Extended Enterprises", and the *approaches* used focus on "Design" and "Dynamics", as summarized in Figure 97 below.²³⁴

²³³ Significant debate has existed regarding the natural academic school or department as the "home" of this doctoral work. The phenomena investigated in this research is clearly the domain of management or business schools (and specifically within a department of strategic management). However, many doctoral programs in management/business schools tend to be discipline-based (e.g. economics or organizational theory). As this research focuses first and foremost on the phenomena (not the methodology), and takes a rather catholic, multi- and inter-disciplinary approach to investigate the phenomena, it has proven to reside more comfortably within a multi-disciplinary "systems division", in this case the MIT Engineering Systems Division.

1.5.1.1 Engineering Systems Defined

"We believe that it is important for industry, government, academia and other stakeholders...to work together to create a new field that we call Engineering Systems to develop a better understanding of the issues surrounding large-scale, complex, technologically enabled systems."²³⁵

The ESD was born out of the increasing demands on the design of complex socio-technical systems (which also have significant socio-economic and socio-political components). The investigation of such complex problems, inevitably involves taking intellectual risks.

"The management of the enterprises that perform design, manufacturing and operational processes is a significant concern in the field. Furthermore, the economic, social and political context in which the engineering systems operate is a significant concern."²³⁶

"We value and accept intellectual risk. This means tackling issues that appear, at least in part, to be non-quantifyable or vague. We have deep respect for all the disciplines we bring together and build upon, including engineering, social sciences and management."²³⁷

It is not a coincidence therefore, that the primary constructs used in this research plan: enterprise *architecture*, enterprise *structural dynamics* and the *industrial evolution* of the enterprise's environment all have their theoretical heritage rooted in "engineering systems".

"Engineering Systems is a field of study taking an integrative holistic view of large-scale, complex, technologically-enabled systems with significant enterprise level interactions and socio-technical interfaces."²³⁸

An "engineering system - as conceived by the ESD - is comprised of the (micro-) product system, the (meso-) enterprise system, and the (macro-) environment system. This research plan therefore focuses on the meso-enterprise system²³⁹ as the unit of analysis, as shown in Figure 98 below.

"The interaction between the designing enterprise and the engineering system is deep. While organizational theorists have well-developed theories of how organizations function and make decisions, this understanding needs to be integrated into the design phase in a quantifiable way."²⁴⁰

²³⁴ These definitions are taken from the MIT Engineering Systems Division's "Strategic Report", 2009.

²³⁵ Moses, J. (2004), pg. 3.

²³⁶ Moses, J. (2004), pg. 2.

²³⁷ MIT Engineering Systems Division, "Strategic Report". (2009).

²³⁸ Hastings, D. (2005), pg. 17.

²³⁹ The enterprise system is sometimes referred to as an "extended enterprise" which includes the firm producing the product system and its key stakeholders, (e.g. customers, suppliers, investors, employees).

²⁴⁰ Hastings. D. (2004), pg. 5.

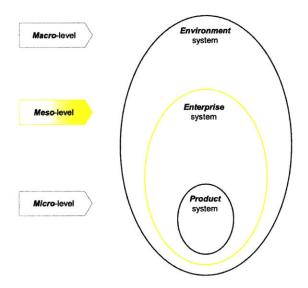

Figure 98: General research focus within the construct of an "engineering system"

1.5.1.2 Engineering Systems approach to Strategic Management

The following characteristics of engineering systems are particularly appropriate to the study of strategic management.

1.5.1.2.1 *Performance* as the Dependent Variable

A common characteristic shared between engineering systems and strategic management is the focus on *performance*, whether of products, product systems, production systems or enterprises performing these functions. When the notion of *relative* performance becomes relevant or important, then *competition* becomes important. This focus on competitive performance will be discussed in more detail later in the section on *enterprise architecting*.

1.5.1.2.2 Holism and Feedback Processes

"A particular feature in the Engineering Systems mode of thought is **holism**. That is, emphasizing the behavior of the whole in contrast to its parts. Holism lends itself to thinking about **appropriate abstractions** for describing and analyzing engineering systems as a whole."²⁴¹

This research dissertation therefore attempts to use holistic, non-reductionist thinking to bring heretofore absent "appropriate abstractions" (e.g. form, function, fit, etc.) to bear on the field of strategic management in order to explain long-term firm performance.

²⁴¹ Moses, J. (2004), pg. 1.

"Much attention is paid in the Engineering Systems mode of thought to certain feedback processes. For example, the organization of an enterprise can influence the architecture of the system it designs. Similarly, the architecture of a system can influence the organization of the enterprise."²⁴²

In addition, this dissertation aims to entertain not a simple correlative approach, nor a linear open loop causal explanation for long-term firm performance, but a closed-loop feedback explanation via the development of an explanation for the evolution of business ecosystems.

1.5.1.2.3 Managing Change and the Life Cycle Perspective

"A key emphasis in the field is on managing change. Large-scale engineering systems tend to change a great deal, especially when we consider long time frames, such as the entire lifetime of the system. Engineering Systems takes a relatively optimistic view of ways of dealing with change. One way of managing change is to consider those aspects of the system that will remain relatively stable. For example, while the overall function of the system may change dramatically over time, its macro-scale architecture may be relatively stable."²⁴³

Unlike many studies in the field of strategic management which tend to be cross-sectional, this research utilizes a longitudinal (including historical) approach examining long time frames in order to examine the entire lifetime of a system (firm and industry). In this way, it is hoped to determine whether or not the "system function" and its associated "macro-scale architecture" changed significantly over the life-cycle. In this way, this research hopes to re-engage the debate of social structure vs. agency in organizational theory.

1.5.1.2.4 The "-ilities"

"From the existing engineering science point of view, there are several traditional properties of engineering systems. These include: function, performance and cost. Engineering Systems emphasizes non-traditional properties or goals of systems, often called 'ilities.' They usually arise from taking a long-term or life-cycle view of systems. These include: flexibility, robustness, etc."²⁴⁴

The tendency of researchers in the field of strategic management is to focus on traditional short term properties of the firm like "profitability" expressed as various efficiency ratios like return on assets, return on equity, return on sales.

This research dissertation takes the long-term or life-cycle view of firms and their enterprise systems by focusing on the "non-traditional" properties of systems including the following "-ilities": flexibility, stability etc.

Therefore, although this research will use the traditional property of "profitability" as the primary dependent variable, it will focus on causal mechanisms which introduce the "-ilities" as independent variables.

²⁴² Moses, J. (2004), pp. 1-2.

²⁴³ Moses, J. (2004), pg. 1.

²⁴⁴ Moses, J. (2004), pp. 6-7.

1.5.1.3 Engineering Systems sub-field: Enterprise Architecture

Within the emerging field of Engineering Systems, it is posited that the notion of "architecture" has theoretical relevance to all systems, whether natural or artificial, whether consciously designed or not. As shown in Figure 99 below²⁴⁵, this doctoral research plan will attempt to contribute to a systems subfield called, *Enterprise Systems Architecture*, or *Enterprise Architecture* for short.²⁴⁶. The research attempts to address the architectures of "intellectual frameworks" on "organizational forms", where the organizations in question are "larger than single companies", namely *business ecosystems* as defined earlier.

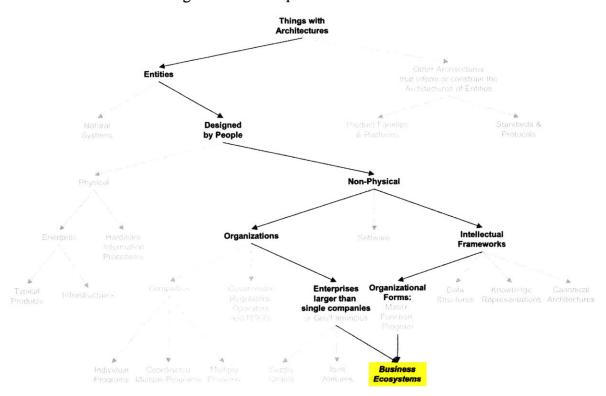

Figure 99: Decomposition of Architectures

"Architecture, especially the architecture of the highest level of an engineering system, is of great interest to Engineering Systems."²⁴⁷

The proposed research will attempt to characterize enterprises at their the highest, most abstract level: i.e. their *form, function, structure* and *behavior* (both transient and steady state).

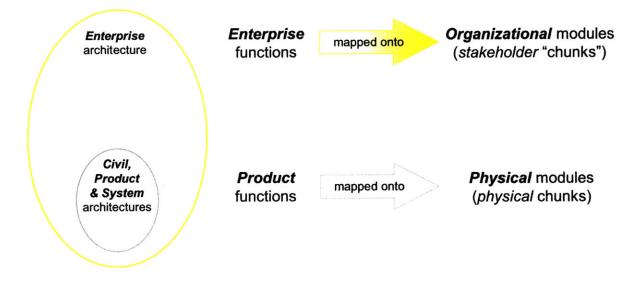

²⁴⁵ Adapted from Whitney, D. et al. (2004), pp. 15-16.

²⁴⁶ The qualifying word "systems" is used to distinguish this endeavor from the growing body of research on "enterprise architecting" which represents a narrower IT space.

²⁴⁷ Moses, J. (2004), pg. 8.

As will be discussed in more detail in Essay #1, this research will posit the construct of an *enterprise* architecture, which will draw concepts from *civil*, *product* and *system* architecture. While these well-developed concepts tend to focus on the mapping of function to physical entities, the notion of enterprise architecture focuses primarily on mapping of function to organizational entities as shown in Figure 100 below.

Figure 100: Enterprise Architecture vs. Civil, Product & System Architectures

Having defined an enterprise architecture, I will begin to explore questions that are central to the emerging field of enterprise architecting relating to the properties of architectures, as expressed by Nightingale and Rhodes (2004) below:

"How do you architect enterprises to optimize around certain properties? What enterprise architecture could maximize long-term stability of the enterprise versus what architecture would maximize the flexibility of the enterprise in regard to its ability to design innovative new products? Can a single enterprise model be 'optimized' for both such properties, or do we need to select for one over another?"²⁴⁸

²⁴⁸ Nightingale, D. and Rhodes, D. (2004), pp. 9-10.

1.5.1.3.1 Enterprise Architecting subfield: Competition

"In enterprise architecting we are faced with an important consideration: How do you architect an enterprise that can most effectively produce a desired 'product system'?"²⁴⁹

By extension, an enterprise that is architected to effectively produce a desired product system, will exhibit higher long-term firm performance than other competing enterprise system architectures. The issue of enterprise architecture for effective product system delivery becomes one of enterprise architecture as an explanatory strategic variable for long-term firm competitive performance.

"Engineering systems are not designed, produced and operated in a vacuum. There are customers of these systems, competing enterprises, societal concerns and governmental policies that also need to be considered."²⁵⁰

One of the primary academic contributions of this research therefore attempts to bridge the heretofore-separate intellectual traditions between *engineering systems* (an in particular, *systems architecting* and *system dynamics*) and *strategic management*.

The research focuses therefore the dynamics of competing meso-enterprise systems, on *complex*, *competitive enterprise architectures*²⁵¹, characterized as having differing architectural forms, as shown in Figure 101 below.

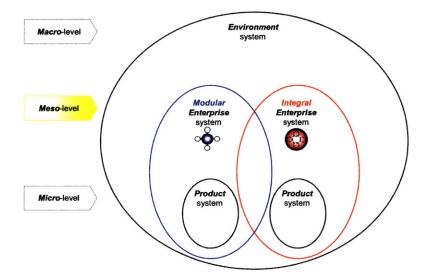

Figure 101: Specific research focus with the construct of an "engineering system"²⁵²

²⁴⁹ Nightingale, D. and Rhodes, D. (2004), pp. 2.

²⁵⁰ Moses, J. (2004), pg. 8.

²⁵¹ ESD Prof. Joe Sussman, furthered this concept in his white paper, "Home Run For LAI", July 8, 2005.

²⁵² Note that the overlap of the competing enterprises is shown to symbolically represent the fact that there are often sharing of key stakeholders among enterprise (e.g. customers, suppliers, investors, etc.).

1.5.1.3.2 Competition case study: Boeing vs. Airbus

"A Boeing-Airbus case study [could be] a 'home-run' [due to its]... high-visibility... international frame of reference... multiple stakeholders interacting in complex and subtle ways... insights applied to other domains."²⁵³

The primary case study in this research plan centers on the competition between *Boeing* and *Airbus*' global enterprises that design and manufacture large-scale, complex, technologically enabled systems. In addition, as these enterprises are embedded in complex economic, social and political contexts, it is appropriate that international faculty whose interests and expertise embrace these "non-engineering" disciplines, as well as engineering systems supervises the research.

1.5.1.4 Mapping Proposed Research onto ESD Intellectual "Topology"

Finally, in order to place this work within existing intellectual traditions, I note that in the spirit of ESD research, the work is intended to build systemic knowledge via bridges between heretofore disconnected academic disciplines.

As is seen in Figure 102 below, the proposed research draws upon - and lies in the intersection of - at least four academic areas identified by ESD^{254} :

- Systems Analysis
- Systems Theory
- Organizational Theory
- Political Economy

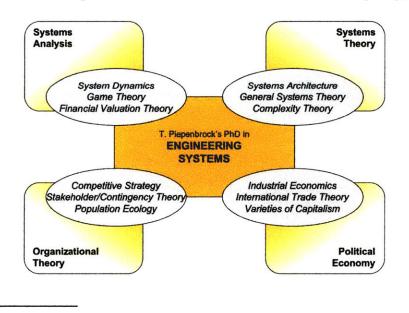

Figure 102: Proposed Research within ESD Intellectual "Topology"

²⁵³ Joe Sussman, ibid.

²⁵⁴ Hastings, D. (2005), pg. 17.

1.5.1.5 Firm-Industry Research Tradition

The research plan described herein builds on the academic tradition of MIT's *Engineering Systems Division* and its predecessor organizations in the scope of its studies of firms and industries as large-scale, complex, technologically-enabled systems with significant enterprise level interactions and socio-technical interfaces. ESD director, Prof. Dan Hastings gives the following examples of engineering systems:

"Examples of Engineering Systems include: automobile production systems, aerospace enterprise systems, air transportation systems..."²⁵⁵.

Figure 103 below shows examples of previous ESD research²⁵⁶ in each of these three domains:

- The International Motor Vehicle Program's (IMVP) study of the automotive industry, uncovered causal mechanisms of the emerging leader, *Toyota Motors*.²⁵⁷
- The *Lean Aerospace Initiative's* (LAI) studies of the aerospace industry²⁵⁸ aim to uncover the causal mechanisms of its emerging leader, *Airbus Industrie*.
- The *Global Airline Industry*'s (GAI) study of the US airline industry, uncovering the causal mechanisms of the emerging leader, *Southwest Airlines*.²⁵⁹

Figure 103: Case Study Building Blocks for Theory Development

As will be discussed later in the research methodology section, these three pieces of *firm-industry* research will form the basis of a theoretical sample upon which the grounded theory is developed and extended.

1.5.2 Strategic Management

Although the field of strategic management has had a rich intellectual history over the past 50 years, more recent critical debates have emerged among some of the field's most pre-eminent scholars which challenge its relevance and epistemological basis (Ghoshal, 2005; Kanter, 2005; Pfeffer, 2005; Hambrick, 2005; Mintzberg, 2005; Donaldson, 2005). This research dissertation is timely in that it attempts to address theses topical discussions.

"Over the last 50 years business school research has increasingly adopted the 'scientific' model – an approach that Hayek (1989) described as the 'pretense of knowledge.' This pretense has demanded theorizing based on partialization of analysis, the exclusion of any role for human intentionality or choice, and the use of sharp assumptions and deductive reasoning (Bailey and Ford, 1996)."²⁶⁰

A recent paper, published posthumously by strategic management professor Sumantra Ghoshal $(2005)^{261}$ triggered an interesting academic debate among some of the leading academics in the field. Ghoshal critiques his own profession - business school academics - as contributing to the development of "bad management theories (which) are destroying good management practices." This research dissertation is designed to attempt to address the concerns articulated by these scholars.

1.5.2.1 The Scientific Model (and the "pretense of knowledge")

"Friedrich von Hayek dedicated his entire Nobel Memorial Lecture to the danger posed by scientific pretensions in the analysis of social phenomena. Because of the very nature of social phenomena, which Hayek described as 'phenomena of organized complexity,' the application of scientific methods to such phenomena' are often most unscientific, and, beyond this, in these fields there are definite limits to what we can expect science to achieve."²⁶²

"Why don't we actually acknowledge that companies survive and prosper when they simultaneously pay attention to the interests of customers, employees, shareholders, and perhaps the communities in which they operate? The honest answer is because such a perspective cannot be elegantly modeled – the math does not exist. Such a theory would not readily yield sharp, testable propositions, nor would it provide simple, reductionist prescriptions. With such a premise, the pretense of knowledge could not be protected. Business could not be treated as a science and we would have to fall back on the wisdom of common sense that combines information on 'what is' with the imagination of 'what ought to be' to develop both a practical understanding of and some pragmatic prescriptions for 'phenomena of organized complexity' that the issue of corporate governance represents. This too is scholarship, but it yields theory that does not pretend to be scientific laws but merely serves as 'walking sticks' – in Fritz Roethlisberger's (1977) terms – to aid sensemaking as we go along, to be used only until a better walking stick can be found."²⁶³

"In describing himself and his work, Sigmund Freud wrote: 'You estimate me too highly. I am not really a man of science, not an experimenter and not a thinker. I am nothing but by temperament a conquistador – an adventurer' (in Jones, 1964, 171). Freud's inductive and iterative approach to

²⁶⁰ Ghoshal, S. (2005), pp. 76-77.

²⁶¹ Professor of strategic management at the London Business School. Ghoshal received dual doctorates in management from the Massachusetts Institute of Technology and the Harvard Business School.

²⁶² Ghoshal, S. (2005), pg. 79.

²⁶³ Ghoshal, S. (2005), pg. 81.

sense making, often criticized for being ad hoc and unscientific, was scholarship of common sense. So indeed was Darwin's, who too practiced a model of research as the work of a detective, not of an experimenter, who was driven by the passions of an adventurer, not those of a mathematician. Scholarship of common sense is the epistemology of disciplined imagination, as advocated by Karl Weick (1989), and not the epistemology of formalized falsification that was the doctrine of Karl Popper (1968)."²⁰⁴

"The trouble with the social sciences is that the **logic of falsification**, which is so very essential for the epistemology of positivism, **is very hard to apply with any degree of rigor and ruthlessness in domain of social theories**. Typically, no theory – which are all, by definition, partial – explains a 'phenomenon of organized complexity' fully, and **many different and mutually inconsistent theories** explain the same phenomenon, often to very similar extents. As a result, nothing can be weeded out nor, given the very different framings, can anything be combined with anything else, except in a very synthetic and ad hoc manner."²⁶⁵

"The answer would help us understand the path toward replacing 'bad theories' with better ones – or perhaps, I should say simpler theories with more complex ones, partial theories with fuller explanations. I don't think ideas such as agency theory/economic man/shareholder rights/incentives as motivators are all wrong, and neither does Ghoshal. They are just too simple and leave out too much."²⁶⁶

1.5.2.2 Solving the Negative Problem (and the "gloomy vision")

"These negative assumptions are manifest in the strong form of determinism in both ecological (e.g. Hannan and Freeman, 1977) and institutional (Di Maggio and Powell, 1983) analysis of organizations; in the denial of the possibility of goal-directed adaptation in behavioral theories of the firm (e.g. Cyert and March, 1963); in the focus on value appropriation rather than value creation in most theories of strategy (e.g. Porter, 1980); and in the assumptions about shirking, opportunism, and inertia in economic analysis of companies (e.g. Alchian and Demsetz, 1972; Williamson, 1975)."²⁶⁷

²⁶⁴ Ghoshal, S. (2005), pg. 79.

²⁶⁵ Ghoshal, S. (2005), pg. 79.

²⁶⁶ Kanter (2005), pp. 93-94.

²⁶⁷ Ghoshal, S. (2005), pg. 82.

1.5.2.3 Self-fulfilling Theories (and the "double hermeneutic")

"All of this would not lead to any negative consequences for management practice but for the distinctive feature of double hermeneutic that characterizes the link between theory and practice in social domains. Unlike theories in physical sciences, theories in the social sciences tend to be self-fulfilling (Gergen, 1973). A theory of subatomic particles or of the universe – right or wrong – does not change the behaviors of those particles or of the universe. If a theory assumes that the sun goes around the earth, it does not change what the sun actually does. So, if the theory is wrong, the truth is preserved for discovery by someone else. In contrast, a management theory – if it gains sufficient currency – changes the behaviors of managers who start to act in accordance with the theory. Whether right or wrong to begin with, the theory can become right as managers – who are both its subjects and its consumers – adapt their behaviors to conform with the doctrine."²⁶⁸

When applying the scientific model to social domains, the object of the research (management *practice*) has the opportunity to implement the subject of research (management *theory*), which can lead to self-fulfillment (Ghoshal, 2005) as shown in Figure 104 below.

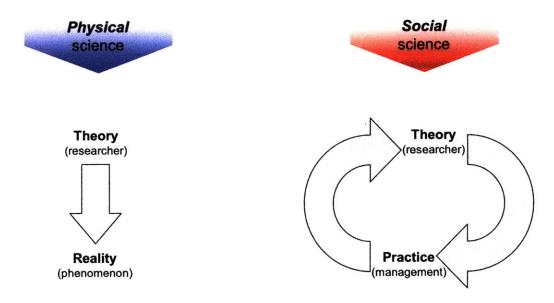

Figure 104: The Theory-Practice Double Hermeneutic in Social Science

"If you do not rest upon the good foundation of **nature**, you will labor with little honor and **less** profit."²⁶⁹

²⁶⁸ Ghoshal, S. (2005), pg. 77.

²⁶⁹ Leonardo da Vinci.

1.5.3 Management / Engineering Knowledge as an Example of the Framework

Before proceeding into a discussion of the framework and its applications to competitive *business* environments, it is interesting to note its application to the competitive *academic* environments, namely the evolution of management / engineering knowledge.

1.5.3.1 Making "Intellectual Bricks" vs. Building "Cathedrals of Knowledge"

"...the one will kill the other ... each mind is a mason."270

As shown in Figure 105 below, theory building can be thought of metaphorically as building buildings. One needs both structurally strong (i.e. rigorously derived and internally valid) components or "bricks" deduced from scientific reductionism as well as functional (i.e. relevant) systems induced from scientific holism. As the previous discussions on the current stalemate in strategic management reveal (Ghoshal, 2005 et al.), the intellectual pendulum has swung back towards the need to begin to reintegrate the bricks of knowledge.

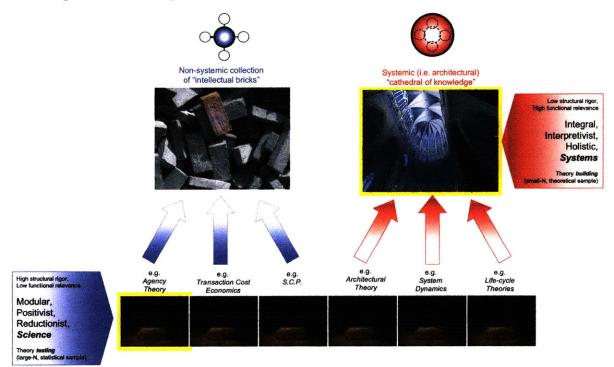

Figure 105: Making "Intellectual Bricks" vs. Building "Cathedrals of Knowledge"

This research takes as a point of departure, a collection of disconnected theories or wellestablished intellectual "bricks", which are each internally-valid enough to venture to assemble a structural system of knowledge which begins to have functional relevance and utility. One of the

²⁷⁰ Hugo, V. (1831) Notre Dame de Paris.

clear difficulties with endeavoring such "systemic" research is that scholars having specialized in building their strong "scientific" brick, are by definition unfamiliar with other scientist's "bricks", and therefore demand a deep, narrow reductionist theory-testing approach to that second "brick". This is precisely why rigorous and relevant theories have yet to be built in complex socio-technical domains. A systemic framework or "cathedral of knowledge" consisting of say 100 bricks can never get beyond the second brick. The following observations from fellow academics reveal the dilemma:

"A PhD at the end of the day is the dedication of five years of your life to scientifically building a small, tight, impenetrable **brick** of knowledge in a very narrow, bounded intellectual domain."²⁷¹

"The frameworks that you suggest, are typically conceived by emeritus professors, near the end of their careers... but come to think of it, we never really get around to it ... looking back on it all, the reality is that probably the most opportune time to conduct such 'big' research was during our PhD years."²⁷²

1.5.3.2 Management / Engineering Science as Modular Enterprise Architecture

The deep and narrow functional specialisms of engineering science have grown up over the past half-century in concert with the "higher, faster, farther" demands of industry and government.

The organizational forms that deliver such *product* innovation tend to be *modular* enterprise architectures.

1.5.3.3 Management / Engineering Systems as Integral Enterprise Architecture

As the industrial and government customers begin to be "over-served" by the deep and narrow functional specialisms of engineering science, the educational ecosystem has evolved a complementary and symbiotically competitive architectural form which serves to integrate such knowledge from management / engineering science and other contextual disciplines in the form of engineering systems to serve the demands for "better, faster, cheaper" knowledge.

The organizational forms that deliver such *process* innovation tend to be *integral* enterprise architectures with long-term trust-based partnership between stakeholders such as academia, industry, government, etc. At MIT over the past 20 years, such separate integral enterprises like: the Technology and Policy Program (TPP), the Leaders for Manufacturing Program (LFM, the System Design and Management Program (SDM) have recently been brought under the umbrella of the integrating mechanism of the Engineering Systems Division (ESD).

This research therefore takes an integral enterprise architectural approach as shown in Figure 106 below, as the environments for knowledge in both the management and engineering fields appear to be more mature and therefore there is a need and opportunity to create innovative knowledge via integration or synthesis using inductive methods and via building long-term trust-based relationships with the phenomena under study.

²⁷¹ MIT Sloan PhD student, spring, 2005.

²⁷² MIT Sloan Professor, fall 2004.

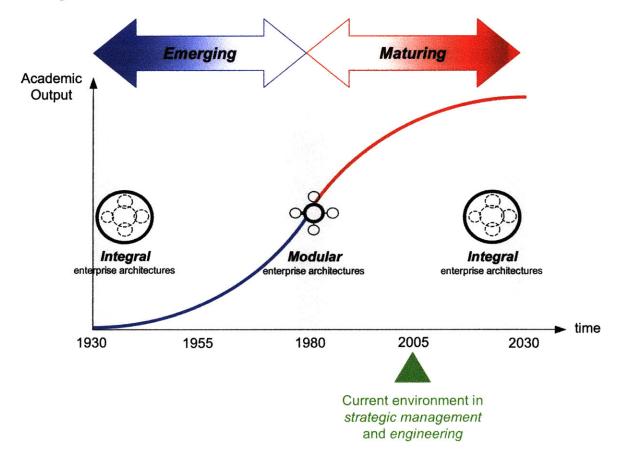

Figure 106: Dissertation as the Evolution of the Dominant Research Architecture

"Our primary endeavor as business school academics over the last half century has been to make business studies a branch of the social sciences (Schlossman, Sedlak, and Wecshler, 1998). Rejecting what we saw as the 'romanticism' of analyzing corporate behaviors in terms of the choices, actions and achievements of individuals (e.g. Andrews, 1980), we have adopted the 'scientific' approach of trying to discover patterns and laws, and have replace all notions of human intentionality with a firm belief in causal determinism for explaining all aspects of corporate performance. Adoption of scientific methods has undoubtedly yielded some significant benefits for both our research and pedagogy, but the costs too have been high. Unfortunately, as philosophy of science makes clear, it is an error to pretend that the methods of the physical sciences can be indiscriminately applied to business studies because such a pretension ignores some fundamental differences that exist between the different academic disciplines."²⁷³

²⁷³ Ghoshal, S. (2005), pg. 77.

1.6 Literature Analysis

"Interesting research reported contrarian findings, disconfirmed established theories and challenged accepted assumptions. The lesson is that researchers should try to develop theories and gather data that disconfirm existing views. Scholars must know the current body of knowledge but not champion it."²⁷⁴

1.6.1 Previous Related Research

There is clearly a considerable wealth of constituent research in the field of strategic management from two schools rooted in microeconomic theory: the Industrial Organization subfield dating back to Bain (1956) advanced the industry structure emphasis and on the resource-based view of the firm dating back to Penrose (1959), with their respective descendant proponents appearing a quarter century later in Porter (1980) and Wernerfelt (1984). Since this time, much research in this field has focused on the refinements of theories in each subfield, including: asset stock accumulation and dynamic capabilities (Dierickx and Cool, 1989; Teece, Pisano and Shuen, 1990).

"We need equally rich models of the firm and the environment that take both organizational and economic modes of explanation seriously."²⁷⁵

Relatively little has been done in studying the longitudinal interactions between the firm and its environment, particularly with respect to developing grounded theory, and particularly with respect to embracing strategic management's primary constituent fields of economics and organizational theory.

"Fortunately, strategy researchers have always been willing to study subjects that cut across existing conceptual boundaries."²⁷⁶

1.6.1.1 Economics and Sociology Literatures

In developing the concept of *enterprise architecture* and tying it to long-term firm performance, this research cuts across economic and sociological boundaries, embracing such diverse sources as: theory of the firm (Coase, 1937; Alchian and Demsetz, 1972; Williamson, 1985), agency theory (Jensen & Meckling, 1976; Fama, 1980), behavioral decision theory (Kahneman et al., 1982, Simon, 1982); organizational contingency theory (Lawrence and Lorsch, 1967), structural functionalism (Selznick, 1948), chaos theory in strategy (Levy, 1994), complexity theory in strategy (Stacey, 1995), structuration theory (Giddens, 1979; Whittington, 1992; Yates, 1997), institutional theory (Fligstein, 2001, Loveridge, 2003), institutional economics (Veblen, 1898; Commons, 1934), mixed duopoly economics (Law & Stewart, 1983; Mai & Hwang, 1989; Horowitz, 1991; Cremer & Crémer, 1992; Futagami & Okamura, 1994), macro- and international economics (Poire and Sabel, 1984; Thurow, 1992; Hall and Soskice, 2001), strategic complementarities (Milgrom and Roberts, 1990, 1995; Whittington et al., 1999),

²⁷⁴ Daft R.L. and Lewin, A.Y. (1990), pp. 5-6.

²⁷⁵ Henderson, R. and Mitchell, W. (1997), pg. 10.

²⁷⁶ Henderson, R. and Mitchell, W, (1997), pg. 12.

stakeholder theory of the firm (Follett, 1918; Freeman, 1984; Evan and Freeman, 1988; Ackoff, 1990; Donaldson and Preston, 1995; Mitchell, Agle & Wood, 1997; Ramirez, 1999; Schilling, 2000; Freeman and McVea, 2006), trust, voice and exit (Hirschman, 1970; Helper, 1990; Sako and Helper, 1998), theory of the growth of the firm (Penrose, 1959; Forrester, 1966), general systems theory (von Bertalanffy, 1962) and systems view of the firm (Ashby, 1956; Forrester, 1961; Simon, 1969).

1.6.1.2 Architecture Literatures

In addition, *enterprise architecture* cuts across the many manifestations of "architecture" in management literature: e.g. complexity in- (Simon, 1962) building- (Alexander, 1964), product-(Ulrich, 1995), systems- (Meier and Rechtin, 2000; Nightingale and Rhodes, 2004), supply chain- (Novak and Eppinger, 1998), organizational- (Sanchez and Mahoney, 1996; Rechtin, 1999), human resource- (Lepak and Snell, 1999), innovation and- (Henderson and Clark, 1990), as well as the various interactions between architectures (Fine, 1998; Sako, 2003).

1.6.2 Placement of Research within the Strategic Management Literature

While the proposed research intends to engage the strategic management intellectual community, it attempts to do so via multi-disciplinary means, bridging both the economics and sociology literatures.

Appendix C illustrates this placement by highlighting those works of the 50 most cited publications in strategic management (Ramos-Rodriguez and Ruiz-Navarro, 2004) that have had the greatest impact on this dissertation.

1.6.3 Placement of the Proposed Framework within the Literatures

1.6.3.1 Framework as *Typology* (capturing the *internal-external* debate)

The framework proposes a typology of organizational sets, which has closest links to the following typologies:

- Political Economy: "Varieties of Capitalism" (e.g. Hall and Soskice, 2001)
 - Liberal Market Economy (LME) vs.
 - Coordinated Market Economy (CME)
- Economics: "Mixed Duopoly" (e.g. Lambertini and Rossini, 1998)
 - Profit Maximizer (PM) vs.
 - Labour Managed (LM)
- Sociology: "Contingency Theory" (e.g. Burns and Stalker, 1961)
 - Mechanistic vs.
 - o Organic

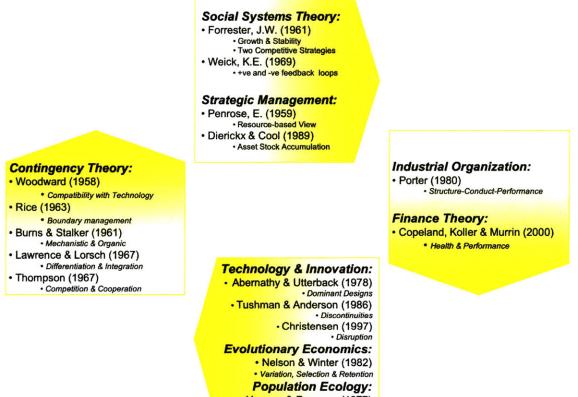

1.6.3.2 Framework as *Evolution* (capturing the *adaptation-determinism* debate)

The framework proposes a theory of the evolution of the organizational sets, which has closest links to the following theories:

- Population / Community Ecology (e.g. Hannan and Freeman, 1977)
- Evolutionary Economics (e.g. Nelson and Winter, 1982)

In order to begin to place the research and its proposed framework within the academic literatures, Figure 107 below summarizes in stylized form a sample of some of the main influences at the intersections between the key constructs.

Figure 107: Placement of the Framework within the Academic Literatures

Hannan & Freeman (1977)
 Structural Inertia

1.6.4 Gaps in Literature

"Unfortunately there is **relatively little research** that explicitly considers how capabilities and environments jointly shape each other... Clearly, **far more work remains** to explore the reciprocal relationship between capabilities and competition."²⁷⁷

"I scoured the literature of the theory of the firm in theoretical economics for discussions of [the growth of the firm] with increasing frustration." 278

While each of the aforementioned references represents well-developed areas of domain knowledge, the interconnections among them have not yet been seriously explored. It is the space in between existing disciplines that this research attempts to exploit. If any research innovations are to be found in this research dissertation, they would lie in a framework which connects the disconnected, which re-members the dismembered, which integrates the disintegrated.

"Each of the research programs [in strategic management] has focused on a different element of the strategy picture: environment, resources, and organizational structure. This division of labor between programs of research has facilitated scientific progress – but at a price."²⁷⁹

While there is a clear wealth of research from diverse theoretic sources - each providing different explanations for long-term firm performance - there is relatively little research in the strategic management literature providing more systemic, meta-theoretical frameworks which capture the plurality and complexity of performance causality into a unifying meta-strategic framework.

"This loudly divided counsel on the best strategy...reflects a certain troubling inadequacy in both perception and understanding. Of course, we do not mean that a good case cannot be made for some of these remedies. We mean, rather, that the sheer cacophony of prescription is itself evidence of a broad-based failure of interpretation, an inability or unwillingness to see that [long-term firm performance] defies the standard categories of analysis and discussion."²⁸⁰

Gaps in the strategic management literature therefore exist in the synthesis and reconciliation of existing competing theories, as well as in bringing existing theories from other non-strategy (and in fact, non-management) sources like *systems architecting*.

"Much exciting theoretical and empirical work remains in coupling dominant designs and technology cycles to environmental conditions and organizational evolution."²⁸¹

[Miller, 1986] "...represented an early attempt to apply the approach of configuration to the field of strategy. Now, 10 years later, we still have far to go. What is often lacking from the configurational literature is the search for the configuration itself: for complex systems of interdependency and their core orchestrating themes."²⁸²

²⁸¹ Tushman, M. and Murmann (1998).

²⁸² Miller, D. (1996), pg. 505.

1.6.5 Contributions to Literature

The primary contribution that this research aims to make is in bridging two heretofore separate and distinct academic and theoretical fields: strategic management and the emerging field of engineering systems, and in particular, systems architecting and system dynamics.

"In addition to the integration gained by the increased recognition of reciprocal causation, integrative frameworks have offered more eclectic views of concepts and phenomena, linked previously disconnected constructs and levels of analysis, and attempted to further the bridging of fragmented models."283

The innovations that this research attempts to bring to the field of strategic management include:

- The notion of architecture applied to the extended enterprise.
- The notion that these enterprise architectures cause firm dynamics.
- The notion that these firm dynamics cause long term firm performance
- The notion of a "dominant design" applied to the extended enterprise architectures in the • evolution of the industry.
- The development of and distinction between two types of organizational inertia: architectural and structural.

1.6.5.1 *Theoretical* Contributions to Literature

The three primary theoretical contributions to the strategic management and emergent engineering systems literatures are:

The first is the introduction of the heretofore-absent theoretical construct of enterprise architecture as an explanation for long-term firm performance. This construct acts both to unify other disconnected theories as well as to simplify the complexity of long-term firm performance.

"The architecture is the form of the system and is the dominant factor in its behavior."284

The second theoretical contribution is the linkage of enterprise architectural form to the enterprise structural dynamics of stability and growth, which in turn impact long-term performance. In this sense, it is a modest theoretical extension and generalization of Edith Penrose's seminal work on the growth of the firm.²⁸⁵

Finally, the third theoretical contribution is the feedback linkage between architectural form, structural dynamics and firm performance to the dynamic evolution of the industrial environment.

²⁸³ Farjoun, M. (2002), pp. 569.
²⁸⁴ Whitney D. et al, (2004), pg. 26.

²⁸⁵ Penrose, E.T. (1959).

1.6.5.2 *Empirical* Contributions to Literature

"Considerable attention has recently been devoted to understanding behavior in large organizational systems. Although some of this work has been based on research, it has more typically been general theorizing with **little support from research data**. Our interest in examining complex organizations is to study **more systematically and empirically** their **internal** functioning in relation to the demands of the external environment on the organization and the ability of the organization to cope effectively with these demands, contributing to a theory of the functioning of large organizations based on empirical research."²⁸⁶

As discussed previously, this research dissertation attempts to validate and extend the ground breaking research performed by Lawrence and Lorsch (1967). Nearly forty years after their work, there is still little empirical data to support theories on large organizational systems.²⁸⁷

Like their original work, this dissertation is based empirically in building grounded theory. However, unlike their original research, this dissertation is interested in the phenomenon of the *external* (i.e. *inter*-firm) functioning of large organizational systems (or "extended enterprises"), as opposed to the internal functioning (i.e. *intra*-firm) functioning of large organizational systems (or "firms").

As will be discussed later, the theoretical framework will be grounded empirically. As such, it is envisaged that there will be empirical contributions to be made, particularly in support of the theoretical work surrounding the shareholder vs. stakeholder debate – particularly by explaining how, when and why each model seems to be more competitively dominant.

The following is a partial list of some of the empirical contributions that this dissertation begins to make to the existing theoretical literature:

- Empirical evidence to begin to validate and extend Lawrence and Lorsch's (1967) structural contingency theories regarding differentiation and integration as *intra*-firm mechanisms to *inter*-firm mechanisms.
- Empirical evidence to begin to *endogenize* Lawrence and Lorsch's (1967) contingency theory namely to explain what drives the dominance of differentiation and intergration and when this dominance switches between the two.
- Empirical evidence to begin to identify and explain variation of enterprise architectural *forms* in population ecology (Hannan and Freeman, 1977) and to demonstrate that certain *late entrants* do not have high mortality rates as the theory suggests, but not only do they survive, they go on to dominate the industry.
- Empirical evidence to begin to support Pfeffer and Salancik's (1978) claims of resource dependence. As the authors themselves lament, 25 years after the publishing of their influeitial work:

²⁸⁶ Lawrence, P.R. & Lorsch, J.W. (1967), pg. 2.

²⁸⁷ Lawrence, P.R. & Lorsch, J.W. (1967), pg. 2 cite the studies by: Burns & Stalker (1961), and Rice, A. (1965).

"The image presented is one of dynamic interaction and evolution of organizations, environments, and interorganizational relations over time as the various actors maneuver for advantage. Again the limits of both authors' methodological training and the available empirical methods and data did not result in explicitly dynamic models showing the evolution of both environments and ourganizational decisions and structures over time...Yet there is a limited amount of empirical work explicitly extending and testing resource dependence theory and its central tenets."²⁸⁸

- Empirical evidence to begin to contextualize and revese the findings Arthur's (1992) and Delery and Doty's (1996) research in Strategic Human Resource Management that "*high commitment*" workforces tend to have *differentiation* strategies.
- Empirical evidence to begin to lend support to Penrose's (1959) theoretical hypotheses that firms have a *stakeholder* approach will differ in competitiveness, commitment, and strategic flexibility from firms that maximize *stockholder* wealth.
- Empirical evidence to begin to lend support to Forrester's (1961) theoretical hypotheses regarding the existence of firm strategies centered around attracting a particular portion of the underlying market demand.
- Empirical evidence to begin to validate the work on strategic complementarities (e.g. Milgrom and Roberts, 1990 and 1995).

"We are hopeful that empirical work will provide evidence of distinctly separated clusters of firm characteristics as support for our theory. Given our assumptions about time trends in prices, we also expect to find an increasing proportion of manufacturing firms adopting the modern manufacturing strategic cluster that we have described."²⁸⁹

- Empirical evidence to begin to validate the recent work in mixed duopoly economics (e.g. Lambertini & Rossini, 1995) which models the strategic interaction between profit-maximizing (PM) and labor-managed (LM) firms.
- Empirical evidence to demonstrate that *intra*-market economy variation can exist and in fact dominate an industry, supporting the "Varieties of Capitalism" theory (Hall and Soskice, 2001) that international political-economic convergence is not occuring as "Corporatism" would suggest. The case study of *Southwest Airlines* (a *Coordinated market firm*) exists within a *Liberal market economy* (LME).
- Empirical evidence and theoretical framework to demonstrate the concept of "Sustainable" Corporate Social Responsibility (CSR).
- Empirical evidence to support the claims of Lenox, Rockart and Lewin's (2006) numerical simulation models which postulate a relationship between environmental interdependencies and firm and industry profitability.

²⁸⁸ Pfeffer and Salancik, (1978), pgs. xii and xvi.

²⁸⁹ Milgrom and Roberts, (1990), pg. 527.

1.6.5.3 Research Methods Contributions to Literature

As will be discussed in detail in chapter 2, this research aims to contribute to the literature on appropriate and innovative research methods when studying complex socio-technical systems.

Few research designs in strategic management incorporate longitudinal field studies across several organizations that comprise the firm and its extended enterprise, as well as those of its competitor.

In addition, few research designs in strategic management view the phenomenon simultaneously from strategic, political and cultural lenses, which entails a combination of both unobtrusive ethnographic and obtrusive clinical methods.

1.6.6 *Publication Plan*

It is envisaged that this research would form the basis for both academic and practitioner publications both in book and journal article forms.

1.6.6.1 Journal Articles

1.6.6.1.1 Academic Journals

"The journals of strategic management are potentially fruitful territory for the kind of interdisciplinary conversation we believe is a key step in making progress on understanding why firms undertake the actions that we observe and how those actions affect their performance."²⁹⁰

It is envisaged that each of the essays of Part II would form the basis for a different stream of publications in academic and practitioner journals. The likely traditional target academic journals which have been most influential in the field of strategic management would be the *Administrative Science Quarterly, Academy of Management Review, Academy of Management Journal* and the *Strategic Management Journal.*²⁹¹ In addition, some of the more recent academic management journals would include *Industrial and Corporate Change* and *Organization Science*.

1.6.6.1.1.1 Paper #1: Defining an Enterprise Architectural Typology

Paper #1 would introduce the concept of *enterprise* architectures and define a modular-integral typology (and possible taxonomy) within the context of various academic literary traditions. Although the paper would cite empirical archetypal examples ranging from *Boeing-Airbus* to *GM-Toyota* to *United Airlines–Southwest Airlines*, its purpose would not be to explicitly tie enterprise architectures to long-term performance. Its purpose would be to merely establish

²⁹⁰ Henderson, R. and Mitchell, W. (1997), pg. 13.

²⁹¹ In a recent bibliographic study of the most influential literature in strategic management from 1980-2000 (Ramos-Rodriguez and Ruiz-Navarro, 2004, pg. 987), these journals were observed to be the most cited in the *Strategic Management Journal*. Other research studies on the most influential journals (Tahai and Meyer, 1999) revealed similar results.

definitions in the tradition of Ulrich's (1995) definition of *product* architectures and to advance a social science framework like social network theory in the tradition of Uzzi (1997).

The likely target academic journals for Article #1 would be the Academy of Management Review, Administrative Science Quarterly, Organization Science or Research Policy.

1.6.6.1.1.2 Paper #2: Competitive Dynamics of Enterprise Architectures

Paper #2 would present empirical evidence from the five-year *Boeing-Airbus* case study illustrating the mechanisms of how position and capabilities interact within the construct of the previously-defined construct of enterprise architecture. This article would be in the tradition of Hall (1976).

The likely target academic journals for Article #2 would be the *Strategic Management Journal*, *Academy of Management Journal*, *Administrative Science Quarterly* or *Organization Science*.

1.6.6.1.1.3 Paper #3: The *Evolution* of Enterprise Architectures

Paper #3 would present historical empirical evidence illustrating the mechanisms of how environmental states shape the previously-defined construct of enterprise architecture, and how competitive dynamic interactions contribution to the co-evolution of the environment which ultimately shape the evolution of the enterprise architectures. This article would be in the tradition of Tushman and Anderson (1986), Anderson and Tushman (1990 and 2001), Utterback and Suárez (1993) and Suárez and Utterback (1995).

The likely target academic journals for Article #3 would be the Academy of Management Review, Administrative Science Quarterly, Organization Science or Industrial and Corporate Change.

1.6.6.1.1.4 Paper #4: The Evolution of *Business Ecosystems*

Paper #4 would integrate the previous three papers into a coherent theory. As such, it would be a summary of this dissertation. A pure theoretical paper in the tradition of Schilling (2000) would target the *Academy of Management Review*, while an empirically-based paper would target *Administrative Science Quarterly, Academy of Management Journal* or *Industrial and Corporate Change*.

1.6.6.1.2 *Practitioner* Journals

The likely target practitioner journals would be the Harvard Business Review, Sloan Management Review, California Management Review and Long Range Planning.

1.6.6.2 Books

It is hoped that this document (and the subsequent dissertation) will form the basis for two different book audiences: academic and practitioner/general audience.

1.6.6.2.1 Academic book

Due to the inherent complexity and multivariate nature of strategic management, it is not unsurprising that of the 20 most influential publications in the field, 18 are in book form (Ramos-Rodriguez and Ruiz-Navarro, 2004).²⁹² As this research aims to bring a holistic systems/enterprise view to the academic field of strategic management, by definition it will be less effective and potent to decompose the work into separate coherent journal articles.

Although these books were based on empirical/theoretical research and were intended for academic audiences (i.e. as textbooks), their relevance to practitioners allowed their cross-over to more mainstream practitioner audiences (e.g. Porter, 1980 & 1985).

1.6.6.2.2 Practitioner book

In addition, a book primarily aimed at practitioners is planned along the conceptual lines of various academic cross-over authors covering multi-industry studies like Christensen (1997), Collins and Porras (1994), Dertouzos, Lester and Solow (1989), Fine (1998) and Utterback, (1994) as well as those covering single-industry studies like Dyer (2000), Hoffer-Gittell, (2003), Murmann et al. (2002) and Womack, Jones and Roos (1990).

A representation of the publication plan is shown in Figure 108 below against the proposed framework.

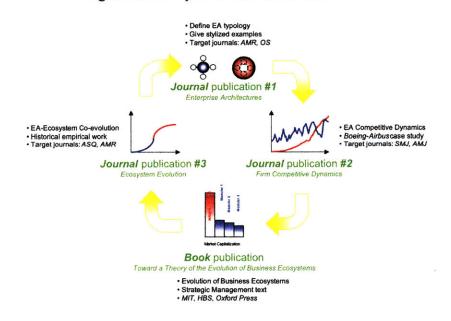

Figure 108: Proposed Publication Plan

²⁹² Interestingly, the only two journal articles in the top 20 most influential publications in strategic management (Wernerfelt, 1984 and Barney, 1991) re-ignited the resource-based view debate initiated 25-30 years earlier in the 16th-ranked publication, *The Theory of the Growth of the Firm*, by Edith Penrose (1959).

1.7 Research Importance

"Longitudinal studies that explicitly focus on the nature of these organizational and environmental interactions as they evolve over time, and that pay particular attention to the ways in which capabilities and environmental conditions shape each other, are thus likely to be particularly fruitful for both theory and practice."²⁹³

"The models of firm decision making have not gone beyond the static implications of the fact that firms are political coalitions. They do not attempt to reflect shifts in coalitions per se. The later task – leading to a more general theory of coalition development – has hardly been touched except conceptually. The significance of such a theory to a theory of the business firm and its growth is obvious."²⁹⁴

If successful, the importance of the proposed research will lie in the value of the meta-theoretical framework as exceeding the value of the sum or the existing theoretical models. Instead of merely connecting heretofore disconnected models, it is hoped that the research will reveal a new way of viewing the interaction of firms and their environments for competitive advantage.

As this research attempts to answer the recent calls from the strategic management academic community to build systemic *theory* grounded in *practice*, it should prove to be important to leaders of firms and strategy consultants who are primarily concerned with- and responsible for delivering firm performance, long-term or otherwise.

"The practitioner and researcher are doubly-linked: the researcher supplies the insights, relationships, and theory for the practitioner. But the practitioner supplies puzzles, ideas, judgments, and priorities for the researcher."²⁹⁵

It is hoped that the importance for practitioners of understanding when and why different enterprise architectures produce superior performance, will be matched by the importance for academic theorists in understanding which ontological and epistemological lenses are needed to understand each architecture.

Finally, for enterprise architects including CEOs and Strategy VPs, this work endeavors to assist in advancing the understanding of how and why firms grow.

"The goal GE has set for sustained organic growth – two to three times the growth of global GDP – translates to about 8% today. Few companies have achieved the kind of growth GE is seeking, and none on a revenue base of \$150 billion."²⁹⁶

As General Electric CEO, Jeff Immelt recently lamented:

"We're now in a slow growth world. Things were different 25 years ago. The business book that can help you hasn't been written yet."²⁹⁷

²⁹³ Henderson, R. and Mitchell, W. (1997).

²⁹⁴ March, J.G. (1962), pg. 678.

²⁹⁵ Bowman, E. H. (1990), pg. 27.

²⁹⁶ Stewart, T.A. and Immelt, J. (2006), pg. 62.

²⁹⁷ Stewart, T.A. and Immelt, J. (2006), pg. 62.

Chapter 2 Research Methodology

Having described in chapter 1 what questions are to be tackled, and why they are important and worthy of research, this chapter discusses how the research questions are to be approached, namely it will answer the "how?", "where?" and "when?" questions.

2.1 Fit between Research Methods and the State of Existing Theory

Recently, researchers have posited a contingent relationship between the state of the existing theory in a field, and the appropriate research method (Carlisle and Christensen, 2004; Edmondson and McManus, 2006). Hoskisson et al. (1999) propose such an evaluation for the strategic management field.

Figure 109 below attempts to map the state of the field from the "double helix" discussed in the previous chapter to the appropriate research methods that I plan to use for this research.

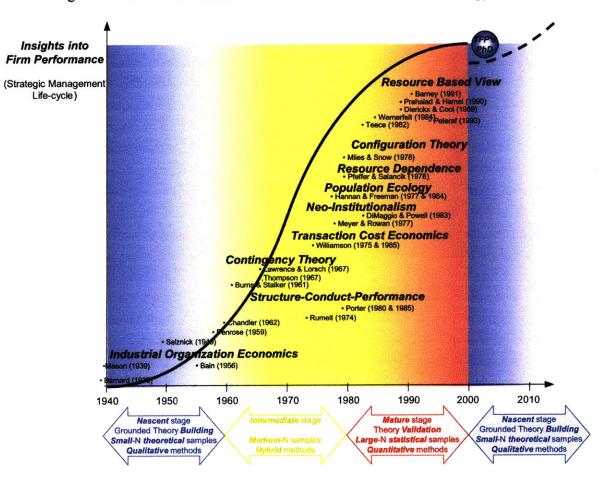

Figure 109: Fit between Research Methods and the State of Strategy Research

2.2 Overview of Research Methodology

"Given the overwhelming changes taking place in organizations and their environments, how can scholars contribute to knowledge? We believe that scholars who have been following traditional research paradigms need to adopt a new mindset for research into the new organizational forms. We believe that at this stage of theory development, research on new forms of organization requires a new approach, quite different from research typically found in academic journals. This work will be characterized by midrange theory and method, grounded research, and research that does not presume to test hypotheses empirically."²⁹⁸

In recent years, organizational scholars have noted rapid and radical changes to traditional organizational forms as a result of significant changes in the environment including increased volatility and hyper-competition in an interdependent global economy (Daft and Lewin, 1993). These scholars have called for a new research paradigm and in fact have founded new research journals.²⁹⁹

"The point of heretical research methods is to find new channels through which to obtain organizational insights and to change the mix of research methods. Although no method is truly heretical, researchers should be encouraged to do whatever it takes to learn about organizations."³⁰⁰

As organizational theorists see organizational form as a strategic variable, such calls for new research have found their way into the more mainstream strategic management journals.

"Strategy researchers are particularly well positioned to conduct the complex, multidimensional, multilevel longitudinal studies that we suspect are necessary if we are to fully understand the interactions between competence and competition."³⁰¹

In order to answer the stated research questions, the philosophy that guides this research design and execution is in-depth, fine-grained (i.e. case-based as opposed to large data base) grounded theory building, using multi-method, multi-level, multi-industry longitudinal studies described in this section.³⁰²

"Strategy research can benefit from using multiple time frames, comparative (historical) research, simultaneous exploration of different levels of analysis, and multiple theoretical lenses. Clearly, such a research agenda is more demanding and therefore it may be better approached in research programs, [and] in large, book-length studies."³⁰³

²⁹⁸ Daft, R.L. and Lewin, A.Y. (1993), pg. ii.

²⁹⁹ For example, Organization Science in 1990.

³⁰⁰ Daft, R.L. and Lewin, A.Y. (1990), pg. 6.

³⁰¹ Henderson R. and Mitchell W., (1997).

³⁰² A good introduction to theory-building research (which has proved influential in my research design) is the October 1989 special issue of the *Academy of Management Review*, dedicated to theory building.

³⁰³ Farjoun, M. (2002), pg. 585.

2.2.1 Grounded Theory Building

2.2.1.1 Motivation

As this research endeavored to solve a rather perplexing substantive problem regarding *Boeing* and *Airbus'* competitive advantages, I decided to take a more (initially) inductive approach to the problem, by building theory from data, taking a fresh look at the phenomena of long-term firm performance, unencumbered with the prevailing concepts, constructs, propositions and theories of the day, and oblivious (initially) to the prevailing theoretical debates in the fields of strategy and organization science.

"Glaser and Strauss criticized the 'overemphasis in current sociology on the verification of theory, and a resultant de-emphasis on the prior step of discovering what concepts and hypotheses are relevant for the area that one wishes to research' (Glaser & Strauss, 1967, pp. 1f) and bemoaned 'that many of our teachers converted departments of sociology into mere repositories of 'great-man' theories' (Ibid, p. 10) leading to an antagonism between 'theoretical capitalists' and a mass of 'proleteriat testers' (p. 11)."³⁰⁴

As this research plan has highlighted gaps in the existing literature pertaining to the questions posed, the research design was guided by the need to build grounded theory (Glaser and Strauss, 1967; Eisenhardt, 1989; Dougherty, 2002). In other words, this research approach focuses on building new theory and only indirectly on testing or verifying existing theories.

"Grounded theory building "reaches into the 'infinite profusion' of social action in organizations in order to tease out, identify, name, and explicate themes that capture the **underlying dynamics and patterns** in the blooming, buzzing confusion that is... management. Grounded theory building tries to understand why and how structures, conditions, or actions might arise, to ferret out generative mechanisms, to explore conditions under which these effects might vary or not, and to qualify their temporary and emergent aspects."³⁰⁵

"In fact, inductive and deductive logics are mirrors of on another, with inductive theory building from cases producing new theory from data and deductive theory testing completing the cycle by using data to test theory."³⁰⁶

As grounded theory building is inherently iterative, the research design unfolds longitudinally over time visiting and revisiting various case history sites over and over as will be described later in this chapter.

"Knowledge begins and ends in experience; but it does not end in the experience in which it began."³⁰⁷

2.2.1.2 Varieties of Grounded Theory

It should be noted that by "grounded theory", I do not restrict my methods to those defined by its original authors, Glaser & Strauss (1967); nor do I wish to engage in the subsequent debate between the Glaserian and Straussian schools over the split in methodology (Kelle, 2005). I merely take a more catholic approach to grounded theory, as espoused by Eisenhardt (1989, 2007).

2.2.1.2.1 Glaser & Strauss (and Glaser vs. Strauss)

Although Glaser & Strauss (1967) were among the first to give a clear articulation of grounded theory in the social sciences, they later disagreed as to how to best create grounded theory (Kelle, 2005).

"Grounded theory according to Glaser emphasizes induction or emergence, and the individual researcher's creativity with a clear frame of stages, while Strauss is more interested in validation criteria and a systematic approach."³⁰⁸

The primary distinction lies in the ability of the researcher to "architect" theory (abstractly and conceptually) vs "engineer" theory (concretely and precisely).

"Strauss and Corbin's coding paradigm is linked to a perspective on social phenomena prevalent in micro-sociological approaches emphasizing the role of human action in social life. Researchers with a strong background in macro-sociology and system theory may feel that this approach goes contrary to their requirements and would be well advised to construct an own coding paradigm rooted in their own theoretical tradition. Glaser's approach of 'theoretical coding' whereby researchers introduce ad hoc theoretical codes and coding families which thay find suitable for the data under scrutiny provides a strategy applicable for a greater variety of theoretical perspectives. However, as has been said before following this strategy is much more challenging expecially for novices since it lacks a readymade conceptual framework like Strauss and Corbin's coding paradigm. Experienced researchers with a broad knowledge in social theory would clearly benefit from the advantages of theoretical coding – having at their disposal not only one possible axis of developing theory but being able to construct such an axis by themselves through the combination of theoretical concepts from different schools of thought."

2.2.1.2.2 Eisenhardt

Eisenhardt (1989) moved the debate forward for organizational theorists by embracing a catholic approach used by this research design.

"Glaser and Strauss (1967) and more recently Strauss (1987) have outlined pieces of the process, but theirs is a prescribed formula, and new ideas have emerged from methodologists...."³¹⁰

"A more subtle challenge arises from confusion about the meaning of 'grounded theory building.' For some scholars, grounded theory building simply means creating theory by observing patterns within systematically collected empirical data. This view often includes some notion of recursively

³⁰⁸ Wikipedia: "Grounded Theory".

³⁰⁹ Kelle, U. (2005), pg. 9.

³¹⁰ Eisenhardt, K.M. (1989), pg. 532.

iterating between (and thus constantly comparing) theory and data during analysis, and theoretically sampling cases (as described earlier). As Langley (1999) noted, this is a widely held view of grounded theory building. In this view, the quality of the theory and the strength of its empirical grounding are more central to research quality than the specifics of the theory-building process. But for other scholars, grounded theory building has a more precise meaning that stems from the original focus of Glaser and Strauss (1967) on the interpretation of meaning by social actors. For example, Suddaby described grounded theory building as 'most suited to efforts to understand the process by which actors construct meaning out of intersubjective experience' (Suddaby, 2006: 634). Others go further to emphasize elaborate processes (and terminology) for how researchers should gather field data and discover theory using a hierarchical structure of categories (Corbin & Strauss, 1990). Constant comparison and theoretical sampling take on precise meanings: 'constant comparison' means simultaneous collection and analysis of data, and 'theoretical sampling' means that decisions about which data to collect next are determined by the theory in progress (Suddaby, 2006). In this view, adherence to specific grounded theory building processes is important in judging research quality. But strict adherence can also result in theory with limited generalizability (Langley, 1999) and idiosyncratic path dependence on the particular empirical starting point. As when coping with the multiple meanings of 'qualitative research,' it is often helpful to deal with the multiple meanings of 'grounded theory building' by avoiding the term unless one is actually using the Glaser and Strauss (1967) approach. theory. "311

This research uses Eisenhardt's eight-step research process (Eisenhardt, 1989) as a point of departure for building theory from case studies.³¹² Below is a brief summary description of the research process planned and/or executed thus far. Note that although this is described sequentially, the approach taken was actually iterative in a "spiral development" process, typical of theory-building or design exercises in general. Each point is explained in more detail in the body of this document.

1. Getting Started

In order to broadly focus research efforts at the outset, the research question was defined as: determining sources of firm competitiveness and long-term performance.

In order to provide better grounding of future construct measures, the following main a priori constructs were used at the outset: enterprise *architectural form*, enterprise *competitive dynamics* and the *industrial evolution* of the enterprise's environment.

In order to retain theoretical flexibility going into the research project, neither theory nor hypotheses connecting constructs were developed at this early stage.

2. Selecting Cases

In order to constrain extraneous variation and sharpen external validity, the specified population was limited the global duopoly in the large commercial aircraft industry, comprising *Boeing Commercial Airplanes* and *Airbus Industrie*.

³¹¹ Eisenhardt, K.M. and Graebner, M.E. (2007), pg. 30.

³¹² Note that although quotation marks have been omitted in this section, the theoretical justification for the use of each of the eight points is taken verbatim from Eisenhardt's paper to ensure sharpness and adherence to her methodology is retained.

More descriptively, the case represents the evolutionary trajectories of one relatively high-performing firm and one relatively low-performing firm. At the beginning of the longitudinally-based research project, *Boeing* was the "market leader", and by the end of the research, they had been overtaken by their rival, *Airbus*.

In order to focus research efforts on theoretically useful cases (i.e. cases that replicate theory by filling conceptual categories), a theoretical (not random) sample was used which covered the diametrically opposed archetypal constructs: *modular* enterprise architecture (i.e. *Boeing*) and *integral* enterprise architecture (i.e. *Airbus*).

3. Crafting Instruments and Protocols

In order to strengthen grounding of theory by triangulation of evidence, multiple data collection methods were used, including: archives, interviews, experiment and observation.

In order to provide a synergistic view of the evidence, both qualitative and quantitative data were combined as typified by the interviews and observations, as well as by the use of numerical archival data used to quantify the performance trajectories.

"For while systematic data create the foundation for our theories, it is the **anecdotal data** that **enable us to do the building**. Theory building seems to require rich description, the richness that comes from anecdote. We uncover all kinds or relationships in our hard data, but it is only through the use of this soft data that we are able to explain them."³¹³

In order to foster divergent perspectives and strengthen grounding, evidence surrounding each firm was taken from multiple stakeholder perspectives including: the firm itself, its customers, its suppliers, its employees, and its investors.

Also, multiple investigators were used in the data collection, analysis and theory building. This included an active research group of professors and researchers at MIT's *Lean Aerospace/Advancement Initiative*, which was set up explicitly to tackle this class of problem.³¹⁴ In addition, an active and diverse on-site case-study team was assembled for the same purposes.³¹⁵

4. Entering the Field

In order to speed-up the analyses and reveal helpful adjustments to data collection activities, a concurrent (as opposed to sequential) approach was taken in which there was an overlap of data collection and analysis.

³¹³ Henry Mintzberg (1979), quoted in Eisenhardt, K.(1989), pg. 538.

³¹⁴ The LAI's *Enterprise Architecting* research team was headed by Prof. Deborah Nightingale and Dr. Kirk Bozdogan.

³¹⁵ Boeing's research team was lead at various times by Sherry Carbary (VP of Strategy), Carolyn Corvi (VP of Airplane Production), Tim Meskill, Adam Kohorn, and Dan Wheeler.

In order to take advantage of emergent themes and unique features of the case, there were flexible and opportunistic data collection methods employed such as: the establishment of an informal and semi-permanent "strategy discovery" discussion series with senior leaders within *Boeing* and its stakeholders. Although the general research topic and timing of the "data-collection" opportunities were held fixed, the participants and themes were kept flexible to attract committed people and issues relevant to the topic at the time.³¹⁶

5. Analyzing Data

In order to gain familiarity with the data and to generate preliminary theory, analysis of the data was restricted initially *within*-case (i.e. *Boeing-Airbus*).

In order to look beyond initial impressions and see evidence through multiple lenses, *cross*-case pattern searches were undertaken of theoretical samples using the enterprise archetypes in industries like automotive (*GM-Toyota*) and airlines (*United-Southwest*).

6. Shaping Hypotheses

In order to sharpen construct definition, validity and measurability, the research design iteratively tabulated evidence for each construct through the longitudinal re-exploration of the constructs with the stakeholders as the hypotheses (i.e. the relationships between the constructs) were evolving. Constructs were continually revisited as hypotheses were emerging, and concurrently, hypotheses were continually revisited as constructs were reviewed.

In order to confirm, extend and sharpen the theory, replication of observations (as opposed to further sampling for new observations) became the modus operandi as the research progressed, particularly across cases.

In order to build internal validity, the research searched for evidence for the "why" behind the construct relationships by building simulation models using dynamic causal mechanisms via the system dynamics method.

7. Enfolding Literature

In order to continue to build internal validity, raise the theoretical level and sharpen construct definitions, an effort was made to compare the theory with *conflicting* literature. Examples include apparent conflicts with the theory of product and supply chain architectural fit (Fine, 1998), the theory of organic-mechanistic firm structures (Burns and Stalker, 1961), and the population ecology theory of firm exit (Hannan & Freeman, 1984).

³¹⁶ An important role of the researcher in these settings was to act as the research "gate-keeper" to maintain focus on the research question, and defend a rigor to the methodological approach defined in this document.

In order to sharpen generalizability, improve construct definition and raise the theoretical level, a significant effort was made to compare the theory with *similar* literature. This is described in more detail in the section of this document entitled: "Previous Related Research & Literature Gaps".

8. Reaching Closure

In order to end the process to ensure "theoretical saturation", the results of iterations were monitored to determine when marginal improvements become small. This tended to occur when the collection of additional supporting and/or dissenting data diminished.

A summary of the research process is illustrated in Figure 110 below. As can be seen, the process is highly iterative; it begins with an inductive focus but progresses toward inductive/deductive regimes; it begins with gathering confirmatory evidence, but progresses toward anomalous evidence.

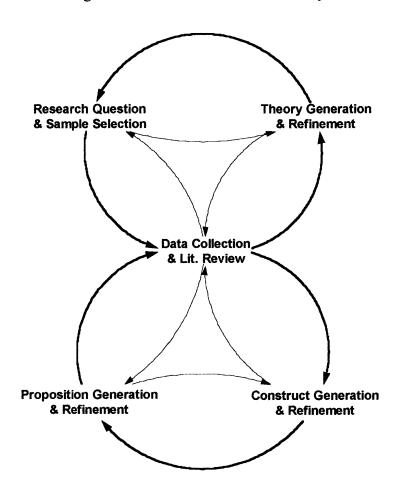

Figure 110: Research Process Summary

2.2.1.3 Small-N Intra-Case and Medium-N Inter-Case Inference

As this research can be described as the search for "outliers" (in both long-term performance) as well as the underlying causes (e.g. species), the case study method is well suited to examine nonobvious phenomena. For example, while *Toyota, Soutwest* and *Airbus* seem on the surface to be "modal" firms, a more intimate study reveals that they may in fact be outlier forms of organizations or a "black swan" in a lake of white swans (or in my heuristic, a "red swan" in a lake of blue swans, as shown in Figure 111 below.³¹⁷

Figure 111: Search for Outliers via In-Depth Case Studies

"You cart a pig into my living room and tell me that it can talk. I say, 'Oh really? Show me.' You snap your fingers and the pig starts talking. I say, 'Wow, you should write a paper about this.' You write up your case report and send it to a journal. What will the reviewers say? Will the reviewers respond with 'Interesting, but that's just one pig. Show me a few more and then I might believe you'? I think we would agree that that would be a silly response. A single case can be a very powerful example."³¹⁸

A first-order, architectural (or "special") explanation for high long-term variance in firm performance may be viewed as far-fetched, however the fact that we attempt to demonstrate its feasibility in only one case study (or in fact in a small set of case studies) does not diminish the theory's validity. The small set of case studies, however may be a powerful example, which serves to stimulate other research in this vein.

"Research involving case data can usually get much closer to theoretical constructs and provide a much more persuasive argument about causal forces than broad empiricial research can. One should use this advantage. However, one will not be able to say, 'You should believe my theory that A leads to B, because I show you an example here.' That is asking too much of a single case study, or even a few cases. The theory should stand on its own feet. One needs to convince the reader that the conceptual argument is plausible and use the case as additional (but not sole) justification for one's argument."³¹⁹

³¹⁷ Note the ironic reference to Karl Popper's falsification proof in which he notes that the observation of a single black swan would falsify the proposition that "all swans are white." See Flyvbjerg, B. (2006).

³¹⁸ Siggelkow, N. (2007), pg. 20.

³¹⁹ Siggelkow, N. (2007), pp. 22-23.

Management research has become increasingly positivist and reductionist, relying on large-N statistical samples to prove an existing theory. This fact, however, does not diminish the importance of small-N theoretical samples from which to build theory in an exploratory mode.

"Since writers of papers based on case research do not have recourse to the canonical statement 'results are significant at p < 0.05' that helps assuage readers' skepticism of empirical papers, researchers usuing case research often feel they are fighting an uphill battle to persuade their readers."³²⁰

While the majority of research using small-N, in-depth case studies, usually claims that the state of existing knowledge is nascent, meriting exploratory research in defining appropriate constructs, this research admits a more naïve, and emergent justification: namely, when the phenomenon was first studied, the researcher entered the field, relatively blind to the existing state of the art of strategic management and organizational theory, and instead, entered equipped with the tools and frameworks of an allied field – architecture and engineering.

"The near-ubitiquous claim that 'not much is known, hence we engage in grounded theory building,' does not seem to me a necessary condition for the justification of case research. Moreover, such claims of existing ignorance at times do not ring true. It can also get writers tied up in knots about professing to have entered the field with no preconceptions. In my view, an open mind is good; an empty mind is not. It is true that one wants to retain the capacity to be surprised, but it seems useful (and inevitable) that our observations be guided and influenced by some initial hunches and frames of reference."³²¹

As will be discussed in more detail later, this research proposes to build grounded theory both from a small-N theoretical sample with *intra*-case inference (namely the *Boeing-Airbus* duopoly in the large commercial airplane industry), as well as extended to include a medium-N theoretical sample with *inter*-case inference (namely the *GM-Toyota* and *United-Southwest* rivalries in the automotive and airline industries respectively).³²²

The extension to medium-N theoretical sample uses quasi-statistical modes of inference across cases, with pure randomization of a true statistical sample being sacrificed for extreme high-performers of a theoretical sample.

³²⁰ Siggelkow, N. (2007), pg. 20.

³²¹ Siggelkow, N. (2007), pg. 21.

³²² MIT ESD and Political Science Professor Ken Oye characterizes such research as "Blue Cluster", as opposed to large-N statistical samples coupled with formal models of the "Red Cluster".

2.2.1.4 Empirical vs. Conceptual Theory Building

"My rule of thumb is that the grander the theoretical claims, the more free-standing the theory has to be. In other words, even of the reader were only to read the conceptual part of the paper, he or she would be convinced of the internal logic of the conceptual argument."³²³

As the theory developed herein has broad ambitions, it has been critiqued as having grand theoretical claims. This, coupled with the fact the theory was grounded in a small-N theoretical sample of comparative case studies, makes the internal logic of the argument, paramount.

Nonetheless, the theory building proposed herein can be categorized both as "empirical" as well as merely "conceptual". Although the very nature of grounded theory building implies theory generated inductively from empirical data, the strategic management community has put a further restriction on the definition of "empirical" theory building – namely that single case studies are insufficient (Saunders and Thompson, 1980). As will be discussed later, this research is based primarily upon in-depth case studies of both firms (and their extended enterprises) in a global duopoly.

"...empirical papers were separated from conceptual papers according to the test that the former had to display an empirically-oriented research design and had to promise (at least) to utilize studies of a number of organizations. Papers based on generalized or non-specific experience or evidence and those drawn from a single case-study were not deemed 'empirical' under this regimen."³²⁴

As an aside, it is interesting to note that one of the most influential pieces of grounded theory building (Penrose, 1959), which ultimately inspired the resource-based view (Wernerfelt, 1984), was based on only one in-depth case study inside the *Hercules Powder Company* (Penrose, 1960).³²⁵ Although Penrose may argue that the origin and purpose of her ground-breaking research was empirically-motivated, by today's definitions, it would be "marginalized" to conceptual theory building due to its focus on one firm.

In addition, the theory building proposed herein can be categorized as "conceptual" as its is also constructed from the aggregation or synthesis of other existing theories and datasets, as was discussed previously under the notion of "logical compound synthesis."

Within both empirical and theoretical bases, the detailed method of theory building includes exploration, concept development and hypothesis generation (Saunders and Thompson, 1980).

"Case-based research is more at the level of an existence proof: Here is one example of how A leads to B. If the reader can reply, 'I'm not really that surprised that you can find in the world at least one example of A leading to B,' the value of the contribution of the paper can be in doubt."³²⁶

The value of the contribution of the theory developed herein will lie in its explanation of an existence proof, which may be used to guide further empirical research.

³²³ Siggelkow, N. (2007), pg. 21.

³²⁵ Rouse and Daellenbach, (1999), pp. 489-490.

³²⁶ Siggelkow, N. (2007), pg. 23.

2.2.2 Multi-method

The goal of the research design is to bridge the more qualitative traditions of case study with the more quantitative traditions of numerical modeling. This inherently requires a multi-method approach.

"Studying variations over time in organ izational forms requires not only longitudinal research designs but also knowledge of historical trends and changes in political systems, modes of economic production, law, patterns of international trade, and other topics often neglected in case studies and surveys of isolated organizations."³²⁷

Solid research methodology in strategic management is based on four important components: (1) mathematical models; (2) statistical data analysis; (3) logical compound synthesis; and (4) indepth case studies (Itami and Numagami, 1992). This research design proposes to embrace multiple methods, working backward from the qualitative case studies, incorporating logical compound synthesis, and finally due to the high levels of dynamic complexity inherent in longitudinal multi-stakeholder research, ends with the development of nonlinear dynamic numerical simulation models.

"I do not believe that formal modeling should be the only style of organizational research. To the contrary, I think the most successful literatures are those that blend detailed description, informal theory and formal modeling."³²⁸

As shown in Figure 112 below, these three methods form an integrated approach toward building and testing grounded theory. The developed framework is grounded *empirically* via comparative case studies, *theoretically* via synthesis of a broad literature of empirical and theoretical research ranging from economics to sociology, as well as being grounded *analytically* via nonlinear dynamic numerical simulation modeling.

³²⁷ Aldrich, H. (2006), pg. xii.

³²⁸ Gibbons, R. (1999), pg. 146.

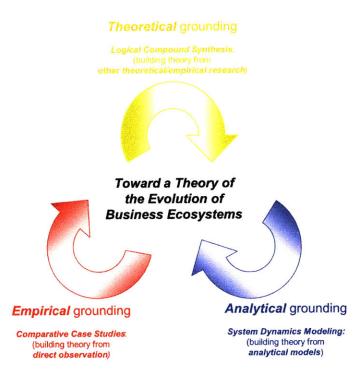

Figure 112: Integrated and Triangulated Research Design

It is important to note that these three approaches were not applied in a purely linear, sequential fashion. In order to capture the rich potential of emergence in grounded theory building, the three approaches were applied integrally, concurrently and iteratively and are therefore mutually reinforcing. Justification of the theory developed solely from any one approach would be incorrect and misleading.

Figure 113 below summarizes conceptually how the three approaches unfold longitudinally, combining a pre-determined linear sequential plan, with superimposed iterative cycles. From this figure, it is observed that although the majority of the impact (not necessarily time spent) from each approach took place within the approach's allotted time frame, time spent iterating both before and after the allotted phase contributed significantly to the final theory developed.

"Indeed, after having laboriously worked out for myself what I took to be an important and 'original' idea, I have often had the disconcerting experience of subsequently finding the same idea better expressed by some other writer. I try always to mention such earlier expositions; I am sure that there are many that I have overlooked, for which I offer advance apology."³²⁹

Finally, note that although the theory developed was generated initially from field-based empirical research, subsequently supported and refined by existing research literatures, and finally refined and extended by analytical modeling, it is estimated that the impact of the three approaches over the life cycle of the theory development is approximately equal (e.g. 33%).

³²⁹ Penrose, E.T. (1959), pg. 2, footnote 2.

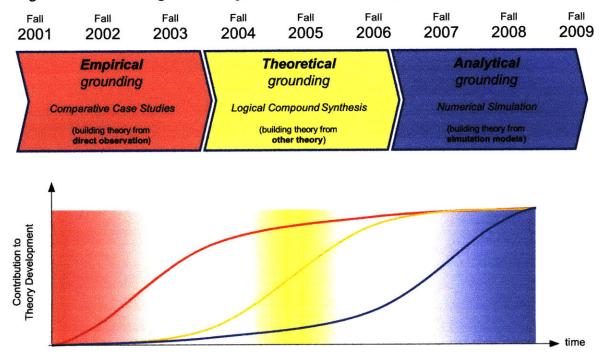

Figure 113: Combining Linear Sequential and Nonlinear Spiral Development Processes

Figure 114 below summarizes the proposed multi-method dissertation in three phases, terminating in the balanced objective of mid-level theory. Note that while this philosophy is broadly inductive, the actual process was certainly iterative between deduction-induction. Each of the phases will be summarized in the following subsections.

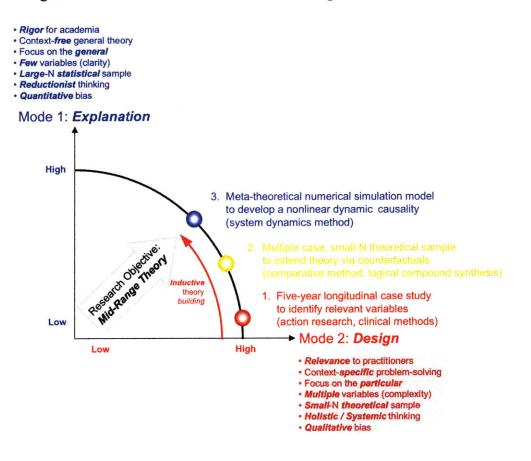

Figure 114: Multi-Method Research and the Rigor-Relevance Tradeoff

2.2.2.1 Case-studies (Field-based & Historical)

The research plan attempts to initially build grounded theory inductively from the qualitative comparative case study described above (Eisenhardt, 1989).³³⁰ Eisenhardt's research process, which is used as a template for the research design is summarized in Appendix D.

"Academic journals have traditionally not accepted or encouraged the deep examination of case studies, but the nature of strategy requires it. The greater use of case studies will be necessary for real progress at this stage of the field's development. I am convinced that more research of this type will be needed to address the dynamics of strategy."³³¹

While the purpose of the case studies aim initially at *exploration* and *description*, the ultimate objective is *explanation*, as it attempts to explain how events occurred and predict how they might qualitatively unfold via cause-effect relationships. As the research plan also calls for multiple case studies, this is the most ambitious, comprehensive and potentially rich use of the case study method (Yin, 2003).³³²

³³⁰ Eisenhardt specifically notes the centrality of inductive process and the role of literature in successfully building theory from cases.

³³¹ Porter, M.E. (1991).

³³² Yin (2003) refers to this as "Type 6" case study research.

Whereas case studies are often dismissed as too qualitative for real science, this is a clear misunderstanding of the reality of grounded theory building is quite different:

"Case histories of firms and industries that were instrumental to the field's early development are sometimes labeled 'prescientific' (e.g. Rumelt et al., 1994). However, a renewed interest in historical and clinical research is not a sign of regression but of the field's maturity. The benefits of such an approach are too great to be ignored by strategy researchers."³³³

"Although sometimes seen as 'subjective,' well-done theory building from cases is surprisingly 'objective,' because its close adherence to the data keeps researchers 'honest.' The data provide the discipline that mathematics does in formal analytic modeling."³³⁴

The research design is modeled after those that produced some of the most influential and frequently cited works in the strategic management literature, like the longitudinal case studies of Penrose (1959), Chandler (1962) and Lawrence & Lorsch (1967).³³⁵

"Whereas Chandler (1962) conducted case histories and classified them to reveal patterns, subsequent researchers have measured strategic and structural variables and used statistical variables to test for connections."³³⁶

2.2.2.2 Comparative Method

"To find answers to our major question, we made a comparative study of competing organizations in each of several industries."³³⁷

Like Lawrence and Lorsch's classic 1967 work, *Organization and Environment: Managing Differentiation and Integration*, this research dissertation uses a comparative approach of studying pairs of competing organizations in each of several industries.

"... the intensive comparative analysis of a few cases may be more promising than a more superficial statistical analysis of many cases. In such a situation, the most fruitful approach would be to regard the comparative analysis as the first stage of research, in which hypotheses are carefully formulated..."³³⁸

The comparative method is one of the basic methods for establishing general empirical propositions, along with experimental and statistical methods. All three methods have been demonstrated to have the objective of scientific explanation, which comprises the establishment of empirical relationship among at least two variables, while all others are held constant (Lijphart, 1971).³³⁹ As will be discussed later in the sample selection process, the small-N theoretical sample of case studies, will form the basis of the comparative method to generate the hypotheses.

³³³ Farjoun, M. (2002), pg. 585.

³³⁴ Eisenhardt, K.M. and Graebner, M.E. (2007), pg. 25.

³³⁵ See Ramos-Rodriguez & Ruiz-Navarro, (2004) for a good bibliometric analysis.

³³⁶ Donaldson, (2001), pg. 78.

³³⁷ Lawrence and Lorsch (1967a), pg. 19.

³³⁸ Liphart, A. (1971), pg. 685.

³³⁹ Note that the method has been criticized for being deterministic in its causality (Lieberson, 1991, 1994; Savolainen, 1994), a charge similarly brought against systems dynamics.

2.2.2.3 Logical Compound Synthesis

"If I have seen farther; it is by standing on the shoulders of giants."340

In addition to building theory inductively from the empirical data, this research also builds theory from existing theories and their associated empirical data sets.

"Just like chemists synthesize various materials into some chemical compounds that are new to the world, researchers of this approach pick up various theoretical concepts and empirical findings as materials and synthesize them into a plausible logical story."³⁴¹

An important part of the grounded theory building is the supplementing of comparative case studies with a rich survey of theoretical concepts and empirical findings within the strategic management literatures as well as in other academic disciplines, including but not limited to: economics, sociology and architecture. To this end, each of the three essays will commence with a summary of these relevant theories and how they contribute (or conflict) with the theory developed herein.

"Gems in isolation are worth far less than when they are strung together in a necklace. They all gain greatly by being **compared and contrasted** in an **orderly fashion**, even if we can not yet weld them together by means of a single, over-arching theory."³⁴²

Researchers however have cautioned against the premature and excessive integration of theoretical models – particularly contingency findings – in the quest for a holistic midrange theory of organizations (Moberg and Koch, 1985, pg 110).

"This approach derives its plausibility from the robust coherence among its component stories and reveals logical connections among conceptual constructs."³⁴³

One of the most influential publications in the field of strategic management itself, Thompson's 1967 classic, *Organizations in Action* (Ramos-Rodriguez and Ruiz-Navarro, 2004) was not based upon original empirical work, but on the synthesis of a multitude of empirical studies within the contingency theory field. As Thompson, himself noted in the preface to his classic:

"I have written this book to call attention to some of [those] developments, which tend to go unnoticed because we are encouraged to converse within disciplines, while organizations are multidisciplinary phenomena. A central purpose of this book is to identify a framework which might link at important points several of the now independent approaches to the understanding of complex organizations."³⁴⁴

Thompson's 1967 classic represents a powerful example of what part of this research dissertation aims towards, effective logical compound synthesis, which in Thompson's case led to 100 testable propositions.

³⁴⁰ This quotation is taken from my doctoral dissertation committee co-chair, Prof. Charles Fine, who used the reference in his book, Clockspeed (Fine, 1998). The saying was originally attributed to Sir Isaac Newton.

³⁴¹ Itami and Numagami (1992), pg. 133.

³⁴² Landsberger, quoted in Magnusen K. (1973), pg. 17.

³⁴³ Itami and Numagami (1992), pg. 133.

³⁴⁴ Thompson, J.D. (1967), pg. xxv-xxvi.

"This book might be considered a conceptual inventory. I assume merely that the concepts relevant to important relationships exist, and once having identified some, I hope to generate potentially significant propositions. We lack the systematic evidence that eventually must come, but there are illustrative studies to indicate that the propositions are plausible. Illustrations are drawn from a variety of fields; and concepts from a variety of disciplines. I have carried concepts from one discipline into fields not typically studied with those concepts. I have tried to say more, using some concepts, than has typically been said with them. At the same time, I have said considerably less, using those same concepts, than has been said. The economist, sociologist, political scientist, or social psychologist will each find that I overlooked refinements and intricacies in concepts he knows well. I hope, however, that I have avoided outright distortion of concepts."

2.2.2.4 Numerical Simulation Modeling

"But how to 'test' that theory, or at least demonstrate its plausibility? The vehicle used in this article is the design and running of a 'history-friendly' model. 'History-friendly' models are intended to enhance understanding of particular interesting and important economic phenomena, in this case the swings in vertical integration and disintegration in the American computer industry. History-friendly models generally are simulation models. The aim of history-friendly modeling is not to explain, in the sense of closely matching through a simulation, the quantitative values observed in the historical episode under investigation, nor in the specification of the model parameters driven by the objective of getting as close as possible to actual empirical values of variables in the actual context being modeled. Rather, the objective is to explore whether the particular mechanisms and forces built into the model can generate, and in that sense explain the patterns in question. The design of a historyfriendly model is guided by the theories, generally verbal, that informed observers and empirically oriented economists hwo have analyzed the phenomena have put forth as their causal explanations, and which the model builders find plausible and interesting. History-friendly modelers believe that much of productive economic theorizing is presented as explanations of particular empirical phenomena by those who know a lot about the empirical details. However, we also believe that it is difficult sometimes impossible, to check out the logic and the explanatory power of such verbal qualitative theorizing, without formalizing the argument. A history-friendly model is built on a simplified formal representation of the theory being considered, and aims to test the consistency and power of that theory by exploring the performance of the model."346

One of the key tenets of theory development in this research is the translation of a qualitative theoretical framework from its qualitative and quantitative empirical grounding to a more precise formal model as Malerba, Nelson, Orsenigo and Winter (2008) argue.

"Simulation modeling provides a powerful methodology for advancing theory and research on complex behaviors and systems, yet it has been embraced more slowly in management than in some associated social science disciplines. Because organizations are complex systems and many of their characteristics are often inaccessible to researchers, especially over time, simulation can be a particularly useful research tool for management theorists. Simulation is a legitimate, disciplined, and powerful approach to scientific investigation, with the potential to make significant contributions to management theory."³⁴⁷

"We... position simulation in the 'sweet spot' between theory-creating methods, such as multiple case inductive studies and formal modeling, and theory-testing methods. Simulation strengths include internal validity and facility with longitudinal, nonlinear, and process phenomena. Simulation's primary value occurs in creative experimentation to produce novel theory."³⁴⁸

³⁴⁵ Thompson, J.D. (1967), pg. xxvi-xxvii.

³⁴⁶ Malerba, F., Nelson, R., Orsenigo, L. and Winter, S. (2008), pp. 204 and 205.

³⁴⁷ Harrison, J.R., Lin Z, Carroll, G.R. and Carley, K.M. (2007), pp. 1229 and 1243.

³⁴⁸ Davis, J.P., Eisenhardt, K.M. and Bingham, C.B. (2007), pg. 480.

The meta-theoretic framework proposed by this research is as interested in *states* as it is in *paths* – that is in an enterprise's *architecture* and its complementary *evolution*. As a result, a formal modeling technique is proposed to capture these dual and complementary interests.³⁴⁹

Due to the systemic coupling between firm competence and industry competition, the dynamic hypotheses that are generated will be converted into more formal nonlinear simulation models via the *system dynamics* method (Forrester, 1961; Sterman, 2000), in an attempt to bring some *explanatory* power to the theory.³⁵⁰

System Dynamics "is a quantitative and experimental approach for relating organizational structure and corporate policy to industrial growth and stability."³⁵¹

System Dynamics is well suited to representing social change processes of growth and stability, and has already been used for testing macro-sociological theories (Jacobsen, Bronson and Vekstein, 1990).³⁵² Regarding the use of system dynamics, its originator, Jay Forrester ambitiously called for "courage" in its use:

"The solutions to small problems yield small rewards... One does not achieve innovation and creativity by being timid... The attitude must be one of enterprise design. The expectation should be for major improvement in the systems."³⁵³

As shown in Figure 115 below, the tripartite research design is superimposed on a longitudinal time-history of the phenomenon under consideration.

³⁴⁹ A similar discussion is given by Farjoun (2002), pp. 575.

³⁵⁰ Note that due to the relatively small sample sizes employed in this research design, quantitative methods like structural equation modeling may not be appropriate due to low statistical confidence issues.

³⁵¹ Forrester, J.W. (1961), pg. 13.

³⁵² As noted by Sastry A. (1997).

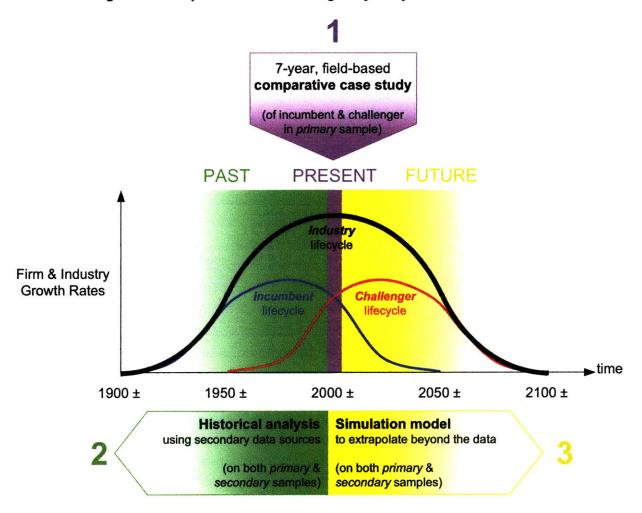

Figure 115: Tripartite Research Design Superimposed on Phenomenon

2.2.3 Multi-level

This research draws empirical data from multiple levels: *micro*-level (i.e. individuals alone or in groups), *meso*-levels (i.e. organizational learning, culture, etc.) and *macro*-level (i.e. clusters of organizations, extended enterprise).

2.2.3.1 Micro-level

The *micro*-level perspective is developed through the in-depth, qualitative exploration of the decision heuristics of the most senior leaders of each firm. While there are over 70 different terms used to describe individual cognition used in organization studies (Walsh, 1995), the most common are *frames, mental models* or *cognitive maps*.

2.2.3.2 Macro-level

The *macro*-level perspective is developed through the modeling of these decision heuristics in the complex dynamic feedback interactions of each extended enterprise as well as their competitive interactions within the ecosystem.

2.2.3.3 Meso-level

By investigating the *micro*-level practices of individuals and groups as they perceive, react to, and (possibly) shape *macro*-level environmental change, this research occupies the "*meso*-domain" (Hall, 1995) where action and structure converge.³⁵⁴

³⁵⁴ This aspect of the research design was influenced by Kaplan, S. (2004).

2.2.4 Multi-lens

Research within complex socio-technical systems requires a multiplicity of "frames" or "lenses" through which to observe the phenomenon, in order to ensure the internal validity of findings. It is important to note that each researcher has certain ways of look at the world which may bias what they see and how they analyze it. It is equally important to note that each class of research problem is best viewed through a particular "lens" and most often through multiple lenses. As such, this research dissertation is designed first to solve the problem defined in chapter 1, and second to utilize lenses which this researcher has most comfort and skill and to acknowledge the potential associated biases.

Ancona et al., (1999) posits three different complementary theoretical lenses for analyzing organizations: the *strategic design*, the *political* and the *cultural* as shown in Figure 116 below.³⁵⁵ Additionally, Ancona et al. (2001) more recently posits an additional organizational lens, the *temporal* which encompasses and integrates the others. This section briefly summarizes each, and how they specifically inform the research dissertation.

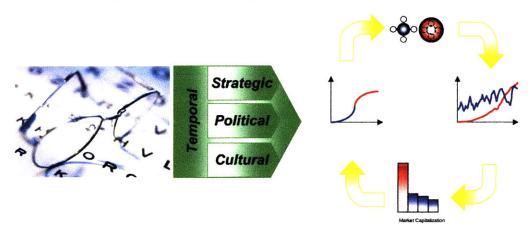

Figure 116: The Three (+ one) Theoretical Lenses

2.2.4.1 The Strategic Design lens

"This perspective asserts that by understanding the **basic principles of organization design**, by aligning the organization's design with its strategy, and by making sure that both strategy and design fit the environment in which the organization is operating, managers can make their organizations successful."³⁵⁶

This perspective looks at the flow of tasks, how people are assigned to these tasks, and how the organization can be *rationally optimized* to achieve its goals.

³⁵⁵ Ancona et al. (2001) actually posit the existence of a fourth lens: the temporal lens. Note that this will be considered in essay #2.

³⁵⁶ Ancona, D. et al. (1999), module 2, pg. 12.

Within the enterprise architectural framework presented in this dissertation, the strategic design lens helps to define the mechanisms of *differentiation*, *integration* and *fit* within the organization and between the organization and its environment. However, as the notion of an enterprise architecture embraces a stakeholder view of the firm, it is by definition a power-sharing entity, which explicitly must also take a political view.

As will be discussed later in this chapter, the research methods required to successfully access and analyze the data include traditional desk-studies of company documents and other secondary data sources as well as ethnographic methods.

"If only it weren't for the people, the goddamned people," said Finnerty, "always getting tangled up in the machinery. If it weren't for them, earth would be an engineer's paradise."³⁵⁷

Although the strategic design lens undoubtedly captures the preponderance of observations in the strategic management literature, the following subsections summarize other points of view of at least equal importance dealing explicitly with human and organizational effects.

2.2.4.2 The *Political* lens

The Political lens can be used on both micro- and macro-phenomena (Mintzberg et al., 2008). Micro-politics arises on the individual actor level, while macro-politics arises social aggregates.

2.2.4.2.1 Micro-politics

The most important aspect of the research design was to ensure high-fidelity micro-data from the most senior decision-makers of each organizational set. As such, it was imperative to treat each data source as having high behavioral complexity -i.e. as having a local politic.

"Fancy what a game of chess would be if all the chessmen had passions and intellects, more or less small and cunning; if you were not only uncertain about your adversary's men, but a little uncertain also about your own; if your knight could shuffle himself on to a new square by the sly; if your bishop, in disgust at your castling, could wheedle your pawns out of their places; and if your pawns, hating you because they are pawns, could make away from their appointed posts that you might get checkmate on a sudden. You might be the longest-headed of deductive reasoners, and yet you might be beaten by your own pawns. You would be especially likely to be beaten, if you depended arrogantly on your mathematical imagination, and regarded your passionate pieces with contempt."³⁵⁸

While the influence of the political lens can dominate the quest for scientific truth in complex enterprises, the exist little academic theory in this domain, and the precious little theory (Machiavelli, 1515) that exists is highly controversial, no matter how influential.³⁵⁹

"One of the pervasive, really significant reasons for application of Machiavellianism in today's organizations centers around **the ugly problem of loyalty**. Loyalty here refers to dedication or commitment to persons, to task, and to organization. Loyalties today are at odds with one another.

³⁵⁷ Vonnegut, (1952).

³⁵⁸ From George Eliot's, *Felix Holt, The Radical* (1980, pp. 237), as quoted in Mintzberg, H. et al. (1998), pg. 234. ³⁵⁹ In fact, one of the building blocks of Williamson's Transaction Cost Economics theory is "opportunistic behavior with guile" (1985).

Of the various forces affecting loyalty, self-interest is perhaps the most powerful, influencing both those who employ Machiavellianism and the recipients thereof."³⁶⁰

2.2.4.2.2 Macro-politics

"A political perspective views an organization as composed of multiple 'stakeholders' i.e. individuals and groups who contribute important resources to an organization and depend on its success but who also have different interests and goals and bring different amounts and sources of power to bear in organizational interactions."³⁶¹

This perspective looks at how power and influence are distributed and used within the firm and its constituent stakeholders.

"A political perspective defines power as the ability to get things done when goals conflict." 362

As discussed above, the very definition of an enterprise architecture as being a collection of stakeholders, implies that the political lens will have at least as much influence as the traditional strategic design lens.

"Machiavellian concepts are much more germaine to the 'guts' of interactions in business than social scientists and/or management analysts care to recognize."³⁶³

As will be discussed later in triangulation methods to ensure theoretical validity, controlling for "political" effects can be important. To this end it is important to recognized when and how the powerful forces of self-interest may be at play.

As will be discussed later in this chapter, the research methods required to successfully access the data differ from those of the strategic design lens.³⁶⁴ These methods include clinical methods.

"The clinician has the license to ask embarrassing questions, to elicit confidential information, and to ask for the airing of organizational 'dirty laundry'. They are licensed to encourage their informants to 'confess', to tell what is 'really going on' as they see it, and, in this sense to gain a 'deeper' dynamic understanding of what is happening and why it is happening."³⁶⁵

2.2.4.3 The Cultural lens

"The cultural perspective rejects claims that strictly structural, **rational** or **interest** factors best explain human behavior. People are thus more than **cogs in a machine or self-interested political actors**. They are also **meaning makers** and through interaction with one another, they continually create, sustain, and modify organizations."³⁶⁶

³⁶⁰ Calhoon, R.P. (1969), pg. 211.

³⁶¹ Ancona, D. et al. (1999), module 2, pg. 40. Paul Carlile was acknowledged as developing the material.

³⁶² Dahl, R. (1957), pg. 203.

³⁶³ Calhoon, R.P. (1969), pg. 205.

³⁶⁴ References to Machiavelli (1515), are made in management: Calhoun (1969) and Feaver (1984).

³⁶⁵ Schein, E. (1987), pg. 41.

³⁶⁶ Ancona, D. et al. (1999), module 2, pg. 64.

This perspective looks at how history has shaped the meanings of different people within an organization.

As discussed above, an enterprise architecture is rooted in both the strategic design and the political lenses. However, as this research endeavors to discover how such rational and yet political systems have evolved over time, as well as the forces which have shaped such evolution, it is important to view such architectures through the cultural lens to determine how history has shaped inertia.

"Inasmuch as culture is a dynamic process within organizations, it is probably studied best by action research methods, qualitative research approaches that combine field work methods from ethnography with clinical and consulting work."³⁶⁷

As will be discussed later in this chapter, the research methods required to successfully access this data differ from those of the strategic design and political lenses. These methods include action research.

2.2.4.4 The *Temporal* lens

"Management science has only begun to deal with the time dimension in business."³⁶⁸

As discussed above, researchers (Ancona et al., 2001) have recently posited the need for a fourth lens through which to view organizations: the *temporal* lens. They acknowledge however that such a point of view for research is difficult:

"It is hard enough to gain organizational access. It is even harder to capture events over time using multiple measures. This not only takes time but additional resources and lots of cooperation. We are accustomed to getting in and out of organizations quickly. These additional considerations preclude the use of a temporal lens. There are also broader, institutional reasons for the lack of focus on time. Doctoral dissertations are planned around short rather than longer stays. We [must] (1) rethink how we do our research (e.g., we need to create new 'contracts' with firms that will let us explore important temporal issues), (2) rethink some of our institutional arrangements, such as encouraging more time-based research in theses and journals, and (3) experiment with new forms of data collection and analysis."³⁶⁹

³⁶⁷ Schein, E. (1990).

³⁶⁸ Forrester, J.W. (1961), pg. 3.

³⁶⁹ Ancona et al. (2001), pg. 647.

2.2.5 Multi-temporal (longitudinal)

"Over the last decade, longitudinal and dynamic analyses of organizations and populations have come to dominate empirical work in organizational sociology."370

As discussed above, researchers (Ancona et al., 2001) have recently posited the need for a fourth lens through which to view organizations: the temporal lens. They acknowledge however that such a point of view for research is difficult:

"It is hard enough to gain organizational access. It is even harder to capture events over time using multiple measures. This not only takes time but additional resources and lots of cooperation. We are accustomed to getting in and out of organizations quickly. These additional considerations preclude the use of a temporal lens. There are also broader, institutional reasons for the lack of focus on time. Doctoral dissertations are planned around short rather than longer stays. We [must] (1) rethink how we do our research (e.g., we need to create new 'contracts' with firms that will let us explore important temporal issues), (2) rethink some of our institutional arrangements, such as encouraging more time-based research in theses and journals, and (3) experiment with new forms of data collection and analysis."371

This research dissertation therefore attempts to answer the recent calls from reputable academic researchers for a more serious and dedicated research design approach in order to capture the heretofore absent richness of organizations that a temporal lens might provide.

"Longitudinal field studies across several organizations offer another promising approach. In general these are large-scale projects, and the participation of organizations is based on a close relationship between senior managers and the researchers."³⁷²

As will be discussed in more detail in subsequent subsections, this research dissertation aims to establish new longer-term contracts with closer trust-based relationships with multiple firms which simultaneously occupy the same competitive space.

One of the fundamental characteristics of this research dissertation, therefore is the study of organizations across time, as the causal mechanisms driving long-term performance unfold longitudinally.

"... it will be necessary for researchers to place themselves into the manager's temporal and contextual frames of reference. Presumably, this would initially involve conducting a retrospective case history to understand the context and events leading up to the present strategy being investigated. However the major focus of the study would entail conducting real-time observations of the events and activities in strategy development while they occur in time, and without knowing a priori the outcomes of these events and activities."373

In addition, a longitudinal approach will enable the observation that both change has taken place within the organizations, as well as how such change occurred (Van de Ven, 1992).

³⁷⁰ Romanelli, (1991), pp. 99-100.
³⁷¹ Ancona et al. (2001), pg. 647.

³⁷² Daft, R.L. and Lewin, A.Y. (1990), pg. 6.

³⁷³ Van de Ven A.H. (1992), pg. 181.

"... there is a need to supplement regularly scheduled data collection with intermittent real-time data. For example, this would involve observing key committee meetings, decision or crisis events, and conducting informal discussions with key organizational participants."³⁷⁴

The research therefore takes a longitudinal approach towards data collection and analysis. This allows the developed theory to take an *ex ante* perspective (i.e. before the outcomes are known). Such a longitudinal approach is important to develop and test theories on organizational change, development or evolution. The *ex ante* perspective allows the opportunity to understand the direction of causality.³⁷⁵

"... it is widely recognized that prior knowledge of the success or failure of a strategic change effort invariably biases a study's findings... it is generally better, if possible, to initiate historical study before the outcomes of a strategic change process become known. It is even better to undertake realtime study of strategic change processes as they unfold in their natural field settings."³⁷⁶

³⁷⁴ Van de Ven A.H. (1992), pg. 181.

³⁷⁵ This aspect of the research design was influenced by Kaplan, S. (2004).

³⁷⁶ Van de Ven A.H. (1992), pg. 181.

2.2.6 Complementary Qualitative & Quantitative Methods

Researchers (e.g. Jick, 1979) have advocated the use of "hybrid designs" which embrace both quantitative and qualitative methods in order to achieve triangulation to enhance the internal validity of the theories being developed.³⁷⁷ The evolution from *qualitative* case studies towards *quantitative* mathematical models requires a rigorous research methodology described herein (Luna-Reves, 2003).

"The coupling of [the case study] and system models would preserve the richness of [the case study] and allow more generalization of the findings."³⁷⁸

In particular, as the primary problem with the qualitative case study is generalizing beyond the particular case, researchers have argued for complementing case studies with simulation.³⁷⁹

"Although system dynamics models are mathematical representations of problems, it is recognized that most of the information available to the modeler is not numerical in nature, but qualitative."³⁸⁰

Forrester (1994) points out that the progression from the qualitative to the quantitative accesses a different *quantity* and *quality* of data, as shown in Figure 117 below.

"The amount of available information declines, probably by many orders of magnitude, in going from mental to written information and again by another similar large factor in going from written to numerical information. Furthermore, the character of information content changes as one moves from mental to written to numerical information. In moving down the diagram, there is a progressively smaller proportion of information about structure and policies."³⁸¹

2.2.7 Induction-Deduction iteration

"This dialectic of the double-loop learning approach to building strategy theory can help in reconnecting strategy theory with the realities faced by managers in dynamic environments."³⁸³

In the quest for creating new 'bisociation' (i.e. connecting things that were not formerly seen to be connected), the research aims to use both inductive and deductive reasoning. Using purely deductive reasoning, new theory development is unlikely, while using purely inductive reasoning (i.e. without identifying assumptions, constructs and interrelationships between them), only description of the phenomena might result.

As shown in Figure 118 below, the research attempts to build theory by cycling inductively and then deductively in creating and testing constructs, frameworks (or typologies) and ultimately models. Equally, this process moves between informal correlative models towards formal causal models as it endeavors to move from *descriptive* theory towards normative theory.³⁸⁴

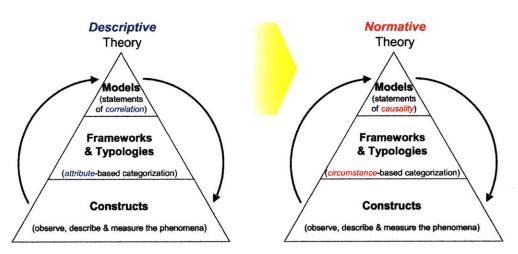

Figure 118: Process used for Theory Building³⁸⁵

Regarding the question of what are the sources of hypotheses, this research design is modeled after the approach taken by Penrose for her classic book, "Theory of the Growth of the Firm". In particular, the research aspires to use the same rich sources, namely: interviews with managers pragmatically rooted in real-world problems, conversations with students and professors, research on economic and sociological theories of architecture and growth, studies of business history, research on business literature and annual reports, extended company visits and observations (Kor and Mahoney, 2000).

While the dissertation itself is likely to be written deductively, the logic of discovery comes inductively from managerial practice. Again, as inspired by Penrose, the aim is to connect the

³⁸³ Mahoney, J. T. and Sanchez, R. (1997). "Competence Theory Building: Reconnecting Management Research and Management Practice." In Heene, A. and Sanchez, R. (Eds.) *Competence-Based Strategic Management*. Chichester: John Wiley, 43-64.

³⁸⁴ Carlile and Christensen, (2004).

³⁸⁵ Source: Carlile and Christensen, (2004).

reconstructed logic of deductive sociology and economics with the theories-in-use of management (Kor and Mahoney, 2000).

"We argue that Penrose's knowledge-creation process can be facilitated if strategic management researchers become engaged in an interactive, reciprocating process. Such rich connections are the stuff that classic management books and research creativity are made of."³⁸⁶

³⁸⁶ Kor Y. Y. and Mahoney J. T. (2000).

2.3 Research Metaphysics

"Darwinism is not a testable scientific theory but a metaphysical research programme. And yet, the theory is invaluable. I do not see how, without it, our knowledge could have grown as it has done since Darwin. In trying to explain experiments with bacteria which become adapted to, say, penicillin, it is quite clear that we are greatly helped by the theory of natural selection. Although it is metaphysical, it sheds much light upon very concrete and very practical researches. It allows us to study adaptation to a new environment (such as a penicillin-infested environment) in a rational way: it suggests the existence of a mechanism of adaptation, and it allows us even to study in detail the mechanism at work. And it is the only theory so far which does all that. "³⁸⁷

With these words, Karl Popper "the father of the philosophy of science", situated Darwin's theory of evolution within science, and characterized the general criticisms weighed against the research in this dissertion. Yet even Popper (1978) changed his mind later upon reflection:

"This is an immensely impressive and powerful theory. The claim that it completely explains evolution is of course a bold claim, and very far from being established. All scientific theories are conjectures, even those that have successfully passed many severe and varied tests. However. Darwin's own most important contribution to the theory of evolution, his theory of natural selection, is difficult to test. The fact that the theory of natural selection is difficult to test has led some people, anti-Darwinists and even some great Darwinists, to claim that it is a tautology. A tautology like 'All tables are tables' is not, of course, testable; nor has it any explanatory power. I mention this problem because I too belong among the culprits. Influenced by what these authorities say, I have in the past described the theory as 'almost tautological', and I have tried to explain how the theory of natural selection could be untestable (as is a tautology) and yet of great scientific interest. My solution was that the doctrine of natural selection is a most successful metaphysical research programme. It raises detailed problems in many fields, and it tells us what we would expect of an acceptable solution of these problems. I still believe that natural selection works in this way as a research programme. Nevertheless, I have changed my mind about the testability and the logical status of the theory of natural selection; and I am glad to have an opportunity to make a recantation. My recantation may, I hope, contribute a little to the understanding of the status of natural selection.. "388

The problem with most forms of evolutionary theory - from Darwin's to this research - lies in the underlying metaphysics: the ontology and epistemology.

"All social scientists approach their subject via explicit or implicit assumptions about the nature of the social world and the way in which it may be investigated. First there are assumptions of an **ontological** nature – assumptions which concern **the very essence of the phenomena** under investigation. Associated with this ontological issue, is a second set of assumptions of an **epistemological** nature. These are assumptions about **the grounds of knowledge** – about how one might begin to understand the world and communicate this as knowledge to fellow human beings."³⁸⁹

This section briefly describes the philosophy of the research methodology, including both its underlying *ontological* (philosophy of *existence* or *reality*) assumptions as well as its overriding *epistemological* (philosophy of *knowledge*) assumptions.

³⁸⁷ Popper, K. (1976), pg. 151, 171-172.

³⁸⁸ Popper, K. (1978).

³⁸⁹ Burrell and Morgan (1979), pg. xiii.

"The distinction between **methodology** and **method** is not a trivial one. A method is a tool or a technique used in the process of inquiry. In contrast, a methodology may be regarded as an 'intricate set of **ontological** and **epistemological** assumptions that a researcher brings to his or her work' (Prasad, 1997, pg. 2)."³⁹⁰

2.3.1 Positivism and Organizational Science

"This article describes the **deficiencies of positivist science** for generating knowledge for use in solving problems that members of organizations face. There is a **crisis in the field of organizational science**. The principal symptom of this crisis is that as our research methods and techniques have become more sophisticated, they have also become increasingly less useful for solving the practical problems that members of organizations face."³⁹¹

This section briefly summarizes the difficult intellectual journey of an avowed positivist (originally trained academically and professionally to understand and design complex technical systems) toward a more interpretivist paradigm, as the nature of the phenomenon to be understood and "designed" (i.e. complex social systems) became more exceedingly more "wicked", rendering my positivist inclinations a hindrance in the quest for the "truth".

"Normal science is concerned with internal validity, experimental rigor, planning, control of confounding variables, and to a lesser extent, external validity. Understanding the phenomenon beforehand makes for clean, tidy research, but the actual knowledge return will be incremental. If a researcher understands the phenomenon well enough to predict and control what happens, why ask the question? The significant discoveries, the best science, require us to be more venturesome and heretic in research design, and to explore fundamental questions without knowing the answer in advance. The worth of the research outcome is measured by surprise. The greater the surprise, the more interesting the result, and the greater the new knowledge about organizations."³⁹²

Leading organizational scientists have recently called for a break from the straitjacket imposed by normal science (Daft and Lewin, 1990, 1993). They have based their arguments on the fact that the phenomenon of effective organizations is so dynamic and complex, that researchers need to explore build theory outside the established confines of the positivist, normal science. This is where this research dissertation takes its que.

"Frameworks can be challenged because their complexity makes it difficult to falsify arguments."³⁹³

Finally, as this dissertation develops a multivariate framework, this inherently makes positivistic falsification difficult (Popper, 1963).

2.3.2 Constructivist Methodology in Strategic Management

"While realists conceive of the research process as **excavation**, where the terrain of phenomena is mined for valuable nuggets of naturally occurring insight, constructivists view the process more as an

³⁹⁰ Mir, R. and Watson, A. (2000), pg. 944.

³⁹¹ Susman G.I. and Evered R.D. (1978), pg. 582.

³⁹² Daft, R.L. and Lewin A.Y. (1990), pg. 7.

³⁹³ Porter, M.E. (1991), pg. 98, footnote 7.

act of sculpting, where the theory-base of the artist interacts with the medium of the phenomena to create a model of reality which we call knowledge." 394

In the linear causal world of natural science where the *realist* paradigm dominates, researchers (subjects) study natural phenomena (objects) without modifying- or being modified by them. In the nonlinear causal world of organizational science, where the *constructivist* paradigm may begin to dominate, researchers (subjects) reflexively shape and are shaped by the phenomena (objects) they are studying as shown in Figure 119 below.

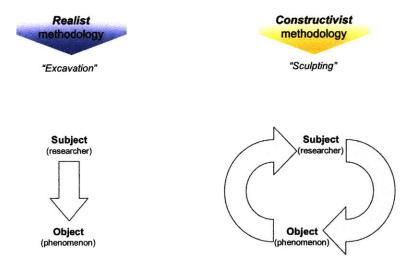

Figure 119: Realist vs. Constructivist Paradigms

While research in the field of strategic management is currently dominated by the *realist* paradigm, this dissertation takes a slightly different *constructivist* approach, which has been argued to be more logical and appropriate for the field of strategic management (Mir and Watson, 2000).

"Constructivism occupies a methodological space characterized by **ontological realism** and **epistemological relativism**. Ontological realism is an important cornerstone of **a field as applied as strategy**, while epistemological relativism helps us explore the constructed nature of the field, where the **researcher is an active participant** rather than a reactor or information processor."³⁹⁵

As shown in Figure 120 below (derived from Mir and Watson, 2000), constructivism is not a polar or binary opposite of realism, but an intermediate form of methodology which is grounded in the reality of realism, while embracing the "messiness" of highly complex social systems, as particularly the higher-level, more "architectural" and power-laden echelons (as will be discussed in a later methods section on "Action Learning / Clinical Methods").

³⁹⁴ Mir, R. and Watson, A. (2000), pg. 943.

³⁹⁵ Mir, R. and Watson, A. (2000), pg. 941.

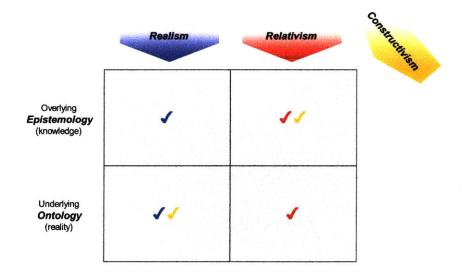

Figure 120: The "Construction" of Constructivism

Such a constructivist approach helps to explain the logic behind the necessity of spending time living, studying and researching in the academic and professional environment of each of the two firms in the primary case study (which will be discussed later in chapter 2). While the *existence* ontologically of an enterprise is not in socially-constructed, the goals, utility etc. of an enterprise is socially-constructed, requiring immersion in and participation with the society a necessary act of creating the knowledge about the phenomenon.

2.3.3 Pragmatist Epistemology in Strategic Management

Finally, a note regarding the philosophical and epistemological approach taken to both the research design and the subsequent theory development is warranted. In the spirit of the practical and applied nature of strategic management research, this work supports a *pragmatist* epistemology (Powell, 2001). It therefore stands in contrast to the purely positivist views that no theory can ultimately satisfy its demands, and the purely anti-positivist views that any theory would satisfy its demands. The criterion used for evaluation is the theory's capacity to solve human problems.

"Truths in strategy are neither certain nor final. The better theory is the one that stimulates better research, better teaching, better practice."³⁹⁶

Under this pragmatist epistemology, the hypotheses developed will be justified through the method of 'abduction' (O'Hear, 1989), which acknowledges the ability to withstand competition among rival theories.

³⁹⁶ Powell, T. (2002), pg. 879.

2.4 Research Settings

The research setting(s) were selected to strengthen the *internal* and *external* validity of the theory developed. As will be discussed in the following sections, internal validity was strengthened by using multiple lenses (i.e. those of different enterprise stakeholders) through which the case study firms were observed. External validity was strengthened by applying the theory developed in multiple industrial settings.

2.4.1 Primary Sample Selection

"Examining outliers departs from accepted methods because the range is restricted and outliers may represent sampling error, a misspecified model, or measurement error. This view of errors of course is based on a premise that normal science 'proof' is the research goal. But outliers are a powerful source of new ideas. Significant insights can arise from studying the best or the worst of a population."³⁹⁷

"A particularly important theoretical sampling approach is 'polar types,' in which a researcher samples extreme (e.g. very high and very low performing) cases in order to more easily observe contrasting patterns in the data."⁸⁹⁸

Given that the primary focus of this research is on building grounded theory, a *theoretical* sample is created.³⁹⁹ The theoretical sampling was designed to build theories of relative competitive performance based on in-depth field-based research of "polar" types of enterprise architectural forms, representing different "strategic groups" within the same industry (Porter, 1981).

"Industry-specific groups create heterogeneity. Firms in different strategic groups within an industry may react differently to environmental disturbances and competitive patterns."⁴⁰⁰

Although the typical model for much of the strategic management research consists of selecting a large 'N' *statistical* sample consisting of many firms competing within a given industry, this research centers on a small 'N' *theoretical* sample which consists of the remaining two large firms in a mature global duopoly.⁴⁰¹ This duopolistic situation presents a unique opportunity to control for industry effects by empirically investigating the strategic trajectories of all (i.e. both) the firms within their industry (Dess, Ireland and Hitt, 1990).⁴⁰²

Multiple firms will be used as data sources however, as the sample will embrace the stakeholders in the extended enterprise of each of the two main members. This is done to give a rich systemic view of the firm's competing enterprises.

³⁹⁷ Daft, R.L. and Lewin, A.Y. (1990), pg. 6.

³⁹⁸ Eisenhardt, K.M. and Graebner, M.E. (2007), pg. 27.

³⁹⁹ With small 'N' theoretical samples, "plausible rival hypotheses" (threats to validity) must be ruled out which make research findings tentative and ambiguous.

⁴⁰⁰ Dess, G.G., Ireland, R.D. and Hitt M.A. (1990), pg. 20.

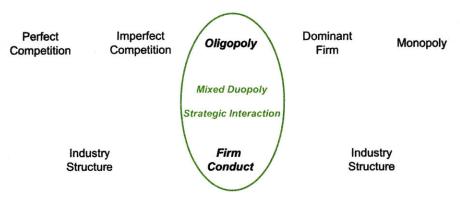

⁴⁰¹ See March, J.G. et al. (1991) on learning from samples of one or fewer.

⁴⁰² Firm "survivor bias" is present as the data set contains only those firms that survived during the time period.

The theory developed herein attempts to understand and predict the competitive dynamics of firms throughout the lifecycle of an industry, from birth to maturity. As a result, the theoretical sample is designed to contain an early entrant firm (which is now the incumbent) and a late entrant firm (which is now the challenger). By definition therefore, the theoretical sample focuses on large, mature firms.⁴⁰³

As this research attempts to understand the co-evolution of firms and industries, datasets in which industries have gone through most of their lifecycle are important. In addition, as industries mature, they tend to shake-out towards oligopoly. By definition, therefore, a large-n statistical sample of the firms in a mature industry becomes difficult. In addition, in the SCP paradigm, firm *conduct* is deemed to govern over industry *structure* in oligopoly settings. This fact allows us to examine the highly important firm conduct in oligopoly settings (as shown in Figure 121 below), provided that a set of well-conceived theoretical samples can be assembled.

Figure 121: Influence of Industry Structure and Firm Conduct on Sample Selection⁴⁰⁴

Spectrum of Industry Structure

Determinants of Firm Performance

This discussion specified the constraints for the selection of the primary theoretical sample:

- Oligopolistic industry structure to ensure relevance of firm conduct (preferably duopoly).
- Mature (post-dominant design) stage of industry evolution with clear *incumbent* and *challenger*.
- Firm objective functions representing both *shareholder value* and *stakeholder surplus* focus (i.e. "mixed duopoly").
- Enterprise architectural forms representing both modular and integral.
- Firms belonging to different "strategic groups" with strategies representing both *differentiated* and *cost-leadership*.

Given these constraints, only one industry and one firm set met all of the above criteria.

⁴⁰³ The focus on large, mature firms is also found in Penrose (1959) and Porter (1980).

⁴⁰⁴ Source: Saloner, G., Shepard, A., and Podolny, J. (2001).

2.4.1.1 Spatial setting

2.4.1.1.1 *Industrial* setting

Spatially, the primary research is confined to a particular global industry: the large commercial airplane industry⁴⁰⁵.

2.4.1.1.2 Incumbent and Challenger

*"The distinction between entrants and incumbents is critical to future studies of performance variation within and across industries."*⁴⁰⁶

After nearly 100 years of intense competition in this industry, the population of competing firms has gone through the various evolutionary stages of variation, selection and retention, resulting in a global duopoly comprising: the US incumbent, *Boeing Commercial Airplanes*, and the EU challenger, *Airbus Industrie*.

For parsimony, the incumbent firm will be referred to as "Firm α ", while the challenger will be referred to as "Firm β " in all industries.

2.4.1.1.3 Firms and their *Extended Enterprises*

Beyond the two firms in the large commercial airplane industry, this research will additionally study their extended enterprises – on multiple dimensions. While there will be tendencies to draw conclusions about the two firms based on the historical trajectories of their respective ownership structures, this research will attempt to enrich this description.

"Airbus was a 'groupement d'intérêt économique', a form of commercial partnership established in French law in the mid-1960's, which was mainly intended to help wine growers. A GIE, as it is known, is a **flexible** and user-friendly **form of corporate structure**, although it tends to baffle Anglo-Saxons – and Americans in particular – used to the **rigid structure of the limited company**."⁴⁰⁷

As shown in Figure 122 below, it is tempting to declare that *Airbus* possesses a modular enterprise architecture based on the observation that it is a loose collection of national companies⁴⁰⁸, while *Boeing* is largely a monolithic or integral enterprise architecture which designs and manufacturers more within the confines of one nation's borders and within one company's logo.

⁴⁰⁵ Standard Industrial Classification, SIC as follows: Division D: Manufacturing; Major Group 37: Transportation Equipment; Industry Group 372: Aircraft and Parts; Industry 3721: Aircraft. "Large" airplanes being defined as those having over 100 seats.

⁴⁰⁶ Walker, G., Madsen, T. L., and Carini, G. (2002). "How does Institutional Change Affect Heterogeneity Among Firms?" *Strategic Management Journal*, 23: 89-104.

⁴⁰⁷ Lynn, M. (1997), pg. 113.

⁴⁰⁸ Airbus is the collection of French (Aérospatiale), German (DASA), Spanish (CASA) and UK (BAE Systems) companies.

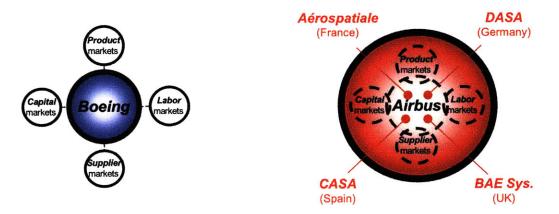

Figure 122: Modular or Integral Enterprise Architectures?

As will be discussed in greater detail in Essay #1, systems or enterprises require both differentiation and integration, with effective enterprises having: a) levels of structural differentiation which are suitable to the demands of the environment, and b) levels of structural integration which match the levels of differentiation.

All complex systems are de-composed in to parts, whether visible or not. Just because one enterprise (*Airbus*) is composed of four visible "modules", namely French, German, Spanish and British companies, does not mean that the enterprise has a "modular" architecture – it depends on the quality of interaction between modules. Conversely, just because another enterprise (*Boeing*) is composed of one visible "module", does not mean that the enterprise has an "integral" architecture.

As will be defined and discussed later, we will need much richer definitions to extract structure from behavior – definitions that transcend the low-level explanations of geographical location and asset ownership. Once these are established, one can then proceed to posit relationships between organizational architectures and the architectures of the products and services they produce.

2.4.1.2 *Temporal* setting

2.4.1.2.1 Industry Clockspeed

"Fruit flies are what I call a fast-clockspeed species. That is, they have an extremely brief life cycle. Mammals, such as elephants and humans live by much slower clockspeeds. They measure their lives in decades, not days. Even slower are reptiles. The hardy sea turtle, whose life span can exceed a century, has evolved little since its terrestrial cousins, the **dinosaurs** roamed the earth... But my work [on researching business evolution], focused primarily on the **dinosaur-like metal bending industries**, **proceeding slowly – painfully so**... For all the supply chain dynamics on view, I might as well have been **watching glaciers advance**... At the slowest end of the clockspeed scale – up there with the sea turtles and the California redwoods – are the **manufacturers of aircraft**."⁴⁰⁹

Recently, researchers have begun to study the dynamic and simultaneous evolution of products, processes and organizations in terms of their "clockspeeds" (Fine, 1998). In an effort to dramatically increase the productivity of such research, Fine cleverly compressed time by choosing to focus his research on the study of those industries and portions of value chains having fast-clockspeeds. In this way he could observe their evolution over a large number of lifecycles, and develop theories which may extend to a more generalizable range of clockspeeds.

While he laments the difficulties of studying corporate "dinosaurs", like *Boeing* (i.e. those having slow product, process or organizational clockspeeds), he recognizes the merit of doing so in order to validate the "dynamic laws of the extended enterprise" that he derived from the fast-clockspeed species. This research dissertation represents one such effort.

The benefit of researching a slow-clockspeed firm like *Boeing* is that one can slowly and carefully observe, dynamically develop and test hypotheses and analyze in real time the movements of the species, as it is locked in a competition with another slow-moving species, *Airbus*. While the benefits are apparent, the costs are high in terms of required resources (e.g. time, money, access, etc.). In addition, the long, extended periods of field observation must inevitably be supplemented and complemented with historical research methods, as even a 5-7 year field-based participatory research program captures only a small fraction of the lifecycle of the products, processes and organizational lifecycles inherent in the industry.

2.4.1.2.2 Time span

Temporally, the longitudinal *quantitative* research spans the 36-year period from the birth of the challenger, *Airbus* in 1970 up to today, where it has recently overtaken the incumbent, *Boeing*.⁴¹⁰ In addition, the longitudinal *qualitative* field-based research is designed to occur over six years. The past four-and-a-half years, spanning from January 2002 to June 2006, documented the managerial cognitive frames of *Boeing* and its enterprise stakeholders. In the three years from 2005-2008, the managerial frames of *Airbus* and its enterprise stakeholders are being researched and documented.

⁴⁰⁹ Fine, C.H. (1998), pp. 4-7.

⁴¹⁰ As measured by annual airplane deliveries (in 2003-2005) and annual airplane orders (in 1998-2005).

The historical milestones of the main competitors within the primary case study industry are shown in Figure 123 below.

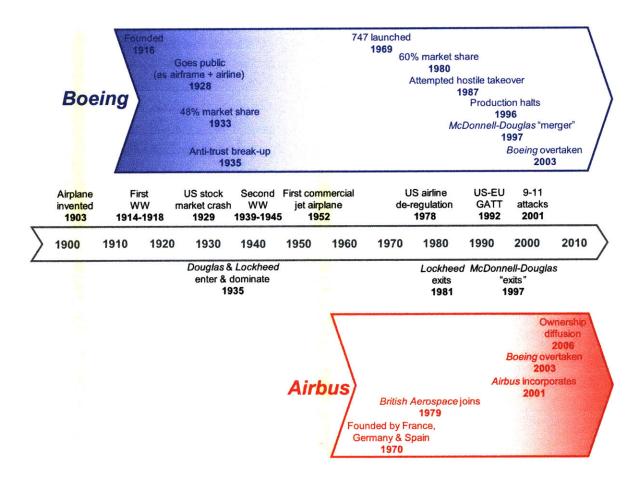

Figure 123: Historical Milestones of Main Competitors in Commercial Airplane Industry

2.4.1.2.3 "Critical Event" / Temporal Discontinuity

"If there was ever a stress test for a good business, this is it."411

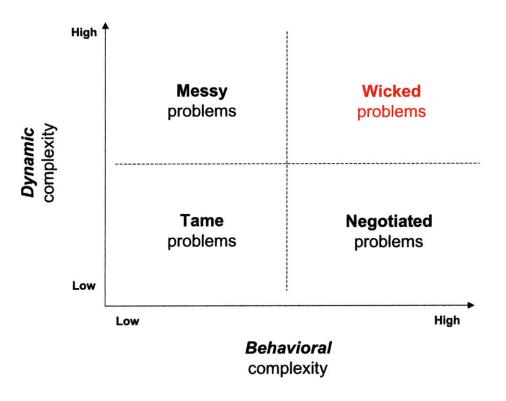

In addition, this research uses the exogenous industry discontinuity of the September 11, 2001 terrorist attacks in the US as a "critical situation" within which to examine firm strategic response.

⁴¹¹ Presentation by Kevin Murphy, airline industry analyst for *Morgan Stanley* at MIT Sloan School of Management, October 2001 (as reported in Hoffer-Gittell, 2003, pg. 236).

2.4.1.3 Industrial idiosyncrasies

2.4.1.3.1 "Wicked" problems

The industry chosen for the primary case study has a high degree of complexity measured on two distinct (but coupled) dimensions: *dynamic* complexity, and *behavioral* complexity (Ackoff, 1974; Roth and Senge, 1995). As shown in Figure 124 below, each will be discussed briefly in the following subsections.

2.4.1.3.1.1 Messy problems: high dynamic complexity

Dynamic complexity occurs when cause and effect are distant in space and time (Senge, 1990, pg. 71). This tends to arise within integral enterprise architectures. Ackoff (1974) refers to such problems as "messes". Sterman (2000, pg. 22) notes that such problems tend to be nonlinear, whereby effect is not proportional to cause.

"The real leverage in most management situations lies in lies in understanding dynamic complexity, not detail complexity."⁴¹²

⁴¹² Senge, P. (1990), pg. 73.

Senge (1990) differentiates *dynamic* complexity from *detail* complexity, which is merely the existence of many variables.⁴¹³ Focus on *detail* complexity often results in "laundry lists"⁴¹⁴ of important variables, but does not reveal sources of *dynamic* complexity. Later in chapter 3, a multitude of plausible explanations for long-term firm performance (or lack thereof) will reveal a focus on detail complexity, and a lack of understanding of dynamic complexity.

2.4.1.3.1.2 *Negotiated* problems: high *behavioral* complexity

Behavioral complexity arises when many diverse agents (or stakeholders), each with conflicting goals and or values have decision-making power. Solution of this class of problem tends to require negotiation, as various zero-sum behavioral games are played among stakeholders, whereas positive sum results would benefit all as in the case of integral enterprise architectures.

For example, when shareholders attempt to value firms, they often rely on "research" conducted by investment bank anaylsts. The potential conflicts of interest and subsequent objectivity of such "research" is clearly disclosed by such investment banks. The extent to which this warning is observed and heeded is a worthy research question.

"[Investment Bank X] does and seeks to do business with companies covered in [Investment Bank X Research]. As a result, investors should be aware that [Investment Bank X] may have a conflict of interest that could affect the objectivity of [Investment Bank X Research]. " 415

2.4.1.3.1.3 *Wicked* problems: Examples

The classic example of the "mildly wicked" problem is the Beer Game or the simple stylized supply chain. Here cause and effect are distant in space and time, and various agents have conflicting local goals and behave as if locked in a zero-sum game. Note that the problem is "wicked" even in the presence of low detail complexity.

As will be argued later, the global commercial airplane industry is "clearly wicked", as cause and effect are very distant in space and time due to the reasons explained below (e.g. high fixed costs, economies of scale, strong learning curve-experience effects, long-development times, long-lived products, etc.).

Finally, "extremely wicked" problems include the Cold War, the Israeli-Palestinian conflict, the U.S. war on terror, etc.

⁴¹³ Sterman, J. (2000), pg. 21, refers to detail complexity as "combinatorial complexity".

⁴¹⁴ Senge, P. (1990), pg. 130.

⁴¹⁵ Anonymous financial services / investment bank research report.

2.4.1.3.2 Economies of Scale & Barriers to Entry

Other industry structural factors include the tend towards *natural monopoly*, i.e. the minimum efficient scale is rather large, given the high fixed production costs, the relatively small annual volumes of sales and the high inherent market and technological risks associated with launching a \$10 billion project, for which there will only be around 1,000 units sold over 20 years (i.e. 50 units per year).⁴¹⁶ In most natural monopoly settings, such an environment makes regulation an expected part of the competitive enterprise dynamics.

As competition tends more and more towards cost-leadership as the modus operandi, production volumes and therefore economies of scale and learning curve effects are a crucial source of cost leadership. It is for these reasons that market share (i.e. delivery share) is an unusually, important metric or proxy for long-term competitive performance.

"International high-technology industries are typically characterized by structural mobility barriers such as irreversible commitments and product differentiation; static and dynamics economies of scale, scope and learning that create increasing returns to scale; and path dependencies and R&D races with high uncertainty and potential first mover benefits. These structural characteristics are viewed as creating imperfectly competitive markets in which supernormal profits or rents, may be possible, and in which time becomes a fundamental dimension of competition."⁴¹⁷

Various research studies have investigated the commercial aircraft industry, including *The MIT Commission on Industrial Productivity* (Dertouzos et al., 1989).

"The argument in the **MIT study**, that many of the difficulties of American firms are having are selfinflicted, is quite persuasive."⁴¹⁸

2.4.1.3.3 Increasing Returns & Imperfect Competition

"Aerospace is afflicted with many of the classic cases of market failure."419

Economist Paul Krugman (1987) argued for free-trade in all but a few rare instances, notably where increasing returns and imperfect competition dominate (e.g. in commercial airplanes).

"If increasing returns and imperfect competition are necessary parts of the explanation of international trade, however, we are living in a second-best world where government intervention can in principle improve on market conditions."⁴²⁰

2.4.1.3.4 Strategic Trade (Industrial) Policy

"As businessmen have always said and economists have usually denied, a protected domestic market can – under some circumstances! – promote rather than discourage exports, and possibly raise national income."⁴²¹

⁴¹⁶ This point was recently reiterated in *The Economist*, June 25th, 2005, pg. 89.

⁴¹⁷ Braham, R. (1995), pg. 73.

⁴¹⁸ Nelson, R.R. (1991), pg. 63.

⁴¹⁹ Neven, D. Seabright, P. and Grossman, G.M. (1995), pg. 316.

⁴²⁰ Krugman, P. (1987), pg. 134.

2.4.2 Secondary Sample Selection: Counterfactuals

"This work was carried out in two distinct, but related phases. The first was a detailed study of...firms operating in one industry. The second phase was a study of a highly effective organization (by conventional economic and commercial standards) and a less effective competitor in each of two other industries."⁴²²

Like Lawrence and Lorsch's classic 1967 work, *Organization and Environment: Managing Differentiation and Integration*, this research dissertation uses a two-phase comparative approach between highly effective and less effective competitors in three different industry settings. The first phase was described in the previous section. The second phase covering competitors in two other industries will be presented in this section.

In an attempt to extend the generality of the proposed theoretical framework (i.e. to ensure external validity of the theory), the research will test from a longitudinal quantitative perspective using panel datasets, the applicability of the theory to *archetypal* competitive spaces in both manufacturing and services: *General Motors* and *Toyota Motors* in the global automotive industry from 1970-2005 and *United Airlines* and *Southwest Airlines* in the US airline industry from 1970-2005.

"Since accurate evidence is not so crucial for generating theory, the kind of evidence, as well as the number of cases, is also not so crucial. A single case can indicate a general conceptual category or property; a few more cases can confirm the indication."⁴²³

The following subsections briefly describe how the theoretical sample will be selected to "control" for various variables by seeking counterfactual case studies.

2.4.2.1 Control for *Industry* effects

"Adequate controls for potential industry effects have not been used in many strategic management studies."⁴²⁴

Many of the most influential empirical studies in strategic management have been demonstrated not to use sufficient controls for industry effects, resulting in erroneous conclusions (Dess et al., 1990). For example, it was observed that firms sampled across multiple industries that use related diversification performed better than firms that used unrelated diversification (Rumelt, 1974). Careful re-analysis of this research revealed that the high firm performance was due to the high profitability of the firm's industries, and those successful industries tended toward related diversification (Rumelt, 1977 and 1982).

"Single industry studies are a relatively straightforward approach to control for industry effects."425

⁴²¹ Krugman, P. (1987), pg. 136.

⁴²² Lawrence and Lorsch (1967a), pg. 19.

⁴²³ Glaser, B.G. and Strauss, A.L. (1967), pg. 30.

⁴²⁴ Dess, G.G., Ireland, R.D. and Hitt, M.A. (1990), pg. 7.

⁴²⁵ Dess, G.G., Ireland, R.D. and Hitt, M.A. (1990), pg. 20.

The logic of the sample selections therefore is to use *single industry studies* (Dess et al., 1990) which investigate an incumbent and its primary challenger. However, to extend the generalizability of the theory while maintaining control for industry effects, the sample will be expanded to include a collection of single industry studies.

As more industries are added, the logic of the sample selection is to use *stratified samples by industry* (Dess et al., 1990), in which the samples are consistent with the variables and relationships being measured. All industries investigated would therefore share fundamental characteristics: (e.g. high consolidation, high entry/exit barriers) as well as share fundamental environmental characteristics (e.g. mature stage).

2.4.2.2 Control for *Environmental* effects

"Use of a single dimension of an industry's environment to build theory and to test proposed relationships empirically may result in a failure to investigate alternative plausible explanations of observed relationships."⁴²⁶

Even though a set of firm pairs operating in the same industry will be analyzed, it is important that the environmental state is controlled. The study therefore proposes to look at firm pairs (an incumbent and challenger), each having been established in different environmental regimes (e.g. emerging and maturing industries), and both competing in an industry that has run its full course to maturity. As will be described later in essay #3, the environment will be characterized using multiple dimensions (e.g. quantity and quality of output) to capture the essence of the environmental state (e.g. munificence, dynamism, and complexity).

2.4.2.3 Control for *Sector* effects

In addition, the sample is intended to begin to control for sector effects, i.e. to determine if the methodology can apply to both manufacturing as well as service industries. It is for this reason that a world-class manufacturing firm (i.e. *Toyota Motors*) and a world-class service firm (i.e. *Southwest Airlines*) are used.

2.4.2.4 Control for International and Socio-Economic effects

Finally, these two case studies, taken together with the primary case study of *Boeing* vs. *Airbus*, form a collection of three cases each representing an incumbent US firm against a challenger representing the three "triad" economic powers: the US (*Southwest Airlines*), EU (*Airbus*) and Japan (*Toyota*). In other words, they were selected to begin to control for national and socio-economic effects - to determine if integral enterprise architectures, which tend to dominate in the mature industries, are not just a product of "socialist societies". The small theoretical sample is not intended to be statistically robust, but merely to present a counterfactual example.

⁴²⁶ Dess, G.G., Ireland, R.D., and Hitt, M.A. (1990), pg. 16.

2.4.2.5 Selection Criteria for Incumbent and Challenger

As the primary sample comprises an industry in a state of duopoly, having a clear incumbent (firm α) and a clear challenger (firm β), the selection criteria need not be very explicit. However, in the secondary and tertiary theoretical samples, clearer definitions are required.

The incumbent (firm α) is defined as the acknowledged leader in the industry, typically measured as having the largest market share at one time in its history.

The challenger (firm β) is defined as having been founded sometime after the current incumbent, and on a clear and sustained trajectory towards displacing the incumbent – regardless of whether or not it has surpassed the incumbent.

2.4.3 Tertiary Sample Selection

Finally, in an effort to further extend the validity and generality of the theory, other case studies are recommended for future in-depth analysis. These are meant to control for other effects like industry clockspeed, and state of industrial evolution. Figure 125 below summarizes the key attributes of the theoretical sample used in this research.

			Independent variable X ₁ (t)	Independent variable X ₂ (t)	Independent variable X ₃ (t)	Variable Y(t)
	Industry	Incumbent /	Enterprise	Structural	Industrial	Firm
	(Sector)	Challenger	Architecture	Dynamics	Evolution	Performance
Primary Case	Com. Airplane	Boeing (US)	Modular	Incumbent	Post-	Incumbent
for theory building	(manufacturing)	Airbus (EU)	Integral	less stable	dominant design	overtaken
Services	Airline	United (US)	Modular	Incumbent	Post-	incumbent
Archetype Case	(services)	Southwest(US)	Integral	less stable	dominant design	overtaken
Manufacturing	Automotive	GM (US)	Modular	Incumbent	Post-	Incumbent
Archetype Case	(manufacturing)	Toyota (JPN)	Integral	less stable	dominant design	being overtaken
Control for	Computer	<i>IBM</i> (US)	Modular	Incumbent	Post-	Incumbent
Clockspeed	(manufacturing)	<i>Dell</i> (US)	Integral	less stable	dominant design	overtaken & exits
Control for Industry Maturity	Comp. Chip (manufacturing)	Intel (US) ???	Modular		<i>Pre-</i> dominant design	Incumbent leads
	Com. Airplane (manufacturing)	Bombar. (CN) Embraer (BR)	Modular Integral	Incumbent less stable	Post- dominant design	Incumbent being overtaken
	Air Cargo (services)	Fedex (US) UPS (US)	Modular Integral	Incumbent less stable	Post- dominant design	Incumbent being overtaken
	Retail (services)	Walmart (US) Costco (US)	Modular Integral	Incumbent less stable	Post- dominant design	Incumbent being overtaken

Figure 125: Proposed Theoretical Sample

Indexendent Indexendent Indexendent Dependent

2.4.4 Addressing Sample Selection Bias

Selection bias occurs when the non-random selection of cases results in inferences based on the resulting sample, that are not statistically representative of the population. The sample selection, therefore (whether large-N or small-N) can bias the theory. We review some of the more frequent concerns and evaluate them in the final chapter.

2.4.4.1 Survivor Bias

"One limitation of the data is that all the firms examined were survivors. As Freeman (1986) noted, studying only surviving firms can create biases if survivors vary from nonsurvivors on critical dimensions being studied. Unfortunately, as a practical matter, it is nearly impossible to obtain accurate historical measures of business strategy for... firms that have failed, particularly those that failed some time ago."⁴²⁷

2.4.4.2 Sampling on the Dependent Variable

A confirmatory bias, like sampling on the dependent variable (or "front-runners bias") can be important source of spuriousness in theory-building. In the case of this research the "dependent variable" can be argued to be long-term firm performance.

⁴²⁷ Boeker (1989), pg. 498.

2.5 Data Sources

Both qualitative and quantitative data were gathered from both primary and secondary sources which allowed the establishment of construct validity.

As summarized in Figure 126 below, in light of the three essays of this proposed research, both primary and secondary data sources are important to define the *structure* of enterprise architectures (Essay #1); primary data sources, in terms of cognitive mental models of the most senior decision makers, gathered longitudinally are important in Essay #2 in order to define how the enterprise architectures *function*; finally secondary data sources, in terms of archival documents are important in Essay #3, in order to define how enterprise architectures *evolve*.

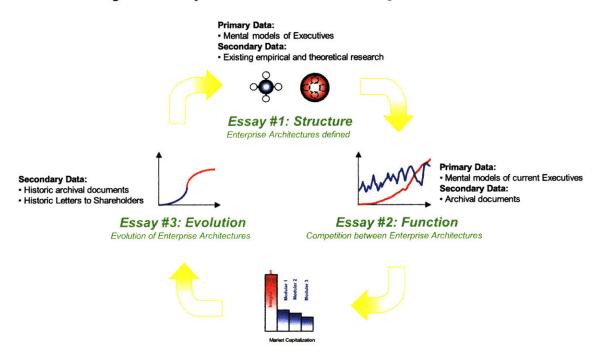

Figure 126: Important Data Sources for each part of the Framework

2.5.1 Primary data sources

As will be discussed in more detail in the subsequent sections, the primary data sources consisted of senior decision makers (informants) at each stakeholder within a given firm's extended enterprise, namely the firm, its customers, suppliers, investors, unions and competitors. The data collection methods and techniques will be discussed in the following section.

2.5.2 Secondary data sources

Examples of secondary data sources included archival documents including published company annual reports as well as interview transcripts from published trade and news journals.

By way of example, longitudinal analysis of *The Boeing Company* alone required the acquisition and review of over 75 years of annual reports totaling over 2,200 pages of text.

Additionally, review of the ongoing dynamics of the *Boeing-Airbus* rivalry included analysis of over 10 news sources per day (from sources like *Factiva*) over the past seven years, totaling over 5,000 pages of text.

In order to begin to piece together the respective histories of *Boeing* and *Airbus*, numerous texts documenting their development were consulted (e.g. Lynn, 1997).

2.6 Data Collection Methods and Techniques

2.6.1 Executive Summary

The plan is simply to work with the most senior leaders of both competitor firms as well as the leaders of their key stakeholders to solve their most difficult strategic problems using whatever methods and techniques are most effective for the situation at hand. Repeat this process periodically over time until theoretical saturation occurs and/or financial and temporal resources expire. Beyond that, there is no more specific plan - there can not be - as the nature of the problem that one is asked in "solving" is continually changing, as well as the composition of the leadership in the enterprises.

2.6.2 Methods

The best way to describe the data collection process is the author led an intensive 6-year longitudinal group model building, critiquing and testing exercise primarily with the senior leaders of the major stakeholders of both enterprises in a global duopoly. The purpose of the model (or grounded theory) development focused on understanding the competitive dynamics within the industry. The resulting model is ultimately then transformed into a more formal simulation model.

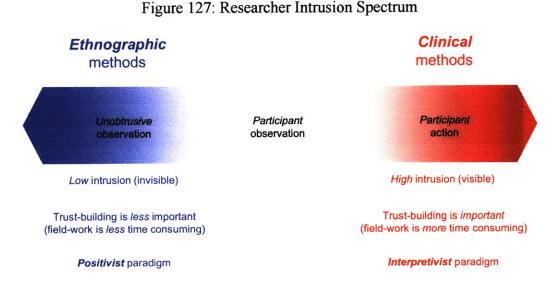

"The specific methods appropriate for this kind of research do exist but are relatively rarely applied to strategy process research - longitudinal studies, action science, the ethnographic approach, and clinical methods."⁴²⁸

As shown in Figure 127 below, the approach taken to data collection is highly pluralist and fullcycle (Chatman and Flynn, 2005), and the primary methods of data collection span the spectrum of researcher presence, ranging from "invisible" ethnographic techniques (Van Maanen, 1988) to the more "visible" techniques of participatory action research (Heron and Reason, 1997), and in particular, *action learning* (Clark, 1972; Pedler, 1991; Revans, 1980, 1982) and ultimately *clinical methods* (Schein, 1987). These will be compared and contrasted in the following sections and implications will be drawn for this research plan.

"We advocate a full-cycle approach to conducting organizational behavior research. Full-cycle research begins with the observation of naturally occurring phenonema and proceeds by traveling back and forth between observation and manipulation-based research settings, establishing the power, generality, and conceptual underpinnings of the phenomenon along the way. Compared with more traditional approaches, full-cycle research offers several advantages, such as specifying theoretical models, considering actual and ideal conditions, and promoting interdisciplinary integration."⁴²⁹

⁴²⁸ Stacey, R. (1995).

⁴²⁹ Chatman, J.A. and Flynn, F.J. (2005), pg. 434.

"As the relationship with the organization develops, it is perfectly possible, indeed quite likely that (ethnographic and clinical) roles will merge more and more. Clinicians find opportunities to 'wander around' and 'observe'...and thus are able to gather the kind of data that the ethnographer is seeking. Ethnographers are likely to be thrust increasingly into clinical roles as they come to be taken for granted and build up trust."⁴³⁰

As we transition the discussion of the research methods used in this dissertation from the more passive towards the more active role of the researcher, it is important to observe the *continuity* of theoretical legitimacy not *discontinuity*.

"Open-ended interviews and participant observation... are ways of discovering how economic participants think about the world. They are means, in other words, of identifying toe model of that portion of the socioeconomic world which the participants themselves use in making decisions. The conventional interpretation is captured in what at MIT is called Robert Hall's law: You can never believe the answer to a direct question about behavior, or more crudely, 'businessmen always lie.' This intrpretation, however, suggests that this law misses the point: what interviews can reveal is not a set of specific answers to specific questions, individual bits and pieces of information. What they reveal are patterns of responses. Each answer, whether true or false, is a piece of that pattern. Individual responses cannot be interpreted in isolation. But the responses grouped together, and taken as a whole, are clues to the mental processes of the economic participants."

⁴³⁰ Schein, E. (1987), pg. 24.

⁴³¹ Piore, M. (1979), pg. 566.

Finally, it is instructive to compare this approach to methods with those from previous influential researchers in the intellectual domains that this research aims to contribute, for example the original contingency theorists. This description of Burns & Stalker's research method bears a strong resemblance to the methods employeed herein.

"The methods of study we have followed are those common to what is called field sociology and to social anthropology. These are simply directed towards gaining acquaintance, through conversation and observation, with the routines of behavior current in the particular system being studied, and trying thereafter to reach an appreciation of the codes of conduct which are supposed by the members of the system to underlie behaviour. All this emerged fairly slowly in the course of the interviews, meetings, lunch-time conversations, and the like. At the same time we, as outside observers, have tried to construct some systematic explanatory description of what we have been told and have observed.

All this is very far removed from any method of investigation which could possibly be called scientific. It does not share the principal advantage of anthropological field method, which lies in a lengthy period of residence in the community being studied. Everything has had to depend on what ability we had to appreciate the significance of the things and happenings we saw during out spells inside factories, and to elicit information in interviews and conversations. We had also to learn to distinguish the tones and additives which were occasioned by our roles as outsiders, as academic people, as confidants, as critics.

Our usual procedure, after the first interview with the head of a firm, was to conduct a series of interviews with as large a number of persons as possible (some 300 persons) in managerial and supervisory positions. Such interviews lasted anything from one hour to a whole working day.

It was during this stage that it proved possible to create a more productive relationship than can be constructed on the basis of one person's seeking information from another. The conventions governing such interviews and the limits of of information regarded as admissible or relevant are nowadays prescribed fairly strictly. To go beyond these limits, it is not enough to demonstrate interest or even sympathy; in the writers' experience, an informant will get to the point of formulating and presenting his experience, beliefs, opinions, anxieties, and criticisms only when there has been established a relationship which is reciprocal in some genuine sense; when there is some point for the informant in going further than the needs of courtesy, and compliance with an undertaking by the firm to co-operate with the researcher, seem to require of him. Thus the researcher has to make the relationship 'real'; one in which he is prepared to behave on his side as what he declares himself to be. This can be done only by showing how he is making use of the information he is receiving; by the occasional interpretation of a situation in terms which are both derived from his perception of the situation as an outsider and as a sociologist or psychologist, and which are also appropriate to his informant's ability or preparedness to comprehend it. From then on, whether the interpretation is accepted or not, there is a freer, more satisfactory quality about the interview, a stronger desire to recruit and present facts, examples and views. There are no interpretations and appraisals contained in any part of this report which have not been communicated at some time or other to persons involved in the situations at issue. Invariably, also, we have found our own ideas being amended, extended or corrected by such traffic.

After we had become acquainted with the general structure and functioning of the organization, we sought opportunities of observing how people dealt with each other, and also of pursuing, by further interviews, some of the problems of description and interpretation which by this time had appeared. In their simplest and most significant form, these problems were presented as discrepancies between the account of the same functions or parts of the organization given us by different people concerned in them. Such discrepancies, in our experience, are always present, and provide the most direct introduction to the analysis of a situation or social system in sociological terms."⁴³²

⁴³² Burns, T. and Stalker, G.M. (1961), pp. 12-15.

2.6.2.1 Ethnographic Methods

"The goal is to reveal the **underlying structure** that is out there, and the assumption dominates that if the ethnographer had **sufficient time** to **observe passively** it would eventually **reveal itself**."⁴³³

Nearly all of the initial fieldwork began as a series of unobtrusive ethnographies at multiple enterprise stakeholder sites. Various techniques such as observation, participant observation, archival documentation review, unstructured, semi-structured and structured interviews, and focus groups⁴³⁴ were employed in order to build empirically valid, albeit relatively shallow data sets.

Within strategic management, recent interest in studying firm heterogeneity with an industry via the resource-based view tradition, has lead to calls from academic to employ more obtrusive methods (Rouse and Daelenbach, 1999).

"Ethnographic methods include those that range from the low-intrusion types such as semi-structured and unstructured interviews, and unobtrusive observation, to high-intrusion methods such as participation observation... Generally speaking, the higher level of intrusion, involvement or participation in an organization, the higher level of understanding, the greater the degree of sensemaking, and the richer the descriptive and analytical possibilities for the data. Participant observation, because it permits trust relations to develop, allows the researcher to collect data that are different in kind and quality from data produced by any other method. It is hard to imagine survey respondents, for example providing sensitive, confidential, or highly consequential data. Similarly, interviewers who do not spend sufficient time within an organization are unlikely to gain access to data that would be exchanged only among trusted insiders within the culture."⁴³⁵

As the next step for the research problem, therefore was to gain focus and sharpness, the opportunity began to slowly emerge to evolve the data collection towards more depth via clinical methods described next.

"It may be true that until the ethnographer becomes 'helpful', he or she will not truly be accepted into the group and given access to the data he needs."⁴³⁶

⁴³⁴ Luna-Reyes, L.F. (2003), pp. 281-282.

⁴³³ Schein, E. (1987), pg. 30.

⁴³⁵ Rouse and Daellenbach (1999), pg. 490.

⁴³⁶ Schein, E. (1987), pg. 28.

2.6.2.2 Action Research / Clinical Methods / Policy Research

"The relationship between the analyst and the client has significantly evolved with the analysis being more often used as a platform for dialog between stakeholders with very different objectives and problem views, rather than a simple delivery of a best solution."⁴³⁷

"While the analyst him/herself may not be neutral, the analysis must be with extensive tradeoff analyses and even game playing to show the interrelationships between different objectives. We are just beginning here but this is a **major paradigm shift** from the analyst, problem definer and solution provider to the analyst aiding in a **complex stakeholder consensus building process** providing neutral information and convening – but not dominating – the debate."⁴³⁸

Academics have begun to question the role of analysts in research (Marks, 2003), leaning toward a more clinical approach, employing action research methods.

"This article describes the **deficiencies of positivist science** for generating knowledge for use in solving problems that members of organizations face. Action research is... a method for correcting these deficiencies. When action research is tested against the criteria of positivist science, action research is found not to meet its critical tests. The appropriateness of positivist science is questioned as a basis for judging the scientific merits of action research. Action research can base its legitimacy as science in philosophical traditions that are different from those which legitimate positivist science."⁴³⁹

In order to capture the depth and complexity of the phenomenon under study, this research dissertation aims to complement the traditional low-intrusion methods of ethnography with the higher-intrusion methods of action research.⁴⁴⁰ In order to understand *how* strategic change processes occur, Argyris (1968, 1985) has argued that significantly new research methods of action science are required.

"...it implies significant researcher commitment and organizational access, which few researchers have achieved to date. As a consequence, very few developmental studies of strategy formulation and implementation have been conducted. One reason why gaining organizational access has been problematic is because researchers seldom place themselves into the manager's frame of reference to conduct the studies."⁴⁴¹

"Pettigrew's book is based on eight years of research. In fact, two of the eight years of research were funded directly by ICI. In the worst case, organizations that pay the costs of becoming the subject of advanced research will try to manipulate the researcher, either by socializing him or her into their value systems or by making cooperation dependent on 'useful' results or at least the display of a 'reasonable' attitude. It is a disturbing proposition that the theory of organization may have finally approached a point where methodological requirements make further advances dependent on the good will of powerful insiders."⁴⁴²

⁴⁴⁰ I am indebted to Prof. Sarah Kaplan for coaching me through the use and validity of clinical methods research, and in particular for pointing me towards the work of Prof. Ed Schein.

⁴⁴¹ Van de Ven, A. H. (1992), pg. 181.

⁴⁴² Streeck, W. (1986), pg. 92.

Action research is known under various names with slightly different meanings in a variety of contexts. These include: "clinical methods" (Schein, 1987), "policy research" (Etzioni, 2006), and "Collaborative Interactive Action Research" (Rapoport et al., 2002).

"Policy research requires a profoundly different methodology from that on which basic research relies, because policy research is always dedicated to changing the world while basic research seeks to understand it as it is." ⁴⁴³

The following subsections each briefly discuss the focus of action research on: strategic capability-building, organizational change and theory building.

2.6.2.2.1 Focus on Strategy Process (not Content)

"In the clinical model, an important distinction is between process consultation that highlights helping the client solve his or her own problems, and expert consulting that puts the clinician into a doctor or expert role from which he or she prescribes solutions."⁴⁴⁴

As previously discussed, this research is designed to establish long-term trust-based relationships with the most senior leaders of both *Boeing* and *Airbus* as well as with the senior leaders of their respective key stakeholders, namely their customers, suppliers, investors and employee unions.

"I have learned much from my teachers, even more from my colleagues, but I have learned the most from my students."⁴⁴⁵

The primary stance of the researcher is as an independent in-house strategy *process* consultant⁴⁴⁶ and executive education provider to the most senior leaders of firms comprising both enterprises. The stated objective of the researcher is to build each enterprise's strategic thinking capabilities, which is broadly achieved by facilitated group model-building exercises, with representatives of each enterprise's key stakeholders. The concurrent participation with both enterprises has been acknowledged a priori, with the obvious stipulation that there would be no exchange of sensitive or proprietary information.⁴⁴⁷ As will be discussed later, the data collection methods range from action learning/clinical methods to ethnography.

"To understand architecture and its impact one needs to understand the **political and cultural** dimensions of leadership and architecting, as Ted Piepenbrock described. [When considering] Ted Piepenbrock's efforts at Boeing, the audience is the Board of Directors, who are trying to make architectural decisions about the Boeing enterprise. Ted's role is not to be an outside architect; rather he is operating as a kind of facilitator in the board's own thinking about its architecture. He does, however, carry out his own research in the firm – this gives him credibility with the audience and helps him elucidate the key choices and consequences facing them in their architecting (i.e. modular versus integral enterprise)."

⁴⁴³ Etzioni, A. (2006), pg. 833.

⁴⁴⁴ Schein, E. (1987), pp. 37-38.

⁴⁴⁵ From the Talmud / Book of Proverbs.

⁴⁴⁶ As opposed to a strategy content provider, which implies no exchange of sensitive or proprietary information.

⁴⁴⁷ Non-disclosure agreements (NDA) as well as non-compete agreements (NCA) without express written consent, were obviously part of the research contracts.

⁴⁴⁸ Comments and critiques of this framework by graduate students in the Spring 2006 MIT ESD class, *Enterprise Architecting*.

In order to integrate information from across intra-firm functions as well as external inter-firm stakeholders, the organizational development literature has acknowledged the importance of boundary-spanning "boundary objects". In this tradition, the process consulting described above resembled a "boundary object" – in as much as a conversation, or a trust-based relationship can be seen as an invisible boundary object.

2.6.2.2.2 Focus on Intervention and Change

"One can not understand a human system without trying to change it. The essential dynamics of the system are assumed to remain invisible to the passive observer."

Unlike, the ethnographer who takes great care not to disturb or contaminate the human system that they are observing, the clinician's aims are the opposite – to purposefully disturb the human system via an intervention designed to change and ultimately improve the organization. While clinical data tends to be deeper and richer than ethnographic data, it may suffer from experimental validity. The research design recognized these trade-offs, and was customized to fit the situation as described below.

"Clinical fieldwork demands a long-term, open-ended, give-and-take commitment to bringing about organizational change."⁴⁵⁰

The use of clinical methods, focused on organizational change requires special characteristics of both the researcher as well as the organization itself. Sterman notes that the researcher requires a unique multidisciplinary set of skills:

"You have an ethical responsibility to carry out your work with rigor and integrity. You must 'speak truth to power', telling the clients that their most cherished beliefs are wrong... even it if means you will be fired. If your client's minds are closed...you must quit. Get yourself a better client. [This requires] both first-rate analytical skills and excellent interpersonal and political skills."⁴⁵¹

Throughout this intensive longitudinal field study, in order to maintain ethical responsibility and integrity, I opted to terminate the fieldwork on multiple occasions. This served to maintain the appearance objectivity in the relationship with the informant organizations, as well as to counter the claims from academics in the ethnographic tradition (but not in the clinical methods tradition) who are concerned with the observer "going native".

The use of clinical methods varied from across firms in the case study depending upon the firm's perceived needs or organizational change. For example, *Boeing*, the incumbent under attack from the challenger, *Airbus*, felt more urgent need at high organizational levels to initiate organizational change. For this reason, clinical methods emerged from initial ethnographic methods at *Boeing*, while the ethnographic methods were more appropriate at *Airbus*. In the quest for sharp methodological fidelity, the clinical phase at *Boeing* was a long-term⁴⁵², open-ended endeavor with "pull" coming from the highest levels of management.

⁴⁴⁹ Schein, E. (1987), pg. 29. Also in Starbuck and Nystrom (1981).

⁴⁵⁰ Schein, E. (1987), pg. 5.

⁴⁵¹ Sterman, J. (2000), pp. 85 and 105.

⁴⁵² A brief survey of recent field-based doctoral research in management reveals that duration of field-based data collection ranges from approximately 6-12 weeks (e.g. W. Orlikowski, 1990; S.Kaplan, 2003).

"The clinician, unlike the ethnographer, is welcome in the halls, meeting rooms and corner offices occupied by those in high position." 453

Finally, Schein (1987) differentiates between *process* consultation and *expert* consultation in clinical fieldwork.⁴⁵⁴ As process consultation focuses on helping the client to solve their own problems (as opposed to expert consultation, which solves the client's problems), this research design focused primarily on the use of process-oriented clinical methods. In this way, managerial frames were more readily revealed through the process of guided joint-discovery or co-creation of knowledge. To this end, the primary technique used was the development of scenarios as strategic conversations (van der Heijden, 1996; Hodgkinson and Wright, 2002).

2.6.2.2.3 Focus on Theory Development

"The clinical perspective is oriented towards the dynamics of change and improvement. It is therefore normative in its orientation and requires underlying theories that provide normative direction – concepts of health, effectiveness, growth, innovation, integration, and the like."⁴⁵⁵

As clinical methods tend to generate normative theory, it fits well within the aims of strategic management scholarship.

"The best use of clinical data is in the construction of variables and theoretical models. The clinician learns about some of the most fundamental dynamics that operate in an organization, and it is often very clear, even though not provable, what those dynamics are."⁴⁵⁶

As will be discussed later, in the *analytical techniques* section, the use of nonlinear dynamic numerical simulation via the system dynamics method relies greatly on clinical data for the development of solid theories and the subsequent robust policy design.

"The power of clinical work... under the label of 'action science'... is that such work provides better variables and better understanding of the system dynamics than other research methods and thus must be utilized more in building useful and parsimonious theory."⁴⁵⁷

One of the more influential theories developed in organizational science is Contingency Theory as developed by researchers like Lawrence and Lorsch (1967). While numerous criticisms of the theory abound, particularly surrounding the adequacy of their concepts and measures (Aldrich, 2006: 126), Lawrence and Lorsch defend their theory by noting the inherent qualitative, clinical nature of their methods.

"As Lawrence and Lorsch (1973) pointed out in reply to their critics, they conducted a clinical study rather than a highly quantitative, rigorously-controlled field study, and their conclusions owe as much to their clinical and professional insight as to the rudimentary data analysis presented."⁴⁵⁸

2.6.3 Techniques

2.6.3.1 Temporal (longitudinal)

The research program is designed to span the social, economic, cultural, institutional and academic environments within which the two enterprises of the case study are embedded. As the theoretical construct of "enterprise architecture" compares the efficiency-based mass production *firm* (e.g. *Boeing*) and its counterpart, the value-infused lean *institution* (e.g. *Airbus*)⁴⁵⁹ the research program is based out of two leading universities in the US and Europe, with their notable strengths rooted in each tradition: MIT and the University of Oxford.

As shown in Figure 128, the research was designed to take place over a nearly eight-year period, being broken down roughly into the following three two-and-a-half-year periods:

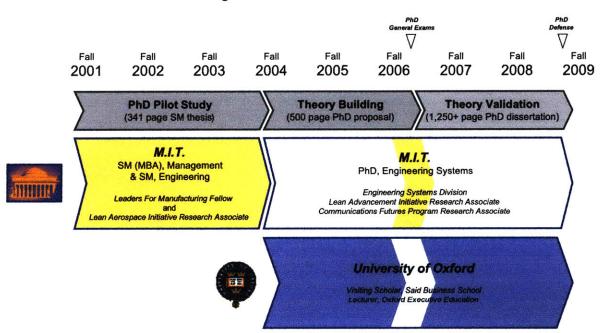

Figure 128: Research Timeline

• Phase I consisted of an initial three-year pilot study was conducted at (*Boeing*) the primary case study site under the academic auspices of the joint MBS/MS *Leaders for Manufacturing* program of the *Engineering Systems Division*. The purpose of the pilot study was to clearly define the research problem, develop preliminary grounded theory and secure a platform (e.g. doctoral funding, doctoral committee, industrial commitment and access) for a doctoral research plan. The results of this pilot study is summarized in the document, "Enterprise Design for Dynamic Complexity: Architecting and Engineering Organizations using System and Structural Dynamics" (Piepenbrock, 2004).

⁴⁵⁹ The "Organization-Institution" dichotomy was first discussed by Selznick, 1957.

- Phase II consisted of another two-year block which was designed to more fully develop grounded theory from empirical field-based case studies by establishing and validating theoretical constructs and propositions.
- Phase III will consist of a final two-year block which is designed to validate and extend the theory developed using two means: first, an via analysis of other firms and industries; second, via extensive multidisciplinary review of theoretical literature. If Phase II built theory grounded in empirical data, Phase III will build meta-theory from existing theories, as well as extend and validate the theory.

As shown in Figure 129, the field-based data collection has been executed from January 2002 to July 2009. Typically, three-month visits were conducted every twelve months for over seven years at *Boeing* and the sites of its constituent stakeholders. The total field contact time thus far exceeds 4,000 hours, including approximately 500 hours of action learning based interviews and discussions with stakeholders described below.

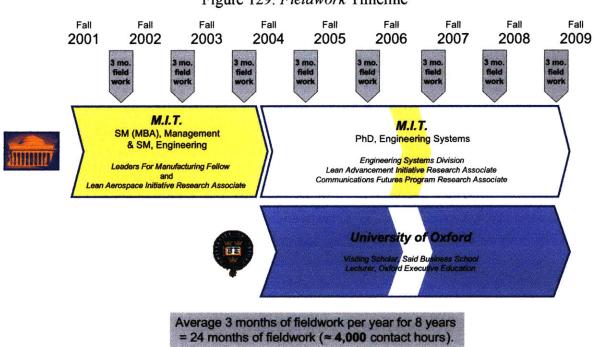

Figure 129: Fieldwork Timeline

Also as is shown in Figure 130 below, the 4,000 hours of fieldwork at both competitors in the global airplane duopoly took place over the time period that the incumbent (*Boeing*) was overtaken by the challenger (*Airbus*). This was an opportune time to capture the complex dynamics of managerial cognitive frames as the reality changed for the first time in such a slow clockspeed industry.

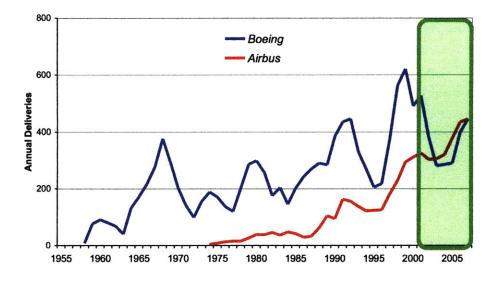

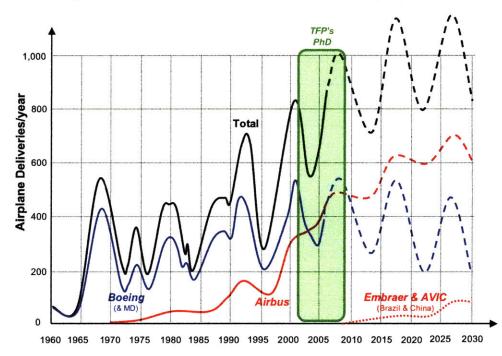

Figure 130: Fieldwork Timeline & Competitive Duopoly Dynamics

In addition, as the industry produces capital goods, it is subjected to well-known oscillations (Sterman, 2000), having a period of approximately ten years. As shown in Figure 131 below, The research therefore took place over one full-cycle in order to capture the dynamics first during the downturn, where integral enterprise archiecture was expected to outperform the modular enterprise architecture, as well as during the upturn, where the converse occurs.

2.6.3.2 Spatial (triangulation)

"Interviews often provoke a 'knee-jerk' reaction that the data are biased in which impression management [by image-conscious informants] and retrospective sensemaking are deemed the prime culprits. The challenge of interview data is best mitigated by data collection approaches that limit bias. A key approach is using numerous and highly knowledgeable informants who view the focal phenomena from diverse perspectives. These informants can include organizational actors from different hierarchical levels, functional areas, groups, and geographies, as well as actors from other relevant organizations and outside observers such as market analysts. Another approach to mitigating bias is to combine retrospective and real-time cases (Leonard-Barton, 1990)."⁴⁰⁰

In addition to the collection of data temporally across time, this research plan calls for spatial collection of data both "horizontally" across the key stakeholders of the enterprise, as well as "vertically" within each stakeholder's hierarchical structure. In this sense, the goal is to map the *micro*-frames of key decision makers across the *macro*-enterprise of key stakeholders.

2.6.3.2.1 Horizontal (Inter-firm) triangulation

"The theory that we are developing together represents the exact opposite way we that currently see our strategy... [it] challenges the conventional wisdom and power structure of the highest levels of this company. Having relentlessly discussed [it] over and over again over the past few years, with people who have a strong vested interest in disproving it, has been given the theory a 'baptism by a hundred fires' – it certainly has been 'pressure-tested'".⁴⁶¹

In order to ensure internal validity of the theory, the research design included triangulation of the data sources. To this end, the above-described data collection techniques were applied internally within *Boeing* at senior leadership levels across multiple functions such as marketing, engineering, manufacturing and supplier management as well as externally to *Boeing's* stakeholders such as its customers, suppliers, labor unions, etc., as shown in Figure 132 below.

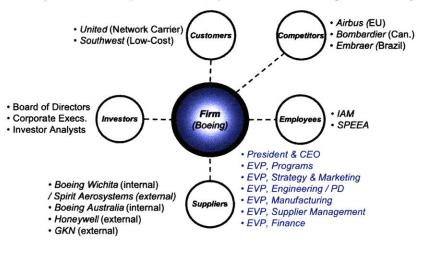

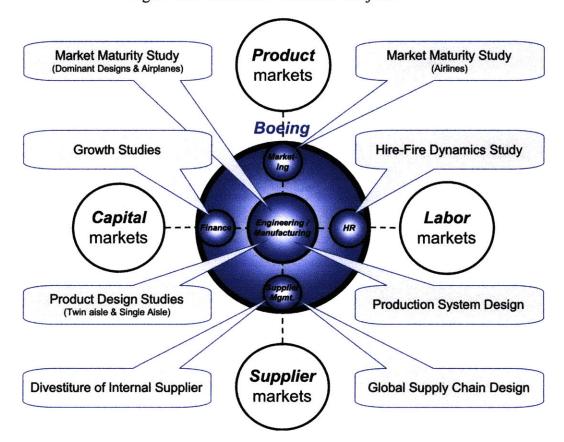

Figure 132: Empirical "Triangulation" of Boeing Case Study

⁴⁶⁰ Eisenhardt, K.M. and Graebner, M.E. (2007), pg. 28.

⁴⁶¹ Quotation from *Boeing* director, Summer 2005.

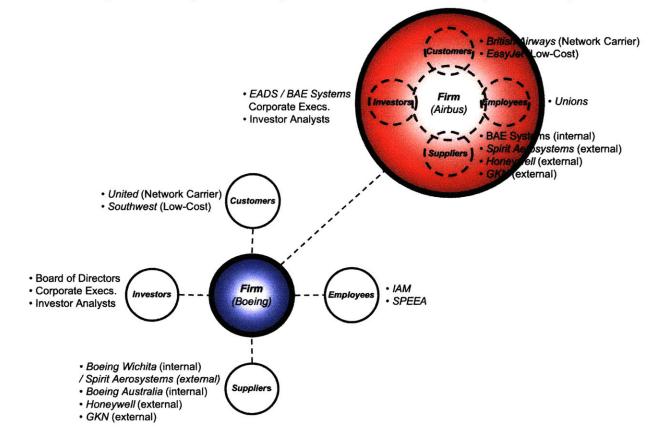

The research was designed to sample a number of the 'internal" functional problems. Examples of the types of intra-firm research studies performed for the functional leaders are shown below in Figure 133.

For the second phase based out of the University of Oxford, a similar schedule and approach is envisaged for *Airbus* and its constituent European stakeholders. In this way, triangulation of data from interconnected sources can begin to paint a systematic picture of the global commercial airframe industry ecosystem which may share common stakeholders like customers or suppliers as shown in Figure 134.

2.6.3.2.2 Vertical (Intra-firm) triangulation

"I have the **biggest risk profile** and the **broadest time horizon** in the company. I can bring to bear the right risk-taking and time horizon trade-offs." *462

In order to further increase internal validity, data collection methods took place a multiple levels with each stakeholder organization. As shown in Figure 135 below, as one ascends an organization vertically, the level of power, control and integration (or "architectural design authority") increases, facilitating the need for different approaches in accessing reliable data. At these levels, as meaning and reality are more socially-constructed, this makes accessing the data more difficult via conventional positivist methods, and easier via more constructivist methods.

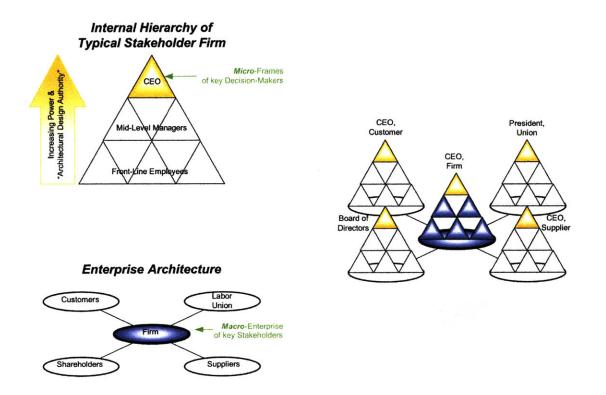

Figure 135: Mapping Micro-Frames Across the Macro-Enterprise

Note that this vertical triangulation within the organization's hierarchy is supported by Thompson's (1967) claims that organizations operate more like closed-systems (i.e. rational, strategic design lens) at lower levels and more like open-systems (i.e. satisficing, political design lens) at higher levels. Thompson refers to three levels: *technical, managerial* and *institutional*. While this research engages all three levels, it particularly emphasizes the open-systems institutional levels where the formal design authority of the "architect" resides.

⁴⁶² General Electric chairman and CEO, Jeffrey R. Immelt, interviewed by Thomas A. Stewart in the Harvard Business Review, "Growth as a Process," June 2006, pg. 69.

2.6.3.2.3 Political, Cultural and Temporal triangulation

Research designs dominated by the *strategic design* lens, view organizations as objective, rational optimizers. As such research methods like survey questionnaires are deemed as logical vehicles to access valid data. The researcher is able to treat the data sources and the data itself as "commodities" in that precious research time and resources are not "wasted" nurturing long-term, trust-based relationships with the data sources, the answers received represent truths or valid data, and that any researcher (given a proper specification of how the original data was collected) can go back to the same data sources, issue the same surveys and get broadly similar "truths" (controlling obviously for longitudinal effects).

This approach may in fact be valid for research in organizations under certain conditions. However, as this research dissertation aims to access data across multiple external stakeholders as well as across multiple internal functions, divisions and levels, as well as longitudinally across multiple time frames, it is by definition crossing important political, cultural and temporal boundaries, requiring the research lenses to incorporate these points of view.

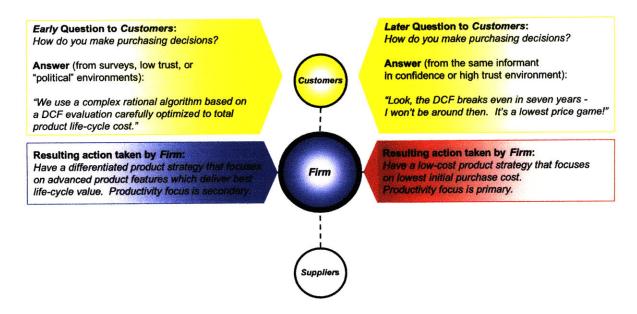

"You have an ethical responsibility to carry out your work with rigor and integrity. You must 'speak truth to power', telling the clients that their most cherished beliefs are wrong... even it if means you will be fired. If your client's minds are closed...you must quit. Get yourself a better client. [This requires] both first-rate analytical skills and excellent interpersonal and political skills."⁴⁶³

Viewed from these lenses, the researcher sees that the data and data sources can not be treated as commodities in that research time and resources must be spent nurturing long-term, trust-based relationships with the data sources, understanding their local objectives and conflicts of interest both within the firms and between firms. In addition to time and resources, this requires specific skill on the part of the researcher to build these relationships with the data sources. As failure to consider these organizational complexities could result in invalid data.

The following examples taken from early phases of this research dissertation illustrates that failure to control for such political, cultural and temporal effects results in significantly different data and theoretical models. Figure 136 below illustrates the significance of not controlling for "political effects" when collecting and analyzing data from the customer stakeholder group.

⁴⁶³ Sterman, J. (2000), pp. 85 and 105.

Figure 136: Data from the Customer stakeholder with and without "political controls"

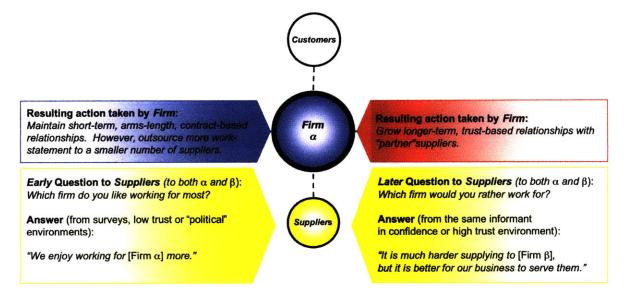

As can be seen, the conventional wisdom of the firm, of the research community at large, and in fact from the initial data acquisition exercises from the research program described in this document, is that customers for the firm's products make purchasing decisions base on complex, yet rational decision algorithms which minimize total long-term costs to the customer. It is interesting to note that this answer from senior managers from the customer stakeholder triangulated consistently with senior managers in the firm and by senior leaders within the investor stakeholder group. This "truth" led the firm, to launch differentiated high-performance products which could balance the initial purchase cost of their product with the long-term operations costs of owning the product.

After spending over three years and over 1,500 hours of research time with the firm and its key stakeholders, and importantly building long-term trust and political capital, when the same data sources were sampled again for longitudinal validity checks, the data was found to be significantly different. This time, in a high-trust, apolitical environment, the same customer informant indicated that although company policy was as he had initially indicated, he was not at liberty to share "the truth" of how he really made decisions, which were ultimately based on lowest initial acquisition costs. This "truth" would lead the firm to precisely the exact opposite product strategy (in fact to that of its competitor) which focused on maximizing productivity so that initial price could be minimized, even at the expense of lower product capabilities and life-cycle costs.

What had changed in this dramatic turn-around in the quality of the data? It appears that the quality of the relationships with the data sources matter significantly. As will be discussed later in Essay#1, there may be a fundamental systemic characteristic of the architecture of the enterprises under study (including the academic community) that encourage short-term, arms length commodity treatment of data sources to make decisions.

Another one of dozens of potential examples is shown below in Figure 137 regarding the supplier stakeholder group.

Figure 137: Data from the Supplier stakeholder with and without "political controls"

2.7 Data Analysis Methods and Techniques

Having discussed the techniques for data collection, this section briefly summarizes the techniques for the analysis of the data. That is, the process in taking written data and transforming it into numerical data suitable for numerical simulation.

"Since 'linking' is at the heart of system dynamics, grounded theory speaks to the same goal of drawing relationships among factors in a targeted system."⁴⁶⁴

Two primary methods (and associated techniques) for analyzing data are briefly discussed: grounded theory and simulation modeling. While these have occasionally been seen as complementary (Burchill and Fine, 1997; Perlow, Okhuysen and Repenning, 2002; Luna-Reyes and Andersen, 2003; Laws and McLeod, 2004), it is the purpose of this section – and in fact this research design – to integrate them into a unified method contributing in a coherent way to the broader research design.

"We used a combination of ethnography and causal loop diagrams. The resulting model is both tightly grounded in our data and provides a logical and internally consistent explanation of how the micro-level interactions involved in decision making combined to create the more macro-level changes we observed. The utility of our approach lies not in the direct transferability of our findings, but in the ability to produce grounded theory that could not be identified with a broader-brush data-collection method. Further, by using causal loop diagrams to specify our emerging theory, we have made it easier for scholars to mathematically formalize and empirically test our results."⁴⁶⁵

2.7.1 Qualitative Analysis Methods

The primary two broadly qualitative analysis methods used for data analysis were: grounded theory and linguistic analysis. Each will be discussed in turn.

2.7.1.1 Grounded Theory

Grounded theory consists not only of a set of techniques to identify major concepts across texts, but more importantly it links the concepts together to generate meaningful theories.

The "texts" used in this research range from first-hand interview transcripts, to second-hand magazine interviews and letters to shareholders. Through the process of "memoing", the concepts and categories that arise through textual analysis are likely to become the stocks and flows of the system dynamics model, described in the next section.

For this research thus far, memos were composed each night summarizing the emerging themes of the day's interview, meetings and discussions. Approximately two hours of off-site work was spent coding and analyzing the field data for every one of the approximately 500 hours of facilitated action-learning / group model building exercises.

⁴⁶⁴ Luna-Reyes and Andersen (2003), pp. 284-285.

⁴⁶⁵ Perlow, Okhuysen and Repenning (2002), pg. 932 and 934.

Based on this information, a conceptual model was built by inferring hypotheses from the field data about causal structural relationships that led to observed patterns of behavior.

"Accurate description and verification are not so crucial when one's purpose is to generate theory. This is especially true because evidence and testing never destroy a theory (of any generality), they only modify it. A theory's only replacement is a better theory."⁴⁶⁶

2.7.1.2 *Linguistic* Theory

"The linguistic turn in the social sciences prompted calls for more complex understandings of organizations that would emphasize language not only as enabling information exchange but also as constructing social and organizational reality (Dandridge, Mitroff & Joyce, 1980; Pondy & Mitroff, 1979). This linguistic approach has led to increased interest by organization theorists in such issues as the intimate relationship between language and organization (Daft & Wiginton, 1979)."⁴⁶⁷

Linguistic analysis has taken an increasing role in the analysis of organizations (Heracleous and Barrett (2001). Multiple methods have emerged which capture the richness of organizational exchange (Suddaby and Greenwood, 2005). This research focuses on using two such accepted approaches: *discourse* analysis and *textual* analysis.

"Semiotics (Barley, 1983), hermeneutics (Philips and Brown, 1993), and discursive (Kilduff, 1993) and narrative analyses (Boje, 1995) have each been introduced as a method for understanding organizational phenomena."⁴⁶⁸

At the core of the theory presented herein, is an organizational (or relational) construct, namely, are enterprise architectures modular or integral. In order to observe this empirically, the chances for success in arriving at a truth (to the extent that such a quest is epistemologically possible) is to observe such relational quantities as "trust" and "patience." This is not a trivial activity. Can one observe these quantities, and if so, how can one communicate these observations as "truths".

"There is a tradition in the analysis of social life that treats the social world as an independently perceivable phenomenon, something that observers delineate, describe, and make coherent. Observation and the observer stand removed. Recent trends in social philosophy challenge this subject-object distinction, viewing as isomorphic the seer and the seen, the knower and the known (Ryan, 1970). The correspondence theory of thuth is rejected, for within a phenomenological perspective, there is no single 'correct' reading of the 'external world.' The problem of qualitative analysis based on fieldwork is that of avoiding solipsism on the one hand and avoiding positivism on the other. One approach to this problem is to make language the locus of analysis and not to confuse the language system used to 'explain' or formulate the world with the objects of study."⁴⁶⁹

2.7.1.2.1 Discourse Analysis

"The concept of 'deep structures' is essential to a fuller understanding of social and natural systems at all levels of analysis (Gersick, 1991; Light, 1979). Deep structures can be defined as relatively

⁴⁶⁶ Glaser, B.G. and Strauss, A.L. (1967), pg. 28.

⁴⁶⁷ Heracleous and Barrett (2001), pg. 755.

⁴⁶⁸ Suddaby and Greenwood (2005), pg. 39.

⁴⁶⁹ Manning (1979), pg. 660.

stable, largely implicit, and continually recurring processes and patterns that underlie and guide surface, observable events and actions. Accounts of deep structure vary indifferent theoretical domains. In the domain of discourse, we hae approached deep structure as persistent features of discourse that transcend individual texts, speakers, authors, situational contexts, and communicative action as a whole and over the long term."⁴⁷⁰

This research seek to reveal the underlying "deep structures" within the discourse of competing enterprise architectures.

2.7.1.2.1.1 *Rhetorical* Analysis

Within the analysis of deep structures in discourse between stakeholders within an enterprise architecture, this research focuses on a particular type of discourse, that of rhetoric, which focuses on political or interest-laden discourse between stakeholders. A table with the chronological listing of the inter-stakeholder discourse (for primary and secondary firms in the theoretical sample) is given in Appendix I.

"Rhetoric, or the art of persuasion, has a long history in the humanities (Richards, 1936; Burke, 1969, Aristotle, 1991) and, at one time, supersceded logic as a mode of assessing truth (Zald, 1993)... Rhetorical analysis shares this interest in the role of language in structuring social action but is distinguished by a very specific focus on suasion and influence. In this context, rhetoric forms a subset of discourse analysis... Rhetoric restricts its focus to explicitly political or interest-laden discourse and seeks to identify genres or recurrent patterns of interests, goals, and shared assumptions that become embedded in persuasive texts (Freedman and Medway)."⁴⁷¹

2.7.1.2.2 *Textual* Analysis

Although much of the linguistic analysis in this research captures stakeholder discourse broadly, it focuses also on capturing language used in texts in more formal texts, like annual reports to shareholders.

⁴⁷⁰ Heracleous and Barrett (2001), pg. 758.

⁴⁷¹ Suddaby and Greenwood (2005), pp. 39-40.

2.7.2 Quantitative Analysis Methods

2.7.2.1 Simulation Modeling

"Grounded theory approaches are used to develop variables which have significant explanatory power and are intimately tied to the data. The cause and effect relationships among these variables are then shown using causal-loop diagramming techniques from the field of system dynamics."⁴⁷²

Having transformed the empirical case data into concepts and categories via memoing, the concepts and categories are then assembled into a causal model with multiple feedback relationships in a method recently described as *Inductive System Diagrams* (Burchill and Fine, 1997).

"The Inductive System Diagram method builds on the strengths of accepted coding practices for variable development and causal-loop diagramming for variable integration."⁴⁷³

This causal model is then transformed into a nonlinear dynamic simulation model via the identification of state variables (stocks or levels) and decision heuristics (flows or rates) which change the states of the system. This method is known as system dynamics (Forrester, 1961, Sterman, 2000).

"Unlike many formal models in the social science literature, ours was not deduced from general principles but, using the methods of grounded theory, was induced from a range of domains. While commonly used to build theory from raw data using qualitative analysis, the grounded theory approach is not limited to this activity. Strauss and Corbin (1994) advocated the development of formal (or general) theories grounded in previously generated domain-specific (what they call substantive) analyses. They remind the reader that Glaser and Strauss (1967) not only urged the use of grounded theory in conjunction with quantitative analysis but also recommended its use to generate theory from theory."⁴⁷⁴

2.7.2.2 Philosophical Stance on Modeling Complex Enterprises

"Chaos theory provides a useful theoretical framework for understanding the dynamic evolution of industries and the complex interactions among industry actors... which exhibit both unpredictability and underlying order."⁴⁷⁵

When modeling complex socio-technical enterprises, this research takes the epistemological view that the range of behavior in question can be best understood via nonlinear dynamic deterministic methods (including, but not limited to chaos theory).

"All nonlinear feedback systems, including human organizations, can be expressed in terms of lawful rules and relationships: that is, such systems are deterministic in the same fundamental sense as Newton's laws or the laws of supply and demand in neoclassical economic theory."⁴⁷⁶

⁴⁷² Burchill and Fine (1997), pg. 469.

⁴⁷³ Burchill and Fine (1997), pg. 476.

⁴⁷⁴ Rudolph, J.W. and Repenning, N.P. (2002), pg. 3.

⁴⁷⁵ Levy, D. (1994), pg. 167.

While Beer (1959) classified the firm or the economy as an "exceedingly complex, probabilistic system", this research takes its philosophical queue from one of Beer's contemporaries in feedback thinking, Forrester (1961) who believed that firms and economies could be modeled as "exceedingly complex, deterministic systems", a space that Beer deemed pointless.⁴⁷⁷

"Patterns of... the evolution of industries can be depicted but there is novelty in each... industry."⁴⁷⁸

System dynamics does not model in order to predict, but in order to understand the underlying structure driving dynamic behavior. It is a pattern-modeling process.⁴⁷⁹

2.7.2.3 Modeling Epistemology

A note of clarification is warranted regarding the use of simulation methods to simulate nonlinear dynamic structure-behavior relationships. As the problem being posed in this research contains high degrees of dynamic complexity⁴⁸⁰, conventional methods of *positivist* science are challenged. A different epistemology is necessary - one rooted in *generative* science is better suited.⁴⁸¹ As Sterman (2000) points out, this is not without its caveats:

"Engineers and econometricians have long struggled with the problem of **uniquely identifying** the **structure and parameters** of a system from its **observed behavior**. In practice the data are too scarce and the plausible alternative specifications are too numerous for statistical methods to discriminate among competing theories."⁴⁸²

The structure and parameters may be *sufficient* to describe the observed dynamics, but may not *necessarily* be the right structure and parameters.

2.7.2.4 Developing Causal Structures form Empirical Data

"Interview data is rich, including descriptions of decision processes, internal politics, attributions about the motives and characters of others, and theories to explain events." 483

Sterman (2000, pg. 141) notes the importance of ensuring that correlative relationships are not mistaken for causal structures. In addition, Sterman (2000, pg. 157) also notes that the ability of gathering rich contextual data is important in developing system dynamics models. Therefore survey data tends not to be as effective as semi-structured interviews.

"The modeler must **triangulate** by using as many sources of data as possible to gain insight into the structure of the problem situation and the decision processes of the actors in it... People have only a

⁴⁷⁶ Stacey, R.D. (1995), pg. 481.

⁴⁷⁸ Atkinson, G. (2004), pg, 282.

⁴⁷⁹ Radzicki, M. (2003), pg. 151.

⁴⁸⁰ Senge, P. (1990), pp. 71-72.

⁴⁸¹ Epstein, J.M. (1999).

⁴⁸² Sterman, J.D. (2000), pp. 26.

⁴⁸³ Sterman, J.D. (2000), pg. 157.

local, partial understanding of the system, so you must interview all relevant actors, at multiple levels, including those outside the organization (customers, suppliers, etc.)"⁴⁸⁴

Finally, Sterman (2000, pg. 157) notes that interviewees have the potential to share much less as well as much more than they really know, making the development of internally consistent causal structures extremely difficult requiring both scientific rigor as well as artful skill.

2.7.2.5 Model Complexity

Regarding model complexity, Repenning (2003) notes that there are two interdependent considerations: the state of the existing theory, and the modeler's ability to develop their audience's intuition for how the model's structure drives its behavior.

"For areas of inquiry where there have been few attempts to understand dynamics in a systematic fashion, simple models are needed, not because the phenomenon is simple, but because there is little on which to build."⁴⁸⁵

In the field of strategic management, while many calls have been to understand the dynamics, relatively little has been done. Therefore, simple models utilizing "generic structures" (Senge, 1990) are expected to be the most effective, and will therefore be the focus of this research plan. Such simple models can be rigorous provided that the underlying assumptions for the relatively few variables used are justified using field data.

"In almost every field of science, a tension has existed constantly between the experimentalists and the theorists. Certainly some of the difficulties between the two groups stem from basic misunderstanding on both sides, of the **nature and function of mathematical models**. Models are too often considered simply as predictors, and any inability to predict accurately is accepted as prima facie evidence of the uselessness of the technique. Actually, only those engineering models designed to fit a particular set of circumstances are even moderately successful as predictors. The more general models of theoretical biology are used to **deduce the form of the possible solutions, rather than to predict future states** of the system being modeled."⁴⁸⁶

2.7.2.6 Proposed System Dynamics Modeling within Framework

Having defined the conceptual properties of the archetype enterprise architectures in Essay #1, it is envisaged that high-level system dynamics models would be built or adapted for each of the remaining two essays in order to capture different dynamics aspects behavior implicit in the framework.

As shown in Figure 138 below, Essay #2 would focus on the medium-term competitive dynamics between two firms in a "mixed" duopoly setting where each firm had diametrically-opposed objective functions, enterprise architectural forms, structural dynamic strategies. In this model, the architectures are assumed to remain constant throughout the simulation i.e. while there may be evolution in the market environment, there will be no "disintegration" and exit of incumbents or re-integration and appearance of new entrants. It is envisaged that the model

⁴⁸⁴ Sterman, J.D. (2000), pg. 157.

⁴⁸⁵ Repenning, N. (2003), pg. 314.

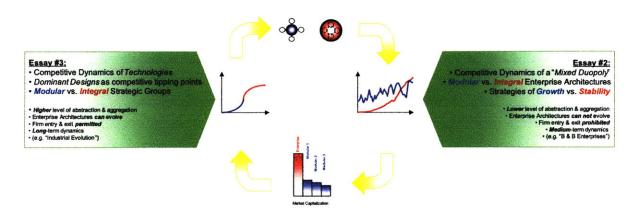

⁴⁸⁶ Wangersky, P.J. (1978), pg. 189.

would take on a simplified version of existing market growth and competition models in the system dynamics literature (Sterman, J.D. 1991; Paich, M. and Sterman, J.D. 1993; Sterman, J.D., Henderson, R. Beinhocker, E.D. and Newman, L.I. 1995; Langley, P., Paich, M. and Sterman, J.D., 1998).⁴⁸⁷

"As a maturing industry adjusts to slower growth... companies' orientations towards adding capacity and personnel must fundamentally shift...these shifts in perspective rarely occur in maturing industries."⁴⁸⁸

Finally, Essay #3 would focus on the higher-level, more abstract, long-term competitive dynamics in a market in which firms can enter and exit. Here competition occurs primarily between competing technologies serving a mass market, as individual competitor firms are aggregated. In this model, dominant designs form tipping points between archetypal strategic groups. "Mixed" duopoly therefore occurs at an aggregated "strategic group" level. The enterprise architectures are permitted to "evolve" throughout the simulation i.e. there could be "disintegration" and exit of incumbents or re-integration and appearance of new entrants. It is envisaged that the model would take on a simplified version of existing industrial evolution models in the system dynamics literature (Weil and Utterback, 2005; Sterman, J.D., Henderson, R. Beinhocker, E.D. and Newman, L.I. 2005).

⁴⁸⁹ Note it is possible that a high-level conceptual model synthesizing the models in Essays #2 and #3 could be added to Chapter 7.

⁴⁸⁷ These system dynamics models are all centered around the core "B&B Enterprises" model of Mark Paich's MIT PhD.

⁴⁸⁸ Porter, M.E. (1980), pg. 239.

2.8 Research Dissertation Critique

"Your doctoral proposal is rather **ambitious** – it is what a senior tenured faculty member would propose at the end of a long and distinguished career."⁴⁹⁰

"This is just a doctoral dissertation. It's not like you are Charles Darwin, trying to develop a theory of evolution...," "491

This work aims to develop a theory of evolution - not of organisms, but of organizations – which although ambitious, will inevitably fall short of the classic work of Charles Darwin. Like Darwin's field research while aboard the *HMS Beagle* from 1831-1836, this research involved intensive longitudinal field work, documenting, analyzing and theorizing about a variety of species in their natural habitats.

"'It is simplistic in its obsession with a few types, it's dogmatic in style, and it contains not one shred of empirical evidence. Reputable academics will hate it.""⁴⁹²

The following briefly summarizes some of the major perceived strengths and weakness of the research design which are evaluated against the perceived norms established within the academic fields that the research aims to impact, namely strategic management and engineering systems.

2.8.1 Research Tradeoffs

As this dissertation aims to build theory, it will inevitably come up against the "postulate of commensurate complexity" (Thorngate, 1976), which asserts that social theories cannot simultaneously maximize the goals of generalizability (external validity), accuracy (internal validity) and simplicity.

"As noted by Weick (1979), the research process involves the **inevitable tradeoffs** among generalizability, accuracy and simplicity."⁴⁹³

It is clear that by design, the theory generated by this dissertation will differ from the norm of most research in the strategic management literature. If well executed, the theory is likely to be above the norm on *accuracy*, near the norm on *simplicity* (relative to the level of complexity of problem addressed), and below the norm on *generalizability*.

By way of an example of one such tradeoff, due to the high level of detail and effort expended on the study of two firms (a duopoly) in one industry, the gains in accuracy come at the inevitable cost of generalizability and potentially parsimony.

⁴⁹⁰ Comment on research from a senior Professor at a renowned university (2004).

⁴⁹¹ Comment on research from a senior Professor at a renowned university (2007).

⁴⁹² Miller, D. (1996), pg. 505. Quotation is feedback that Miller received from an SMJ reviewer on his paper on 'configurations'. Note that ten years later, Miller writes: "It was therefore a wonderful surprise to win the 1995 Strategic Management Society SMS Award for my article."

⁴⁹³ Dess, G.G., Newport, S. and Rasheed, A.M.A. (1993).

"Given growing interest in the evolution of organizational communities, some scholars have also deployed a multi-population census, which tracks a number of interdependent populations simultaneously. **Resource limitations** may require **limited temporal coverage** and **less precise** measurement of vital events (Ruef, 2000)."⁴⁹⁴

2.8.1.1 Accuracy (internal validity)

Merriam (1998, pp. 204-205) notes that internal validity can be strengthened by a number of strategies that have been incorporated in this research design: triangulation in time, space and organizational level (Denzin, 1970); long term observation of the same phenomenon, continuously and at discrete intervals; peer examination in which comment on findings is solicited among both academic and practitioner groups; and participative or collaborative modes of research in all phases of the research design.

These and other strategies are employed to ensure that the theory built by this research is empirically grounded in the data, which has been studied intensely through multiple lenses over considerable spatial and temporal variables. To this end, the accuracy is anticipated to be relatively high and therefore above the norm.

2.8.1.2 Generalizability (external validity)

"No useful theory can rest on the assumption that everything is unique. It is probably inevitable that the early history of a scientific endeavor will be characterized by the opposite assumption, and by the search for universals. I believe it is a sign of relative maturity when a field begins to focus on patterned variations."⁴⁹⁵

This proposed research, like that of contingency theory, acknowledges partial uniqueness in theory development. It recognizes the relative maturity of the strategic management field and therefore seeks "patterned variations" and not fully generalizable universals.

The fact that a theoretical sample of multiple case studies were used across a variety of industry and geographic settings, establishes some initial degree of external validity. This is however far from the traditional statistical sample approaches to the positivist branches of both the strategic management and engineering systems fields. As such, it is likely that external validity would be deemed below the norm – a consequence of the high internal validity tradeoff.

Recall also, that this research does not make claims for grand theory, and aims only for the contingent modes of explanation that can be expected when building theory on complex socio-technical systems.

2.8.1.3 Simplicity (parsimony)

"Construction of a simulation model involves a **tension between simplicity and elaboration**. We we give talks on our simulations, a frequent (perhaps the most frequent) question we get is 'Why don't you

⁴⁹⁴ Aldrich and Ruef (2006), pg. 268.

⁴⁹⁵ Thompson, J.D. (1967), pg. xxv.

add variable X to the model?' For theory development purposes, the objective is to construct a model based on a simplified abstraction of a system – guided by the purpose of the simulation study – that retains the key elements of the relevant processes without unduly complicating the model (Burton & Obel, 1995)."⁴⁹⁶

Finally, although this research aims to cover multiple variables, across multiple strategy domains, covering the inputs of multiple levels of multiple stakeholders in the quest for building *configuration* research in strategic management, the resulting theory is potentially very simple at the highest level of abstraction – which is the level at which this research intends to be evaluated.

Of course, more internal validity is gained by using the lower levels of abstraction into the mechanics of architectural properties, structural dynamics, financial valuation and industrial evolution as this research strives to do, which necessarily makes the work far from parsimonious. As such, it is likely that the simplicity would be at or near the norm on aggregate.

"Artful simplification is the hallmark of skillful modeling." "497

2.8.2 Research Strengths and Limitations

Due to the nature of this research design, which uses case-based theoretical sampling, the resulting theory, although potentially rich in accuracy and ecological validity, is bound to be limited both in its generalizability and the confidence in its causality (Hammersley, 1990).

2.8.2.1 Accuracy (internal validity)

Due to the robustness of the research design, particularly with respect to the longitudinal primary case study, the constructs and propositions generated are likely to have relatively high internal validity.

Determination of causality in complex systems is by definition, problematic, particularly if some of the main "input" causal variables are difficult to observe and measure directly (e.g. enterprise goals, boundaries, interfaces). The "output" variables (e.g. enterprise production output) tend to be easier to observe and measure. Simulation modeling is used therefore to lend indirect support to claims of difficult to measure and specify variables.

"Even if some variables in the computational model cannot be easily observed, the output variables often can be. Empirical confirmation of a simulation's predictions provides indirect support for the theory embodied in the model of the underlying (unobserved) processes." ⁴⁹⁸

⁴⁹⁶ Harrison, J.R., Lin, Z., Carroll, G.R., and Carley, K.M. (2007), pg. 1238.

⁴⁹⁷ Nelson and Winter (1982), pg. 402.

⁴⁹⁸ Harrison, J.R., Lin, Z., Carroll, G.R., and Carley, K.M. (2007), pg. 1238.

2.8.2.2 Generalizability (external validity)

"One strength of building theory from cases is its likelihood of generating **novel theory**... [a weakness is that it] may result in narrow and **idiosyncratic theory**. Such theories are likely to be testable, novel and empirically valid, but they do lack sweep...they are essentially theories about specific phenomena. "499

While the creation of a theoretical sample, which consists of *single industry studies* does avoid the problems inherent in much strategic management research of controlling or industry effects, it does suffer from generalizability of the results (Dess et al., 1990).

"Generalizability is based on the **uniqueness of the industry's environment**...clearly the more unique the environment, the less generalizable the results."⁵⁰⁰

The theoretical sample selected was a *collection* of single industry studies, designed to extend the generalizability of the theory. However, it is important to characterize the uniqueness common to of all the industries studied, which share among other traits relatively high industry concentration, entry/exit barriers, and some degree of product and service differentiation – the imperfect competition of oligopolies.

As the research was not designed to cover the cases of perfect competition for commodities, but to focus on firms in oligopolies where firm conduct is more relevant, the resulting theory is not expected to extend to such a general class of firms.⁵⁰¹

2.8.2.3 Simplicity (parsimony)

"A surprising challenge can arise from readers who are disappointed by parsimonious theory. Single cases can enable the creation of more complicated theories than multiple cases, because single-case researchers can fit their theory exactly to the many details of a particular case. In contrast, multiple-case researchers retain only the relationships that are replicated across most or all of the cases. Since there are typically fewer of these relationships than there are details in a richly observed single case, the resulting theory is often more parsimonious (and also more robust and generalizable)."⁵⁰²

The use of multiple-cases (i.e. the primary and secondary cases) in this research allowed for a more parsimonious (as well as more generalizable) theory to emerge than would have been generated from only one case, due to the removal of "degrees of freedom" inherent in theorizing across phenomena.

⁴⁹⁹ Eisenhardt, K. (1989), pp. 546-547.

⁵⁰⁰ Dess, G.G., Ireland, R.D. and Hitt, M.A. (1990), pg. 13.

⁵⁰¹ An independent survey-based sample of critiques of this research is summarized in Appendix J. It is the result of teaching the material to senior executives in the *Wharton-Oxford Gateway to Strategic Leadership* program from 2005-2006.

⁵⁰² Eisenhardt, K.M, and Graebner, M.E., (2007), pg. 30.

2.8.3 Towards "Good" Theory

"We suggest that if the field is serious about producing stronger theory, journals need to reconsider their empirical requirements. We argue that journals ought to be more receptive to papers that test part rather than all of a theory and use illustrative rather than definitive data."⁵⁰³

The goal of this research of developing grounded theory is hoped to be evaluated against criteria as established by writers and evaluators of theory in organizational theory (Sutton and Staw, 1995; Weick, 1995).

"People's natural inclination is to require greater proof of a **new or provocative idea** than one they already believe to be true. Therefore, if a theory is particularly interesting, the **standards** used to evaluate how well it is tested or grounded need to be **relaxed**, **not strengthened**. We need to recognize that major contributions can be made when **data are more illustrative than definitive**."⁵⁰⁴

"Not everything discussed in the introduction of a manuscript need be operationalized in the method section nor show up in a set of regression equations. If theory building is a valid goal, then journals should be willing to publish papers that really are stronger in theory than method. Authors should be rewarded rather than punished for developing strong conceptual arguments that dig deeper and extend more broadly than the data will justify."⁵⁰⁵

"We have even counseled our graduate students to leave out portions of their theory that are not measured well and to delete otherwise interesting data that did not directly relate to their theoretical argument. The result of these omissions is that the craft of manuscript writing becomes an art of fitting concepts and arguments around what has been measured and discovered."⁵⁰⁶

"Consider whether the evidence provided by people such as **Freud**, **Marx**, or **Darwin** would meet the empirical standards of the top journals in organizational research. When theories are particularly interesting or important, there should be greater leeway in terms of empirical support. A small set of interviews, a demonstration experiment, a pilot survey, a bit of archival data may be all that is needed to show why a particular process **might be true**."⁵⁰⁷

⁵⁰³ Sutton, R.I. and Staw, B.M. (1995), pg. 371.

⁵⁰⁴ Sutton, R.I. and Staw, B.M. (1995), pg. 382.

⁵⁰⁵ Sutton, R.I. and Staw, B.M. (1995), pg. 382.

⁵⁰⁶ Sutton, R.I. and Staw, B.M. (1995), pg. 381.

⁵⁰⁷ Sutton, R.I. and Staw, B.M. (1995), pg. 383.

2.8.4 Future Research

"We need perhaps contingent theories of explanation...we would not expect a single unified theory to emerge from such efforts, because such a unified explanation is clearly a long way off, even if it is a desirable goal, but we would expect that it would produce fruitful and novel generalizations."⁵⁰⁸

Therefore, in the quest to discover the deep underlying foundational nature of long-term firm competitive performance and the evolutionary systemic interactions between the firm's capabilities and its environment, this research will necessarily be bounded by contingent theories of explanation, however novel and fruitful they may aim to be.

"Perhaps 'grand' theory requires **multiple case studies** – an accumulation of both theory-building and theory-testing empirical studies."⁵⁰⁹

In order to more deeply validate and extend the generalizability of the mid-range theory developed by this research plan, another concurrent doctoral research plan has been proposed (and is being undertaken by the author) which is grounded in more traditional, deductive, correlative, statistically quantitative, hypothesis-based, theory-testing methods.

⁵⁰⁸ Henderson R. and Mitchell W., (1997).

Part II: THEORETICAL CONSTRUCTS & PROPOSITIONS

Chapter 3 Firm Performance

We begin decomposing the theory, by examining what we are trying to explain: superior long term firm performance.

3.1 Shareholders vs. Stakeholders: The Counterintuitive Puzzle

"How do firms that have a stakeholder approach differ in competitiveness, commitment, and strategic flexibility from firms that maximize stockholder wealth?"⁵¹⁰

The primary purpose of this investigation is to explore the sources of firm competitive advantage and specifically on the relatively narrow metric of maximization of shareholder value.

3.1.1 Market Value

As shown in Figure 139 below, the market capitalization of two "world-class" firms, one representing manufacturing (*Toyota Motors*) and one representing services (*Southwest Airlines*) greatly exceeds that of the sum of their major competitors. And yet as will be argued in chapter 4, this is a not metric which they are trying to maximize, while ironically it is the prime goal of their competitors.

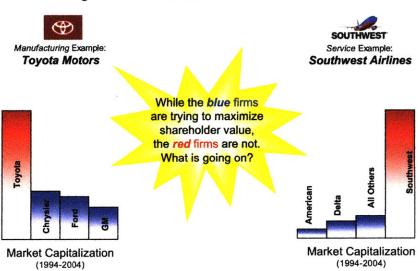

Figure 139: Dominant Firm Performance

Instead of illustrating the shareholder value performance as a static or averaged snapshot as shown above, we will explore most dependent and independent variables in this research as longitudinal time histories. Figure 140 illustrates the trajectories of market capitalization for the incumbent-challenger pairs in the global automotive industry: *General Motors & Toyota Motors*.

⁵¹⁰ Rugman, A. M. and Verbeke A. (2002).

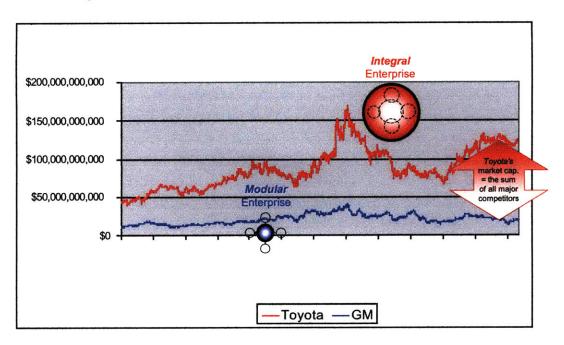

Figure 140: GM vs. Toyota Market Capitalization Trajectories

Similarly, Figure 141 illustrates the trajectories of market capitalization for the incumbentchallenger pairs in the US airline industry: *United Airlines* and *Southwest Airlines*.

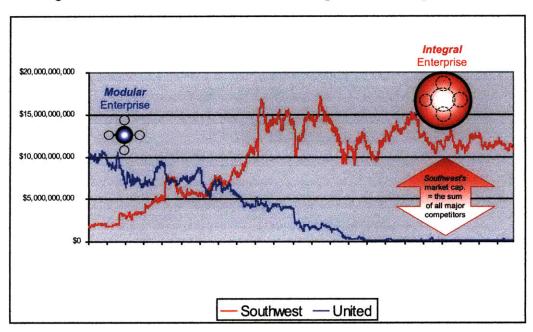

Figure 141: United vs. Southwest Market Capitalization Trajectories

3.1.2 Market Value Decomposition: The Income Statement

One of the determinants of stock market value is the firm's past performance, as is evidenced by the residual cash flows which are deconstructed on the firm's income statement: i.e. its *top-line* revenues, its *bottom-line* net income or profits and the hypothesized *enabling system properties* which feedback to transform top-line revenue growth into bottom-line profit growth and then back into top-line revenue growth again.

This dissertation will therefore review the performance of dominant incumbent "market-makers" (growth *and* productivity) as being top-line driven, and the challenger "market-takers" (growth *through* productivity) as being bottom-line driven as shown in Figure 142 below. In the following subsections, we will examine evidence of each type of enterprise architecture as revealed on the income statements.

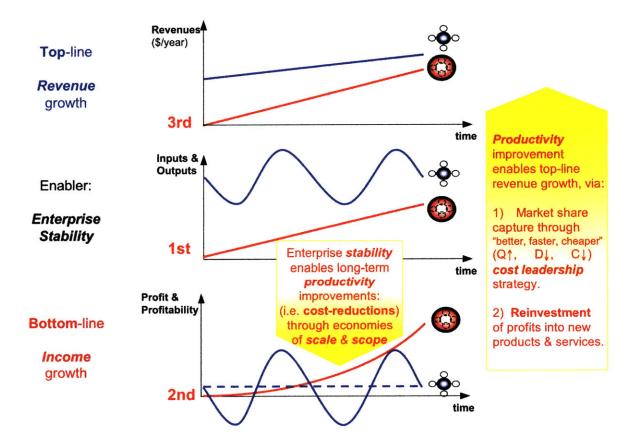

Figure 142: Architectural Imprint on the Income Statement

3.1.2.1 Top-line Revenues

"The goal GE has set for sustained organic growth – two to three times the growth of global GDP – translates to about 8% today. Few companies have achieved the kind of growth GE is seeking, and none on a revenue base of \$150 billion."⁵¹¹

3.1.2.1.1 Auto Industry

25-year time histories of revenues for major competitors in the automobile industry are shown in Figure 143 below.

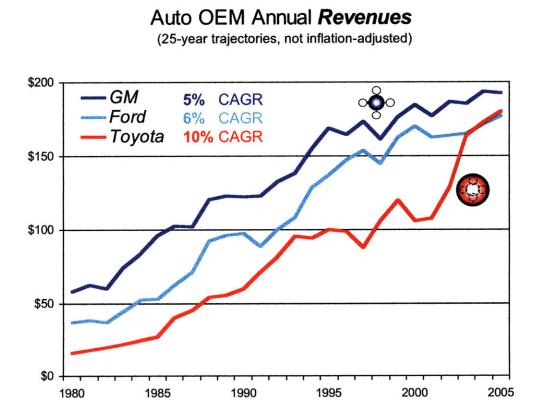

Figure 143: Top-line Revenues: Auto Industry

As can be seen, the late entrant *Toyota* has grown its top-line revenues at compound annual growth rates that are approximately twice their major competitors, GM and Ford.⁵¹² While their output has grown, they have achieved this by more than just volume, but on generating premium prices, especially in the last decade or so. From this evidence, *Toyota* may be a company that *GE* wishes to learn from if they want 8% organic growth on a revenue base of \$150 billion.

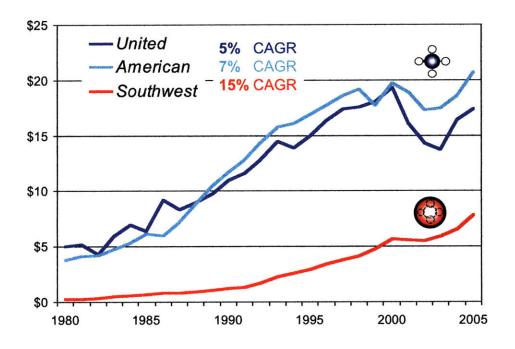

⁵¹¹ Stewart, T.A. and Immelt, J. (2006), pg. 62.

⁵¹² Note that Japan's "lost decade" (1992-2002) adversely affected *Toyota's* revenue growth as domestic sales were still significant.

3.1.2.1.2 Airline Industry

25-year time histories of revenues for major competitors in the U.S. Airline Industry are shown in Figure 144 below.

Figure 144: Top-line Revenues: Airline Industry

Airline Annual Revenues

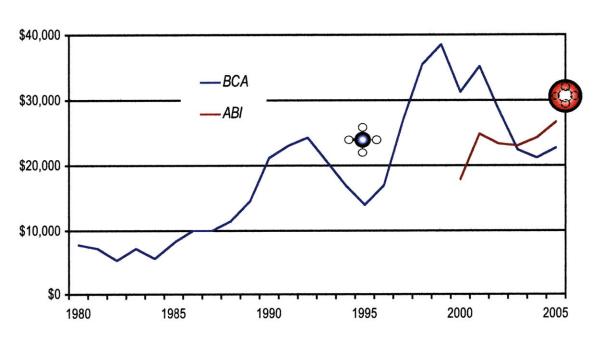

(25-year trajectories, not inflation-adjusted)

As can be seen, the late entrant *Southwest* has grown its top-line revenues at compound annual growth rates that are approximately twice their major competitors, *United* and *American*. It is interesting to note the relative stability of revenue growth of *Southwest*, especially under extreme exogenous events like 9-11, which affected all three carriers.

3.1.2.1.3 Airplane Industry

25-year time histories of revenues for major competitors in the Large Commercial Airplane Industry are shown in Figure 145 below.⁵¹³

Figure 145: Top-line Revenues: Airplane Industry

Commercial Airplane OEM Annual Revenues (25-year trajectories, not initiation-adjusted)

More refined data reveal that *Airbus's* revenue growth (which broadly tracks its market share growth) has outpaced *Boeing's* by a factor of two.

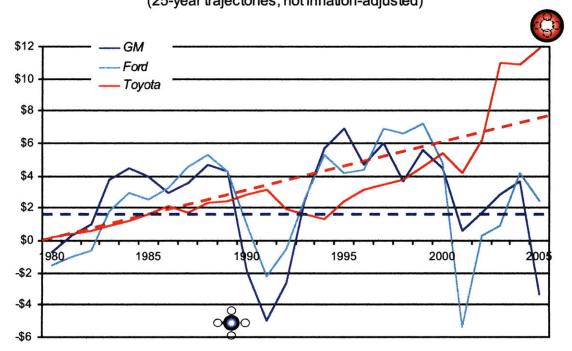

⁵¹³ Note that the data for *Airbus* are scarce because it has only existed as (a subsidiary of) a publically listed company, *EADS* since 2000.

3.1.2.2 Bottom-line Profits

3.1.2.2.1 Auto Industry

25-year time histories of profit for major competitors in the automobile industry are shown in Figure 146 below.

Figure 146: Bottom-line Profits: Auto Industry

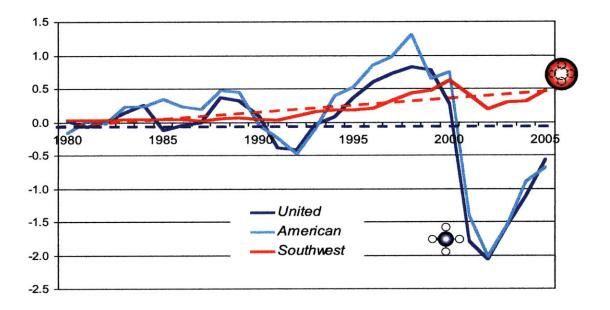

Auto OEM Net Income (25-year trajectories, not inflation-adjusted)

Note that while GM and Ford's profits appear to oscillate, Toyota's profits are more stable. Also note that the trajectory of GM and Ford's profits remain flat with no growth, while Toyota's trajectory is one of clear growth.

3.1.2.2.2 Airline Industry

25-year time histories of profit for major competitors in the U.S. Airline Industry are shown in Figure 147 below.

Figure 147: Bottom-line Profits: Airline Industry

Airline Annual Net Income

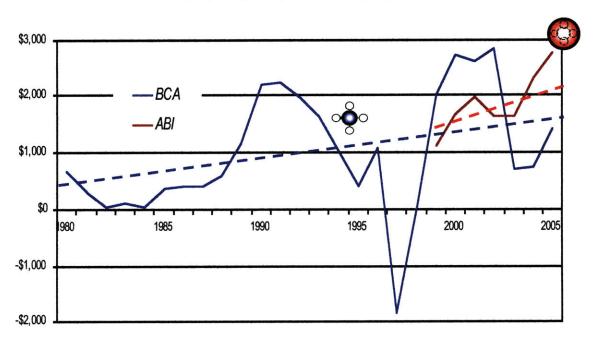

(25-year trajectories, not inflation-adjusted)

Again, note that while *United* and *American's* profits appear to oscillate, *Southwest's* profits are more stable. Also note that the trajectory of *United* and *American's* profits remain flat with no growth, while *Southwest's* trajectory is one of clear growth.

3.1.2.2.3 Airplane Industry

25-year time histories of profit for major competitors in the Large Commercial Airplane Industry are shown in Figure 148 below.

Figure 148: Bottom-line Profits: Airplane Industry

Commercial Airplane OEM Annual Operating Profit (25 year trajectories, not inflation-adjusted)

Again, although the data are limited for *Airbus*, we see a higher, less volatile, faster growing profit trajectory.

3.1.2.3 Profit-ability

In order to determine the relative profitability, one must normalize profits with respect to revenues, which results in an efficiency metric.

3.1.2.3.1 Auto Industry

25-year time histories of profitability for major competitors in the automobile industry are shown in Figure 149 below.

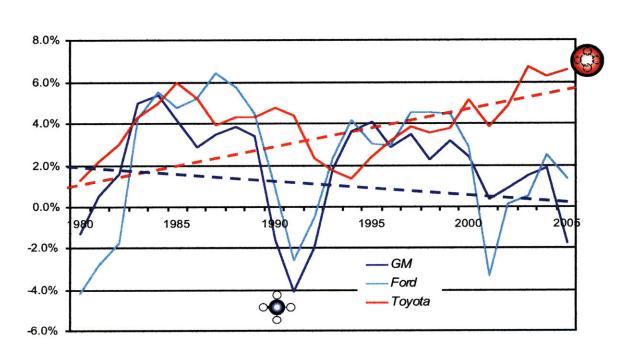

Figure 149: Profit-ability: Auto Industry

Auto OEM Annual Profit <u>ability</u> (25-year trajectories)

Here we see the trajectory of the ability of *GM* and *Ford* to translate revenues into profits actually decreasing over time. One might expect that in the not-to-distant future, these companies might need to seek bankruptcy protection, especially under an exogenous deleterious shock.

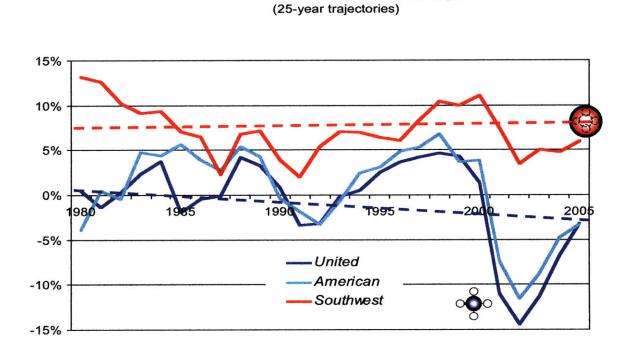

From *Toyota's* upward profitability trajectory, one might infer that they would be able to survive deleterious shocks without resort to bankruptcy.

3.1.2.3.2 Airline Industry

25-year time histories of profitability for major competitors in the U.S. Airline Industry are shown in As shown in Figure 150 below.

Figure 150: Profit-ability: Airline Industry

Airline Annual Profit ability

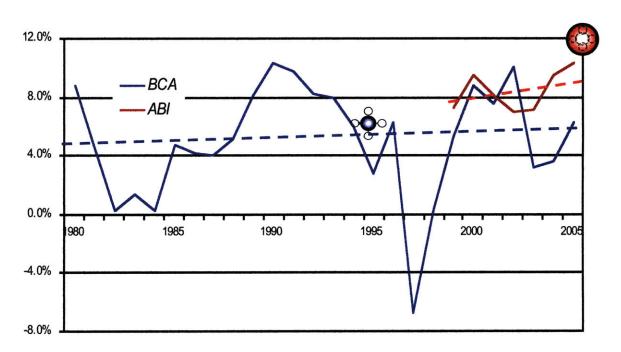

Again, we see the trajectory of the ability of *United* and *American* to translate revenues into profits actually decreasing over time. One might expect that in the not-to-distant past or future, these companies might need to seek bankruptcy protection, especially under an exogenous deleterious shock, like 9-11.

From *Southwest's* stable profitability trajectory, one might infer that they would be able to survive deleterious shocks without resort to bankruptcy.

3.1.2.3.3 Airplane Industry

25-year time histories of profitability for major competitors in the Large Commercial Airplane Industry are shown in Figure 151 below.

Figure 151: Profit-ability: Airplane Industry

Commercial Airplane OEM Annual Profit <u>ability</u> (25 year trajectory) <u>ability</u>

Again, although the data are limited for *Airbus*, we see a higher, less volatile, faster growing profitability trajectory.

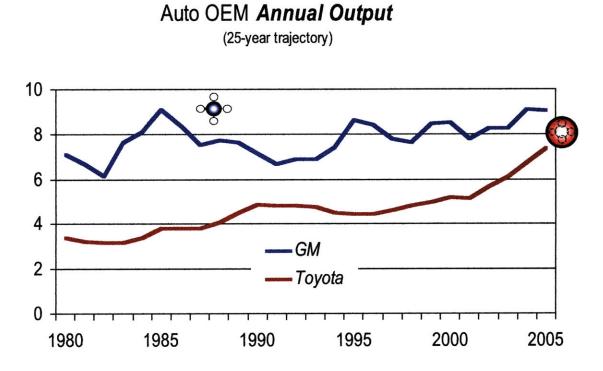

3.1.2.4 Enabling Enterprise Stability

Having presented some evidence of the financial trajectories of the firms in the theoretical sample, we now postulate what system properties might contribut to the underlying long-term superior performance. We have noted that stability might be such a system property. Although this will be discussed in more detail in Chapter 5, we briefly make some initial observations here.

3.1.2.4.1 Auto Industry

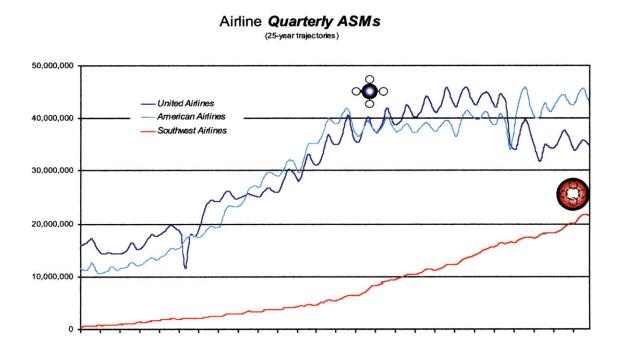

25-year time histories of output for major competitors in the automobile industry are shown in Figure 152 below.

3.1.2.4.2 Airline Industry

25-year time histories of output for major competitors in the US airline industry are shown in Figure 153 below.

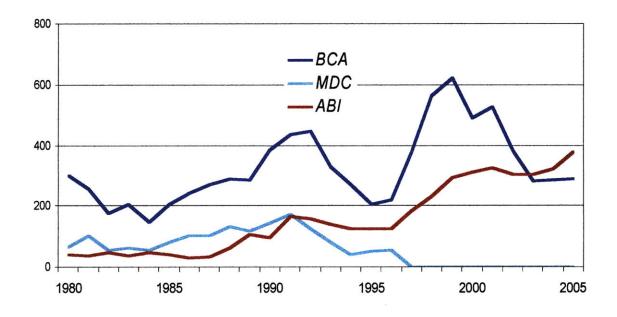

Note that from a macro-temporal perspective, *United* and *American* have plateaued, while *Southwest* contiues its near-exponential growth. On a more micro-temporal perspective, United and American appear to have a more amplified (less dampened) second order oscillation, having a period of vibration of one year, matching the seasonal cycles of air travel, while Southwest appears to dampen this response.⁵¹⁴

⁵¹⁴ Also note in an extremely micro-temporal perspective (i.e. daily) United and American have greater output variability as they serve business travelers who want to travel around 8am and 5pm, while Southwest have flights evenly spaced throughout the day, which has lower operating costs and attracts price-sensitive travelers.

3.1.2.4.3 Airplane Industry

25-year time histories of output for major competitors in the large commercial airplane industry are shown in Figure 154 below.

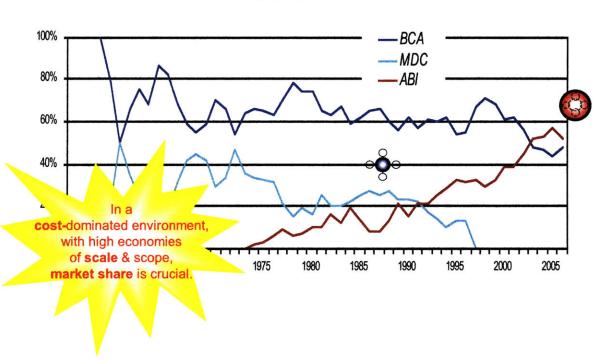

Commercial Airplane OEM Annual Deliveries (25-year trajectories)

Finally, we return to the long-term firm performance in the global large commercial airplane industry between the incumbent, *Boeing* and the challenger, *Airbus*. As *Airbus* only recently became a publicly listed incorporated firm, a long-term longitudinal comparison of its share price or market capitalization vis a vis *Boeing* is unfortunately not possible. As an initial proxy to determine an indication of the relative longitudinal performance of the two firms, we can observe market share time histories in Figure 155 below. Note we will later look at a richer matrix of financial and operational performance metrics including profitability, R&D investment, etc.

Commercial Airplane OEM % Delivery Share (50-year trajectories)

"For the past 30 years, we **didn't worry about Airbus** because we consistently held 60% market share and we thought they were just taking market share from McDonnell Douglas. Now that Douglas is gone and Airbus continues to grow, it turns out that there may be **something deeply different in Airbus**, and something inherently similar in Boeing and McDonnell Douglas."⁵¹⁵

⁵¹⁵ Boeing Senior Executive, Summer 2005.

3.1.3 Market Value Decomposition: Balanced (top- and bottom-line) Growth

Total Return to Shareholders (TRS) has been demonstrated to be correlated with concurrently high rates of both top-line revenues growth and bottom-line income growth.

Modular enterprise architectures assign a functional decomposition resulting in a clear separation and of ownership (by principals, typically shareholders) and management (their agents). This "efficiency" results in the classic principal-agent problem (Jensen and Meckling, 1976). Agency Theory posits that managers are typically interested in maximization of top-line revenues, as their pay and influence is tied to expanding the size of the firm, while investors are typically interested in maximization of bottom-line profits. Recent research has begun to support these claims (Cannella and Monroe, 1997; Gray and Cannella, 1997).

Integral enterprise architectures on the other hand assign a less clear functional separation of ownership and management, alleviating some of the problems and costs of agency. Resolution of these functional conflicts occur above at system or architectural level. Researchers have referred to this as Stewardship Theory (Donaldson and Davis, 1990).

3.2 Explanations for Firm Success

3.2.1 Popular Explanations

Toyota Motors is seen as having a "lean" production model (Womack, Jones and Roos, 1990). Porter has noted that Japanese firms do not have strategy, but have excellence in operations (Porter, 1996).

Southwest Airlines is seen as having a successful operational model. Porter extended this explanation to include an "activity network" (Porter, 1996).

Airbus Industrie is seen as "cheating" in the sense that they are not playing on a level field, largely due to the presence of government subsidies.

All these explanations tend to focus on tactical or operational issues, as opposed to some higher level strategic or architectural explanation.

3.2.2 Plausible Rival Hypotheses

"The persuasiveness of the arguments is greatly strengthened if serious attention is given to *alternative explanations* – and why these alternative are unlikely to hold. It is hard to overdo this part of the paper. The more robustness checks one can offer, the more convinced readers will become of the newly proposed mechaninsms."⁵¹⁶

The proposed framework takes a decidedly *systemic* view of explaining long-term firm performance. Typically these non-systemic explanations can be summarized under the following two mental models:

3.2.2.1 Explanations based on *Detail* Complexity

"We have the right strategy...we just need better execution."

The preponderance of senior executive reasons for inadequate firm performance lies in the explanation of poor execution of strategy, rather than on poor strategy itself or even more abstractly, architectural misfit with environmental conditions. This class of plausible rival hypothesis is embedded in the focus on increasing *efficiency*, given a fixed strategy or architecture. Such hypotheses tend to focus on "laundry list" thinking, and consist of a series of disconnected causes, which typically persist over time.

By way of example, *General Motors* – after suffering the systematic 30-year decline of market share – boldly exclaimed on the inside cover of its recent annual report:

"Here's what's new about GM's strategy this year: Nothing."517

⁵¹⁶ Sigglekow, N. (2007), pg. 23.

⁵¹⁷ From General Motors' 2003 annual report, pg. 3.

These hypotheses are difficult to disprove using traditional reductionist approaches, due to their focus on *detail* complexity. An alternative means of disproving this class of plausible rival hypotheses lies in the observation of the longitudinal persistence of the problem, which may point to deeper underlying systemic explanations, of the stylized observation: If a firm consistently and persistently is not able to execute its strategy over the long term, then maybe it has a strategy that is fundamentally not implementable, or which is simply out of synch with the demands of the environment.

A means to attempt to counter such plausible hypotheses, is to conduct longitudinal research in order to question whether poor long-term performance is in fact due to continued poor execution (in which case, one might question if an un-executable strategy is in fact a good one), or is it due to a series of disconnected deleterious exogenous events, or is something more systematic and structural happening?

3.2.2.2 Explanations based on *Dynamic* Complexity

The largest class of plausible rival hypotheses are non-systemic in space and time (i.e with narrow time horizon and local or functional explanations).

"No one could have predicted this terrible event which was obviously beyond our control."

The other class of plausible rival hypothesis is based on explanations invoking dynamic complexity (i.e. cause and effect are distant in space and time, and are outside of the firm's control). As discussed later, these are valid explanations, given a firm's enterprise architecture, but they are not robust when one relaxes this architectural constraint.

3.2.2.3 Example: International Trade Subsidies

"In high-technology industries, which typically are characterized by economies of scale and learning curve effects, subsidized challengers who are expanding will gain a reduction in net costs as a direct result of the subsidy, and a secondary efficiency gain from the increasing returns to scale as they expand output. As a result, the profit-maximizing option for the incumbents typically would appear to be to adopt an 'accommodating' or 'submissive' response." ⁵¹⁸

In order to illustrate both types of explanations, we shall turn to the example from the primary case study of the *Boeing-Airbus* global duopoly. By far, the most popular explanation for *Airbus*' recent dominance of *Boeing* is the "subsidies" that it receives from the French, German, Spanish and British governments. This will be demonstrated in the course of this research dissertation not to be incorrect, but in fact an incomplete explanation in terms of *detail* complexity as well as boundedly rational in terms of *dynamic* complexity.

As is shown in Figure 156 below⁵¹⁹, aircraft manufacturers find it difficult to "close the business case" on developing a new commercial airplane, with \$10-\$15 billion dollars in non-recurring development costs front-loaded 5-7 years before any potential future revenue stream. With even

⁵¹⁸ Brahm, R. (1995), pp. 79-80.

⁵¹⁹ Developed from Piepenbrock, T.F. (2004). Note: money is shown in green flowing counter-clockwise, while products / services are shown in yellow flowing clockwise.

the most conservative investment hurdle rates, the NPV of the cash flow is low and often negative. Secondly, even if firms could secure financing on such low-return and risky projects, their customer's governments often mandate industrial participation in the form of offset agreements. Both of these scenarios give rise to the solution that *Boeing* and *Airbus*' suppliers' governments ultimately take on the development costs under "risk-sharing partnerships".

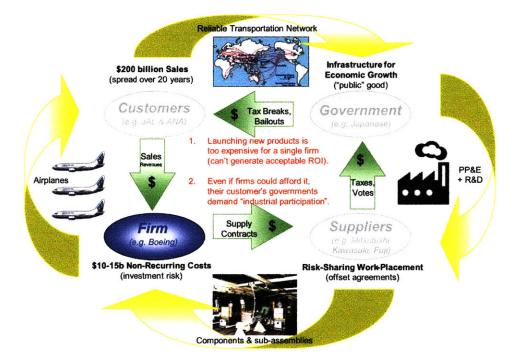

Figure 156: "Wicked" Problems in the Commercial Airplane Industry

Note how cause and effect are very distant in space and time (i.e. high *dynamic* complexity), and multiple stakeholders with differing objectives are playing (i.e. high *behavioral* complexity). The result is a very "wicked" problem.

Within the international and macroeconomic trade theory literature, comparative advantage is deemed to be the mechanism driving international trade. This is based on the assumption of constant returns to scale and perfect competition. However as Krugman (1987) points out, *economies of scale* - which is based on the assumption of increasing returns to scale and imperfect competition - is a cause of trade separate from *comparative advantage*.

"If increasing returns and imperfect competition are necessary parts of the explanation of international trade, however, we are living in a second-best world where government intervention can in principle improve on market outcomes."⁵²⁰

It may be that in certain industries under certain conditions, that government subsidies are not only necessary, but rational and intelligent; or more generally, in certain ecosystems, at certain times in it's evolutionary development, broader system boundaries will produce better system performance that the converse.

⁵²⁰ Krugman, P.R. (1987), pg. 134.

3.2.3 Intra-species vs. Inter-species Explanations

Explanations for competitive advantage – as posited in this methodology - can arise from two sources: differences *within* a competitor species, and differences *between* species of competitors.

Intra-species competitive advantage is a survival of the "fittest", where here "fit" means in the best shape (i.e. most efficient).

Inter-species competitive advantage is a survival of the "fittest", where here "fit" means the most responsive or adaptive to change (i.e. most effective environmental fit). It is this second explanation that this research will focus on. In other words:

- The competitive ecosystem will be composed of *heterogeneous* genotypes.
- The competitor exhibiting the greatest "efficiency-fitness" will not necessarily win the survival of the fittest competition. The winner in the long-run is posited to be the one which has best "environmental fitness".
- As a result, this research does not seek to advance traditional efficient-fitness theories of explanation, but to advance effective-fitness theory.

Before we leave this chapter which has been focused on the primary "dependent" variable of long-term superior firm performance, we want to briefly introduce the next chapter, which is focused on describing the primary "independent" variable of enterprise architecture – the underlying explanation of an inter-organizational species.

3.3 Notes from the Field: On Observing a Rare Species

After many years of intense adaptation and selection which saw the rise and fall of numerous and diverse species, a rich global ecosystem was reduced to only two competitors, locked in a fierce battle for survival as their environment grew ever colder.

Although they shared many similar characteristics - most scientists classified these competitors as belonging to the same species - I had a hunch that there were far greater hidden differences than visible similarities. In fact, the differences were so profound that I believed they could not in fact be rival cousins within the same species, but rather wildly different species fighting over the same territory. Outwardly they both looked like wild jackals, but inwardly one behaved more like a tame turtle, with very different internal DNA *structure* that drove wildly different outward *behavior*. Like the tale of the tortoise and the hare, the outcome of this struggle was far from obvious – in fact it was counterintuitive to scientists and children alike with the weaker of the two - the tortoise - appearing in fact to be slowly overtaking the stronger. In this battle of survival of the *fittest*, it was in fact the least "fit" competitor (in terms of strength or health) that was winning, because it appeared to be the competitor with the best "fit" with its harsh environment.

I was delighted therefore to be given the opportunity to live with each species in their respective lairs, observing them, testing them, getting to know them, their habits, their rituals, their "personalities", and their relationships with their environment, in an attempt to decode their respective DNA. It was a rare opportunity indeed for an aspiring scientist interested in studying how ecosystems evolve to spend extended periods of time over a number of years with every competitor of an ecosystem, especially during the crucial time when the "weaker" challenger competitor began to overtake the stronger incumbent. In fact, as the data unfolded, there appeared an interesting irony – the weaker challenger appeared to be defeating the stronger incumbent by employing the same behavior (derived from the same structure) that was seen in the ancestors of the incumbent itself. A strange cycle of DNA renewal appeared to be taking place on a population level over many generations.

Of course having been trained like most aspiring scientists, I was anxious to isolate a few variables in which to study in large numbers of diverse species in many ecosystems to test other scientist's theories, but this unique situation presented a very different opportunity. I had the "constraint" not of studying countless diverse species under controlled experiments in the laboratory, but of studying two apparently polar opposite species in the complex richness of their own entire ecosystem, watching (and in fact, helping) each try to dominate the other.

This opportunity led me not to test existing theories, but to try to build a new theory appropriate for a new phenomenon: the description of a new species and an explanation for the counterintuitive ways in which it competes. The goal therefore is not a narrow, generalized truth about some specific aspect of competition common in all ecosystems, but a broader systemic understanding of the evolution of the underlying forms and structures that drive the behavior and performance of diverse species.

3.3.1 Common Characteristics, Traits and DNA

Figure 157 below is a brief initial list of the common characteristics, or traits of the DNA of the three companies that form the basis of our initial theoretical sample.

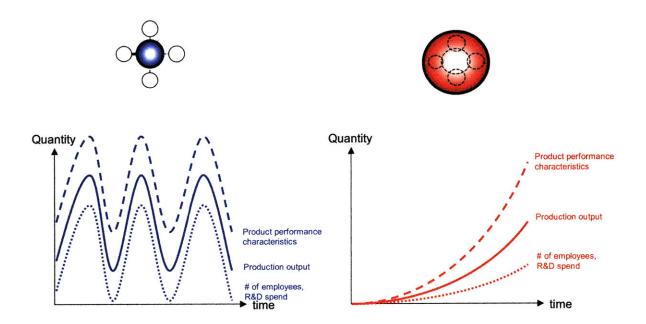

Figure 157: Common Characteristics of Dominant Competitors

One of the more important characteristics of each species is the quality of growth - or level of enterprise stability - which has many dimensions. As shown in

Figure 158 below, enterprise stability can be expressed in terms of high-level aggregate variables like production output, production input or product performance characteristics. Stylistically, modular enterprise architectures tend to exhibit time-histories which oscillate in the prime enterprise variables, while integral enterprise architectures tend to exhibit time-histories which possess more stability.

Figure 158: Stylized Enterprise Stability

3.3.2 Defining and Measuring Each Species

In the following three essays, a framework will be developed which enables qualitative and quantitative description of each "species", allows for their competitive dynamics and finally observes how the outcomes of these dynamics shape the evolution of the larger ecosystem in which they inhabit.

In essay #1, it will be argued that each species can be described *a priori* using qualitative descriptions of their high-level "input" forms and functions. These will be presented in a typology / taxonomy format.

In essay #2, it will be argued that each species can be defined *a posteriori* (i.e. inferred from observing their high-level "output" behaviors) using quantitative descriptions. These quantitative descriptions will allow for numerical simulation of competitive dynamics between the two species.

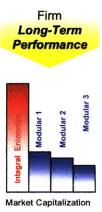

In essay #3, it will be argued that the dynamics arising from competition between species results in an evolution of the larger ecosystem.

3.4 Chapter Summary

This chapter introduces three subsequent essays which form an integrated framework which attempts to explain long-term firm performance. In this chapter, we defined the nature of the problem, namely the maximization of shareholder value.

The context for this construct within the framework is shown below in Figure 159. In the following chapter, we will next discuss how enterprise architectures provide the highest level explanations for the performance of the firm.

Figure 159: Firm Performance within Framework

Chapter 4 Enterprise Architectures

4.1 Introduction

4.1.1 Definition of Purpose, Precision and Accuracy

"Some of the concepts used here are not defined with great **precision**, largely because no highly refined definition is required for my **purposes**; a more detailed or more precise application of the analysis may well justify further effort in this direction."⁵²¹

"There is no advantage (and much error) in making definitions of words more precise than the subject matter they refer to."⁵²²

As an enterprise architecture is a high-level, abstract and conceptual notion of complex social phenomena, its precise definition can not and need not be articulated precisely.

"A nonlinear vision loses accuracy when it is converted into propositions. Theorists start with a vision for a theory an change it 'from entwined ideas at the edge of words to a linear order in which the ideas are unraveled and set forth in the form or a propositional argument' (TenHouten and Kaplan, 1973, pg. 147)."⁵²³

In addition, as an enterprise architecture is complex, nonlinear, and emergent, the development of a theory built around such a notion is likely to lose its accuracy in the translation to more linear definitions.

"I am not aware of any social scientists who claim to have a theory that precisely predicts human behavior. Instead, we correctly speak in terms of 'tendencies,' 'inclinations,' and 'propensities.' In empirical tests, we consider it a big success if our preferred theory explains just 10% of variance in human or organizational behavior. Most social scientists, I believe, marvel at how little grasp we have – after decades of trying – on the factors that influence human behavior."⁵²⁴

4.1.2 Construct of Architectural Form

Based on this, the primary construct - which is borrowed from product design theory (Ulrich, 1995) and supply chain design theory (Fine, 1998) - is the notion of an *architecture*, which if extended outward towards a firm's ecosystem, is termed herein as an *enterprise architecture*. Note that this *inter*-firm architecture, is to be distinguished from the classical *intra*-firm architecture, that is common in the organizational design literature.⁵²⁵

"Building on the product architecture concept enables development of the construct of supply chain architecture, a **richer concept** than that of traditional make/buy or vertical integration, which focuses primarily on ownership of assets in the supply chain."⁵²⁶

⁵²¹ Penrose, E.T. (1959), pg. 3.

⁵²² Robinson, J. (1956), pg. 361, cited in Penrose, E.T. (1959), pg. 3, footnote 1.

⁵²³ Weick (1995), pg. 386. 1.

⁵²⁴ Hambrick, D.C. (2005), pg. 105.

⁵²⁵ The idea for this distinction came from Prof. Michael Tushman.

⁵²⁶ Fine, C.H. (1998), pg. 136, referring to work by Novak, S. (1998).

Although reference is made to a *product* architecture, an *enterprise* architecture – being a socioeconomic construct - is not seen statically, but dynamically (or more accurately, as evolutionary). It is a social construct, "built" by humans for social purpose. Like humans and human organizations, it evolves whether by design or otherwise.

4.1.2.1 Basic definition of "Enterprise Architecture": Genotypes

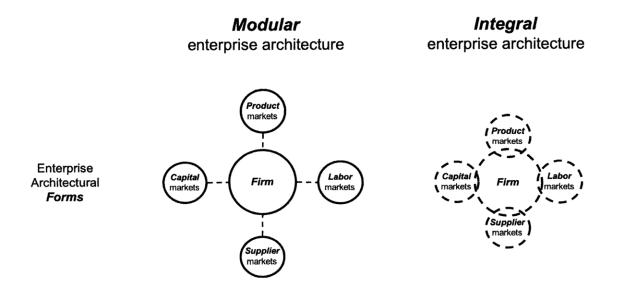

The enterprise (or ecosystem) is broadly defined as the firm and its relevant stakeholder groups. Drawing from the stakeholder theory of the firm (Mitchell, Agle & Wood, 1997), the architecture in question focuses primarily (but not exclusively) on the fundamental stakeholders of: customers, suppliers, employees and investors.

"Typologies at their best are memorable, neat and evocative." ⁵²⁷

"Taxonomic development is a critical element in the future health of organization science."528

This construct characterizes a *typology* of enterprise architectural forms or "archetypes", which are fundamental basis for the underlying dynamic capabilities of the enterprise. While the typology of enterprise architectures is a *continuum*, the extreme archetypal cases (fully modular and fully integral)⁵²⁹ are presented in their discrete binary form in Figure 160 below, and will be described in detail in the dissertation. It must be stressed that various *hybrid* architectural forms exist between these binary extremes, each having slightly different properties and structural dynamics. These subtleties will also be discussed in the theoretical framework.

Figure 160: Simple definition of "Enterprise Architecture"

⁵²⁷ Miller, D. (1996), pg. 506.

⁵²⁸ McKelvey, B. (1975), pg. 509.

⁵²⁹ Note, in software architecting, the notions of open modular and proprietary integrated are additional distinctions.

4.1.2.2 Contingent definition of "Enterprise Architecture": Phenotypes

"The world consists of two kinds of people: those who divide everything into two groups and those who don't."⁵³⁰

The enterprise architectures shown previously are generic, they are the genotypes. This framework, however endeavors to provide an environmental context within which such architectures thrive and grow, these are the phenotypes. In Essay #3, we will discuss in more detail the environmental conditions which support these architectures, but for now, the following color convention will be used ass shown in Figure 161 below.

- Blue signifies an architecture that grows in a growing market environment.
- Red signifies an architecture that grows in a maturing market environment.

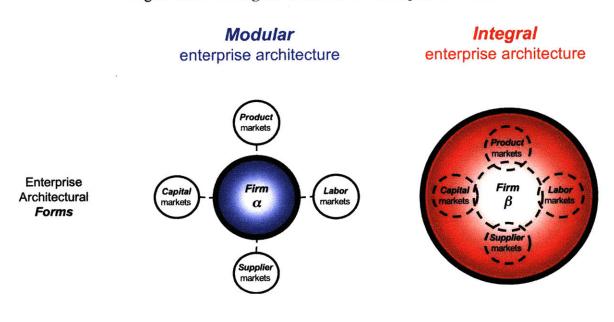

Figure 161: Contingent definition of "Enterprise Architecture"

⁵³⁰ Anonymous.

4.1.3 Construct as Continuum

A qualitative view of the primary case study companies is shown in Figure 162 below, in order to illustrate that the while the constructs are represented as discrete theoretical binary archetypes, they are at the ends of a spectrum or continuum of enterprise architectures.

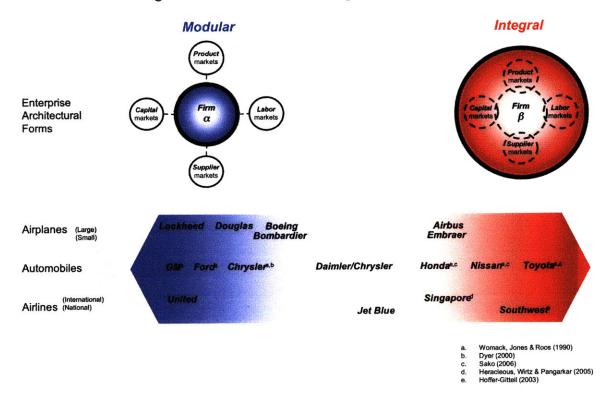

Figure 162: Continuum of Enterprise Architectures

As an explanatory construct, the enterprise architecture is likely to yield stronger and more accurate predictions in the cases of *GM* vs. *Toyota*, and *United* vs. *Southwest* Airlines as they represent clearer cases of archetypal extremes, given a state of environmental evolution. By contrast, it will be argued that *Boeing* and *Airbus* represent both more moderate archetypal forms, and therefore the enterprise architecture, while fundamental and primary in its explanatory power, must concede to traditional explanations of efficiency etc.

It is fitting therefore to use the notion of architecture to describe complex social systems, as it is a *systemically complete*, yet *imprecise* notion that captures "tendencies". As shown in Figure 163 below, an architecture neither predetermines choice, nor over-constrains action. It does however enable and give tendencies. Within an enterprise architecture, firms can have a wide variation of modular to integral tendencies in the components that make up their architectures. For example, modular enterprise architectures can and certainly do have "Theory Y" managers (McGregor, 1960), they can and certainly do have low cost strategies in certain market segments (Porter, 1980), however this does not take-away from the mean properties of "Theory X" pre-dominance and differentiated product strategy focus, which will be discussed in subsequent sections, particularly as the environmental state defines the architecture.

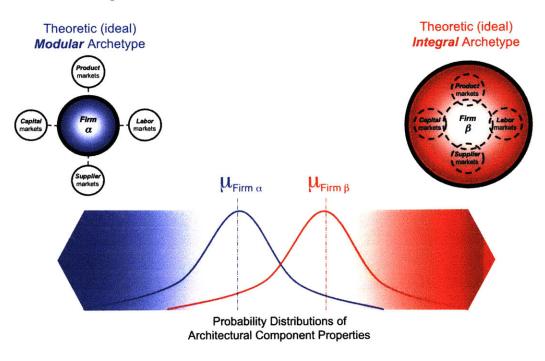

Figure 163: Architecture as Continuum of Probabilities

4.1.4 Construct as Mediator...

Recalling from chapter 1, Astley and Van de Ven's (1983) characterization of key debates in organizational theory was parsed along two axes: level of analysis and role of human agency. The construct of enterprise architecture therefore attempts to address and unify both debates.

4.1.4.1 ... between Firm and Environment

In an attempt to answer the primary research question: "Is firm performance due to the characteristics of the firm or the environment?", the answer is hypothesized to lie in *how the firm interacts with the environment* - in other words, the nature of the *architecture of the firm's extended enterprise*.

4.1.4.2 ... between *Determinism* and *Choice*

"Nothing is more **fundamental** in setting our research agenda and informing our research methods than our view of the nature of human beings whose behaviors we are studying... it makes a difference to research, but it also makes a difference for the proper design of ... institutions."⁵³¹

An enterprise architecture is primarily a social (not a physical) construct. Like physical architecture, it both enables and constrains, but does not determine activity or human action.

⁵³¹ Simon, H. (1985), pg. 293.

"We shape our buildings; thereafter, our buildings shape us."532

While most people think of physical architecture as static and unevolving, the truth is that it does on a rather slow and punctuated timeframe. An enterprise architecture, as a social construct is more obviously dynamic and evolving. It is emergent, as its invisible structure must be recreated every day in every new human interaction (Giddens, 1979).

"When does a building actually become built?."533

4.1.5 Construct as Embedded Enabler of Strategic Change

The construct of enterprise architecture also serves as a pedagogical tool embedded within the ongoing process of enacting an existing architecture to create a means of self-reflexive analysis and enterprise (re)design.⁵³⁴

"To understand architecture and its impact one needs to understand the political and cultural dimensions of leadership and architecting, as Ted Piepenbrock described. [When considering] Ted Piepenbrock's efforts at Boeing, the audience is the Board of Directors, who are trying to make architectural decisions about the Boeing enterprise. Ted's role is not to be an outside architect; rather he is operating as a kind of facilitator in the board's own thinking about its architecture. He does, however, carry out his own research in the firm – this gives him credibility with the audience and helps him elucidate the key choices and consequences facing them in their architecting (i.e. modular versus integral enterprise). It is, I would argue, more sophisticated in its understanding of enterprises as enacted systems and enterprise architecture as a practice that requires embedding. This isn't to say that implementation will be successful – Ted himself thinks it will be near impossible for a modular enterprise to become integral. But he is putting the possibility of implementation at the center by locating the architects and audience in the same, very powerful people and using himself and his expertise as provocation and facilitator."

⁵³² Attributed both to architect, LeCorbusier (1887-1965) and to Sir Winston Churchill in a speech in 1943.

⁵³³ LeCorbusier (1887-1965).

⁵³⁴ I am indebted to fellow MIT PhD student, Jason Jay for helping me clarify this concept.

⁵³⁵ Comments and critiques of this framework by graduate students in the Spring 2006 MIT ESD class, *Enterprise Architecting*.

4.1.6 Heuristics associated with Architectural Form

Heuristic 1a:

The architecture is the *form* of the system, and is the dominant factor in its *behavior*.⁵³⁶ The architectural *form* of an enterprise (modular or integral) defines the enterprise's *effectiveness*. Enterprise *effectiveness*, together with enterprise *efficiency*, define an enterprise's performance capability. (Note: the more effective enterprise structure may not exhibit the highest performance in the short term.)

Heuristic 1b:

The architectural *form* of an enterprise is defined by the *boundaries* and *interfaces* between the key stakeholders or input providers (i.e. those who significantly affect the firm's costs and/or revenues). These are in turn defined by the *quantity* of stakeholders within a group and by the *quality* of relationships with stakeholders. The boundaries are characterized both *spatially* (near vs. far) and *temporally* (short-term vs. long-term).

Heuristic 1c:

The architectural *form* of an enterprise can be defined either by its *inputs* (i.e. the quantity and quality of relationships with key stakeholders), or by its *outputs* (i.e. the growth and stability characteristics). Given either inputs or outputs, one can infer the enterprise's architectural form.

Heuristic 1d:

The power and influence distribution of the stakeholder space is not homogeneous with respect to driving structural dynamics of growth and stability. (For example, the shareholders in a modular enterprise contribute relatively more influence to enterprise growth requirements).

The enterprise architecture concurrently and reflexively defines and is defined by managerial cognitive frames, which influence their behaviors and strategic choices and modes of operation. In addition, the enterprise architecture defines the participant firm's robustness to various environmental threats.

⁵³⁶ D. Whitney et al. (2004), pg. 26.

4.2 Theoretical Foundations

The notion of *inter-firm* enterprise architectures - while not explicitly found in the management literature - can be constructed from a variety of eclectic theoretical traditions. The following briefly summarizes a few of the threads in various fields.

4.2.1 Economic *theories*

The discussion of economic theories is divided into micro- approaches, focusing on the firm and markets, as well as macro- approaches, focusing on national and international economies.

4.2.1.1 Micro-economics

4.2.1.1.1 Specialization and the Division of Labor

One of the first important contributions to the discussion of enterprise architectures, lies in one of the original theoretical justification for liberal free-market economics by Adam Smith (1776).

The notion of efficiencies based on specialization of tasks and the division of labor will loom large in our later exploration of modular enterprise architectures. This focus on "division" (or differentiation) lies in juxtaposition to the focus on "multiplication" (or integration) in integral enterprise architectures.

Finally, note that Smith's work will also form the basis of a later discussion on craft, mass and lean production.

4.2.1.1.2 New Institutional Economics

The definition of an enterprise architecture relies on some fundamental economic theory, which questions the reasons why firms exist at all – and which hypothesize that firms arise when markets fail.⁵³⁷ This line of theory, embedded in *new institutional economics*, attempts to characterize a spectrum of economic production ranging from markets to hierarchies (Coase, 1937; Alchian and Demsetz, 1972; Williamson, 1985).

4.2.1.1.2.1 Theory of the Firm

"A firm is likely to emerge in those cases where a very short-term contract would be unsatisfactory." 538

"It seems improbable that a firm would emerge without the existence of uncertainty."539

The mechanisms of markets are quite different from those creating hierarchies, and in fact from those of intermediate networks. Understanding this distinction will be fundamental in defining the spectrum between modular and integral enterprise forms. From the above quotations from Nobel laureate, Ronald Coase (1937), one might conjecture that while firms emerge due to the presence of long-term contractual demands and uncertainty, integrated enterprises may emerge due to the presence of even longer-term contractual demands as well as greater uncertainty.

4.2.1.1.2.2 Transaction Cost Economics: Markets, Hierarchies & Hybrids

In addition to the classical distinctions between markets and hierarchies, this work will advance the recent theories which have characterized a form between market and hierarchy: the *network* (Powell, 1990) or *hybrid* organization (Ahmadjian and Lincoln, 2001).

As shown in Figure 164 below, Gibbons (2004) posits that the transaction costs of nonintegration between firms in the form of rent-seeking/haggling (e.g. with the supplier stakeholder) are similar to the costs of non-integration within firms in the form of politicking (e.g. with the labor stakeholder).

"I am fully persuaded that **rent-seeking between organizations** is an important **transaction cost of non-integration**. I will define rent-seeking as individually optimal (but socially destructive) **haggling** over appropriable quasi-rents. **Politicking within firms** seems to be the inescapable internalorganizational analog of haggling between firms."⁵⁴⁰

⁵³⁹ Coase, R. (1937).

⁵⁴⁰ Gibbons, R. (2004), pp. 25 and 30.

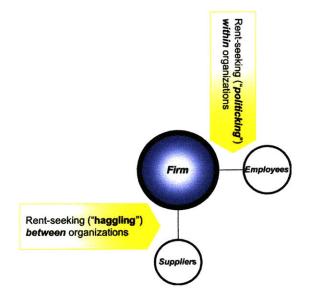

Figure 164: Transaction Costs of Non-Integration between and within Organizations

The traditional focus on contracting between the firm and its employees (Alchian & Demsetz, 1972), was broadened by Jensen & Meckling (1976) to include other stakeholders:

"Contractual relations are the essence of the firm, not only with employees but with suppliers, customers, creditors, and so on. The problem of agency costs and monitoring exists for all of these contracts, independent of whether there is [team] production. [As a result], it makes little or no sense to try to distinguish those things that are 'inside' the firm (or any other organization) from those things that are 'outside' of it. There is in a very real sense only a multitude of complex relationships (i.e. contracts) between the legal fiction (the firm) and the owners of labor, material and capital inputs and the consumers of output."⁵⁴¹

4.2.1.1.2.3 Agency Theory

Jensen & Meckling (1976) observed that when interests diverge between principals and their agents, losses may be incurred by the principals. These losses however can be minimized by imposing various controls on the agents.

The complementary viewpoint to agency theory has been suggested as "stewardship theory" (Donaldson and Davis, 1989 and 1991), in which the interests of principals and agents are aligned.

⁵⁴¹ Jensen and Meckling (1976), pp. 310-311.

4.2.1.1.3 Economics of Profit-Maximizing and Labor-Managed Firms

4.2.1.1.3.1 Terminology

Even within the academic discipline of economics, numerous names have been used to describe the two different economic firm types as shown in Table 8 below. For the sake of simplicity, this research uses the following terminology: *profit maximization* (PM) and *labor managed* (LM).

Economic	Profit	Labor
Firm Type	Maximizing	Managed
Alternative Terminologies and Contexts	Capitalist, Entrepreneurial, Private	Cooperative, Employee-controlled, Illyrian, Public State-Owned Welfare-maximizing

Table 8: Terminologies for Economic Firm Types

4.2.1.1.3.2 Objective Functions

"The force driving this outcome is the strategic asymmetry between the PM and the LM firm in terms of their respective objective functions."⁵⁴²

One of the most striking differences between PM and LM firms lies in their objective functions. In the following subsections, each will be briefly discussed in turn. In subsequent sections, the *objective* functions will be translated into *reaction* functions to investigate competitive interactive games.

4.2.1.1.3.2.1 Profit Maximizing (PM)

The objective function of the PM firm has been represented (Cremer and Crémer, 1992; Delbono and Rossini, 1992).

4.2.1.1.3.2.2 Labor Managed (LM)

The objective function of the LM firm has been represented (Lambertini and Rossini, 1998, pg. 15) as the maximization of the profit per worker, V:

$$V = (\text{revenues} - \text{costs}) / \text{labor}$$
$$V = (pq - rk) / L$$

Where p is the market price, q is the quantity sold by the firm, r is the price of capital, k is the quantity of capital used in the production process, and L is the quantity of labor used.

⁵⁴² Lambertini and Rossini (1998), pg. 20.

4.2.1.1.3.2.3 Mixed Objective Functions

"The objective of a capitalist firm that engages in cooperative bargaining with its workforce can be represented as a weighted function of profit-maximization and the typical LM objective."⁵⁴³

While the objective functions of PM and LM firms vary, various researchers have noted that there may be mixed objective functions (Law, 1977; Svenjar, 1982; Aoki, 1984; Miyazaki, 1984).

⁵⁴³ Neary and Ulph (1996), pg. 2.

4.2.1.1.3.3 Homogeneous Duopoly competition

While much has been written about homogeneous duopoly competition between PM firms, the literature on duopoly competition between LM firms is more rare and recent. Each type of homogeneous duopoly will be briefly examined below with respect to either quantity or price competition under simultaneous or sequential conditions.

4.2.1.1.3.3.1 Cournot (Quantity) competition

As shown in Figure 165 below, Lambertini and Rossini (1998) develop the reaction functions for an LM duopoly as upward-sloping, in contrast to the reaction functions for a PM duopoly as downward sloping.

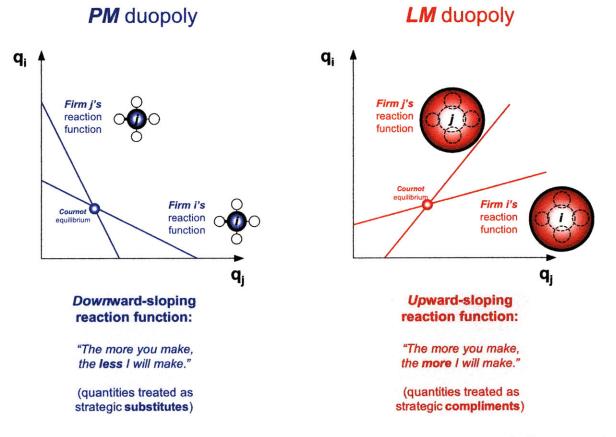

Figure 165: Reaction Functions for PM and LM Duopolies in Quantity Space

For the PM's downward-sloping reaction functions, quantities are treated like strategic substitutes, while for the LM's upward-sloping reaction functions, quantities are treated like strategic compliments, as first introduced by Bulow et al, 1985).

Lambertini and Rossini (1998) then summarize the responses of homogeneous duopolies with respect to capital commitment investments as shown in Figure 166 below.

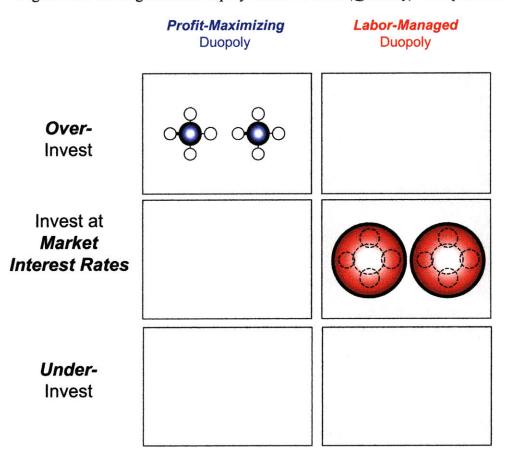

Figure 166: Homogeneous Duopoly under Cournot (Quantity) Competition

Zhang (1993) and Haruna (1993) discuss the use of excess capacity to deter entry in LM industries and economies.

4.2.1.1.3.3.1.1 Stackleberg (sequential) competition

The issue of choosing roles in a sequential duopoly is summarized by Lambertini (1995), and summarized in Figure 167 below.

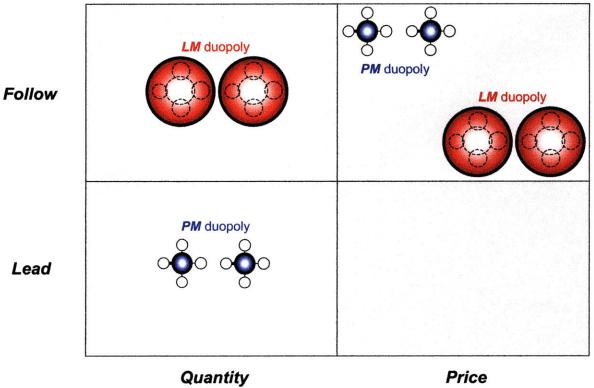

Figure 167: Sequential Games in a Homogenous Duopoly

Quantity competition

Price competition

4.2.1.1.3.4 Heterogeneous ("Mixed") Duopoly competition

"The analysis of the behaviour of mixed markets, where firms with different objective functions coexist, started at the end of the last decade [the 1980s] and still continues."⁵⁴⁴

While the literature on the economics of homogeneous duopolies is extensive, the literature on the economics of heterogeneous or "mixed" duopolies is more recent and more sparse (Law & Stewart, 1983; Mai & Hwang, 1989; Horowitz, 1991; Cremer & Crémer, 1992; Futagami & Okamura, 1994; Neary & Ulph, 1996; Lambertini & Rossini, 1998; De Fraja & Delbono, 2002). See Appendix H for a summary.

This "mixed' duopoly characterizes the situation where each competitor has a different objective function, namely *profit maximization* and *labor managed*. It is the contention of the framework developed in this research dissertation that the *modular* enterprise architecture is characterized by the PM objective function, while the *integral* enterprise architecture is characterized by the LM objective function.

"Conventional wisdom suggests that firms deviating from profit-maximization will suffer forced exit in the long run. We reverse this conclusion. Empirical evidence is consistent with this prediction of relatively robust market survivability of LM firms" ⁵⁴⁵

The empirical work undertaken in this research dissertation tends to support much of this relatively recent theoretical work, which predicts the robustness of the LM form.

"The upshot is that the LM firm is relatively more aggressive than the PM firm in its investment behaviour. This combined with the LM firm's relatively accomodatory behaviour in choosing output levels at given levels of the capital stock, results in the LM firm being a more robust market competitor over an extensive subset of the parameter domain." 546

If this theoretical result holds true, supported empirically by evidence in this research dissertation, then one is confronted with the question, "why if LM firms are so robust, are there apparently so few of them?" Leading hypotheses (Neary & Ulph, 1996) center around the difficulty in formation of LM firms as opposed to their survivability once established.

"The LM firm is not able to survive competition with a PM firm, when starting from scratch. The LM firm is so 'prudential' that it doesn't enter the market."⁵⁴⁷

Finally, as will be discussed more in chapter 6, the birth rates of various enterprise architectures will be argued to be contingent upon the nature of the architectures of the existing competitors. Specifically, it will be posited that integral enterprise architectures (or LM firms) will find it to be very difficult to "grow" in the early environment, rich with modular competitors (or PM firms).

⁵⁴⁴ Lambertini, L. and Rossini, G. (1998), pg. 14.

⁵⁴⁵ Neary and Ulph (1996), pp. 1.

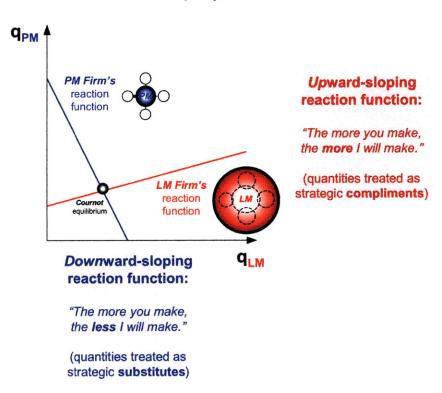

⁵⁴⁶ Neary and Ulph (1996), pp. 20.

⁵⁴⁷ Lambertini, L. and Rossini, G. (1995), pg. 11.

4.2.1.1.3.4.1 Cournot (Quantity) competition

In order to investigate the equilibrium of a mixed duopoly under Cournot competition, one must first begin with the reaction functions which is downward-sloping for the PM firm and upward-sloping for the LM firm as shown in Figure 168 below.

Figure 168: Reaction Functions for a Mixed Duopoly in Quantity Space

Mixed duopoly

Lambertini and Rossini (1996) investigated the responses of homogeneous duopolies with respect to capital commitment investments as shown in Figure 169 below. The key to understanding the seemingly counter-intuitive results lies in understanding the respective firm's reaction functions.

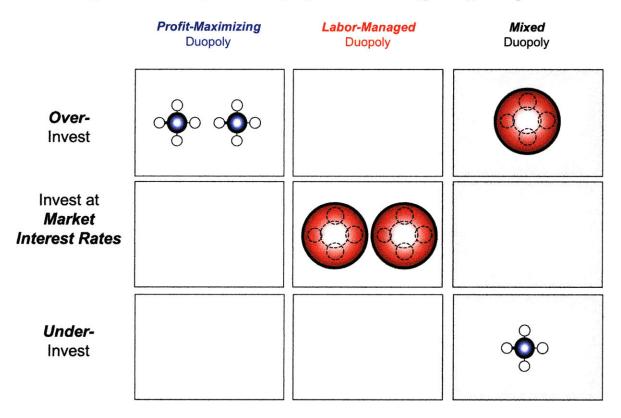

Figure 169: Heterogeneous Duopoly under Cournot (Quantity) Competition

As will be discussed in more detail in chapter 5, not only does the LM firm keep expanding output ("the more you make, the more I will make") more than a PM firm ("the more you make, the less I will make"), but it relentlessly expands capacity more *slowly* than the PM firm.

4.2.1.1.3.4.2 Bertrand (Price) competition

When we model mixed duopoly competition in Chapter 7, we will take a rather severe "winnertakes-all" competitive assumption is akin to Bertrand (price) competition, rather than the weaker form of Cournot (quantity) competition where the market is shared in proportion to relative firm growth rates.

4.2.1.1.4 Strategic Complementarities

"...doing more of one thing increases the returns of doing more of another..." ³⁵⁴⁸

Milgrom & Roberts (1990 and 1995) argued within an economics framework the benefits of integrated and interdependent activities. In fact later, Porter (1996) referred to such complementarities as "activity networks". Later Whittington et al. (1999) empirically demonstrated that such complementarities (while rare) are linked to increased performance. As will be discussed later, the presence of such complementarities signal the presence of an integral enterprise architectures.

While Hedlund (1994) and Whittington et al. (1999) posit that such complementarities are part of a "new" and more successful form of organization, this research posits that they are note necessarily new in an *absolute* sense, but they are new in a *relative* sense, that is new relative to the state of the evolution of the industry in which firms are embedded.

⁵⁴⁸ Milgrom and Roberts (1995), pg. 181.

4.2.1.2 Macro-Economics and Political Economy

"Some Western economists and organization theorists go to great length to formulate theories of the firm in terms of opportunism, moral hazard, incentive compatibility, and monitoring. Work in the transaction cost tradition following Coase (1937) and Williamson (1975), agency theory (for example Jensen and Meckling, 1976), and property rights (for example Alchian and Demsetz, 1972) all share the preoccupation with opportunism obstructing the achievement of efficiency in given, specified tasks or transactions. Aoki (1990) stresses the shortcomings of such models for understanding the Japanese firm."⁵⁴⁹

The literature in macro- and international economics has tended to focus on the Anglo-Saxon vs. the German/Japanese models (Piore and Sabel, 1984). In fact, Aoki and Jackson (2008) use a micro-economic game theoretic approach to define various equilibria in the linkages between organizational architectures and corporate governance, which are reflected in the the Anglo-American, German and Japanese models. The following subsections give examples of how each of these models are characterized.

4.2.1.2.1 Varieties of Capitalism

The Varieties of Capitalism (VoC) perspective (Crouch and Streeck, 1997; Hall and Soskice, 2001) is a national level explanation of integral enterprise architectures driven by institutional complementarities (Goyer, 2006). At the core of these varieties of capitalism, expressed herein as enterprise architectures, lies the constructs of trust and equity in interorganizational relationships (Scheer, Kumar and Steenkamp, 2003).

"The VoC perspective emphasizes the critical importance of patterns of institutional complementarities across the various sub-spheres (finance and corporate governance, industrial relations, innovation system, and inter-firm relations) of the economy that lead to diverging forms of behavior on the part of economic actors."⁵⁵⁰

While rooted in political economy, it focuses on the firm as the center of analysis (Hall and Soskice, 2001; March, 1962).

"It brings the firm back into a central position in our understanding of the political economy."551

The VoC literature has been characterized in a number of theoretical and empirical ways. The theoretical characterizations have occured as *liberal market economies* vs. *coordinated market economies*, as *consumer economics* vs. *producer economics* or as economic *statics* vs. *dynamics*. The empirical charactizations have taken the form of Anglo-Saxon model vs. the German-Japanese model. Each will be discussed briefly in turn.

⁵⁴⁹ Hedlund, G. (1994), pg. 80.

⁵⁵⁰ Goyer, M. (2006), pg. 401.

⁵⁵¹ Hall, P.A. and Soskice, D. (2001), pg. v.

4.2.1.2.1.1 Liberal Market Economies vs. Coordinated Market Economies

The Liberal Market Economy (LME) and Coordinated Market Economy (CME) represent the ideal types at the extremes of the spectrum of a continuum of varieties of capitalism, as presented by Hall and Soskice (2001). Figure 170 below qualitatively summarizes select nations on the VoC spectrum. Note that this provides the macro-institutional context for firms operating within these political economies. It does not, however, necessarily predetermine firm or enterprise architectures, as a LME could support an enterprise architecture that has strong CME tendencies as is the case of *Southwest Airlines* in the US LME.

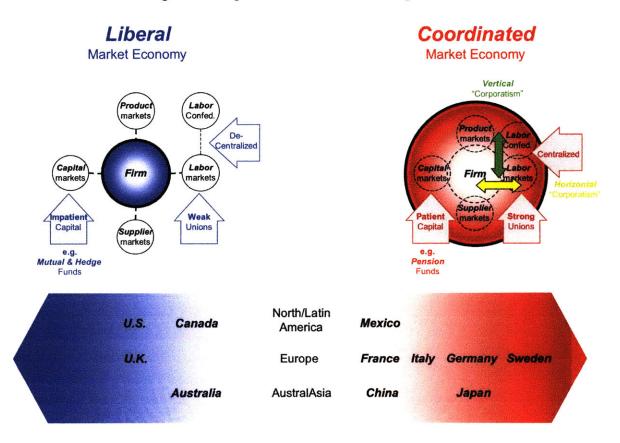

Figure 170: Spectrum of Varieties of Capitalism

Finally, Hall and Soskice (2001) posited that each variety of capitalism was better suited to different forms of innovation: LME's produce *radical* innovation, while CME's produce *incremental* innovation.

"In short, the institutional frameworks of **liberal** market economies provide companies with better capacities for **radical** innovation, while those of **coordinated** market economies provide superior capacities for **incremental** innovation."⁵⁵²

⁵⁵² Hall and Soskice. (2001), pg. 41.

4.2.1.2.1.2 Consumer vs. Producer Economics

This dialogue within the field of macro- and international economics has tended to classify the Anglo-Saxon model as *profit* maximizing based on *consumer* economics, while the German/Japanese model is *market share* maximizing based on *producer* economics (Thurow, 1992).

It is interesting to note that while *profit* maximizing firms tended to grow-up in *mass* production economies where the power was in the "*producer* push" world, and yet this is based on macroeconomic *consumer* economics.

Conversely, *market share* maximizing firms tended to grow-up in *lean* production economies where the power is in the "customer pull" world, and yet this is based on macroeconomic *producer* economics.

Heuristic 1e:

The architectural *form* of an enterprise is governed by the *institutional environment*. While it will be possible to find both integral and modular enterprise architectures within a given institutional environment (e.g. U.S. capitalism), there are clear national tendencies. General:

"Anglo-Saxon firms are profit maximizers; Japanese business firms play a game that might better be known as 'strategic conquest'. Americans believe in 'consumer economics'; Japanese believe in 'producer economics."⁵⁵³

"While firms in producer economics and consumer economics both want profits, the role played by profits is very different. In the profit-maximizing firm, profits are the goal – the objective function. In the empire-building firm, profits are the means to the end of a larger empire – a constraint. The goal is market share."⁵⁵⁴

"The time scale of what the Japanese mean by profit maximizing is so long that it isn't what Anglo-Saxons mean by profit maximizing."⁵⁵⁵

"Firms based on the principle of producer economics are clearly on the offensive in international markets, while those based upon profit maximizing are on the defensive. But perhaps this is just the ebb and flow of economic battle. In the 1950s and 1960s the profit maximizing firms of the United States put their competitors on the defensive."⁵⁵⁶

Key Stakeholders:

"The United States has organized a system that is the exact opposite of that of Germany and Japan. Those countries have organized a system (business groups) to minimize the influence and power of impatient shareholders, while the United States has organized a system (fund dominance) to maximize the influence of impatient shareholders."⁵⁵⁷

⁵⁵³ Thurow, L. (1992), pg. 32.

⁵⁵⁴ Thurow, L. (1992), pp. 124-125.

⁵⁵⁵ Thurow, L. (1992), pg. 131.

⁵⁵⁶ Thurow, L. (1992), pp. 149-150.

⁵⁵⁷ Thurow, L. (1992), pg. 136.

"If the executives of profit-maximizing American firms are asked to state the order in which they serve various constituencies, **shareholders come first**, with customers and employees a distant second and third. Most managers will argue that the sole purpose of the company is to maximize shareholder wealth. Customers and employees are only important to the extent that they contribute to this goal. If Japanese firms are asked the same question, the order of duty is reversed – employees first, with customers second and shareholders third."⁵⁵⁸

4.2.1.2.1.3 Profit maximization (Consumer economics)

General:

"The Anglo-Saxon model is not wrong. Individualism and the desire for consumption and leisure are all parts of human nature. But they are not all of human nature. Individualistic consumer economics is not wrong! It merely explains only part of what needs to be explained! Man is not just a consumption-leisure-maximizing machine. He or she is also a producer."⁵⁵⁹

Market Share:

"If one examines the American consumer electronics industry, it is a history of profit-maximizing strategic retreat into oblivion. But at every point in time, they made their demanded rate of return. Being rational, they would go out of business before they would accept a below-market rate of return."⁵⁶⁰

"Fighting for greater market share is **irrational** to the rational profit maximizer. He would rather surrender than fight. Fighting lowers one's consumption. Since his theories tell him that he can always go work for the winner, going out of business is the rational thing to do. Who one works for is not important. The consumption maximizer is a mercenary who would rather switch than fight."⁵⁶¹

Labor:

"The United States is in a statistical class by itself when it comes to **labor-force turnover**. From an income-maximization perspective, this is a sign of **efficiency**. Workers are dismissed when they aren't needed."⁵⁶²

Investment:

"In the United States, private research and development spending falls in recessions and rises in booms. In Europe and Japan, it does not. To an American firm, cutting R&D is a technique for maintaining profits during a period of declining sales. In Europe and Japan, R&D is not cut, since it is seen as the source of long-run competitive strength."⁵⁶³

"In American accounting conventions, since **R&D** is expensed, cutting R&D spending leads to higher bottom-line profits immediately. In Japan, where **R&D** is capitalized, it does not. The Japanese accounting system is set up to discourage short-term behavior. The American counterpart is set up to encourage it."⁵⁶⁴

⁵⁵⁸ Thurow, L. (1992), pg. 137.

⁵⁵⁹ Thurow, L. (1992), pp. 118 & 120.

⁵⁶⁰ Thurow, L. (1992), pg. 133.

⁵⁶¹ Thurow, L. (1992), pg. 133.

⁵⁶² Thurow, L. (1992), pg. 139.

⁵⁶³ Thurow, L. (1992), pp. 141-142.

⁵⁶⁴ Thurow, L. (1992), pg. 142.

"Private time horizons are believed to be too short. **Private hurdle rates used in business-investment** calculations are always far above the economy's long-term rate of return on assets. In the United States, the private hurdle rate is 15 to 20 percent, while the historical rate of return on business assets is 7 percent. Banks such as the Japanese Development Bank or the Long-Term Credit Bank are designed to finance the long-term investments that normal banks and firms avoid."⁵⁶⁵

4.2.1.2.1.4 Market-Share maximization (Producer economics)

General:

Japanese practices "should make Japanese business firms **inefficient**, yet when facing American or European competition, **they always seem to win**. Their market share always goes up, never down. What are handicaps for others are strengths for them. Are the Japanese just better as individuals – playing the same game but just doing it better by working harder, saving more, and being smarter than everyone else – or does their success spring from **having organized a different system**, playing the game differently? Is Japan just better, or is it exceptional?"⁵⁶⁶

"Germany, the dominant European economic power, sees itself as having a 'social-market' economy and not just a 'market' economy. Codetermination is required to broaden the ranks of corporate stakeholders beyond that of the traditional capitalistic owners to include workers."⁵⁶⁷

Goals & Objectives:

"Their goal is market-share maximization (strategic conquest) and value-added maximization (a measure that includes profits and wages), not simple profit maximization."⁵⁶⁸

Investment:

"Empires overinvest relative to profit-maximizing firms, since they plan to last forever. Their aim is future expansion, not maximizing current consumption."⁵⁶⁹

"To lengthen time horizons and accept a lower rate of return, impatient consumption-oriented stockholders must be kept under control. The Japanese or German business groups have been organized to do just that. With interlocking ownership, impatient consumption-oriented shareholders can be held at bay."⁵⁷⁰

Labor:

"The empire-building firm sees labor as a strategic asset to be nurtured. One wants the highest quality and best-fed soldiers."⁵⁷¹

⁵⁶⁵ Thurow, L. (1992), pp. 145-146.

⁵⁶⁶ Thurow, L. (1992), pp. 114.

⁵⁷¹ Thurow, L. (1992), pg. 138.

4.2.1.2.1.5 Economic (comparative) Statics vs. Economic Dynamics

One of the key issues of competitive advantage is short-term efficiency vs. long-term dynamic capabilities, as captured by the economic concepts of "comparative statics" (i.e. getting onto the maximum place on the production possibilities curve) and "economic dynamics" or moving the production possibilities curve out.

"The theoretical advantages of profit maximization were in fact mathematically derived under the assumptions of what economists call 'comparative statics'. In comparative statics, a stable no-growth environment, firms prove their effectiveness by becoming efficient. The cost minimizer wins. Japanese lifetime employment and seniority wages should, for example, be a handicap. In economic dynamics, the central problem is rapid growth. In reaching this growth goal, many of the cost-cutting advantages of comparative statics may be liabilities... a short-run static advantage that turns out to be a long-run dynamic handicap. "⁵⁷²

4.2.1.2.1.6 National Examples: Anglo-Saxon vs. German-Japanese models

"The German/Japanese model is one of close co-operation between banks and enterprises, a paternalistic state and a communitarian view of management-worker relations. This model translates into a long-term view of strategy, a readiness to invest in equipment and training and a respect for the hands-on skills required for technology and production."⁵⁷³

"The Anglo-Saxon model, associated with turbulent financial markets and impatient lenders, hostile takeovers and a hire-and-fire approach to labour... an emphasis on short-term financial results, an aggressive external orientation to strategy, and a high valuation put on speed and flexibility."⁵⁷⁴

⁵⁷² Thurow, L. (1992), pg. 150.

⁵⁷³ Albert (1991).

⁵⁷⁴ Albert (1991).

4.2.2 Sociology & Organizational theories

Much of sociological and organizational theories are predicated on the organization as an open system which exchanges with the environment and therefore may or may not adapt to the environment. Three broad schools of thought fall into this "fit" category with differing emphases on the level of change and adaptation, as shown in Figure 171 below.

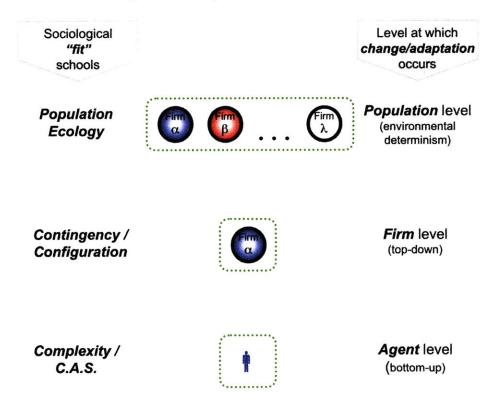

Figure 171: Organizational Theories of "Fit"

4.2.2.1 Theories of Bureaucracy

4.2.2.1.1 Division of Labor vs. Centralization of Authority (Weber)

In his exploration of the ideal type of bureaucracy, Weber (1952) noted two primary and opposing forces acting in all organizations: the division of labor and the centralization of authority (or coordination).

4.2.2.1.2 Conflict vs. Order

Sociologists have different assumptions about the nature of society, with one of the key debates surrounding the dichotomy of order-conflict, also known as "regulation-radical change." Cohen (1968) presents two models of society with competing sets of assumptions:

"Commitment, cohesion, solidarity, consensus, reciprocity, co-operation, integration, stability and persistence. Coercion, division, hostility, dissensus, conflict, malintegration and change."⁵⁷⁵

Burrell and Morgan (1979) simplify and summarize the work of and another prominent sociologist, Dahrendorf's (1959).

"The order view of society emphasizes: stability, integration, functional co-ordination and consensus. The conflict view of society emphasizes: change, disintegration, conflict and coercion."⁵⁷⁶

These concepts will form the theoretical underpinnings of the grounded theory that is being developed herein.

4.2.2.1.3 Theory X and Theory Y (McGregor)

McGregor (1960) was one of the first to acknowledge two very distinct styles of management which are summarized in Table 9 below.

Enterprise Architecture	Modular	Integral		
Managerial Style	Theory X	Theory Y		
Characteristics	Authoritarian, directive, coercion, control	Flexible, open, democratic, motivating, delegation, trust and intrinsic job satisfaction		

Table 9: Contrasting Managerial Styles: Theory X & Theory Y

⁵⁷⁵ Cohen (1968), pp. 166-167.

⁵⁷⁶ Burrell and Morgan (1979), pp. 12-13.

4.2.2.2 Social Systems Theories

The following theories encompass a series of major threads in sociology and organizational theory from General System Theory (with the focus on physics and biological metaphors), Structural Functionalism (with the focus on the biological metaphor) and Contingency Theory.

4.2.2.2.1 Structural Functionalism

As was discussed in Part I, the framework presented herein can be expressed in terms of structural functionalism. This sociological paradigm based its theories on biological analogies and sought to explore morphology, physiology and development in social systems. As a result, Essay #1 will confine itself to the exploration of morphology or form and structure without reference to function.

4.2.2.2.1.1 Cooperative Systems

Barnard (1938).

4.2.2.2.1.2 Cooptation

As a structural functionalist, Selznick (1948) posited a sociological mechanism for ensuring stability, called "cooptation".

"Cooptation is the process of absorbing new elements into the leadership or policy-determining structure of an organization as a means of averting threats to its stability or existence. This is a defensive mechanism..."⁵⁷⁷

⁵⁷⁷ Selznick, P. (1948), pg. 34.

4.2.2.2.2 General Systems Theory

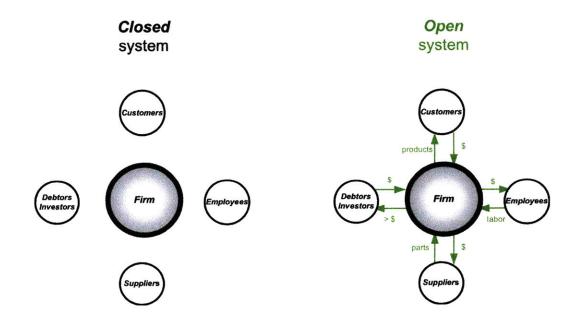

"General system theory seeks to classify systems by the way their components are organized (interrelated) and to derive the 'laws,' or typical patterns of behavior, for different classes of systems singled out by the taxonomy."⁵⁷⁸

"Certain methods of studying behavior apply to all organized systems, namely structure, function and evolution. Any organized system can be seen from these three perspectives which encompass the broadest scope of a general system theory."⁵⁷⁹

Foundational theorists in General Systems Theory included von Bertalanffy (1962), Boulding (1956), and Rappoport (1968).

4.2.2.2.2.1 Open vs. Closed Systems

Closed systems are characterized by isolation from their environment, while open systems are characterized by an exchange with their environment. Within organizational systems, this exchange might include information, material, energy, etc. While closed systems characterize phenomena like physics, it was also used to characterize organizations up until the general systems theorists (von Bertalanffy, 1950). Figure 172 below summarizes this distinction.⁵⁸⁰

⁵⁷⁸ Rapoport, A. (1968), pg. xvii.

⁵⁷⁹ Rapoport, A. (1968), pg. xx.

⁵⁸⁰ Ackoff, R. (1990), draws a similar diagram of an open systems (stakeholder) view of the corporation.

4.2.2.2.2.2 Open-Closed Systems vs. Open-Closed Causality

"von Bertalanffy may have confused the concept of a closed loop of circular causality with his own notion of a 'closed system.' The later is a system that exchanges no material or energy with its environment, an entirely distinct and independent idea from the notion of a closed sequence of causes and effects."⁵⁸¹

Richardson (1990) presents a compelling history of feedback thought in the social sciences. As a fundamental part of his thesis, he chronicles the historical uses (and misuses) of the notion of firms as "open" systems.

"A 'closed system' in general systems theory is a system that experiences no interchange of material, energy, or information with its environment. In contrast, Forrester's concept represents a system that is not 'materially closed,' but rather 'causally closed' – the closed boundary separates the dynamically significant inner workings of he system from the dynamically insignificant external environment. The two views of closed systems – materially closed and causally closed – are related but are significantly different. No serious system dynamics model is closed in the general system theory sense. Every one exchanges material with its environment. Because of such exchanges, Forrester's 'closed boundary' systems are, in von Bertalanffy's terms, 'open systems."³⁵²

This point is very important to the theory developed in this dissertation, as although most strategy research embraces firms as open systems which exchange material etc. with their environments, the preponderance of this research implicitly assumes that firms' while openly exchanging things with their environments have little active role in determining collectively with their environments *what* is to be exchanged, *how much, how often* and *why* it is exchanged. This is shown in Figure 173 below.

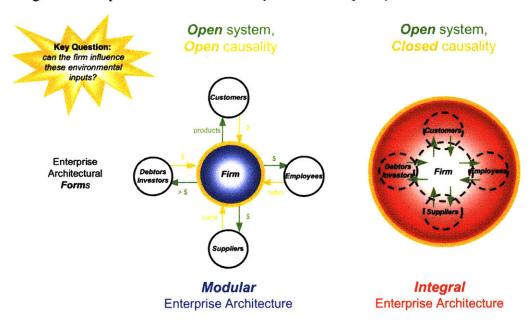

Figure 173: Open and Closed Causality within an Open Systems Framework

4.2.2.2.3 Structural Contingency Theory

Structural contingency theory (Burns and Stalker, 1961; Woodward, 1965; Lawrence and Lorsch, 1967; Thompson, 1967; Blau, 1970) has left an important mark on organizational theory in that it specifies that the most effective organizational structural designs are contingent upon environmental (Burns and Stalker, 1961), technological (Woodward, 1965) and size (Blau, 1970) factors. Table 10 below summarizes the primary research contributions of the contingency theorists.⁵⁸³

Year	Author	Research Setting	Claims
1954	Gouldner	1	Differences in work structuring reflected degree of
		(gypsum company)	danger and uncertainty in production.
1958	Woodward	92	Differences in structural features reflect complexity of
		(industrial firms)	technology employed.
1958	Rice	1	There are three environmental imperatives that must be
1963		(Indian textile firm)	satisfied: technological, social and economic.
1961	Burns &	20	More simple & stable environments yield mechanistic
	Stalker	(industrial firms)	structures vs. organic structures.
1967	Lawrence	6	More complex environments demand more
	& Lorsch	(firms)	differentiation & integration.
1967	Thompson	0	Different levels within organizations are more open to
		(theoretical)	the environment than others.
1971	Blau et al.		Effects of size and environmental complexity on
			structure.
1973	Galbraith		Related task complexity and structural complexity.
1978	Pfeffer &		Power / dependence relations among organizations.
	Salancik		

Table 10: Contingency Theory Research Summary

As shown in Figure 174 below, contingency theory can be thought of as explaining variation in two ways: between organizations and within organizations.⁵⁸⁴

⁵⁸³ Source: W. Richard Scott in Introduction to Thompson (1967), pg. xix-xxi.

⁵⁸⁴ Source: W. Richard Scott in Introduction to Thompson (1967), pg. xix-xx.

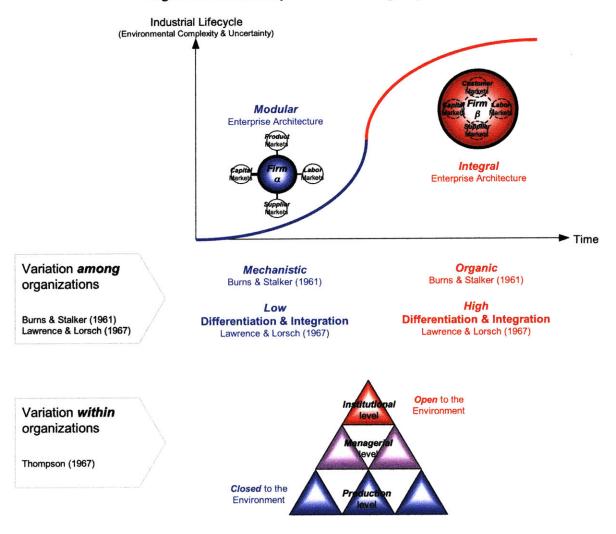

Figure 174: Summary of Two Contingency Models

4.2.2.2.3.1 Mechanistic vs. Organic (Burns & Stalker)

Burns and Stalker (1961) identified environmental *variability* (characterized as "stable" and "unstable") as a critical contextual factor in organizational design. They hypothesized two corresponding organizational designs: formal "mechanistic" and informal "organic" which would produce more effective performance in the respective environments of stability and instability.

Classical organizational theorists tended to view organizations - no matter how complex they are - as *deterministic*. To the contrary, modern organizational theorists tend to view organizations as *probabilistic*. Burns and Stalker (1961) captured this dichotomy using the terms "mechanistic" and "organic".

Table 11 below summarizes the mechanistic and organic archetypes.

"We are now at the point at which we may set down the outline of the two management systems which represent for us the two polar extremes of the forms (or 'ideal types') which such systems can take when they are adapted to a specific rate of technological and commercial change."⁵⁸⁵

Characteristic	Mechanistic	Organic
a. Knowledge & experience	The specialized differentiation of functional tasks	The contributive nature of special knowledge & experience
b. Nature of the individual tasks	Abstract, with purposes distinct from those of the organization as a whole	Realistic, with tasks set by the total situation of the organization
c. Means of task definition & reconciliation	Immediate superiors	Interaction with others
d. Definition of rights, obligations & methods	Attached to each functional role	A limited field (shedding of 'responsibility')
e. Translation of rights, obligations & methods	Responsibilities of the functional position	Spread of commitment to the organization
f. Structure of control, authority & communication	Hierarchy	Network
g. Location of technical & commercial knowledge	Exclusively at the top of the hierarchy	Anywhere in the network
h. Direction of communication & interaction	Vertical	Lateral
i. Content of communication	Instructions & decisions (command)	Information & advice (consultation)
j. Condition of membership	Loyalty to the organization & obedience to superiors	Commitment to organization's tasks & ethos of progress & expansion
k. Sources of importance & prestige	Internal (local) knowledge, experience & skill	Affiliations & expertise external to the firm

Table 11: Mechanistic and Organic Organizational Archetypes (Burns & Stalker)⁵⁸⁶

4.2.2.3.2 Small & Large Batch and Process Technologies (Woodward)

Woodward (1965) observed that there were more effective organizational designs depending upon the type of production technologies employed.

4.2.2.3.2.1 Craft, Mass and Lean Production

A quarter century later, researchers at MIT's *International Motor Vehicle Program* (IMVP) studying the global automobile industry identified similar production technologies with implications for organizational design (Womack, Jones and Roos, 1990; MacDuffie, 1991).

"This dissertation examines the thesis that flexible production systems are supplanting mass production systems because of their superior manufacturing perfomance. The dissertation argues that flexible production systems follow a different 'organizational logic' than mass production. This logic has two dimensions: structural and cultural. The 'structural logic' of a production system is identified in terms of the deployment of resources, the link of core production activity to the market, the structure

⁵⁸⁵ Burns, T. and Stalker, G. M. (1961), pp. 119 and xi..

⁵⁸⁶ Burns, T. and Stalker, G. M. (1961), pp. 120-122.

of authority relations, and the link between conception and execution. The 'cultural logic' is identified as a way of thinking about production activities that emphasizes their integration with innovation activities."⁵⁸⁷

In our research, we take a more macro-enterprise view of such "organizational logic." In addition, we define external environmental contingencies (as well as internal organizational contingencies) which enable the success of mass and flexible production systems.

4.2.2.3.3 Uncertainty Reduction (Thompson)

Thompson (1967) argued that much of organizational action can be explained by the need to reduce uncertainty, which originates in the environment (Kamps and Polos, 1999). He articulated much of his theory through 95 propositions.

⁵⁸⁷ MacDuffie, J.P. (1991), abstract.

4.2.2.3.4 Differentiation and Integration (Lawrence & Lorsch)

From a systems theory point of view, Stacey (1995) notes that the forces of integration lead to stable equilibrium via negative feedback, while the forces of division lead to instability via positive feedback.

This "division of labor – centralization of authority" dichotomy would later be reiterated by Lawrence and Lorsch, in their 1967 classic, *Organization and Environment: Managing Differentiation and Integration.*⁵⁸⁸ They demonstrated that organizational subunits adapted separately to their own specific environments. Therefore, organizations which face dynamic (or unstable) and diverse (or heterogeneous) environments, must possess a greater degree of structural differentiation and integration in order to be effective.

4.2.2.2.3.4.1 Critiques

4.2.2.3.4.1.1 Invalid & Inconsistent Claim

Lawrence and Lorsch's claim that higher levels of environmental dynamism and diversity are best met with higher levels of organizational differentiation is supported by the empirical data in this research. However, their subsequent claim that these higher levels of organizational differentiation are matched by corresponding higher levels of organizational integration, is neither supported by empirical data in this research, nor in fact by the empirical data in their original seminal research.

From an assessment of their original empirical data (albeit a small-N theoretical sample used for building grounded theory), the first claim indeed seems plausible, as high-performing firms in increasingly dynamic and diverse environments indeed do have higher levels of organizational differentiation. See Table 12 below.⁵⁸⁹

Table 12: Inter-Industry	Differentiation and	Integration Comparison
--------------------------	---------------------	------------------------

Industry	Organization Performance	Avg. Differentiation	Avg. Integration
Plastics	High Performer	10.7	5.6
Foods	High Performer	8.0	5.3
Containers	High Performer	5.7	5.7

Note, however, that the second claim indeed seems implausible, as high-performing firms in increasingly dynamic and diverse environments indeed have *lower* levels of organizational differentiation. This finding is broadly in line with the empirical data gathered in this research.

⁵⁸⁸ This connection between Weber and Lawrence and Lorsch was originally made by Scott and Mitchell (1972), pp.

⁵⁸⁹ Taken from Lawrence and Lorsch (1967a), pg. 103.

Finally, from their own theorizing, they seem to indicate the incompatibility of these opposing forces:

"The findings of this study indicate that, other things being equal, differentiation and integration are essentially antagonistic, and that one can be obtained only at the expense of the other." ^{\$90}

"Our findings have also indicated that the states of differentiation and integration are **inversely** related. The more differentiated an organization, the more difficult it is to achieve integration."⁵⁹¹

"Integration is a better single predictor of performance than differentiation alone."592

Presumably, if the two are as incompatible and as hard to achieve as they suggest, then one might expect that performance would suffer if firms didn't focus on one or the other, as the environment dictates.

4.2.2.3.4.1.2 Longitudinal Discontinuity

Finally, while Lawrence and Lorsch's first claim of contingency appears to be supported by this research, it is limited in that it represents a cross-sectional slice. They are able to make *inter*-industry comparisons between high performing firms:

"In any case, the contrast between the plastics and the container organizations is very sharp. In a sense, the represent opposite ends on a continuum, one dealing with a very dynamic and diverse environment, where innovation is the dominant issue, while the other is dealing with a very stable and homogeneous environment, where regularity and consistency of operations were important."⁵⁹³

Conversely, the data represented by this research is longitudinal, and therefore allows for intraindustry heterogeneity to be compared over time. This allows us to make *intra*-industry comparisons between high performing firms.

⁵⁹⁰ Lawrence and Lorsch (1967b), pg. 47.

⁵⁹¹ Lawrence and Lorsch (1967a), pg. 157.

⁵⁹² Lawrence and Lorsch (1967b), pg. 46.

⁵⁹³ Lawrence and Lorsch (1967a), pg. 155.

4.2.2.2.4 *Political* Theories of the Firm

As an extension of social system and contingency theories, political coalition theory sees the interaction of the environment as a political process, with power relationships being contingent on resource dependence. March (1962) was one of the first to articulate the case for the business firm being a "political coalition".

"Basically we assume that a business firm is a **political coalition** and that the executive in the firm is a **political broker**. The **composition** of the firm is not given; it is **negotiated**. The **goals** of the firm are not given; they are **bargained**. We assume that there is a set of potential participants in the firm. At least initially, we think of such classes of potential participants as **investors (stockholders)**, **suppliers**, **customers**, **governmental agents**, and various types of employees." ³⁹⁴

March (1962) characterizes the differences between economic theories of the firm and political theories of the firm.

"The focus of attention shifts from the owners (and their objectives) to the actual, operating organizers of the coalition – whoever they may be. In general, we view **stockholders** much as a theory of political systems might view **citizens**. Their demands form loose constraints on the more active members of the coalition. Their initiative in policy formation and in determining the nature of the coalitions is small."⁵⁹⁵

"The theory [of the business firm as a political coalition] does not solve the problem of conflict by simple payments to participants and agreement on a superordinate goal. Rather it emphasizes the importance of policy demands and payments and of sequential rather than simultaneous mediation of demands." ⁵⁹⁶

4.2.2.2.4.1 *Resource Dependence* Theory (Pfeffer & Salancik)

The resource dependence theory looks at the ways in which organizations reduce environmental uncertainty (Thompson, 1967; Pfeffer and Salancik, 1978; Pfeffer, 1982). These include either internal "buffering" or external "bridging".

Recent theorists have noted the limitations of Pfeffer and Salancik's formulation, by disaggregating the notion of interdependence into two dimensions: power imbalance and mutual dependence (Casciaro and Piskorski, 2005).

4.2.2.2.4.2 Stakeholder Theory of the Firm

Much of the establishment of a theoretical construct of an enterprise architecture is based on the relatively new theoretical notion that the firm is not necessarily designed specifically to advance the unitary profit interests of the owners or shareholders. There are other types of firms driven by different "objective functions", namely those who are trying to balance the plural objectives

⁵⁹⁴ March, J.G. (1962), pg. 672.

⁵⁹⁵ March, J.G. (1962), pg. 674.

⁵⁹⁶ March, J.G. (1962), pg. 674.

of multiple stakeholders. Within the strategic management field, Whittington (2000) identifies this range of objective functions or "profit motives" as a primary classification of firms.

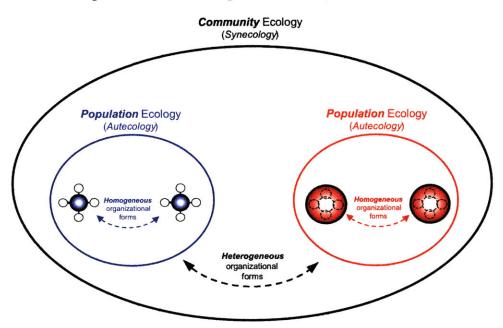

The stakeholder view of the firm is a relatively new theoretical perspective within the fields of economics and organizational theory (Follett, 1918; Freeman, 1984; Evan and Freeman, 1988; Ackoff, 1990; Donaldson and Preston, 1995; Mitchell, Agle & Wood, 1997; Ramirez, 1999). While the major works have proliferated in the past 25 years, the thread can be traced back to the ideas of Mary Parker Follett in the field of political science in 1920's (Schilling, 2000).

As will be discussed later in Essay #2, the stakeholder view of the firm implies a formal recognition of a series of exchanges with entities or stakeholders outside the firm. This relationship with the firm's environment is seen as an "open" system, however it may not be seen as causally open, depending on how the causal mechanisms are constructed.

As will be discussed in the following section, this recognition of firms with differing objective functions has been made recently within the field of economics under the heading of "mixed" duopolies.

4.2.2.3 Ecological View

The ecological view of organizations and organizational change takes an evolutionary perspective. Borrowed from the intellectual domain of biological ecosystem science, which is divided into "synecology", which is the study of multiple, interdependent populations within communities and ecosystems, and a subset called "autecology", which is the study of individual organisms within single populations (Whittaker, 1975, pp. 4-5) as shown in Figure 175 below.

While much work in organizational sociology has focused on autecology (known as "population" or "organization" ecology), relatively little work has focused on synecology (known as "community" ecology). The framework developed herein is an attempt with this higher, more general analysis of ecosystems.

"The perspectives adopt different levels of analysis and produce contrasting views of the characteristic mode and tempo of organizational evolution. Population ecology limits investigation to evolutionary change unfolding within established populations, emphasizing factors that homogenize organizational forms and maintain population stability. Population ecology thus fails to explain how populations originate in the first place or how evolutionary change occurs through the proliferation or heterogenous organizational types. Community ecology overcomes these limitations: it focuses on the rise and fall of populations as the basic units of evolutionary change, simultaneously explaining forces that produce homogeneity and stability within populations and heterogeneity between them."

This research postulates that if intra-species structural inertia were zero, then variation would take place within species, and population heterogeneity would not exist.

⁵⁹⁷ Astley, 1985, pg. 224.

4.2.2.3.1 *Population* Ecology (Autecology)

The first definitions of population ecology is the organizational unit and its environment, that is, the organizational *form* and the organizational *niche*.

4.2.2.3.1.1 Organizational Form

Population ecologists define populations as the collection of organizations exhibiting the same structural form (Carroll, 1984). *Form* is defined as a "blueprint for organizational action" (Hannan and Freeman, 1977, pg. 935) that a number of organizations share. In this sense, an organizational form can be expressed as a typology or taxonomy as will be suggested later in this chapter under the categorization of *architectural form*.

"Form serves as the organizational ecologist's analogue to the biological ecologist's species. Form summarizes the core properties that make a set of organizations ecologically similar. Oranizational populations are specific time-and-space instances of organizational forms."⁵⁹⁸

Note that while *ecologists* define *populations* as organizations exhibiting the same structural form, *economists* define *industries* as including all organizations serving the same demand or function, which could include quite diverst types of providers of substitutable products (Scott, 2003, pg. 127, footnote 2). This framework therefore defines multiple populations of organizational forms serving an industry (or niche).

Hannan and Freeman (1989, pg. 51) identify four properties of organizations which can be used to classify them into forms:

- Stated goals (i.e. *objective functions*)
- Forms of authority (i.e. *modular* vs. *integral*)
- Core technology (i.e. growth vs. stability)
- Marketing strategy (i.e. *differentiated* vs. *cost-leadership*)

4.2.2.3.1.2 Organizational Niche

We will consider explicitly and formally the niches (and niche overlap) in the mathematical modeling in Chapter 7.

4.2.2.3.1.3 Structural Inertia

In chapter 6, we will present empirical evidence of the existence of structural (or architectural) inertia, which facilitates the downfall of incumbent architectures and enables the late entry and survival of challenger architectures.

⁵⁹⁸ Hannan and Carroll, 1995, pg. 29.

4.2.2.3.2 Community Ecology (Synecology)

"The organization field can be viewed as encompassing the other levels: the individual organization, the organizational set, and two or more populations of interdependent organizations."⁵⁹⁹

Synonymous with inter-organizational *community* is the organizational *field* (Scott, 2003, pp. 129-132).

Much of the focus of organizational ecology research has focused on populations of organizations – otherwise known as "population" ecology – while relatively few references exist in the management literature on multiple populations or "community" ecology (e.g. Astley, 1985; Beard and Dess, 1988). It is however at the community level, that populations of organizations adapt to form new species of populations.

"That the community is the essential adaptive mechanism may be taken as the distinctive hypothesis of ecology."⁶⁰⁰

4.2.2.3.2.1 Verhulst Population Growth in Finite Environment

In order to define how populations grow, we can determine the key variables which enable and constrain their growth.

4.2.2.3.2.2 Species Archetypes: r-strategists and K-strategists

Birttain and Freeman (1980) adapted these concepts from organisms to organizations. We will develop these further in Chapter 7.

4.2.2.3.2.3 Lotka-Volterra (Predator-Prey) Inter-species Competition

Although the Lotka-Volterra Predator-Prey equations are famous for their potential to generate chaotic oscillation through a balancing loop between predator and prey, we will focus on the reinforcing behavior between competitors in Chapter 7.

⁵⁹⁹ Scott, 2003, pg. 131.

⁶⁰⁰ Hawley, 1950, pg. 31.

4.2.2.4 Institutional and Neo-Institutional Theory

4.2.2.4.1 Institutional Theory

We note that the actors in the enterprise architectures may in fact not conform to rationality assumptions of classical economics, and instead rely on informal mechanisms espoused by Institutional Theory (Selznick, 1949). Selznck's work on co-optation will be particularly relevant when we explore how an (integral enterprise architecture) organization engages the environment for its survival.

4.2.2.4.2 *Neo-Institutional* Theory

As one of the "bit four" theories to grow out of the 1960's contingency theory, neo-institutional theory was launched by the works of Meyer and Rowan, in1977 and DiMaggio and Powell in 1983.

"What makes organizations so similar? Once a set of organizations emerges as a field, a paradox arises: rational actors make their organizations increasingly similar as they try to change them."⁶⁰¹

While much of the new debate in economics and strategic management in the past two decades has focused on what are the sources of firm *heterogeneity* (Barney, 1991), the debate in sociology has been just the opposite: what are the sources of firm *homogeneity* or institutional isomorphism (Meyer and Rowan, 1977; DiMaggio and Powell, 1983).

⁶⁰¹ DiMaggio and Powell, 1983, pg. 147.

4.2.2.5 Social Network Theory

This section deals with an important subset of social network theory, namely *inter-firm* network theory.

4.2.2.5.1 Embeddedness

"Research on embeddedness is an exciting area in sociology and economics because it advances our understanding of how social structure affects economic life."⁶⁰²

Some of the original research on "embeddedness" within inter-firm networks was done by Schumpeter (1950) and Granovetter (1985), and was subsequently developed by researchers like Uzzi who focus specifically on "structural embeddedness" or on how the "network architecture of exchange relationships influence economic activity" (Uzzi, 1997, pg. 36).⁶⁰³

4.2.2.5.1.1 Under-embedded network

Uzzi (1997) characterizes a continuum of exchange relationships with the neoclassical form as follows:

"In the ideal-type atomist market, exchange partners are linked by **arms-length** ties. **Self-interest** motivates action, and actors regularly switch to new buyers and seller to take advantage of new entrants or avoid dependencies. Personal relationships are **cool and atomistic**."⁶⁰⁴

4.2.2.5.1.2 *Over*-embedded network

Conversely, the embedded form has the following characteristics:

"Embedded actors satisfice rather than maximize on price and shift their focus from the narrow economically rational goal of winning immediate gain and exploiting dependency to cultivating long-term, co-operative ties. The basic conjecture of this literature is that embeddedness creates economic opportunities that are difficult to replicate via markets, contracts or vertical integration."⁶⁰⁵

"In an embedded logic of exchange, trust acts as the primary governance structure. Joint problemsolving arrangements promote voice rather than exit. On a microbehavioral level, actors follow heuristic and qualitative decision rules, rather than intensely calculative ones. These factors furnish an alternative mechanism for matching customer demand to production."⁶⁰⁶

Uzzi (1997) then goes on to demonstrate empirically the competitive advantages of embeddedness, but notes some economic limitations, particularly with regard to adaptability:

- ⁶⁰⁴ Uzzi, 1997, pg. 36.
- ⁶⁰⁵ Uzzi, 1997, pg. 37.

⁶⁰² Uzzi, 1997, pg. 35.

⁶⁰³ Uzzi does not consider the other three forms of embeddedness put forth by Zukin and DiMaggio (1990): cognitive, political and cultural.

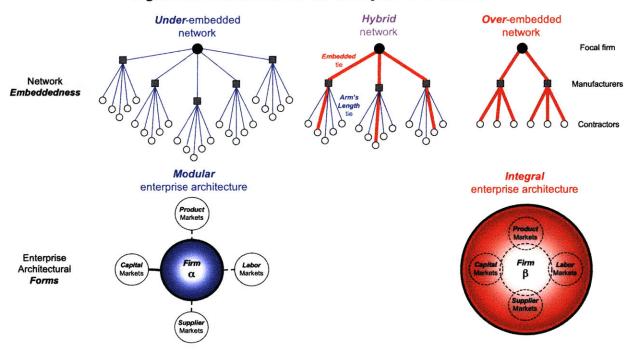

⁶⁰⁶ Uzzi, 1997, pg. 61.

"Embeddedness is a logic of exchange that promotes economies of time, integrative agreements, Pareto improvements in allocative efficiency, and complex adaptation. These positive effects rise up to a threshold, however, after which embeddedness can derail economic performance by making firms vulnerable to exogenous shocks or insulating them from information that exists beyond their network."⁶⁰⁷

"The same processes by which embeddedness creates a fit with the current environment can paradoxically reduce an organization's ability to adapt." ⁵⁰⁸

4.2.2.5.1.3 Hybrid network

Figure 176 below illustrates the concept of embeddedness with respect to the enterprise architectural theory presented in this research.⁶⁰⁹

⁶⁰⁷ Uzzi, 1997, pg. 35.

⁶⁰⁸ Uzzi, 1997, pg. 57.

⁶⁰⁹ Note that Uzzi's work appears to focus on the supply or value chain axis only. Note unfortunately that Uzzi refers to the hybrid network as "integrated". This unfortunately is confusing with respect to the terminology used in this dissertation.

4.2.2.5.2 Socialization

Granovetter 's (1985) theories of socialization echo a typology of under-socialized behavior underpinned by much of economics (modular enterprise architecture) and over-socialized behavior underpinned by much of sociology (integral engerprise architectures).

4.2.2.5.2.1 Under-socialization

With price as the integrating mechanism, socialization processes are less relevant, and more in line with the demands of modular enterprise architectures.

4.2.2.5.2.2 *Over*-socialization

When plural objective functions exist, adherence to the stability of social norms become more relevant, which is in line with integral enterprise architectures.

4.2.2.5.3 *Keiretsu* as *Inter*-firm Networks

Various threads have emerged, including the empirical observation of social forms like Japanese "keiretsu" (Lincoln, Gerlach and Ahmadjian, 1996).

4.2.2.6 Behavioral Decision Theory

4.2.2.6.1 Bounded Rationality

Much of the work on bounded rationality, (e.g. Simon, 1958; Cyert and March, 1963) will be extended in an enterprise architectural setting, where decision makers will be subjected to making decisions that are boundedly rational in stakeholder space and time.

4.2.2.6.2 Exploitation vs. Exploration

The tradeoff between exploitation and exploration (March, 1991) will be made apparent as is the fundamental tradeoff between modular and integral enterprise architectural forms.

4.2.2.6.3 Loose vs. Tight Coupling

When Simon⁶¹⁰ speaks of loosely-coupled systems as being more "stable", he is referring to their "survivability" or "damage-tolerance", as they are able to localize disruptions. Later, I shall argue that loosely-coupled systems correspond to the notion of modular architectures, which generate greater degrees of *in*stability - with stability meaning in this case variablility.

⁶¹⁰ See Weick, K (1976) also.

4.2.2.7 Complexity / Complex Adaptive Systems Theory

More recently, sociological contingency theory has taken a new form, that of complex adaptive systems.⁶¹¹ This has begun to find its way into the strategic management literature (Levy, 1994; Stacey, 1995; Lengkick-Hall and Wolff, 1999; Caldhart and Ricart, 2004). Researchers have explored evolutionary biological⁶¹² phenomena (Kauffman, 1993) and mapped them onto business phenomena (Levinthal, 1997; Rivkin, 2000; Sigglekow, 2002).

4.2.2.7.1 NK Model of Interdependencies

Kauffman's (1993) NK model defines interdependencies between activities, where each of N total activities interacts with K other activities. The NK model has been transported to the strategic management domain by Levinthal (1997) and Rivkin (2000). In management research, the NK model can be thought of as a complex production function, which is comprised of these activities as well as the traditional capital and labor (Lenox, Rockart and Lewin, 2006). In this way, the NK model captures interdependencies between activities in a more general way than Milgrom and Roberts' (1990, 1995) complementarity concept which invokes the power and simplicity of supermodularity.

The presence of *low* interdependencies between parts, chunks, or stakeholders (i.e. N=1) signals a *modular* enterprise architecture, whereas the presence of *high* interdependencies between parts, chunks, or stakeholders (i.e. N \approx K) signals an *integral* enterprise architecture, as shown in Figure 177 below.

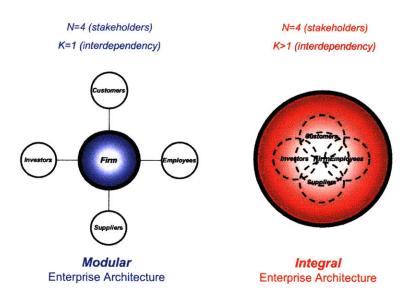

Figure 177: NK Model and Enterprise Architectures

 ⁶¹¹ I am indebted to Dr. Felix Reed-Tsochas of the University of Oxford for assisting me in developing this.
 ⁶¹² Note that the notion of a *fitness* function in evolutionary biology is simply the negative of a *potential* function in the nonlinear physics of attractors and basins.

Modular enterprise architectures therefore possess a rather simple objective function or "landscape", which is a single concave globally optimal peak. Integral enterprise architectures on the other hand possess a more complex objective function or landscape, which consists of multiple local optima, having the appearance of a rugged surface (as will be summarized in the next section).

4.2.2.7.2 Fitness Landscapes

A fitness landscape is simply the representation of genotype similarity on the horizontal axis and fitness or reproductive / business success on the vertical axis.

In applying this concept to the framework presented herein, it is posited that fitness or business success in an emerging market is characterized by competition between enterprises having similar genotypes / phenotypes in a *stable* landscape. Conversely, fitness or business success in a maturing market is characterized by competition between enterprises having different genotypes / phenotypes in a *rugged* landscape as shown in Figure 178 below.

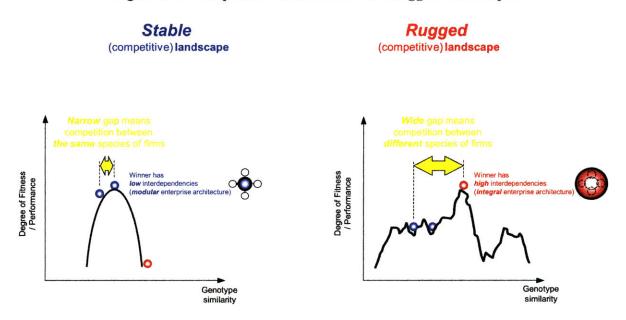

Figure 178: Competition within Stable and Rugged Landscapes

4.2.2.7.2.1 Part-Whole Relationships

In biology, the part-whole relationship is the relationship between an organism's *genetic* structure (or internal interdependencies) and its phenotype (or *overall* structure), which is in turn related to the organism's fitness with its environment (or external interdependencies).

4.2.2.7.2.2 Rugged Landscapes

Kauffman (1993) modeled the selection dynamics in the biological domain with heterogeneous interdependent traits. He found that as the number of interdependent elements increases, the fitness landscape presents an increasing number of local optima (Dosi et al. 2003, pg. 105-106).

"In the presence of strong interdependencies (as is often the case in many complex products), the system can not be optimized by separately optimizing each element from which it is made. Indeed, in the case of strong interdependencies, it might well be the case that some, or even all, solutions obtained by tuning each component 'in the right direction' yield a worse performance than the current one." 613

4.2.2.7.3 Competition vs. Cooperation

Political scientist, Robert Axelrod, in *The Evolution of Cooperation* (1984) used game theoretic research with the iterated Prisoner's Dilemma results in a TIT-FOR-TAT as optimal. This was followed up more recently with agent based modeling in *The Complexity of Cooperation* (1997).

"Fool me once, shame on you. Fool me twice, shame on me!"614

"Toyota has two faces. It is a stern father and a compassionate mother."⁶¹⁵

⁶¹³ Dosi et al. (2003), pg. 106.

⁶¹⁴ Ancient Chinese proverb.

⁶¹⁵ Shogo Tsuru, former chairman of Nippon Oil Seal, as quoted in Hino, S. (2006), pg. 59.

4.2.3 Strategic Management *theories*

4.2.3.1 SCP vs. RBV

There is clearly a considerable wealth of constituent research in the field of strategic management from two schools rooted in microeconomic theory: the Industrial Organization subfield dating back to Bain (1956) advanced the industry structure emphasis and on the resource-based view of the firm dating back to Penrose (1959), with their respective descendant proponents appearing a quarter century later in Porter (1980) and Wernerfelt (1984). Since this time, much research in this field has focused on the refinements of theories in each subfield, including: asset stock accumulation and dynamic capabilities (Dierickx and Cool, 1989; Teece, Pisano and Shuen, 1990).

It will be demonstrated theoretically later in this chapter that different enterprise architectures will be built and operated by people and institutions having different mental models or who operate a different "core logic" (Lengnick-Hall and Wolff, 1999) regarding the nature and purpose of strategy.

In fact, it will be hypothesized that *modular* enterprise architectures operate a core logic, which is more closely aligned with the SCP paradigm and the hypercompetitive and high-velocity perspectives that embody "guerilla logic" (Lengnick-Hall and Wolff, 1999).

In contrast, it will be hypothesized that integral enterprise architectures operate a core logic, which is more closely aligned with the RBV paradigm and the ecosystem/chaos perspectives that embody "complexity logic" (Lengnick-Hall and Wolff, 1999).

4.2.3.2 Flexibility vs. Comittment

Ghemawat, (1992), Pacheco-de-Almeida, G., Henderson, J.E., and Cool, K.E. (2008).

4.2.3.3 Profit-Maximizers vs. Profit-Seekers

Each of these two schools can be seen to represent the assumptions behind *modular* enterprise architectures (SCP) and *integral* enterprise architectures (RBV). The SCP school assumes firms as profit-*maximizers*, while the RBV school (including Schumpter-Penrose-Nelson/Winter) assumes firms as profit-*seekers*.⁶¹⁶

4.2.3.4 *M*-Form vs. *N*-Form

Hedlund (1994) was one of the first to move from the multi-divisional form (Chandler, 1962) to the network form. This has implications for the modular and integral enterprise architectures respectively.

⁶¹⁶ Cantwell, (2002), pp. 13.

4.2.3.5 Strategic Groups

The notion of "strategic groups" was asserted by Porter (1980, 1981), in an effort to discretize heterogeneity of firms within an industry. As will be discussed later, enterprise architecture configurations of modular vs. integral will be seen to belong to different strategic groups.

4.2.4 Architectural theories

The notion of *enterprise architecture* cuts across the many manifestations of "architecture" in management literature: e.g. complexity in- (Simon, 1962) building- (Alexander, 1964), product-(Ulrich, 1995), systems- (Meier and Rechtin, 2000; Nightingale and Rhodes, 2004), supply chain- (Novak and Eppinger, 1998), organizational- (Sanchez and Mahoney, 1996; Rechtin, 1999), human resource- (Lepak and Snell, 1999), innovation and- (Henderson and Clark, 1990), as well as the various interactions between architectures (Fine, 1998; Sako, 2003).

Although, civil, product and system architecting are focused primarily on technological systems, the concepts can be extended along the spectrum towards socio-technical systems and ultimately towards social systems. As shown in Figure 179 below, this is a matter of increasing both behavioral and dynamic complexity (Rittel and Webber, 1973; Senge, 1990).

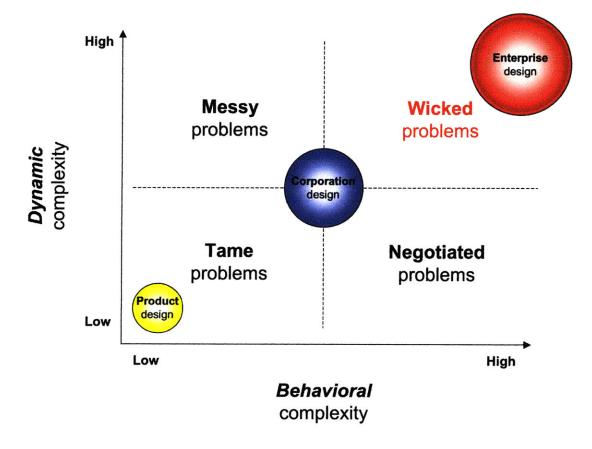

Figure 179: From Technical, to Socio-Technical, to Social Systems

4.2.4.1 Civil Architecture

4.2.4.1.1 Form (and Structure)

"Form: The shape and structure of an object. The essence of something."⁶¹⁷

"Structure: Something made up of a number of **parts** that are held or put together in a **particular** way."⁶¹⁸

4.2.4.1.2 Function

"Function: the action for which a person or thing is particularly fitted or employed."⁶¹⁹

In classical architectural theory, the relationship between architectural form and function is important and explicit. A similar relationship can be seen to drive the business enterprise's architectural form, namely the business objective function.

"Form follows function."620

Heuristic 1f:

The architectural *form* of an enterprise will be governed by the objective *function* of the enterprise (or at least by the "keystone" firm). Modular enterprises are driven by the maximization of *economic value*, while integral enterprises are driven by the creation and distribution of *stakeholder surplus*.

"The starting point for the book is therefore Chandlerian: How does strategy determine structure, and what are the complex ways in which structure and strategy interconnect? Here strategy may be defined as the planning and carrying out of the growth of organizations, and structure is understood to mean the organizational form devised to administer activities and resources (Chandler, 1962, pg. 13)."⁶²¹

This is a modification of Chandler's classic *Strategy and Structure* (1962), which explored *intra*firm design (focusing on the evolution of the multi-divisional "M-form") as opposed to *inter*firm design. Chandler asserted that the firm's *internal structure* should follow its strategy. In comparison, this framework is asserting that a firm's *external architecture* should follow its *objective function*. It is important to note that the concepts of both form and function are higher level and more abstract notions than Chandler's.

"Form and function are one."622

Finally, in the spirit of systems thinking and feedback causality, Frank Lloyd Wright (1939) argued for the integration of form and function as existing in a concurrent duality.

⁶²² Frank Lloyd Wright (1939).

4.2.4.1.3 Fit

The notion of "fit" is well established in civil architectural terms (Wright; Alexander, 1964; etc.) This topic will be taken up again in more detail in chapter 6, where the environment is explored in more detail.

4.2.4.2 *Product* Architecture

While the focus of *civil* architecture was largely on environmental fit, as well as form following function, the focus of *product* architecture lies in decomposing functions and mapping them onto structures to achieve the desired performance.

The following briefly summarizes and attempts to disentangle the various definitions and uses of "architecture" in the product development and management literatures.

4.2.4.2.1 Building Blocks, Components, Chunks, Modules

Product architecture is broadly defined as the mapping of function to form. Most researchers in product development use different terms to express form (or components of form) ranging from "building blocks" or "chunks", (Ulrich, 1995; Ulrich and Eppinger, 1995) and "modules" (Baldwin and Clark, 2000).

"Product architecture is the assignment of the functional elements of a product to the physical building blocks of the product."⁶²³

"Product architecture is the scheme by which the function of the product is allocated to physical components."⁶²⁴

"The architecture of the product is the scheme by which the functional elements of the product are arranged into **physical chunks** and by which the chunks interact."⁶²⁵

"An architecture specifies what modules will be part of the system, and what their functions will be." 626

While *product* architecture is defined in both functional and *physical* terms, *enterprise* architecture is defined in both functional and *organizational* terms as will be discussed in later sections.

4.2.4.2.2 Interfaces

"In management literature, more than in the engineering literature, there is a tendency to home in on *interface* specification as an important feature of modularity."⁶²⁷

⁶²³ Ulrich, K. and Eppinger, S. (1995), pp. 182-183.

⁶²⁴ Ulrich, K. (1995), pg. 419.

⁶²⁷ Sako, M. (2003), pg. 231.

4.2.4.2.3 Typology of Product Architectures

4.2.4.2.3.1 Modular

According to Ulrich and Eppinger (1995, pg. 183), modular product architectures:

- have functions assigned to one chunk;
- therefore, a chunk executes only one function;
- interactions between chunks are clearly-defined;

4.2.4.2.3.2 Integral

According to Ulrich and Eppinger (1995, pg. 184), integral product architectures:

- have functions assigned to more than one chunk;
- therefore, a chunk executes more than one function;
- interactions between chunks are ill-defined;

"An integral architecture allows for redundancy to be eliminated through function-sharing."⁶²⁸

An example of the range of product architectures employed is shown in Figure 180 below. In this example, a passenger airplane can be seen to have two primary functions, providing lift for flight, and providing a cabin for the passengers.

A conventional modular one-to-one mapping of function to form would entail an architectural solution in which separate physical "chunks" or modules would be separately designed, built and operated to accommodate each function. In this example, the wings (with their special airfoil shape) would serve to create lift, while the tubular fuselage would house the payload or passengers.

Conversely, an integral many-to-one mapping of function to form would entail an architectural solution in which one "chunk" or module would be integrally designed, built and operated to accommodate both functions. In this example, the fuselage would become the lifting device, or put another way, the wings would house the payload or passengers.

⁶²⁸ Ulrich, K. and Eppinger, S. (1995), pg. 188.

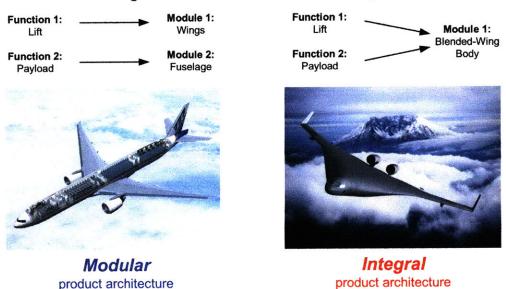

Figure 180: Product Architecture Example

"Conventional aircraft comprising separate wings and fuselages accomplish the functions of providing lift, carrying fuel, and housing passengers using separate portions of the aircraft. Typically wings and fuselages are designed by different engineers and made in different factories. The Airbus Consortium was structured to take advantage of this architecture. Wings are made in the UK, fuselage barrel sections in Germany, tail sections in Spain, and final assembly and integration takes place in France. But there are some disadvantages in terms of coordination as well as transportation of large subassemblies. For example, the International Space Station may have suffered from certain mismatches between physical and organizational architectures."

As will be discussed in subsequent sections, product architectures may have an influence on the design of organizational architectures. Because an integral product architecture like an airplane (Fine, 2005), can have its product and organization chunked in an apparently "modular" fashion, does not necessarily make the enterprise architecture modular. In fact, by the definitions provided herein, Airbus is an integral enterprise architecture which enables it to decompose the product into apparent "modules" designed and produced by apparently "modular" entities in distant geographic locations. However, it maintains high-level integration between the organizational chunks, thus delivering the intgeral product (and more importantly, the integral product portfolio) in an integral way. Just because a complex organism has more functions performed in different locations, does not necessarily make it more modular than a single-celled organism. Both Boeing and Airbus have broadly similar functional decompositions in their products (wings, fuselage, engines, avionics) and their enterprise architectures (customers, suppliers, investors, employees). The differences lie in how the objectives, boundaries and interfaces are managed ultimately define modularity or integrality. We are interested in function as well as structure.

⁶²⁹ Whitney, D. et al. (2004), pg. 10. Also noted in "Airbus' Jigsaw Plane", BusinessWeek, March 14, 2006.

4.2.4.2.4 Design Rules

"Design rules allocate functions to modules, identify operating principles, and set interfaces among modules that determine how organizations evolve."⁶³⁰

Helper and Khambete (2006, pg. 10) note that Baldwin and Clark (2000) emphasize the *location* of interfaces as opposed to the ways of *governing* the interfaces:

"Baldwin and Clark define a modular architecture as one which has few interdependencies between modules (and more interdependencies within modules). Their book focuses on the impact of the **location** of these interfaces (what happens if modules are split, recombined, etc.) They argue that a modular architecture promotes innovation by allowing more division of labor. They pay little attention to ways of governing interfaces (interdependencies) between components; mentioning only two: **Design rules (highly structured)** and **Discussion (loosely structured)**."⁶³¹

4.2.4.2.4.1 Three Types of Modularity

Modularity in design, manufacturing and use. (Baldwin and Clark, 2000). (Brusoni and Prencipe, 2006).

4.2.4.2.4.1.1 Modularity in Design

4.2.4.2.4.1.2 Modularity in Manufacturing

4.2.4.2.4.1.3 Modularity in Use

⁶³⁰ Brusoni and Prencipe (2006).

⁶³¹ Helper and Khambete (2006), pg. 10, footnote 6.

4.2.4.2.5 Product Performance

"I define product **performance** as how well the product implements its **functional** elements. Product performance **excludes economic performance**, except to the extent that it arises from the product's technical performance, because economic performance is also highly dependent on the firm's production, service, sales and marketing activities."⁶³²

Having defined the spectrum of product architectures, the obvious question is: "Which architecture performs better?" The answer is obviously, "It depends."

"Arguments for the integral design are often largely technical or performance-based, whereas arguments for modular tend to be based on business concerns such as cost and time to market."⁶³³

4.2.4.2.5.1 *Modular* performance

In general, modular product architectures are designed for *local* high performance (Ulrich, 1995, pg. 432). In addition, modular architectures tend to exhibit lower acquisition cost, which must be balanced against higher relative life-cycle costs.

4.2.4.2.5.2 Integral performance

"A product embodying an integral architecture will often be designed with the highest possible performance in mind."⁶³⁴

In general, integral product architectures are designed for *global* high performance (Ulrich, 1995, pg. 433) defined for narrow and specific environmental conditions. In addition, integral architectures tend to exhibit lower life-cycle costs, in spite of their higher acquisition costs.

⁶³² Ulrich, K. (1995), pg. 432.

⁶³³ Fine, C.H. (1998), pg. 136, acknowledging D. Whitney's contribution.

⁶³⁴ Ulrich, K. and Eppinger, S. (1995), pg. 184.

4.2.4.3 System Architecture

While the focus of *product* architecture was largely on decomposing functions and structures to achieve the desired performance, the focus of *system* architecture lies in greater detail and dynamic complexity, as well as design for emergence.

The following two sub-sections articulate two very different and potentially complementary processes for architecting systems.⁶³⁵

4.2.4.3.1 Top-down Deterministic Mechanistic Reductionism

"*Reductionism* relies on the assumption that a *divide-and-conquer* strategy will really work, that understanding the behavior of each element and defining each interface correctly and completely will assure a properly working system. This assumption brings with it a host of other attitudes and methods, generally called **top-down**, that assume that things can be **preplanned and scripted**, and that following the script is the way to get a successful result."⁶³⁶

As we have discussed in other social science literatures, this top-down approach is reminiscent of Theory X (McGregor, 1960), hierarchical command and control organizational structures. The reductionist divide-and-conquer strategy is reminiscent of the efficiencies of division of labor (Lawrence and Lorsch, 1967). The deterministic preplanned and scripted approach is reminiscent of the mechanistic traditions (Burns and Stalker, 1961).

4.2.4.3.2 Bottom-up Emergent Organic Holism

"In contrast to top-down is **bottom-up**, in which requirements and system design are expected to **emerge** over time and by means of **trial and error**. Under these assumptions, no complete script can be written, not all of the events and decisions can be anticipated or scheduled, and the final result is not known."⁶³⁷

As we have also discussed in other social science literatures, this bottom-up approach is reminiscent of Theory Y (McGregor, 1960), flat and empowered organizational structures. The holist strategy is reminiscent of the effectiveness of integration (Lawrence and Lorsch, 1967). The emergent and unscripted approach is reminiscent of the organic traditions (Burns and Stalker, 1961).

⁶³⁵ Weick, K. (1993) refers to the two types of organizational design as: formal and emergent.

⁶³⁶ Whitney et al. (2004), pg. 4.

⁶³⁷ Whitney et al. (2004), pg. 4.

4.2.4.4 Organizational Architectures

"Modular and integral architectures are like oil and water. They don't mix." "638

In addition to the study of physical architectures, whether civil, product or system, the discussion then tends towards the architectures of those organizations which design, produce and operate the physical architectures.

A recent study of the literatures in 36 journals on modularity in product, process, organization and innovation over the past 35 years revealed relatively little work in the area of organizational modularity (Fixson, 2006). Table 13 below summarizes the literatures at the intersection of modularity and organizations.

Authors	Year	Modularity Type			Industry	
		Product	Process	Organ- ization	Innovation	
Baldwin & Clark	2000			1	✓	Computer
Browning	2001	✓	✓	✓		Auto. sub-system

Comparing Physical- and Organizational Architectures

4.2.4.4.1.1 Common Points

From both physical architectural theory as well as sociology / organizational theory, we know the following:

4.2.4.4.1.1.1 Architecture *Enables* Function

Structure (or its more abstract form, architecture) is necessary to *enable* function. For example, in order to conduct the function of producing manufactured goods, one needs a structure/architectural form like a factory. In order to conduct the social function of business, one needs an organizational structure like a bureaucracy (Weber, 1952).

4.2.4.4.1.1.2 Architecture *Constrains* other Functions

In doing so, structure (architecture) *constrains* other functions. For example, the physical structure/architectural form of a factory, while enabling some production functions, constrains other functions like pursuit of leisure activities, like swimming. The social structure of bureaucracy, while enabling some business functions, constrains other functions like conducting an insurgent revolution.⁶³⁹

4.2.4.4.1.1.3 Architecture does not *Predetermine* Choice

But within an architecture, a range of *choice* (i.e. functional flexibility) is preserved. For example, within the physical architecture of a factory, one can manufacture goods or one can even meditate (even if not in a church, synagogue, mosque or temple). Within the organizational structure/architecture of a bureaucracy, one can conduct business or one can even raise a family (even if not in a more informal, trust-based environment).

⁶³⁹ It is interesting to note that when radical environmental change occurs, people in social organizations tend to preserve structures, instead of higher-order goals and objectives.

4.2.4.4.1.2 Differences

4.2.4.4.1.2.1 Visibility

Physical architectures are visible, while organizational architectures are invisible. This can present problems in theory development and testing in social science via "unobservables".

4.2.4.4.1.2.2 Evolution

Physical architectures can be approximated as static, or at least they "evolve" very slowly. Organizational architectures are dynamic, that is they have the potential to evolve very rapidly, particularly if their structural inertia is low (Hannan & Freeman, 1984).

4.2.4.4.1.2.3 Emergence

Physical architectures can be approximated as top-down deterministic, while organizational architectures are bottom-up emergent, that is they are continually enacted by their constituent agents.

4.2.4.4.2 Two Levels of Organizational Architecture

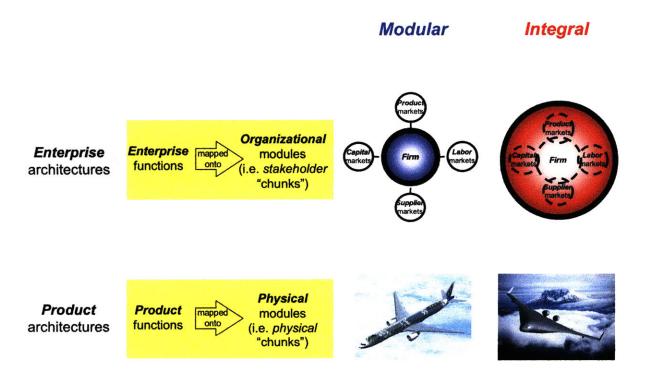

We will next explore both inter- and intra-firm architectures in the following sub-sections.

4.2.4.4.2.1 Inter-firm (Enterprise) Architectures

4.2.4.4.2.1.1 Concept Extended from Product Architecture

While we previously examined how the notion of architecture was used to map function to physical form, we now use the concept to relate how function relates to organizational form as shown in Figure 181 below.

Figure 181: Mapping Function to Organizational (not Physical) Form

4.2.4.4.2.1.2 Sub-case Example: Supply Chains

Baldwin and Clark (2000) show that firm boundary decisions in the computer industry are mediated by stakeholder groups representing both labor and capital markets. They argue that modularization or disintegration of the computer industry is driven by users demand for compatibility (modularity-in-use), which lead to modularity-in-design. The "environmental" or stakeholder factors that enabled such a transformation were the mobility of technical labor in the first instance, and the availability of venture capital to fund modular design firms.

Sako (2003) compares the catalysts driving product and organizational architectures in the computer and automobile industries, by searching for explanations in the stakeholder groups of labor and capital markets. She argues that the catalyst driving modularity in the automobile industry is modularity-in-*production* generated by the assembly of technologically and ergonomically complex components. The "environmental" or stakeholder factors that enabled such a transformation were the wage differentials of labor in the first instance, and the drive by investors to push for outsourcing and consolidation in a maturing industry with overcapacity and cost-competition.

Finally, Piepenbrock (2004) extends Baldwin and Clark (2000) and Sako's (2003) analyses to the commercial airplane industry, by noting that the catalyst driving modularity is modularity-in-*use* generated by the imperative of offset agreements in order to access international markets. This adds another stakeholder to the discussion, namely the customer via access to product markets. The "environmental" or stakeholder factors that enabled such a transformation were the wage differentials of labor to a small degree, but the access to risk-sharing partnerships with suppliers as a means of capital investment.

Figure 182 below, adapted from Sako (2003), applies the framework to illustrate the different catalysts driving product and organizational architectures in three industries: computers, automobiles, and airplanes.

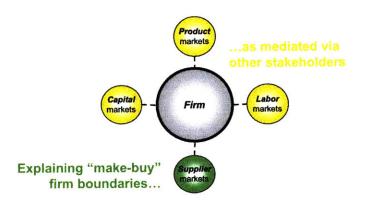

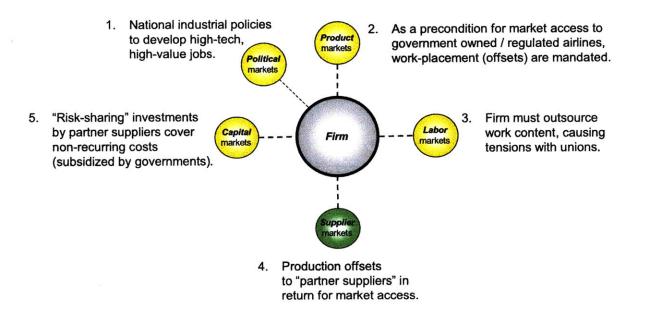

Figure 182: Stakeholder Catalysts driving Product and Organizational Architectures

Industry	Computers	Automobiles	Airplanes
Reference	Baldwin and Clark (2000)	Sako (2003)	Piepenbrock (2004)
Catalyst for Modularity	MiU → MiD (user demand for compatibility)	MiP → MiD (production complexity and ergonomics)	MiU, MiP → MiD (market access via production offsets)
Organizational Adaptation	Modular design teams & start- ups first, outsourcing later	Outsourcing, tiering and consolidation of suppliers	Outsourcing, tiering and consolidation of suppliers
Labor markets	Mobility of technical labor	Wage differentials between OEM and suppliers	International socio-political demand for work-placement
Capital markets	Venture capital for start-ups	Investment banking advice for M&A	Risk-sharing partner suppliers fund development costs
Product markets			Offsets give market access to international sales

Within the commercial airplane industry, the above-described stakeholder analysis, which ultimately drives product- as well as organizational architectures (and subsequent outsourcing) is shown in Figure 183 below.

Figure 183: Product & Organizational Architectures in Commercial Airplane Industry

4.2.4.4.2.2 Intra-firm Architectures

A mapping can be posited to exist between *inter*-firm (enterprise) architectural functions, and *intra*-firm functions or projects as shown in Figure 184 below.⁶⁴⁰ It will be demonstrated that a modular *inter*-firm enterprise architecture tends to be served by a modular *intra*-firm architecture, while an integral *inter*-firm enterprise architecture tends to be served by an integral *inter*-firm architecture.

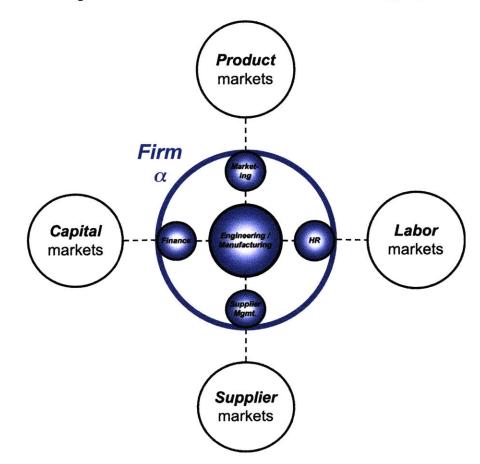

Figure 184: Inter-firm to Intra-firm Functional Mapping

Functional vs. Project (Forrester, 1961). Nadler & Tushman (1997).

⁶⁴⁰ Note that the customer-firm-supplier axis represents the three minimum internal business processes of marketing, engineering and supplier management as discussed in Hagel and Singer (2000).

4.2.4.5 Multi-Level Nesting: Product-Organizational Architecture Mapping

An overarching research question in this intellectual domain has been: "We know that organizations design products, but do products design organizations?" Recent research has observed that products do not design organizations, but knowledge does (Brusoni, 2006).⁶⁴¹

"Modular products can lead to modular organizations, as product design rules define both the technological and organizational architecture of the firm (e.g. Sanchez and Mahoney, 1996; Shilling, 2000; Sturgeon, 2002; Langlois, 2003). Empirical studies questioned such findings: non-modular organizations that produce modular products were observed in the aircraft engine (Prencipe, 1997), hard disk drive (Chesbrough and Kusunoki, 2001) and automotive industries (Takeishi, 2002). These studies illustrated that firms consist of different domains, e.g. organizational structures, technological architectures, etc. that may obey different design rules. The evolution of the firm's knowledge bases also plays a fundamental role in mediating the relationship between product and organization design (Brusoni et al. 2001)."⁶⁴²

While researchers like Fine (1998, 2005) have demonstrated that high firm performance results when product and organizational (i.e. supply chain) architectures are aligned, other researchers have demonstrated that *integral* organizations can indeed produce *modular* products (Prencipe, 1997; Chesbrough and Kusunoki, 2001; Takeishi, 2002 and Piepenbrock, 2004).

In fact, examples of *modular* organizations successfully producing *integral* products are not common. This research dissertation will attempt to show that in the commercial airplane industry, *Boeing* is evolving toward a more modular enterprise architecture, while its products are relatively more integral. Conversely, *Airbus* has a more integral enterprise architecture, while its products are more modular.

"Conventional aircraft comprising separate wings and fuselages accomplish the functions of providing lift and housing passengers using separate portions of the aircraft. Typically wings and fuselages are designed by different engineers and made within different factories. The **Airbus** consortium was **structured to take advantage of this architecture**. Wings are made in the UK, fuselage barrel sections in Germany, tail sections in Spain, and final assembly and integration take place in France."⁶⁶³

Many researchers have observed the coincident relationship between product architecture and higher level organizational and even supply chain architectures (Sanchez and Mahoney, 1996; Fine, 1998; Schilling, 2000; Sturgeon, 2002; Langlois, 2003; Helper and Khambete, 2006) as shown in Figure 185 below.

⁶⁴¹ I am indebted to Prof. Nightingale for helping me to clarify these concepts.

⁶⁴² Brusoni and Prencipe (2006).

⁶⁴³ Whitney et al. (2004), pg. 10.

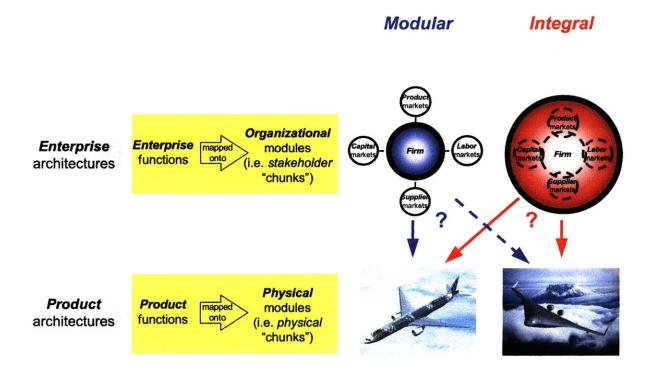

Figure 185: Deterministic Mapping of Product and Enterprise Architectures

The observation that successful product architecture drives (or is driven by) coincident supply chain architecture, does not necessarily imply that these in turn drive (or are driven by) coincident enterprise architectures (Prencipe, 1997; Chesbrough and Kusunoki, 2001, Takeishi, 2002; Sako, 2003; Brusoni and Prencipe, 2006). The potential reasons are hypothesized to be:

- The relatively narrow nature of the technologically-oriented interface information that drives the relationship between firm (product) and supply chain, compared to the more pluralistic information relating to investor and labor issues.
- Enterprise architecture does not necessarily drive product architecture, but product *system* (or platform) architecture. For example, it is much easier and more likely for an integral enterprise architecture (like that of *Airbus*) to produce a family or system of products which share more commonality, than it is for a modular enterprise architecture (like that of *Boeing*). In a sense, it is not *Airbus*' integral product's, but their integral product *strategy*, that is produced by the integral enterprise architecture.
- If/when product architectural changes are required, it will take successively longer times to evolve/adapt the architectures of the supply chain, and even longer to evolve/adapt the architectures of the enterprise. The greater the scope of the system in space and time, the greater the degree of architectural inertia.

Heuristic 1g:

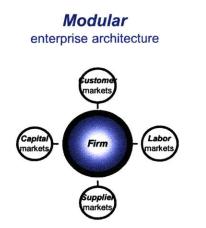

The nested architectures of product, supply chain and extended enterprise, will tend to be aligned along the integrality-modularity spectrum, as an indication of optimized performance. It is noted however that structural inertia increases with increasing extent of the architectures, making alignment changes slower.

"To a significant degree, product and supply chain architectures tend to be **aligned** along the integrality-modularity spectrum...in essence, product and supply chain architectures tend to be **mutually reinforcing**."⁶⁴⁴

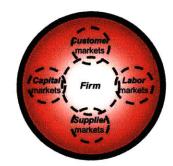

⁶⁴⁴ Fine, C.H. (1998), pg. 140.

4.2.5 Summary of Theoretical Underpinnings of Construct

Figure 186: Construct in Architectural Theory

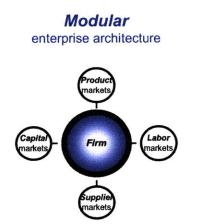

Integral enterprise architecture

Singular	Objective	Plural
(Maximization of <i>Shareholder Value</i>)	Function	(Maximization of <i>Stakeholder Surplus</i>)
Narrow	Enterprise	Broad
(narrow spatial, short temporal)	Boundaries	(broad spatial, long temporal)
Simple (High quantity of participants in a stakeholder class, Low quality of stakeholder relationships)	Stakeholder Interfaces	Complex (Low quantity of participants in a stakeholder class, High quality of stakeholder relationships)

Figure 187: Construct in Economic / Political Science Theory

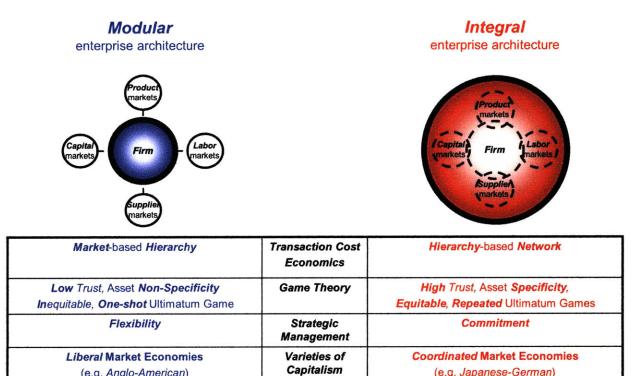

Integral enterprise architecture

<i>Mechanistic</i> (<i>Unstable</i> Environment)	Contingency	Organic (Stable Environment)
<i>Loose</i> -coupling	Theory	Tight-coupling
Resource Independence	Resource	Resource Dependence
(High Positional Power)	Dependence	(Low Positional Power)
<i>r-strategist</i>	Organizational	K-strategist
(<i>Opportunist</i> species)	Ecology	(Equilibrium species)
Exploitation	Organizational Learning	Exploration

Figure 188: Construct in Sociology / Organization Theory

Figure 189: Summary of Architecture Typologies in the Literature

4.3 Enterprise Architecture: 3D-Functional Decomposition

"A company is its chain of continually evolving capabilities – that is, its own capabilities plus the capabilities of everyone it does business with." "645

"To extend a systemic approach to strategy, I suggest that a company be viewed not as a member of a single industry, but as part of a business ecosystem that crosses a variety of industries."⁶⁴⁶

Although based on the theory of architecture/modularity where the "chunks" can be functionally independent or interdependent, the enterprise architectue is not a physical / technological construct, but an organizational / relational contruct. The stakeholders are defined in functional "chunks" along three orthogonal axes: the axis defining the customer-supplier relationships of the value chain, the axis defining the factors of production, and the axis defining the nature of competition. Each will be briefly discussed in the following subsections.

4.3.1 Value Chain Axis

As shown in Figure 190 below, this pair of stakeholders comprise the customer and supplier "chunk" taken from Porter's 1985 classic.

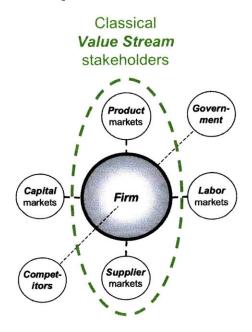

Figure 190: Enterprise Architecture: Value Chain Axis

⁶⁴⁵ Fine, C.H. (1998), pg. 71.

⁶⁴⁶ Moore, J.F. (1993).

4.3.1.1 Product / Service markets (customers)

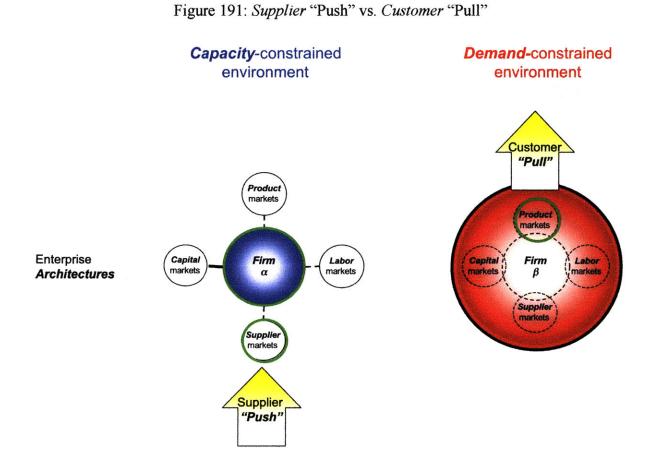

4.3.1.2 Supplier markets (suppliers)

Firm boundaries (Sako, 2006). Make-Buy. Vertical Integration. Outsourcing. Offshoring (Helper and Khambete, 2006).

4.3.1.3 Supplier "Push" vs. Customer "Pull"

"You can have any color you'd like ... as long as it's black."647

When markets are growing rapidly, the industry is generally capacity-constrained and the producer tends to be in control in a "push" mode. Conversely, when markets begin to mature, the industry is generally demand-constrained and the customer tends to be in control in a "pull" mode as shown in Figure 191 below.

⁶⁴⁷ Henry Ford's famous "push" tactics in the early automobile industry.

4.3.2 Factors of Production Axis

As shown in Figure 192 below, this pair of stakeholders comprise the capital and labor (K, l) "chunk" taken from classical economics. As will be discussed later, these stakeholders often provide the "teleological pull" or objective functions for the enterprise.

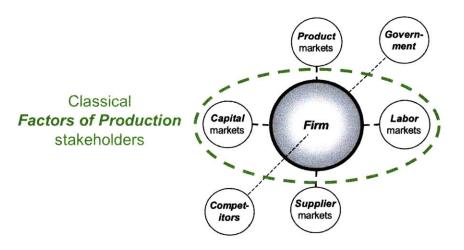

Figure 192: Enterprise Architecture: Factors of Production Axis

As we will discuss later in chapter 6, the relative dominance of capital vs. labor is contingent upon the state of the industrial evolution.

4.3.2.1 Capital markets (investors)

For the purposes of the framework, "capital" markets refers both to debt and equity markets, having fixed and variable (or residual) claims on the enterprise's cash flows. Each will be discussed in turn.

4.3.2.1.1 Capital Structure: Debt vs. Equity

Modigliani and Miller won the nobel prize for demonstrating (under certain circumstances) the irrelevance of capital structure.

"When a company earns more on borrowed money than it pays in interest, returns on equity will rise, and vice versa. Leverage thus improves financial performance when things are going well, but worsens performance when things are going poorly. It is a classic fair-weather friend."⁶⁴⁸

Higgins (2004) notes that leverage can both help and hurt ROE, depending on certainty of ROIC. In fact, based on empirical research (McConnell and Servaes, 19995), Higgins (2004) notes that debt levels should vary with firm growth.

"For 'high-growth' firms corporate value is negatively correlated with leverage, whereas for 'lowgrowth' firms corporate value is positively correlated with leverage." ⁶⁴⁹

"[In] rapidly growing businesses... high growth and high debt are a dangerous combination."650

"Slow-growth companies have a much easier time with financing decisions. Face the reality that the business has few attractive investment opportunities, and seek to create value for owners through aggressive use of debt financing. Use the company's health operating cash flow as the magnet for borrowing as much money as is feasible, and use the proceeds to repurchase shares."⁶⁵¹

4.3.2.1.1.1 Debt markets

4.3.2.1.1.2 Equity markets

Equity markets can be divided into *public* and *private* equity. Within this classification, equity investors can be characterized on the dimensions of *patience* as well as *activism*.

4.3.2.1.1.2.1 Quality of Equity Investors

4.3.2.1.1.2.1.1 Public vs. Private Equity

4.3.2.1.1.2.1.2 "Patient" vs. "Impatient" capital

⁶⁴⁸ Higgins, R.C. (2004), pg. 194.

⁶⁴⁹ Higgins, R.C. (2004), pg. 215.

⁶⁵⁰ Higgins, R.C. (2004), pg. 215.

⁶⁵¹ Higgins, R.C. (2004), pg. 217.

Within the Varieties of Capitalism framework, Goyer (2006) examines the varieties of institutional investors (ranging from the "patient" capital of pension funds, to the "impatient" capital of mutual/hedge funds) in France and Germany. He concludes that firm-level institutional arrangements of workplace organization account for the most significant variable in ascribing why French firms attract more short-term impatient capital (e.g. mutual/hedge funds) particularly from Anglo-Saxon investors, while German firms attract more long-term patient capital (e.g. pension funds).

"The concentration of power in the CEO of **French** companies is valued by **mutual and hedge funds**, since it makes it easier to reorganize the strategy of the firm quickly – a key aspect of the preferences of this type of investors given their **short-time horizon**. By contrast the relative absence of mutual and hedge funds, coupled with the growing strength of **pension funds** with their demands for financial transparency and **long-term horizon**, constitutes a **stabilizing** factor for the institutional arrangements of **workplace organization** of **German** companies."⁶⁵²

Conflicting accounts of pension funds exist however:

"Everyone who has worked with American managements can testify that the need to satisfy the **pension fund** manager's quest for **higher earnings next quarter**, together with the panicky fear of the raider, constantly pushes top management towards decisions they know to be costly, if not suicidal, mistakes. The damage is greatest where we can least afford it: in the fast growing, middle-sized, high-tech or **high-engineering firm** that needs to **put every available penny into tomorrow** – research, product development, market development, people development, services – lest it lose leadership for itself and for the U.S. economy."⁶⁵³

A recent example of patient capital comes from *Airbus*' parent company, *EADS*.

"Lagardere recently reported a 57% drop in 2006 profit, due largely to the poor performance of its 7.5% stake in EADS. Chief executive Arnauld Lagardère, who also co-chairs EADS, also ruled out the sale of the company's stake in EADS when announcing his annual results. 'I will play my role and I want to carry on being part o EADS's growth,' he told Le Monde. He added that he saw no need for a capital increase at EADS, presumably in lieu of politicians who wish to take a bigger role in Airbus. So concerned was Lagardère about EADS' future the he vowed to return any upcoming dividend back to the company. 'The Airbus situation has affected everyone, the employees above all, but also the shareholders and notably the small investors who have suffered from the drop in shares,' he said.'

4.3.2.1.1.2.1.3 Institutional vs. Individual Investors

Hansen and Hill (1991) determined empirically that contrary to popular belief, *institutional* owners are not necessarily myopic and that greater institutional ownership may be associated with greater R&D expenditures.⁶⁵⁵ They show that it is *individual* investors who exhibit more short-term orientation.

⁶⁵² Goyer, M. (2006), pg. 423.

⁶⁵³ Drucker, P. (1986), pg. 32, as quoted in Hansen and Hill (1991), pg. 1.

⁶⁵⁴ Olson, P. (2007), "Lagardere Won't Cut and Run from Airbus," Forbes magazine, March 14, 2007.

⁶⁵⁵ This research applied to time-series studies of four technology-driven industries: pharmaceuticals, chemicals, computers, and aerospace. It should be noted that while in R&D investment in most technology-driven industries was positively correlated with degree of institutional holdings, this relationship was reversed in the aerospace industry – it appears that institutional investors are myopic in aerospace stocks.

"American firms are myopic... in the sense that time horizons are short. [This] partly has to do with the high cost of capital in the United States."⁶⁵⁶

Gover (2006) compares the varieties of institutional investors in France and Germany.

"I distinguish primarily between **pension** and **mutual/hedge funds**. Pension funds constitute **long**term investors that acquire an equity stake in corporations primarily for diversification purposes; mutual/hedge funds seek to maximize assets under their management as they possess a shorter term horizon and operate under competitive pressures to beat market benchmarks. The importance of this distinction between different types of investors is primarily driven by its implications for the mode of coordination of firms. As Hall and Soskice (2001) have argued, access to patient capital constitutes a key feature of coordinated market economics, as opposed to liberal market economics that rely on short-term, risk capital. The investment strategies and time horizons of mutual/hedge and pension funds have different consequences for the sustainability of national models. Mutual and hedge funds posess short-term investment strategies and time horizons. They also exhibit firm-specific preferences since the performance of their portfolio is shaped by the behavior of a smaller number of companies than is the case for pension funds."⁶⁵⁷

⁶⁵⁶ Nelson, R. (1991), pg. 62.

⁶⁵⁷ Goyer, M. (2006), pp. 400-401.

4.3.2.1.1.2.2 Managerial capitalism

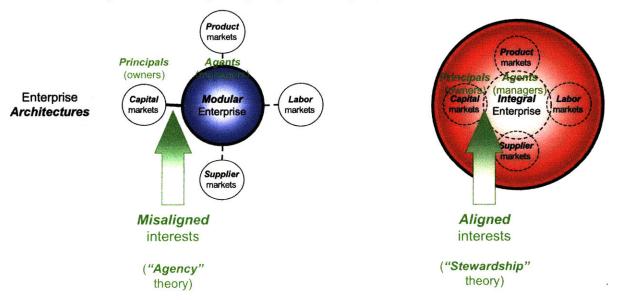

A variety of forms of "capitalism" have emerged, the most advanced of which is known as "managerial capitalism" which is the result of the separation of ownership from management.

The capital markets or equity investors are traditionally seen as the "owners" of the firm. They claim any residual profits from the operations of the firm. Recently, researchers (e.g. Ghoshal, 2005) have begun to call into question this theory.

4.3.2.1.1.2.2.1 Principal-Agent problem: Agency vs. Stewardship

In an effort to increase efficiency through specialization (Smith, 1776), the functions of firm ownership and management were separated, resulting in a modular link in this portion of the factors of production axis. This however created a misalignment of incentives resulting in unintended inefficiencies, known as the 'principal-agent' problem (Jensen & Meckling, 1976; Fama, 1980).

Note however as shown in Figure 193 below, that an integral enterprise architecture (by definition) is one in which is designed to minimize or mitigate the misaligned incentives of the principal-agent problem which is known as "stewardship" (Donaldson and Davis, 1989 and 1991).

Davis, Schoorman and Donaldson (1997) summarize the key characteristics of each form as is shown in Table 14 below.

Enterprise Architecture	Modular	Integral	
Governance Theory	Agency theory	Stewardship theory	
Model of Man	Economic man	Self-actualizing man	
Behavior	Self-serving	Collective-serving	
Psychological Mechanisms			
Motivation	<i>Lower</i> order / economic needs (psychological, security, economic)	<i>Higher</i> order needs (growth, achievement, self-actualization)	
	Extrinsic	Intrinsic	
Social Comparison	Other managers	Principal	
Identification	Low value commitment	High value commitment	
Power	Institutional (legitimate, coercive, control)	Personal (expert, referent)	
SituationalMechanisms			
Management Philosophy	Control oriented	Involvement oriented	
Risk orientation	Control mechanisms Trust		
Time orientation	Short-term	Long-term	
Objective	ive Cost control Performance enhanceme		
Cultural Differences	Individualism	Collectivism	
	High power distance	Low power distance	

Table 14: 0	Comparing Agency ar	nd Stewardship	Theories
-------------	---------------------	----------------	----------

As will be discussed in Chapter 5, ownership and managerial functioning are driven by different objectives of profit and growth.

4.3.2.1.1.2.2.2 Board of Directors: "Architectural" Gatekeeper

The shareholders, via the board of directors, have an important power: selecting, evaluating and rewarding the chief architect.

Many researchers have recently begun to question why the shareholders are the stakeholders that get to select the leadership, most recently Ghoshal (2005). Ghoshal argues that the primacy of shareholders interests was based on the (now) outdated notion that they were the risk-takers of the enterprise. Instead he argues, the employees are the true risk-takers of the enterprise:

"In every substantive sense, employees carry more risks than do the shareholders. Also, their contributions of knowledge, skills and entrepreneurship are typically more important than the contributions of capital by shareholders, a pure commodity that is perhaps in excess supply."⁶⁵⁸

This point of view is what was earlier described as "human capitalism", or "labor-managed firms".

⁶⁵⁸ Ghoshal, S. (2005), pg. 80.

4.3.2.2 Labor markets

The discussion of labor (or human capital) markets proceeds along the dimensions classically associated with other capital markets -i.e. in the make vs. buy analysis (Miles and Snow, 1984) of determining the boundaries of the firm, meaning is labor internalized or externalized?

Additionally the discussion of labor markets will include the quality of the interfaces between the firm and its human capital stakeholders, specifically along the short-term arm's length and long-term trust-based dimension.

4.3.2.2.1 Boundaries (make vs. buy)

Lepak and Snell (1999); Sako (2006).

4.3.2.2.2 Interfaces (arm's length vs. trust-based)

The integral EA form of the labor stakeholder sees long-term trust-based employment. Although this does not preclude the existence of labor unions (as *Southwest Airlines* demonstrated) it does tend to minimize their formal *raison d'etre*.

Although such integrality clearly exists in some enterprises (e.g. in the form of life-time employment), it is debatable as to the degree of complete foresight about its long-term effects. Evolutionary economists (Nelson, 1991) question the rationality of the origins of such practices:

"Thus, as I understand it, large Japanese firms adapted 'lifetime employment' for their skilled workers in the early post war era to try to deal with a problem of skill shortages and labor unrest. It is quite unclear how many Japanese managers foresaw advantages associated with worker loyalty."⁶⁵⁹

Like other stakeholder architectures, the effects of integrality in the labor stakeholder group involve temporal tradeoffs.

"Guaranteeing job security intensifies the tradeoff between short and long term effects. In the short run performance is worse." 660

⁶⁵⁹ Nelson (1991).

⁶⁶⁰ Sterman, Repenning and Kofman (1997), pp. 515-516.

In Table 15 below, Arthur (1992) defines two systems of workplace industrial relations. Table 15: Two Systems of Workplace Industrial Relations

Industrial Relations	Type of System		
Functions	Cost Reduction	Commitment Maximizing	
Organization of Work	Job tasks narrowly defined	Broadly defined jobs	
Employee Relations			
Staffing/Supervision	Low skill requirements; Intense supervision/control	High percent of skilled workers; Self-managing teams	
Training	Limited training efforts	More extensive, general skills training	
Compensation	Limited benefits; Relatively low wages; Incentive-based	More extensive benefits; Relatively high wages; All salaried/stock ownership	

In Table 16 below, Delery and Doty (1996) show the following rankings of human resource practices from a survey study using Likert rankings of the banking industry.

Ideal Strategic Profiles Variables	Market-type (Prospector)	Middle-of-the-Road (Analyzer)	Internal (Defender)
Results-oriented appraisals	4.44	3.41	2.38
Profit sharing	6.33	4.26	2.19
Job descriptions	3.38	4.49	5.60
Employment security	2.79	3.90	5.01
Internal career opportunities	3.86	4.67	5.48
Training	3.08	4.24	5,40
Participation/voice	4.60	5.36	6.12

Table 16:	HR Practices	in Configura	tions
-----------	---------------------	--------------	-------

4.3.2.3 Dominant Factor of Production (capital vs. labor)

In certain situations, capital is relatively the more dominant factor of production, while in other situations, labor is relatively the more dominant factor of production. In the following subsections, we will explore important contingencies; and in essay #3, we will integrate these contingencies into a coherent environmental assessment in order to determine which combinations of contingencies (i.e. *traditional* capitalism or *human* capitalism) are expected to dominate during the life-cycle of an industry's (or more accurately, a business ecosystem's) evolution.

4.3.2.3.1 Traditional vs. Human capitalism

4.3.2.3.1.1 *Traditional* capitalism (*capital* dominance)

Traditional capitalism is characterized by the relatively rapid building of physical capacity (e.g. property, plant and equipment), often for economies of scale. For this to happen rapidly, capital markets are required which demand high rates of growth. The main attributes of *traditional* capitalism are:

- Capital (not labor) markets are the focus of the objective function: "profit maximization".
- Capital (not labor) is the risk-bearing factor of production (Ghohal, 2005)
- Capital (not labor) supply is the system constraint (Ghoshal, 2005)
- Capital (not labor) is the source of competitive advantage

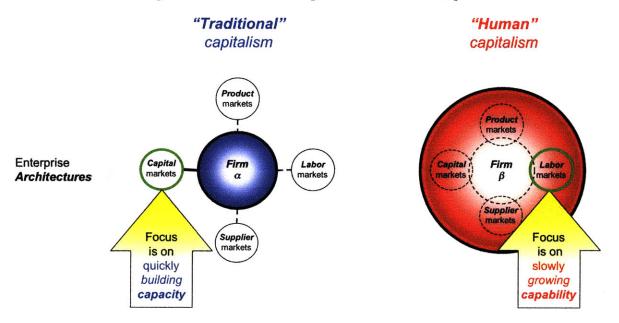

4.3.2.3.1.2 Human capitalism (labor dominance)

Human capitalism on the other hand is characterized by the relatively slow growing of knowledge-based capability, often for economies of scope. For this to happen, stability is often required for the labor markets. The main attributes of *human* capitalism are:

- o Labor (not capital) markets are the focus of the objective function: "labor-management".
- Labor (not capital) is the risk-bearing factor of production (Ghoshal, 2005)
- Labor (not capital) supply is the system constraint (Ghosahl, 2005)
- Labor (not capital) is the source of competitive advantage

4.3.2.3.2 Enterprise Architectural tendencies

While it is theoretically not impossible for both enterprise architectural forms to focus on traditional vs. human capitalism, this framework asserts that by definition, modular enterprise architectures tend to focus on physical capital as a means to ramp up physical *capacity* expansion, while integral enterprise architectures tend to focus on the *capability* of human assets as the source in innovation (whether product or process) and therefore competitive advantage. Figure 194 below summarizes the diametrically-opposed postures of each of the extremes of enterprise architectures.

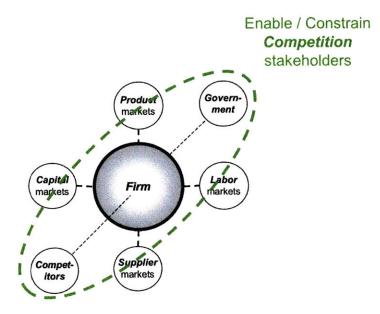

4.3.2.3.3 Cultural / National tendencies

While Anglo-Saxon capitalism has tended to focus on the providers of *capital*, the German-Japanese capitalism has tended to focus on the providers of *labor* (Thurow, 1992). Such stakeholders tended to integrate in order to achieve scale and therefore market power in the forms of unions. This would suggest that Anglo-Saxon traditions have a greater tendency towards modular enterprise architectural forms, while the German-Japanese capitalism has a tendency towards integral enterprise architectural forms.

4.3.3 Competitive Enablers and Constraints Axis

As shown in Figure 195 below, this pair of stakeholders comprise the competitor and government "chunk". "Government" is meant in the generic sense, covering local, state, federal and "meta-" levels like its participation in the World Trade Organization.

4.3.3.1 Regulatory markets (governments)

[In the U.S.] "business and government seldom work together and often are at odds."661

"Many of the organizations which play an important role in resource allocation, including governmental organizations, are not profit-maximizers."⁶⁶²

The role of governments both in regulating national industries and promoting international interests is important (Krugman, 1987; Brahm, 1995).

4.3.3.2 *Profit* markets (competitors)

Game theory, mixed duopoly.

⁶⁶¹ Nelson, R. (1991), pg. 63.

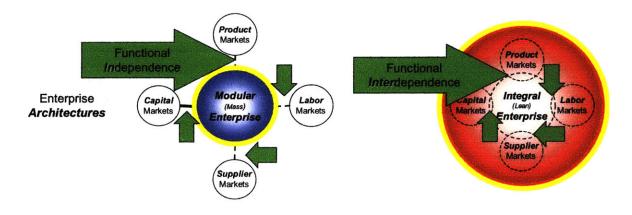

⁶⁶² Stiglitz, J.E. (1991), pg. 15, quoted in Braham, R. (1995), pg. 76.

4.3.4 Functional Decomposition

"Decomposition is a time-honored problem solving strategy (Simon, 1969). It often works effectively, provided the process under consideration is not strongly coupled to other systems. When couplings are strong, however, decomposition may lead to ineffective policies. Worse, piecemeal policies may intensify the problem (Forrester, 1971; Ackoff, 1978) or even lead to catastrophe (Perrow, 1984). Decomposition methods ignore feedback processes and discount time delays and side effects. Decomposition in complex, tightly coupled dynamic systems optimizes the parts at the expense of the whole and the present at the expense of the future."

As shown in Figure 196 below, the functional decomposition among stakeholders creates chunks (or stakeholder pairs) which are either functionally independent (in the case of modular enterprise architectures) or functionally interdependent (in the case of integral enterprise architectures).

4.3.4.1 Functional Independence

When an industry is in "push" mode, stakeholder power resides with the central firm. Therefore the interests of other stakeholders are relatively less important. Functions can be decomposed successfully to stakeholders in a modular fashion, and the zero-sum game of wealth distribution is played, particularly as this is the "dominant design" of enterprise architectures, and the winner is the one who plays it the most efficiently.

4.3.4.2 Functional Interdependence

When an industry is in "pull" mode, the stakeholder power is more distributed within the enterprise. Therefore the interests of other stakeholders are relatively more important. Functions cannot be decomposed successfully to stakeholders in a modular fashion, and a positive-sum game of wealth distribution is played. The winner is the one who plays it the most efficiently.

⁶⁶³ Sterman, Repenning and Kofman (1997), pg. 519.

4.3.4.3 Enterprise Performance

"In the presence of strong interdependencies (as is often the case in many complex products), the system can not be optimized by separately optimizing each element from which it is made. Indeed, in the case of strong interdependencies, it might well be the case that some, or even all, solutions obtained by tuning each component 'in the right direction' yield a worse performance than the current one. In the presence of strong interdependencies, the problem cannot therefore be decomposed into separate sub-problems which could be optimized separately from the others (Marengo, 2000)."⁶⁶⁴

The maximization of stakeholder surplus is by its very title a more global optimization around the relevant stakeholders who impact the long-term strategic advantage of the firm. It recognizes that the enterprise-level decomposition of functions across different stakeholders can and often does result in sub-optimal system performance, particularly if strong interdependencies exist across stakeholders, as shown in Figure 197 below.

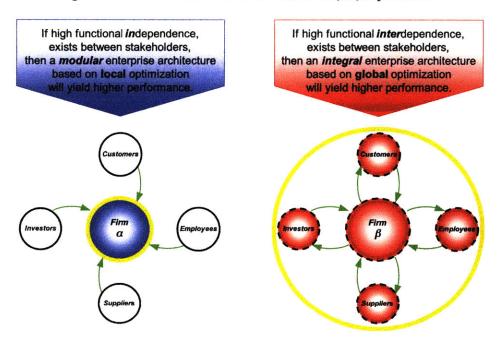

Figure 197: Performance and Functional In(ter)dependence

Note that the converse statements are also true and important. For example, if high functional *inter*dependence exists between stakeholders, then a *modular* enterprise architecture based on local optimization, would result in global sub-optimization and hence low performance. The formula one race car finding itself in a mud-bog, would be an example of increasing the functional performance of the parts (i.e. faster engine, or greater aerodynamics), would make the system performance no better, and in fact worse off if one considers the amount of resource spent on these activities as opposed to other "architectural" activities.

[.] 10

⁶⁶⁴ Dosi et al. (2003), pg. 106.

4.4 Enterprise Architecture: Objective Functions, Boundaries & Interfaces

Having defined the constituent chunks of the enterprise, we can now define the three properties that enable a typology of architectural forms: Objective Functions, Boundaries and Interfaces. Each will be briefly discussed in turn.

4.4.1 Enterprise *Objective Functions*

At its core, the enterprise architecture construct is about the functional independence or interdependence between stakeholder chunks. As different stakeholders have different and often conflicting goals, this construct is deeply rooted in the notion of power an politics, in which we build from past theoretical work:

"The business firm is a political coalition and the executive is a political broker. The composition of the firm is not given; it is negotiated. The goals of the firm are not given; they are bargained. We assume that there is a set of potential participants in the firm such as investors, suppliers, customers and various types of employees."⁶⁶⁵

"A political perspective defines power as the ability to get things done when goals conflict."666

This section outlines the goals or objective functions which drive the ultimate forms of the firms and their extended enterprises – the "forcing" functions. In this sense, the objective functions are an acknowledgement of a goal-directed or *teleological* change process (Van de Ven, 1992).

The objective function of the enterprise is broadly classified as a problem of corporate governance.

"Corporate governance deals with the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment."⁶⁶⁷

The following outlines two extremes in objective functions: maximization of *shareholder* value vs. the maximization of *stakeholder* surplus. While objective functions are complex and varied, this section will characterize them on a continuum from the traditional maximization of shareholder value to the more recent maximization of stakeholder surplus. Figure 198 below summarizes the spectrum of objective functions.

⁶⁶⁵ March J. (1962).

⁶⁶⁶ Dahl R. (1957).

⁶⁶⁷ Shleifer and Vishny (1997), pg. 737.

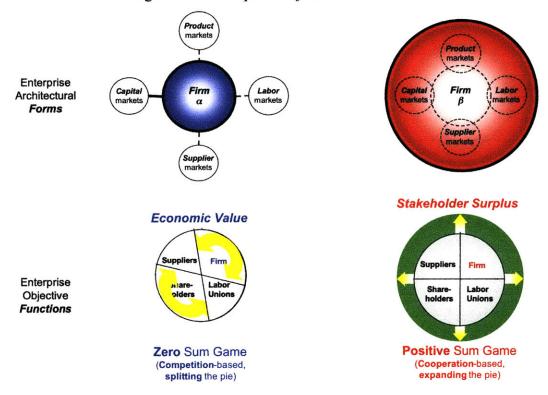

Figure 198: Enterprise Objective Functions

4.4.1.1 Maximizing Shareholder Value

"Milton Friedman [said]: 'Few trends could so thoroughly undermine the very foundation of our free society as the acceptance by corporate officials of a social responsibility other than to make as much money for their stockholders as possible' (Friedman, 2002, pg. 133).""⁶⁶⁸

The maximization of shareholder value is by its very title a very local optimization around a specific stakeholder group, the shareholders or equity investors.

"Whose income 'ought' to go down? Historically we have used economic growth to avoid having to make this judgment. Economic growth has been seen as the social lubricant that can keep different groups working together." 669

We will note in Chapter 5 that during times of high growth, the zero-sum game does create serious problems, as all stakeholders are growing. It is only when growth begins to slow down that the zero sum game starts to become dysfunctional.

⁶⁶⁸ Ghoshal, S., (2005), pg. 79.

⁶⁶⁹ Thurow, L. (1980), pg. 17.

4.4.1.2 Maximizing Stakeholder Surplus

Henry Ford, perceived as one of the greatest (modular) "capitalists", defended himself from a lawsuit by shareholders in 1919, for suspending *Ford's* dividend payments by arguing that *Ford* should serve a broader constituency of stakeholders than just the shareholders. He stated *Ford's* purpose as being:

".. to do as much good as we can, everywhere, for everybody concerned...and incidentally to make money."⁶⁷⁰

This positive sum objective function, coupled with *Ford's* vertically integrated Rouge complex, begins to sound like an integral EA, not the modular EA that we have come to observe over the past 50 years. One explanation is that, like *Boeing*, incumbents originally began their lives as integral EA, and have since disintegrated into modular EA.

Likewise, Owen D. Young, *General Electric* Chariman from 1922-1945 echoed the same pluralistic stakeholder-based sentiments:

"Managers are no longer attorneys for the stockholder; they are becoming trustees for an institution. It makes a great deal of difference in my attitude towards my job as an executive officer of General Electric whether I am a trustee of the institution or an attorney for the investor."⁶⁷¹

Leading academics have recently begun to challenge the most fundamental assumptions driving business today, the firm's objective function (Ghoshal, 2005).

"After all, we know that shareholders do not own the company – not in the sense that they own their homes or their cars. They merely own the right to the residual cash flows of the company, which is not at all the same thing as owning the company. They have no ownership rights on the actual assets or businesses of the company. We also know that the value a company creates is produced through a combination of resources contributed by different constituencies: Employees, including managers, contribute their human capital, for example, while shareholders contribute financial capital. If the value creation is achieved by combining the resources of both employees and shareholders, why should the value distribution favor only the latter? If these truths are acknowledged, there can be no basis for asserting the principle of shareholder value maximization. There just aren't any supporting arguments. Why do we not fundamentally rethink the corporate governance issue? Why don't we actually acknowledge in our theories that companies survive and prosper when they simultaneously pay attention to the interests of customers, employees, shareholders, and perhaps even the communities in which they operate? Such a perspective is available, in stewardship theory for example (Davis, Schoorman, and Donaldson, 1987),"⁶⁷²

Toyota, arguably the world's premier manufacturing company and the current dominant challenger in the automotive industry, states the following as its objective function:

"We maximize **shareholder value** over the **long term** by harmonizing the interests of **all our stakeholders**: customers, suppliers, employees, and members of the community at large, as well as shareholders."⁶⁷³

⁶⁷⁰ Quote taken from FTmagazine, June 11, 2005, issue no. 109, pg. 22.

⁶⁷¹ Quote taken from FTmagazine, June 11, 2005, issue no. 109, pg. 22.

⁶⁷² Ghoshal, S., (2005), pp. 79-81.

^{673 1998} Toyota annual report.

4.4.2 Enterprise Boundaries

The academic discussion around the "boundaries of the firm" has historically (Coase, 1937) embraced only its supplier markets in the traditional "make-buy" decision. More recently, it has embraced the firm's labor markets (Sako, 2006). This framework attempts to address a broader set of stakeholders which define the "boundaries of the firm", which include the complementary stakeholders to suppliers and employees, namely customers and investors as shown in Figure 199 below.

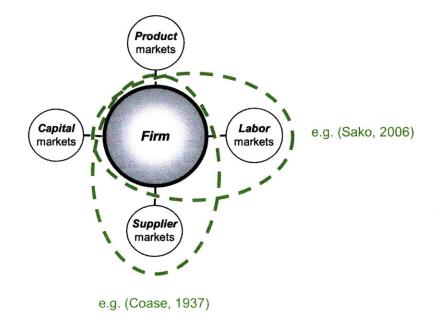

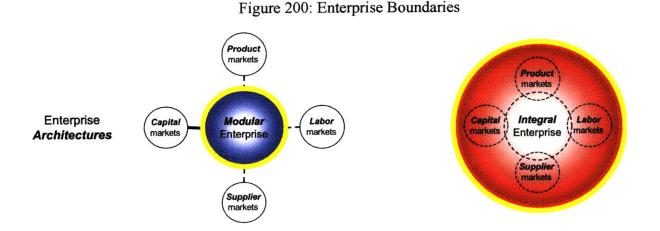

Figure 199: Classical discussions around the "Boundaries of the Firm"

As shown in Figure 200 below, the boundaries of the enterprise vary according to the objectives of the firm. These vary from local optimization of the firm, to more global optimization of the firm and its extended enterprise.

Organizations have long been recognized as exchanging things with their environments, called "open" systems. The boundaries of the organization (both spatial and temporal) define the extent of the organization, and the degree of "openness". As will be shown below, the firm exchanges things with entities outside of its control, and in that sense, all firms are open systems with respect to their stakeholders. However, as we shall explore later, different enterprise architectures (modular and integral) vary in their *control* over these exchanges with their extended enterprises. Specifically in chapter 5, when we address the structural dynamics of enterprises, we will draw a distinction between open and closed systems and open and closed *causal* systems.

Rice (1958, 1963) focused on boundary management issues.

[The primary task of leadership is] "to manage the relations between the enterprise and its environment so as to permit optimal performance of the primary task of the enterprise [which is] the task that it must perform to survive."⁶⁷⁴

⁶⁷⁴ Rice, A. (1963), pp. 13-15.

4.4.2.1 Spatial

"Firms and their attributes are parts of the environment and are linked to it by exchanges of resources."⁶⁷⁵

As noted by various researchers (Fine, 1998; Dyer and Singh, 1998), the spatial boundaries of the firm can be important in defining a firm's competitive advantage.

"Key firm resources may reside in a firm's external network".676

4.4.2.1.1 *Vertical* Integration (boundaries)

The theory of the firm (Coase, 1937) provides insights into why firms exist vis a vis markets, and where the efficient boundary of the firm should be. Either the price mechanism coordinates economic activity in market transactions, or managerial authority coordinates economic activity in vertically-integrated firms.

Later Williamson's transaction cost economics (Williamson, 1975) extended this theory by positing logical firm boundaries based on the transaction as the unit of analysis. While Coase focused on costs as the discriminating criterion between firms and hierarchies, Williamson posited a set of factors which generated these transaction costs: asset specificity, uncertainty, frequency, opportunism and bounded rationality, with asset specificity being the most important.

The classic case study of vertical integration or the make-buy problem is *General Motors-Fisher Body*.

4.4.2.1.2 Virtual Integration (interfaces)

"General Motors and Toyota are helpful for illustrating why the categories in 'make versus buy' or 'vertical integration versus outsourcing' are inadequate: they do not account precisely for the complexity of relationships we observe in practice. Rather than using the categorization of vertically integrated or disintegrated, supply chain relationships can be categorized on a scale running from the highly integral to the highly modular, depending on the degree of proximity of the members in the chain along four dimensions: geographic, organizational, cultural and electronic."⁶⁷⁷

More recently other researchers, while acknowledging power and clarity of transaction cost economics, have questioned the complexity that it captures. Instead of focusing on asset ownership, Fine (1998) posits four dimensions of "proximity": geographic, organizational (including ownership), cultural and electronic.

In this sense, Fine (1998) is less interested in who owns the assets (i.e. legal *boundaries*), but in how the assets are managed (i.e. *interfaces*). The *quality* of the relationships between stakeholders (often called "relational coordination" or "relational contracting" is very important in determining an enterprise's architecture and will be discussed in the following sections.

⁶⁷⁵ Farjoun, M. (2002), pp. 577.

⁶⁷⁶ Farjoun, M. (2002), pp. 577.

⁶⁷⁷ Fine, C.H. (1998), pg. 158.

4.4.2.2 Temporal

"Time horizon is a temporal yardstick for evaluating success or failure that reflects the dynamics of a firm and its context."⁵⁷⁸

"What are the implications of the difference in the time frames involved in firms sustaining superior performance as opposed to experiencing decline and bankruptcy?"⁶⁷⁹

4.4.2.3 Effect of Spatio-Temporal Boundaries on Strategy

Modular EA

(decisions are close in space & time)

Those enterprise architectures which are managed to a narrow spatial and temporal boundaries (i.e. modular), have great tactical advantages, while those which are managed to broader spatial and temporal boundaries (i.e. integral) have greater strategic advantages. As shown in Figure 201 below, the analogy is to a game of chess, where the integral enterprise architecture, by optimizing more globally has a greater vision both of the board as well as of many moves in advance. It is "built" to deal with greater dynamic complexity, where cause and effect are distant in (stakeholder) space and time, even though such extra vision has added costs.

Figure 201: Effect of Spatio-Temporal Boundaries on Strategy

Integral EA

(decisions are distant in space & time)

⁶⁷⁸ Lengnick-Hall and Wolff (1999), pg. 1119.

⁶⁷⁹ Farjoun, M. (2002), pg. 587.

4.4.3 Enterprise Interfaces

4.4.3.1 Quantity of Stakeholders

The first obvious descriptor of the architecture is the quantity of stakeholders within a specific chunk.

4.4.3.2 Quality of Stakeholder Relationships

The quantity-quality dimensions are not orthogonal. They are interrelated, with quality ultimately driving the quantity.

Fine (1998) defines the supply chain integrality along four dimensions: geographic, organizational, cultural and electronic.⁶⁸⁰

Within the context of off-shoring, Helper and Khambete (2006) define three types of organizational interfaces: information (e.g. degree of tacitness), incentive alignment (e.g. asset ownership, employment stability), and proximity (e.g. geographic and cultural).

Ghemawat (2001) defines proximity in terms of four distances: cultural, administrative, geographic and economic.

Trust is an important construct in defining the quality of stakeholder relationships, and recently, researchers have posited that trust is multi-dimensional, and differs between the firm and different stakeholders (Pirson and Malhorta, 2008).

4.4.3.2.1 Two Relationship Archetypes

Two different types of relationships are discussed. The qualitative properties of each can be extracted approximately via such classic games as the "ultimatum game".

4.4.3.2.1.1 Managing Contracts: Short-term, Arm's Length

Based on an ideology-based "gloomy-vision" (Ghoshal, 2005). Examples include: transactioncost economics having opportunism with guile (Williamson, 1975); agency-theory (Jensen and Meckling, 1976); exit (Helper, 1990).

4.4.3.2.1.2 Growing Relationships: Long-term, Trust-Based

"A company run on the basis that nobody can be trusted will be a **dysfunctional** place that has little chance of achieving anything much for its shareholders, let alone its customers or those who work there...for **trust lies at the heart of wealth creation**."⁶⁸¹

⁶⁸⁰ Fine, C.H. (1998), pp. 136-137.

⁶⁸¹ Gapper (2005), pg. 102.

Based on an ideology-based "positive organizational scholarship" (Ghoshal, 2005). Examples include: relational coordination (Hoffer-Gittell, 2003); relational contracting (Gibbons, 1999 and 2004); voice (Helper, 1990).

4.4.3.2.2 Costs of Quality (of Stakeholder Relationships)

In addition to the long-term cost reductions associated with the learning curve and economies of scale, the costs of quality of relationships can have a significant impact on transaction costs as shown in Figure 202 below.

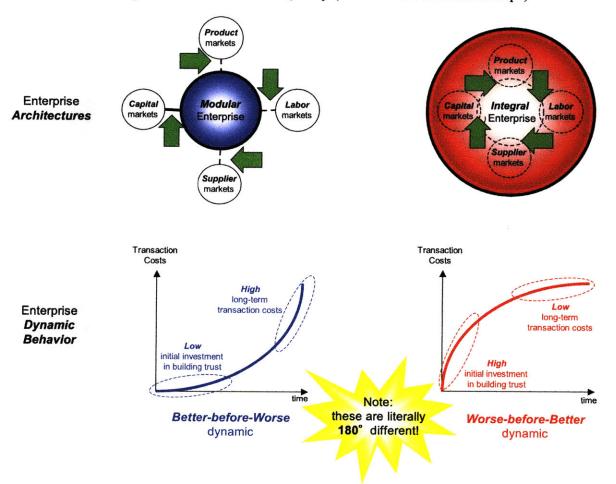

Figure 202: The Costs of Quality (of Stakeholder Relationships)

The properties of trust are highly nonlinear. It takes a long-time to build, and yet it can be destroyed instantaneously.

4.5 Enterprise Architectural Forms (Isomorphic Archetypes)

"The abstract concepts of modularity and integrality are shown to be useful for categorizing systems and illustrating how architectural form can influence important system characteristics." ⁶⁸²

This section will begin to differentiate between two extreme ends of the architectural continuum: modular and integral enterprise architectural isomorphic forms.

"Some architectures are easier to manage during **design**, others easier to manage during **operation**. Some are more robust to **deliberate attack**, while others are more robust to **random failures**."⁶⁸³

4.5.1 Modular Enterprise Architectures

The "modern" notion of *architecture* arose in the 1960's (Simon, 1962; Alexander, 1964) around the early concepts of nonlinear systems thinking & complexity science. Modular architectures are based on the reductionist-based *linear* view of systems, whereby the system can be functionally decomposed, optimized, and the resulting performance is equal to the sum of the parts.⁶⁸⁴ Integral architectures by contrast are based on the nonlinear view of systems, whereby design and global optimization occurs on the system level, and the performance can be equal to more than the sum of the parts.

Heuristic 1h:

A modular enterprise architecture will have relatively narrowly defined system boundaries⁶⁸⁵, and its *interfaces* are characterized by *short*-term, arms-length management of contracts with many undifferentiated stakeholders, i.e. a high quantity of a given stakeholder type, and relatively *low-quality* stakeholder relationships.

Heuristic 1i:

Exploitation is best served by organizational forms which exhibit *differentiation*. Therefore, a *modular* enterprise architectural form will have a greater degree of *exploitation* (or revenue growth) potential than an integral enterprise architectural *form*.

".. organizations innovate by switching between organic structures during early phases of an innovation to mechanistic structures for execution phase." 686

Heuristic 1j:

The modular enterprise is based on the offensive routines of the market-maker.

⁶⁸² Whitney et al. (2004), pg. 1.

⁶⁸³ Whitney et al. (2004), pg. 9.

⁶⁸⁴ Adam Smith's "division of labor" is a classic formalization of efficiency-driven disintegration.

⁶⁸⁵ The broad system boundaries implies an "open systems" approach to the firm.

⁶⁸⁶ Tushman et al. (2004), summarizing Duncan (1976).

4.5.2 Integral Enterprise Architectures

Heuristic 1k:

An *integral* enterprise architecture will have relatively *broadly* defined system *boundaries*⁶⁸⁷, and its *interfaces* are characterized by *long*-term, trust-based growing of relationships with few differentiated stakeholders, i.e. a *low quantity* of a given stakeholder type, and relatively *high-quality* stakeholder relationships.

Heuristic 11:

Exploration / innovation (whether in products or processes) is best served by organizational forms which exhibit *integration*. Therefore, an *integral* enterprise architectural form will have a greater degree of *exploration* (product or process innovation) potential than a modular enterprise architectural form.

"Cooptation is the process of absorbing new elements into the leadership or policy-determining structure of an organization as a means of averting threats to its stability or existence. This is a defensive mechanism..."

Heuristic 1m:

The integral enterprise is based on the defensive routines (e.g. co-optation) of the market-taker.

Heuristic 1n:

The integral enterprise has a more symbiotic, integral, long-term trust based relationships with its *competitors* than do modular enterprises.

Heuristic 10:

For an enterprise to have an *integrated* architecture, does not necessarily imply that it is "vertically integrated" in the classical sense of ownership of assets.⁶⁸⁹

⁶⁸⁷ The broad system boundaries implies an "open systems" approach to the firm.

⁶⁸⁸ Selznick, P. (1948), pg. 34.

⁶⁸⁹ Novak, S. and Eppinger, S. (1998) noted this in the automobile industry; Fine, C.H. (1998) developed a richer set of dimensions of "proximity"; Dyer, J. (2000) developed a the concept of "virtual integration".

4.5.2.1 Intra-species Heterogeneity within the Integral Enterprise Isomorph

Although the framework has thus far focused on the development of isomorphic enterprise architectural forms (i.e. exhibiting homogeneity within an isomorph while simultaneously allowing for evolutionary heterogeneity, due to the stage of disintegration), this section will begin to describe the complexity within the integral enterprise architecture species.

4.5.2.1.1 Institutional Exogenous Push vs. Individual Endogenous Pull

Enterprise architecture integrality can arise from two centripetal forces: either it can arise from the *institutional* exogenous push from the external stakeholders, or *individual* endogenous pull from the central architect(s), located within the firm that keeps the stakeholders engaged in a long-term, trust-based way as shown in Figure 203 below.

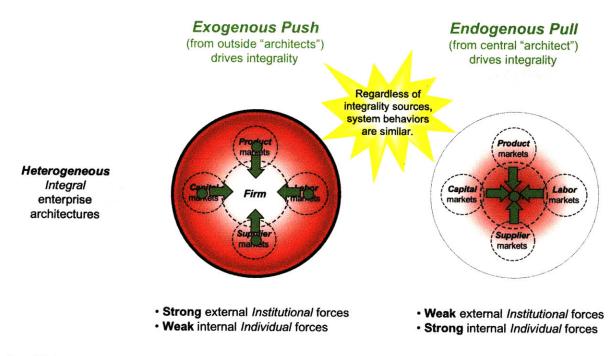

Figure 203: Institutional Exogenous Push vs. Individual Endogenous Pull

It will be argued in Essay #2, that regardless of which centripetal mechanism is operating, the dynamic behavior of the integral enterprise architecture is the same.

4.5.2.1.2 Examples and *Sustainability* of the Integral Enterprise Isomorph

We can use the three case studies used in the theoretical sample (*Airbus, Toyota* and *Southwest*) to infer different sources or combination of sources of enterprise integrality as shown in Figure 204 below.

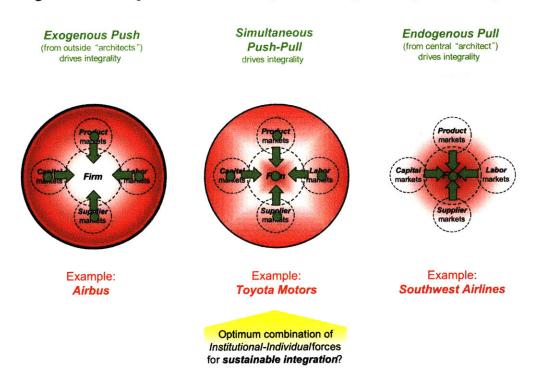

Figure 204: Examples and Sustainability of the Integral Enterprise Isomorph

Airbus might be an example of an integral enterprise architecture pushed together exogenously by strong environmental or institutional forces (e.g. European integration), while *Southwest* might be an example of an integral enterprise architecture pulled together endogenously by strong individual forces (e.g. CEO Herb Kelleher).

Toyota might however be an example of an integral enterprise architecture simultaneously pulled together endogenously by strong individual forces as well as exogenously by strong institutional forces. In fact, one might argue that the two forces feedback to create a more sustainable model, in which sustainable integrality is achieved by early internal architects which designed an exogenous environmental system which continues to nurture and select future internal architects, who continually redesign the relationship with the environment.

The sustainability of such a system arises from its mitigation of the continual concerns of leadership succession associated with the endogenous pull only (e.g. replacing a charismatic leader like Kelleher at *Southwest*), and from its mitigation of the continual concerns of broad and integrated social commitment associated with the institutional exogenous push only (e.g. maintaining a strong pan-European resolve via *Airbus* to challenge the US).

4.5.2.2 Integral Architecture and "New" Organizational Forms

"The business press heralds the twenty-first century corporation. Academic commentators identify new forms of organization, variously characterized as 'individualised', 'network', 'postmodern', 'federal', or 'cellular'."⁶⁹⁰

Recently in the management literature, researchers have begun to claim that there are new organizational forms which are displacing the old (Daft and Lewin, 1993; Whittington et al., 1999). The improved performance associated with these forms however have not systematically been tested (Nohira, 1996), in fact some researchers have been rather critical of such claims (Victor and Stephens, 1994).

"For Hedlund (1994 p. 83), too, the N-form comprises an 'integrated set' of practices, while Miles and Snow (1992) emphasize the 'systemic' character of the new organizational forms."⁶⁹¹

This research attempts to acknowledge the existence of such "new" organizational forms, but aims to define them as "new" not in absolute terms, but in relative terms – relative that is to the state of industrial evolution. Although organizational forms will undoubtedly continue to follow a unique path-dependent trajectory, making them "new" at each new future, this research seeks to find the underlying and abstracted commonality, such that there is a predictable determinism in the chaos.

⁶⁹⁰ Whittington et al. (1999), pg. 583.

⁶⁹¹ Whittington et al. (1999), pg. 584-585.

4.5.2.3 Integral Example: Japanese Keiretsu

"Groups allocate resources among their members according to a long-term vision of collective welfare. They provide a safety net for their weak members, police profiteering by imposing penalties when a member firm does too well, and insulate their membership from the harsh scrutiny of tax authorities and investment analysts by managing the reporting of profits and losses to show steady, incremental growth. The actions of groups in this regard are collectively 'rational' for the existing membership as a whole, though not necessarily rational for its strongest members"

Keiretsu are typically organized either horizontally or vertically. (Lincoln, Gerlach and Ahmadjian, 1996). It appears that long-term corporate performance is different depending upon which type of keiretsu and under which environmental conditions they are operating. For example, Lincoln et al. (1996) noted that between 1965-1988, members of Japan's "big-six" horizontal keiretsu have lower profitability than independents. The same cannot necessarily be said for Japan's vertical keiretsu during that time frame.

Others. (Dyer, 1999?; Hino, 2006.)

4.5.2.3.1 Horizontal keiretsu

The "big-six" horizontal keiretsu in Japan include the three reincarnated pre-war *zaibatsu*: *Mitsui, Mitsubishi* and *Sumitomo* as well as the post-war bank-centered groups: *Fuyo, Dai-Ichi Kangyo* and *Sanwa* (Lincoln, Gerlach and Ahmadjian, 1996, pg. 68).

4.5.2.3.2 Vertical keiretsu

Vertical keiretsu are groupings of firms, their suppliers and distributors. In Japan for example some of the most noteworthy are: *Hitachi* or *Toyota* (Ahmadjian, 1995; Aoki, 1988; Asanuma, 1989).

⁶⁹² Lincoln, Gerlach and Ahmadjian, 1996, pg. 85 and 86.

4.5.3 Orthogonality of Archetypes

Modular and integral enterprise architectures are not just marked by differences in boundaries and interfaces, by the quantity and quality of relationships with stakeholders, but by different emphases in dominant stakeholders. The confluence of these influences begins to point out the orthogonality of the enterprise archetypes.

As shown in Figure 205 below, the *modular* enterprise architecture is characterized by supplier "push" in a capacity-constrained world, and is focused on shareholder profit-maximizing goals. Conversely, the *integral* enterprise architecture is characterized by consumer "pull" in a demand-constrained world, and is focused on labor-managed goals. Note that in each case, these are diametrically opposed or orthogonal constructs.

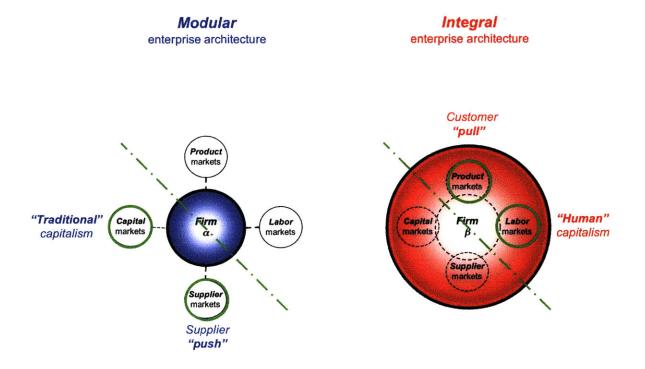

Figure 205: Orthogonality of Archetypes

4.6 The Process of Architecting Enterprises

The first step of architecting, is to understand the environmental conditions at a very deep level, and then to design the enterprise (or artifact) to fit within the requirements of the environment.

"There is an overriding management task in first interpreting correctly the market and technological situation, in terms of its instability or of the rate at which conditions are changing, and then designing the management system appropriate to the conditions, and making it work. 'Direction' is the distinctive task of managers-in-chief..."⁶⁹³

Heuristic 1p:

Enterprise architectural "design" may or may not be a conscious, rational, strategic choice (i.e. voluntaristic vs. deterministic).⁶⁹⁴ One determining factor is the maturity of the enterprise relative to the maturity of the industry.⁶⁹⁵

"We are called to be the architects of the future, not its victims." "696

"The architect must be a **prophet**... a prophet in the true sense of the term. If he can't see at least **ten** years ahead, don't call him an 'architect'."⁶⁹⁷

Heuristic 1q:

Enterprise architectural "design" is possible, however it requires long-term vision to seek environmental signals through the noise, boundary-spanning negotiation skills, and the ability to simplify complexity.

Organizational theorists Karl Weick (1993) and Peter Senge et al. (1999), have noted that design can be viewed from the perspectives of *formal* and informal or *emergent* design. In civil architectural terms, these are also referred to as: *self-conscious* and *unselfconscious* design. These will be discussed briefly in the following subsections.

4.6.1 Formal (self-conscious) design

"Formal design [is] the conscious, intentional architecture of organizations, such as guiding ideas and strategies, established structures, and policies and rules."⁶⁹⁸

4.6.2 Emergent (unself-conscious) design

"Emergent design [is] the ways that people naturally 'redesign' the organization as they live in it." "699

⁶⁹³ Burns and Stalker (1961), pg. viii (of the preface to the second edition by Tom Burns).

⁶⁹⁴ Herb Kelleher, CEO of *Southwest Airlines*, architected the enterprise's integral form.

⁶⁹⁵ For example, modular incumbents in a H.F.F. world were voluntaristic, while in a B.F.C. world, they become deterministic. See Astley and Ven de Ven (1983), and Whittington (2000)

4.7 Chapter Summary

This chapter was the first of three essays which forms an integrated framework which attempts to explain long-term firm performance. In this chapter, we defined the construct of an *enterprise architecture*, its sources and properties.

The context for this construct within the framework is shown below in Figure 206. In the following chapter, we will next discuss how these architectures provide the highest level explanations for the ensuing dynamic performance of the firm.

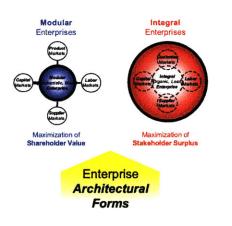

Figure 206: Enterprise Architecture within Framework

Chapter 5 Competitive Dynamics

Having defined the various enterprise architectural forms (or species) occupying the ecosystem, we can now discuss how these species function, that is, what market niches they occupy, how they serve those markets, and the dynamics of competition both within and between species.

"We [Ford] have been going out of business for 40 years."700

5.1 Introductory Constructs and Propositions

"We should have a system of economics that is structure. We do not have it. We are all hanging by our eyebrows from skyhooks economically, just as we are architecturally."⁷⁰¹

Having outlined a framework for the understanding of an enterprise architectural form, we now need to translate it operationally into a more concrete structural form, in order that we may understand and ultimately predict the dynamics of the enterprise.

5.2 Theoretical Foundations

The notion of *enterprise structural dynamics* can be constructed from a variety of eclectic theoretical management traditions ranging from general systems theory (von Bertalanffy, 1962) to system dynamics (Forrester, 1961). The following briefly summarizes a few of the threads in various fields within economics and sociology.

5.2.1 Economic Theories

5.2.1.1 Penrose and Firm Growth

"The question I wanted to answer was whether there was something inherent in the very nature of the firm that both **promoted its growth** and necessarily **limited its rate of growth**."⁷⁰²

Theories of firm growth have tended to focus on corporate growth through the inorganic mechanism of mergers and acquisitions in the development of the diversified M-form and beyond.

Theories of growth of the strategic business unit or the single product firm are relatively rare. One of the first researchers to tackle the topic was Penrose, in her 1959 classic, *The Theory of the Growth of the Firm.* It tended to focus internally on the constraints and enablers of the development of resources of the firm, which ultimately led to the school of thought in strategic management today known as the *resource-based view* of the firm.

⁷⁰⁰ Ford CEO, Alan Mulally, "The New Heat on Ford," by David Kiley, Business Week, June 4, 2007.

⁷⁰¹ Frank Lloyd Wright.

⁷⁰² Penrose, E. (1959).

5.2.1.2 Marris and Growth vs. Profitability

"In the managerial utility function: growth rate is a proxy for income, power, prestige, and accompanying managerial gains from growth; and stock-market value is a proxy for job security."⁷⁰³

Following in Penrose's search for the enablers and constraints to firm rates of growth, Marris (1963) noted that the separation of ownership from management created a principal-agent conflict regarding the tradeoff between growth and profitability as shown conceptually in Figure 207 below.

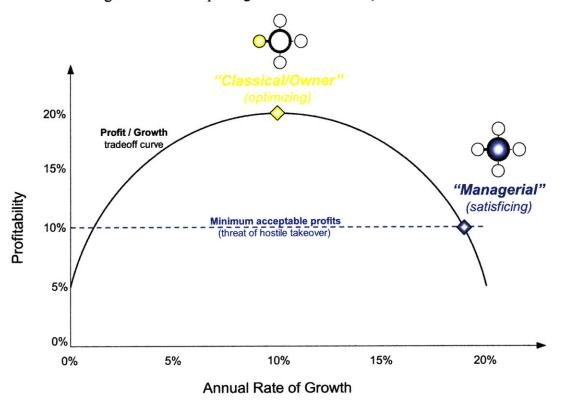

Figure 207: Principal-Agent conflicts in Profits and Growth

"Growth models, unlike managerial static models, required the development of a new of transformation function to specify the constraint against which utility was to be maximized. They required, that is to say, a body of theory to indicate the trade-off between growth rate and stock-market value – a 'valuation curve' with the (normalized) level of stock-market value on one axis and the expected growth rate of the size of the firm on the other."⁷⁰⁴

It is interesting to note that the trade-off between profits and high rates of growth is hypothesized to lie in the general "dynamic diseconomies of scale", or degradation of capabilities.

⁷⁰³ Marris, R. and Mueller, D.C. (1980), pg. 42.

⁷⁰⁴ Marris, R. and Mueller, D.C. (1980), pg. 42.

"The relationships were also embellished by taking account of the costs of administrative inefficiencies caused by rapid growth in size ('dynamic' diseconomies of scale, not to be confused with static phenomena) as suggested by E.T. Penrose (1959)..."⁷⁰⁵

Empirical evidence both in the U.S. (Holl, 1977) and Australia (Lawriwsky, 1984), supports the claims that managers – without contravening incentives – tend to maximize growth and satisfice profits.

As will be discussed in chapter 6, a life-cycle theory of the firm (Mueller, 1972), predicts that this severity of this owner-manager conflict varies throughout the age (and growth ability) of the firm.

5.2.1.3 Goodwin and the Business Cycle

"Goodwin showed that the antagonist relationship between workers and capital owners could lead to cycles."⁷⁰⁶

Goodwin was one of the first economists who tried to combine the behaviors of growth and cyclicality (Weber, 2005), which was based on the classical predator-prey models (Lotka, 1925; Volterra, 1926).

Within the framework of the enterprise architecture presented herein, it is the tension created by the separation of the interests of the factors of production (i.e. the capital owners and the labor) which generates the business cycle oscillation as shown in Figure 208 below.

⁷⁰⁵ Marris, R. and Mueller, D.C. (1980), pg. 42.

⁷⁰⁶ Weber (2005), pg. 5.

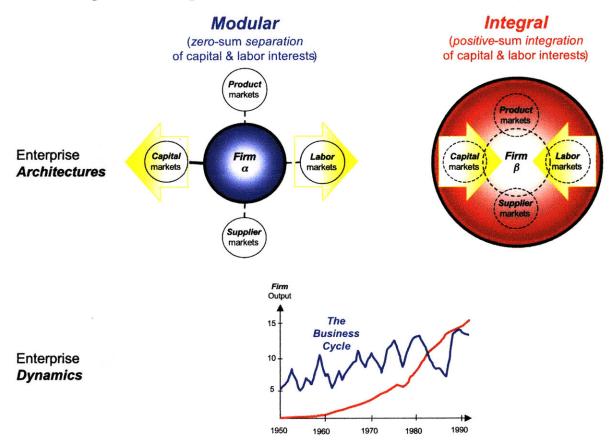

Figure 208: Enterprise Architecture as a Generator of the Business Cycle

Note that system dynamicists (e.g. Forrester, 1968b; Mass, 1976; Sterman, 2000) have long demonstrated via numerical simulation, the plausibility of workforce-inventory interactions in the form of a balancing loop with delay as the origin of the business cycle.

5.2.1.4 Kuznets and the Machine Investment Cycle

In addition to the lightly-damped, 3-5 year business cycle, the enterprise architecture can be used to idealize the heavily-damped 20-year machine-investment or Kuznets cycle. As shown in Figure 209 below, the enterprise architecture can be used to visualize the sources of both the business cycle (i.e. the balancing behavior with delays between firm's inventory and labor markets) and the Kuznets cycles (i.e. the balancing behavior with delays between the firm's inventory and capital markets).

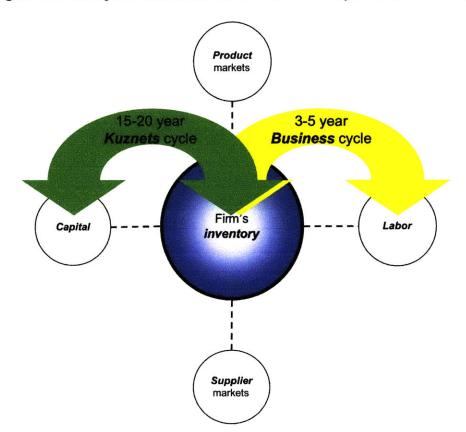

Figure 209: Enterprise Architecture and the Business Cycle and Kuznets Cycle

5.2.2 Sociology and Organizational Theories

A good discussion of the various threads can be found in Burrell and Morgan (1979).

5.2.2.1 Structural Functionalism

5.2.2.2 System Theory

The multidisciplinary field of general systems theory began in the 1950's with great ambition (von Bertalanffy, 1962). The intellectual traditions attempted to develop generic system characteristics across many fields from mechanistic to organismic to organizational.

5.2.2.2.1 System Goals: Growth and Stability

"Organization has three goals which are growth, stability and interaction."⁷⁰⁷

Early social systems theorists (Henderson, 1935; Boulding, 1956; Forrester, 1961; Scott, 1961) explored the range of system goals. Henderson (1935) hypothesized the goals of stability, growth and interaction, which later researchers classified as development (Ackoff, 1999). Boulding (1956) and Forrester (1961) focused on growth and stability.

"The goal is 'enterprise design' to create more successful management policies and organizational structures...which influence growth and stability."⁷⁰⁸

System Dynamics "is a quantitative and experimental approach for relating organizational structure and corporate policy to industrial growth and stability."⁷⁰⁹

"Top-management structures have different forms, different attitudes, and different histories. They differ in courage, conservatism, flexibility, rapidity of reaching decisions, and in the objectives being sought. Just as the operating functions interact with one another to produce important dynamic behavior characteristics, so will the interaction between top-management structure and the operating departments favor different growth and stability patterns."⁷¹⁰

5.2.2.2.2 Open vs. Closed Causal Systems

Much of the theory of enterprise architectures and their resulting structural dynamics hinges upon assumptions of the boundary of the firm (or of the unit of competitive analysis) which defines how the firm engages its environment. This issue will become important again later in essay #3 as we investigate the implications for industrial evolution.

There is a rich and slightly incoherent view of firms as either closed or open systems in the social sciences. Clarification of the definitions of these terms is crucial to understanding the discrepancies.

⁷⁰⁷ Scott, W.G. (1961), pg. 20.

⁷⁰⁸ Forrester, J.W. (1961).

⁷⁰⁹ Forrester, J.W. (1961), pg. 13.

⁷¹⁰ Forrester, J.W. (1961), pg. 329.

5.2.2.2.3 Open – Closed Systems and Functional In(ter)dependence

Modular enterprise architectures are characterized by functional independence. This can be modeled causally as an open causal system.

Integral enterprise architectures are characterized by functional interdependence. This can be modeled causally as a closed causal system.

5.2.2.2.4 Feedback Systems: *Positive & Negative*

While organizational theorists (Lawrence and Lorsch, 1967) have discussed the integrationdivision dichotomy, systems theorists (Stacey, 1995) note that the forces of *integration* lead to *stable* equilibrium via *negative* feedback, while the forces of *division* lead to *instability* via *positive* feedback.⁷¹¹ Both forms of feedback can lead to different forms of growth: stable and unstable.

It is interesting to note that the quest for *efficiency* is argued both for the forces of integration (Stacey, 1995, pg. 484) causing stability via negative feedback and for the forces of division (Smith, 1776), causing instability via positive feedback.

5.2.2.2.5 Feedback Systems: System Dynamics and Cybernetics

In a compelling historical review of feedback thinking, Richardson (1991) hypothesizes the existence of two subtle but important threads within the social sciences: the servomechanisms and cybernetics threads.

System Dynamics "is a quantitative and experimental approach for relating organizational structure and corporate policy to industrial growth and stability."^{7/2}

System dynamics is a method for understanding how structure drives behavior in a wide range of social and technical systems.

"To Professor Jay Forrester, for codifying the dynamics of social systems as long ago as the 1950's. I remain mystified as to why these essentially simple mechanisms that constitute the processes of change in all social systems have lain largely unnoticed for four decades."⁷¹³

⁷¹¹ Stacey, R.D. (1995), pp. 484-485.

⁷¹² Forrester, J. W. (1961), pg. 13.

⁷¹³ Warren, K. (2002).

5.2.3 Strategic Management Theories

5.2.3.1 Dynamic Capabilities

"We define dynamic capabilities as the firm's ability to integrate, build, and reconfigure internal and external competences to address rapidly changing environments."⁷¹⁴

Teece, Pisano and Shuen (1997) define dynamic capabilities as operating in rapidly changing environments. Yet they also ironically note that firm success, like *Toyota Motors* and *Southwest Airlines* fall outside conventional exploitation of market power models. We present some evidence to the contrary.

"We doubt that game theory can comprehensively illiminate how Chrysler should compete against Toyota or Honda, or how United Airlines can best respond to Southwest Arilines since Southwest's advantage is built on organizational attributes which United cannot readily replicate."⁷¹⁵

5.2.3.2 Functional Configurations

Miles and Snow (1978) defined a configurational typology which ultimately led to one of the top ten most influential publications in strategic management (Ramos-Rodriguez and Ruiz-Navarro, 2004). By studying four industries: publishing, electronics, food processing and health care, they defined a typology of four strategic types: *prospectors, analyzers, reactors* and *defenders*.

These strategic types were deemed to be equally effective independent of the environmental conditions. In Essay #3, it will be shown that other researchers demonstrated environmental contextual variables govern the performance of strategic types (Hambrick, 1983).

5.2.3.2.1 The Four Types

5.2.3.2.1.1 Prospectors

"Prospectors are characterized by their constant search for new products and markets. They continually experiment with new product lines and venture into new markets. These organizations are the creators of change in their markets and are the forces to which competitors must respond. As such, prospectors are more concerned with searching for new opportunities and will likely not be as efficient as defenders."⁷¹⁶

5.2.3.2.1.2 Analyzers

5.2.3.2.1.3 Reactors

5.2.3.2.1.4 Defenders

⁷¹⁴ Teece, Pisano and Shuen (1997), pg. 516.

⁷¹⁵ Teece, Pisano and Shuen (1997), pg. 512.

⁷¹⁶ Delery and Doty (1996), pg. 810.

"The defender has a **narrow and stable** product-market domain and **seldom makes major** adjustments in its technology or structure. The emphasis is on better and more efficient ways to produce a given product or service and on defending a market. A defender does little research and development. When defenders persue new products, they import the technology from outside the organization."⁷¹⁷

5.2.3.2.2 Empirical Examples

In Table 17 below, Arthur (1992) shows the results of an empirical study of IR practices and strategy of US Steel Mini-mills. Note that while it does show empirical match between strategy and IR practices, it does not specify levels of firm performance.

		Business Strategy	
		Low Cost	Differentiation
Industrial Relations System	Cost Reducing	8 (89%)	8 (40%)

Table 17: Strategy-HRM Fit

It is important to note that the three case studies presented in this dissertation demonstrate the opposite matching, namely that commitment maximizing IR systems tend map to Low Cost strategies, contingent upon the state of the industry's evolution.

In Table 18 below, Delery and Doty (1996) show the following rankings from a survey study using Likert rankings of the banking industry.

Table 1	8:	Configuration	Attributes
---------	----	---------------	------------

Ideal Strategic Profiles Variables	Prospector	Analyzer	Defender
Technological progress	5.64	4.82	4.86
Product / market breadth	5.68	5.18	1.59
Product innovation	6.95	4.68	1.68
Quality	5.47	5.30	5.86
Price level	6.61	4.40	1.32
Active marketing	6.52	5.54	3.14
Long-range financial strength	4.11	5.83	4.88
Resources level	4.86	5.18	4.30
Investment in production	2.91	4.59	6.18
Internal analysis level	3.68	5.62	6.82
External analysis level	6.95	5.24	2.05
Level of risk	6.00	2.62	2.68
Proactive management style	6.76	4.90	2.86

⁷¹⁷ Delery and Doty (1996), pg. 810.

5.3 Structural Mechanics

5.3.1 Structural Building Blocks

In order to build a theory translating architectural form into structural dynamics, we must next define the underlying structural building blocks which generate the dynamic reference modes.⁷¹⁸ These include the following, which will be described in more detail:

- Positive (reinforcing) feedback
- Negative (balancing) feedback
- Delays
- · Carrying capacity

"Learning to recognize and account for time delays goes hand in hand with learning to be **patient**, to **defer gratification**, and to trade **short-run sacrifice** for **long-term reward**. The abilities do not develop automatically. They are part of a **slow process of maturation**.

In a world of short time horizons, of annual, quarterly or even monthly performance reviews, the incentives people face often mean it is rational for them to be aggressive and ignore the delayed consequences of their actions.

The problem is one of aggregation. The individual firm tends to view itself as small relative to the market and treats the environment as exogenous, thereby ignoring all feedbacks from prices to supply and demand."⁷¹⁹

The two key feedback relationships (positive and negative) will first be described along with the two essential building blocks of time delays and system carrying capacity. These will subsequently be assembled into a set of reference modes that capture the fundamental structural dynamics of the enterprise architectures.

"The qualitative distinction between these two sorts of feedback mechanisms, one amplifying heterogeneity and the other sustaining the current level of heterogeneity, is likely to be robust. Heterogeneity in competitive position is sustained by existing market relations and tends to be amplified by overall market position."²⁰

⁷¹⁸ Forrester, J.W. (1968).

⁷¹⁹ Sterman, J.D. (200), pp. 696-697.

⁷²⁰ Levinthal, D. and Myatt, J. (1994), pg. 61.

5.3.2 Fundamental Reference Modes

Having defined the structural mechanics or principles of systems, we can next describe how these generate the fundamental reference modes which are summarized in Figure 210 below.

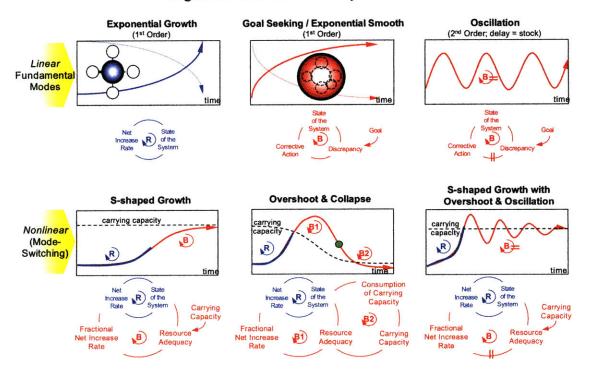

Figure 210: Fundamental Reference Modes

- Exponential Growth / Decay
- · Goal-seeking Growth / Decay
- Oscillation
 - Balancing Loop with delays
 - Conflicting Goals⁷²¹
- S-Shaped Growth
- Overshoot and Collapse
- Overshoot and Oscillate

"An appropriate caveat to these market positional advantages is that they are self-reinforcing in competitive environments in which the bases of competitive advantage are stable. Conversely, in changing environments, these same self-reinforcing mechanisms may lead to decline in the firm's competitive position (Levinthal, 1992)."⁷²²

⁷²¹ See Peter Senge interview, "Illuminating the Blind Spot: Leadership in the Context of Emerging Worlds." on McKinsey/SoL joint research project.

⁷²² Levinthal, D. and Myatt, J. (1994), pg. 47.

5.3.3 The "Physics" of Growth

The physics of growth depends upon the assumptions of model boundaries and therefore exogenous constants. Figure 211 below summarizes the structures and behaviors of a variety of single and multi-loop, linear and nonlinear first order systems, with exogenous constants shown in green.⁷²³ Note that one would not expect to see any oscillation in any of these behaviors, due to the fact that they are all first order systems.

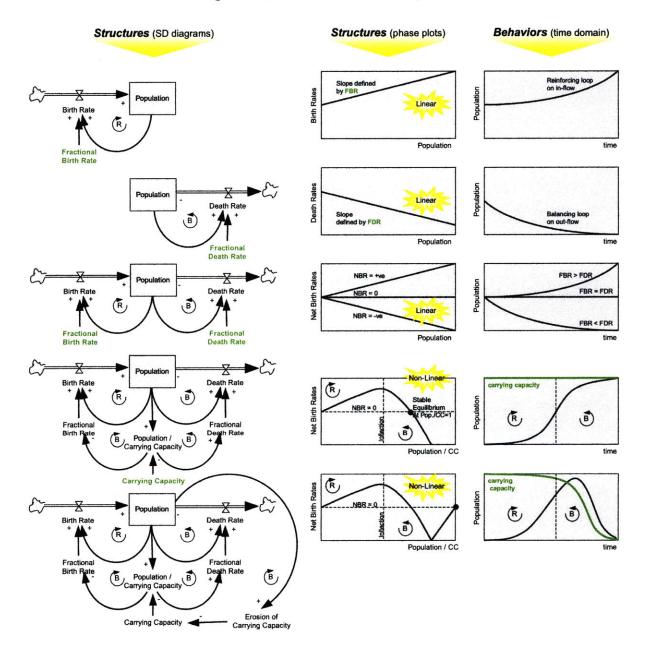

Figure 211: First Order Growth Systems

⁷²³ Sterman, J.D. (2000) pp. 118-127 and 282-290 provides a good discussion of growth modes.

"The question I wanted to answer was whether there was something inherent in the very nature of the firm that both **promoted its growth** and necessarily **limited its rate of growth**."⁷²⁴

"The analysis of the **limits to growth** – the factors determining the **maximum rate of growth** of firms – cannot, in its present formulation at any rate, be tested against the facts of the external world, partly because of the difficulties in expressing some of the concepts in **quantitative terms** and partly because of the impossibility of ever knowing for any given firm what is, or what would have been, its maximum rate of growth. Perhaps some of these difficulties will be overcome in **different formulations** constructed by others..."

"In order to find comprehensive and rigorous answers to the questions Penrose (1959) posed concerning firm growth processes, more conceptual and especially empirical research needs to be done on the dynamics of growth, that is analyzing the paths and the effects of the outcome of different sequences in the growth process."⁷²⁶

⁷²⁴ Penrose, E. (1959).

⁷²⁵ Penrose, E. (1959), pg. 4.

⁷²⁶ Kor and Mahoney (2000), pg. 128.

5.3.4 Enterprise Inertias

In contrast to the traditional beliefs of "classical" strategic management, where managers have high degrees of *rationality* and search capabilities, and where organizations have high degrees of *plasticity*,⁷²⁷ the notions of *inertia* posit that organizations are typically unable to react to environmental change in a timely manner.⁷²⁸

This framework, however broadens the perspective of strategy by identifying not one, but two separate forms of organizational inertia: *architectural* and *structural*, both of which ultimately arise from the enterprise's architectural form, as shown in Figure 212 below. Broadly speaking, architectural inertia limits the firm's response to *environmental* change, while structural inertia limits the firm's response to *operational* change.⁷²⁹

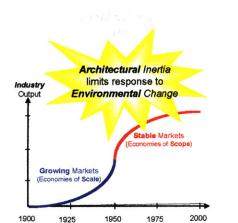

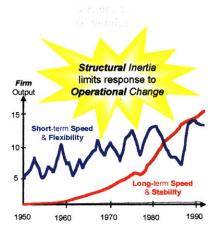

Figure 212: Architectural and Structural Inertia

⁷²⁷ Gavetti and Rivkin (2004).

⁷²⁸ Whittington, R. (2000).

⁷²⁹ While the terms "architectural" and "structural" inertia are coherent and consistent with the overall framework developed herein, they will undoubtedly cause confusion in the strategic management community. My use of the term "architectural" inertia to describe resistance to *environmental* change is termed "structural" inertia by population ecologists, which is the term that I use to describe resistance to *operational* change.

The following subsection briefly explores structural inertia and its effects on the dynamics of operational change. Chapter 6 will explore architectural inertia and its effects on the evolution of enterprise architectures in response to environmental changes.

5.3.4.1 Structural Inertia

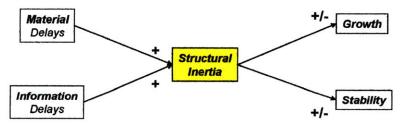

The notion of *structural* inertia limits the firm's response to *operational* change. Specifically, when looking at aggregate system variables like firm output (Q), it is clear that some enterprises undergo more severe instability or oscillations than others when subjected to similar environmental shocks (like variable customer demands). Structural inertia therefore is fundamental in defining an enterprise's approach to such system goals as *growth* and *stability*.⁷³⁰

Heuristic 2a:

Modular enterprise architectures tend to have less structural inertia than equivalent integral enterprise architectures. As a result, modular enterprise architectures have greater short-term speed and instability than equivalent integral enterprise architectures.

The determinants of structural inertia are also different than the determinants of architectural inertia. Although age and size have secondary impact on structural inertia, the fundamental drivers are those material, information and mental state delays in the system, as shown in Figure 213. Such delays tend to inject time into the system, making its fundamental period of oscillation longer. Instability therefore occurs when the fundamental period of oscillation is close (i.e. near resonance) with the fundamental period of oscillation of the forcing function (e.g. customer orders).⁷³¹

As an aside, please note that not only can structural inertia cause the amplification or attenuation of enterprise instability, but other structural quantities, like damping and stiffness can have similar effects. These will be discussed later.⁷³²

Heuristic 2b:

As the nature of customer demand changes tends to consist of a series of small, frequent, pulses, the "loading function" on the enterprise tends to be multi-frequency transients.

⁷³⁰ The field of System Dynamics explicitly addresses the mechanics of social system inertia. See Forrester (1961, 1968).

⁷³¹ Piepenbrock, T. (2004).

⁷³² Piepenbrock, T. (2004).

By way of a brief illustrative example, *Boeing*, the 90-year old large incumbent currently has a modular enterprise architecture. This would imply high architectural inertia (due to its age, size and routines) making it difficult to survive discontinuous environmental change⁷³³, while its structural inertia is relatively low due to its short-term speed and growth objectives.

Conversely, *Airbus*, the 40-year old smaller challenger currently has an integral enterprise architecture. This would imply lower architectural inertia (due to its age, size and routines) making it easier to survive discontinuous environmental change⁷³⁴, while its structural inertia is relatively high due to its long term speed and stability objectives.

"As we go back into a commodity supply system, the structural character begins to change. In the distribution system for manufactured products, goods are shipped in response to orders. A product is shipped to a customer only if he wants it. Stresses within the system manifest themselves more by a change in the flow rate of goods than by changes in price. We commonly observe that a factory will adjust production rate to market demand by production-rate changes that are larger and faster than are the price changes. By contrast, the commodity system tends to be one in which supply rates can be adjusted but slowly. The commodity is not produced to the specific order of the customer. Price fluctuates more rapidly than supply rate."

⁷³³ Like "disruptive innovations" at the low end of its market from *Embraer* and *Bombardier* for example. See Christensen et al. (2004).

⁷³⁴ Ibid.

⁷³⁵ Forrester, J.W. (1961), pp. 322.

5.3.5 Time and the Causal Levels of Competition

Wernerfelt (1984) argued for clarity in the strategic management literature by differentiating between competition based on *products* and competition based on a deeper generating mechanism, namely *resources*.

This research argues for a deeper generating mechanism, namely that of an *enterprise architecture*, which ultimately enables and constrains (but does not determine) what resources can be generated and how they might be built and maintained.

As shown in Figure 214 below, the research assembles a causal logic in which integral enterprise architectures are built based on the mutual consent of the stakeholder ecosystem to take the time required to develop the capabilities necessary to dominate a market over the long term. This is a "patient", long-term thinking ecosystem.

Conversely, modular enterprise architectures are built to extract as much rent from the ecosystem as possible to be given to the shareholders. This stakeholder group typically demand high rates of return (and therefore growth). This tends to be an "impatient" short-term thinking ecosystem.

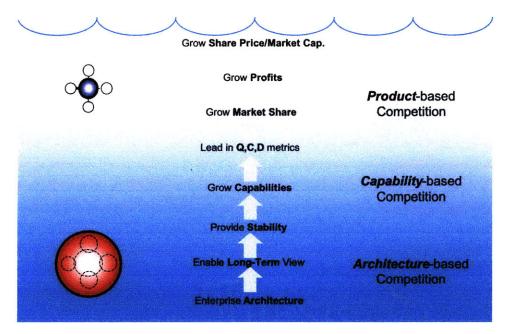

Figure 214: Time and the Causal Levels of Competition

It has been observed empirically⁷³⁶, that when a modular architecture is competing against an integral enterprise architecture, and is losing ground over the long run, it tends to adopt the "surface details" of the integral enterprise architecture, without changing the fundamental nature of its modular architecture, making its long-term competitive position even worse.

⁷³⁶ Empirical observations include: automobiles (Womack et al., 1990), airlines (Hoffer-Gittell, 2003) and large commercial airplanes (Piepenbrock, T. 2004).

5.4 Enterprise Architecture Form-Structure Mapping

Having dfined the characteristics of enterprise architectural forms, this section will now begin to map these forms to their associated "structures" or functional behaviors. These functional behaviors will be divided into *quantity*-based and *quality*-based growth variables.

5.4.1 Quantity Growth (Operations Strategy)

This sections deals with the growth in *quantity* of enterprise inputs (e.g. workforce, R&D spending) and outputs (e.g. annual number of cars produced, annual number of seat-kilometers flown).

"Top-management structures have different forms, different attitudes, and different histories. They differ in courage, conservatism, flexibility, rapidity of reaching decisions, and in the objectives being sought. Just as the operating functions interact with one another to produce important dynamic behavior characteristics, so will the interaction between top-management structure and the operating departments favor different growth and stability patterns."⁷³⁷

Having defined the spectrum of enterprise architectural forms, characterized by the modular and integral archetypes in chapter 4, we will now begin a stylized mapping of their structural dynamics. As can be seen in Figure 215 below, the growth of the modular enterprise is characterized by instability (i.e. positive feedback), while the growth of the integral enterprise is characterized by stability (i.e. negative feedback). It is important to note that the growth trajectories of each enterprise architecture are not subtly different, in fact they are 180 degrees different.

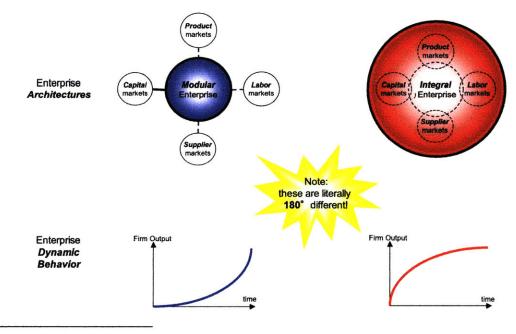

Figure 215: Enterprise Architecture Form-Structure Mapping

⁷³⁷ Forrester, J.W. (1961), pg. 329.

Heuristic 2c:

The structural *dynamics* of an enterprise (growth vs. stability), will be governed by the architectural *form* (modular vs. integral) of the enterprise. The modular enterprise is "built" for exponential growth, while the integral enterprise is "built" for goal-seeking stability.

"Firm growth is a result of a process of development... in which an interacting series of internal changes leads to increases in size accompanied by changes in the characteristics of the growing object."⁷³⁸

Heuristic 2d:

The dynamic response of any socio-technical system is governed by three structural properties: *structural inertia* (Hannan and Freeman, 1984), *structural damping*, (e.g. time constants used in exponential smoothing for decisions – i.e. level of "patience") and *structural stiffness*. Modular enterprise architectures tend to have shorter natural periods of oscillation (i.e. less inertia, less damping and/or more stiffness) than integral enterprise architectures.⁷³⁹

Heuristic 2e:

The dynamic response of the enterprise is a function of both the enterprise's endogenous structural properties, and those of the exogenous environment. The "dynamic amplification" of the enterprise is a function of the ratio of the natural periods of oscillation of the enterprise with respect to the environment.⁷⁴⁰

Heuristic 2f:

The structural mechanics of an enterprise defines the enterprise's *efficiency*. Enterprise *efficiency*, together with enterprise *effectiveness*, define an enterprise's performance capability. (Note: the more efficient enterprise structure may not exhibit the highest performance.)

Heuristic 2g:

A modular enterprise architecture having a greater degree of exploitation potential will be driven by shorter-term objectives, be able to have faster short-term growth rates, based on the positive or reinforcing feedback dynamics of economies of scale, associated with mass production. Rapid short-term growth is driven by competition for building capacity via the capital markets (known as "capitalism").

"Mass production is, in fact, a system ideally suited to the survival of large enterprises in a highly cyclical economy. Both workers and suppliers are considered variable costs. The problem with the American pattern is that it is extremely corrosive to the vital personal relationships at the core of any production process."⁷⁴¹

⁷³⁸ Penrose, E. (1959), pg. 1.

⁷³⁹ Piepenbrock, T. (2004).

⁷⁴⁰ Piepenbrock, T. (2004).

⁷⁴¹ Womack, Jones and Roos (1990), pp. 247-248.

Heuristic 2h:

A *modular* enterprise operates under the following reinforcing circular managerial mental model: "demand for my products is *not* durable...therefore I *can't* keep my supply stable...therefore my long-term costs are *not* lower...therefore demand for my products is *not* durable....

Heuristic 2i:

An *integral* enterprise architecture having a greater degree of *exploration* potential will be driven by *longer*-term objectives, be able to have faster *long*-term growth rates, based on the *negative* or *balancing* effects of economies of *scope*, associated with *lean* production. Rapid long-term growth is driven by competition for growing capability via the labor markets (known as "*human capitalism*").

"... the well-known 'lean production system' was developed within a highly integral supply chain."742

Heuristic 2j:

An *integral* enterprise operates under the following reinforcing circular managerial mental model: "demand for my products is *durable*...therefore I *can* keep my supply stable...therefore my long-term costs are *lower*...therefore demand for my products is *durable*....

5.4.1.1 Optimum Rates of Growth

A significant research area in strategic management explores whether there is an optimum rate of firm growth, and if so, what are its bounds

Raisch and Krogh (2007) posit that minimum rates of growth are determined primarily by competitive pressures for marktet share in order to achieve economies of scale and scope. They also posit maximum rates of growth are determined by external market limits, external or internal financial limits (i.e. the "sustainable growth rate"), or internal managerial limits (Penrose, 1959).

"Not all growth is good. An analysis of Fortune Global 500 companies shows that businesses that grew within the limits of their growth corridors performed far better than others – even those that grew faster." 743

Empirically, Raisch and Krogh (2007) demonstrate that "smart growth" firms which stay within their "growth corridor" deliver average returns to shareholders that are nearly double those firms that grow either faster or slower than their "growth corridors". They also note that such "smart growth" firms are relatively rare, comprising only 25% of their sample of *Fortune* Global 500 firms (between 1995 and 2004).

⁷⁴² Fine, C.H. (1998). pg. 138.

⁷⁴³ Raisch and Krogh (2007), pg. 65.

5.4.2 Quality Growth (Marketing Strategy)

"Many economists would be wont to propose that the strategy represents a firm's solution of its profit maximization problem, but this seems misconceived to me... firm strategies seldom determine the details of firm actions, but usually at most the broad contours.""⁷⁴⁴

"The architectural form is the solution-neutral restatement of the problem."745

5.4.2.1 Structural vs. Strategic variables

This section begins to explore the role of strategy within the context of an enterprise architecture. It will attempt to contribute to the debate of the importance of "structural" variables vs. the importance of "strategic" variables.⁷⁴⁶ As shown in Figure 216 below, the relationships between firm and industry structure are related to firm performance – either with or without strategy. As can be seen, the main strategic frameworks of SCP, SSP and RBV are shown.⁷⁴⁷

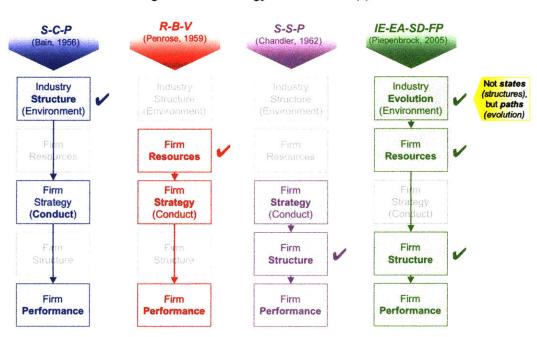

Figure 216: Strategy vs. Structure(s)

What this research aims to resolve therefore is the importance of strategy – namely under what conditions does it matter?⁷⁴⁸

⁷⁴⁴ Nelson, R. (1991), pg. 67.

⁷⁴⁷ Farjoun, M. (2002), pp. 573.

⁷⁴⁸ Whittington, R. (2000).

5.4.2.2 Strategic Positioning: Differentiation vs. Cost-Leadership

Classical strategy defines that firms achieve competitive advantage via strategic choices of differentiation vs. cost-leadership (Porter, 1980).

5.4.2.3 Strategic Investment: Flexibility vs. Commitment

Pacheco-de-Almeida et al. (2008) highlight the strategic investment choices between flexibility and commitment, which lie at the center of the choice between modular and integral enterprise architectures: with the former being designed for flexibility, and the latter for commitment.

"This high-profile example [between **Airbus** and **Boeing**] illustrates the fundamental strategic trade-off between commitment and flexibility that managers face when deploying firm resources to establish product-market positions. **Commitment** and **flexibility** lie on the **opposite ends** of a firm's investment spectrum, and scholars have been divides as to which of the two strategies is the main driver of investment value."⁷⁴⁹

5.4.2.4 Enterprise Efficiency vs. Effectiveness

Pfeffer and Salancik (1978) articulated clearly between internal *efficiency* and external *effectiveness*.

"The effectiveness of an organization is its ability to create acceptable outcomes and actions. It is important to avoid confusing organizational effectiveness with organizational efficiency. The difference between the two concepts is at the heart of the external versus internal perspective on organizations. **Organizational effectiveness is an external standard** of how well an organization is meeting the demands of the various groups and organizations that are concerned with its activities. **Organizational efficiency is an internal standard** of performance."⁷⁵⁰

The sources of long-term firm performance are known to emanate from the development of a sound strategy along with the execution of that strategy through its operations. The positioning school of strategy focuses on where in the cost-quality space to play, and the resource-based view school of strategy focuses on how to get to the firm's efficiency frontier (Porter, 1996; Markides, 2001; Saloner, Shepard and Podolny, 2001).

Porter (1996) famously argues that operational excellence is a necessary but insufficient condition for success as shown in Figure 217 below. Similarly, this research argues that strategy is a necessary but insufficient condition for success.

⁷⁴⁹ Pacheco-de-Almeida, Henderson and Cool, (2008), pg. 517.

⁷⁵⁰ Pfefer and Salancik, (1978), pg. 11.

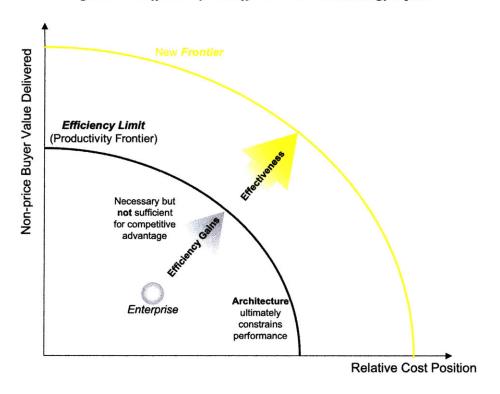

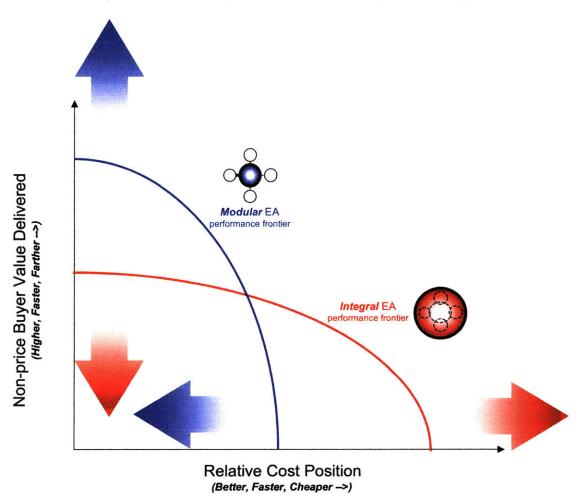

Figure 217: Efficiency vs. Effectiveness in Strategy Space

.

5.4.2.5 Strategic Biases of Enterprise Architectures

Unlike the previous discussion, this research will attempt to demonstrate that different enterprise architectures have different strategic predispositions, which bias shape of the performance frontiers. As shown in Figure 218 below, the modular enterprise architecture has historical biases toward differentiated products, and as such exhibits a vertical stretch of its performance frontier. Conversely, the integral enterprise architecture has biases toward low cost (via its high stability), and as such exhibits a horizontal stretch of its performance frontier. It will be argued thin chapter 6 that environmental pressures act to bias these performance envelopes.

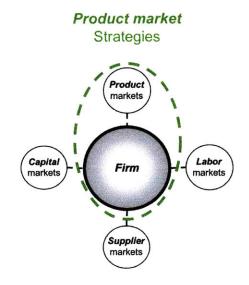

This research attempts to illustrate that the construct of enterprise architecture, which both enables and constrains performance, lies above operations and even strategy. It can determine what strategies are viable, and what operations - no matter how efficient - will be effective.

5.4.2.6 Case Studies: Product Strategy in Commercial Airplanes

In order to illustrate the above concepts, we will focus on one link in the enterprise architecture: the relationship between the firm and its customers through product markets, as shown in Figure 219 below.

Figure 219: Examining the Product Market Strategies in Commercial Airplanes

Two cases will be briefly explored to illustrate systemic architectural thinking. The first is the alleged competition between the *Boeing* 787 and the Airbus A380. The second is the real competition between the *Boeing* 787 and the *Airbus* A350, and more importantly how the evolution of product strategies can be explained by the respective enterprise architectures.

Note that in both cases, whether in direct or indirect competition, the trajectories of each firm are out of phase.

5.4.2.6.1 Boeing 787 vs. Airbus A380

"Two companies with fundamentally different products, based on diametrically opposite visions of the future, [are] engaged in a Hatfields versus McCoys battle with billions of dollars at stake. Boeing versus Airbus is one of the most hard-fought, closely watched marketing battles out there. It is also one of the most fascinating. Not long ago, it appeared as if Airbus had gained the upper hand. If Boeing succeeds in winning this battle – and it appears to be well on its way – it will amount to one of the great reversals of business fortunes. It will also serve as proof of the wisdom of understanding the marketplace well enough to lead, rather than follow."⁷⁵¹

"Another gamble by Boeing [is] that the future of the airline business will be in point-to-point nonstop flights with medium-size planes rather than the current hub-and-spoke model favored by Airbus, which is developing the 550-seat A380 superjumbo as its premier long-haul jetliner."⁷⁵²

Much has been said in the press about the "radically" different strategies of *Boeing* and *Airbus*, since *Boeing* abandoned its Sonic Cruiser for the 7E7, renamed the 787. It has been suggested that *Boeing* has adopted a strategy supporting "point-to-point" airline networks, with smaller airplanes traveling greater distances, as is evidenced by the 787. Conversely, *Airbus* has adopted a strategy supporting "hub-and-spokes" airline networks, with larger airplanes, as is evidence by the A380. This is another example of non-systemic "laundry list thinking". If one were to look *spatially* at the entire portfolio of products, as well as *temporally* the longitudinal timing and phasing of new product introduction initiatives, it is obvious that the "spin" in the press is just that (even though the sources of such spin come from the firm's PR functions themselves).

"A number of commentators have **spuriously** evaluated the prospects of the 787 and A380 as a question of the hub versus spoke concept of aviation growth. This is **wrong** because it is abundantly clear that the future will be characterized by **both**. These aircraft are not competitors; they are designed for **different markets**."⁷⁵³

Figure 220 below illustrates the current product performance portfolios of both the incumbent (*Boeing*) and the challenger (*Airbus*).

⁷⁵¹ Babej, M.E. and Pollak, T. (2006) "Boeing versus Airbus," Forbes, May 24, 2006.

⁷⁵² Wayne, L. (2006) "Boeing Bets the House on Its 787 Dreamliner," The New York Times, May 7, 2006.

⁷⁵³ Lawrence and Thornton (2005), pg. 149.

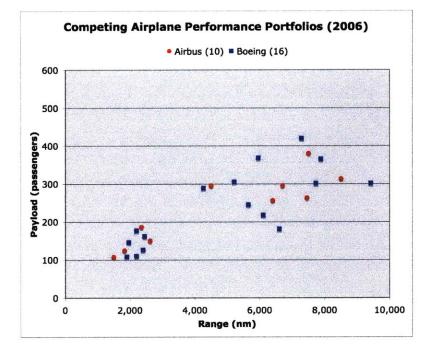

Figure 220: Product Performance Portfolios in Commercial Airplanes - 2006

By way of comparison, Figure 221 below illustrates the future product performance portfolios of both the incumbent (*Boeing*) and the challenger (*Airbus*).

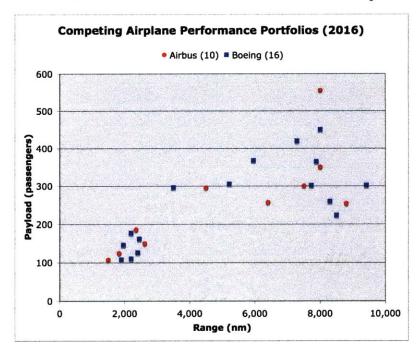

Figure 221: Product Performance Portfolios in Commercial Airplanes - 2016

While *Airbus* will have added the (hub-and-spokes) A380 to finally round out its product portfolio, as well as the middle-market (point-to-point) A350, *Boeing* will have added its (point-to-point) 787 and its (hub-and-spokes) 747-8. There is no significant difference in product performance portfolio strategies.

5.4.2.6.2 The Evolution of Boeing 787 vs. the Evolution of the Airbus A350

The real competition in the "middle of the market" is between *Boeing's* 787 and *Airbus'* A350. It is interesting to observe the inherent architectural tendencies of each firm's product development trajectories (including their respective "false-starts").

As shown in Figure 222 below, *Boeing*, being true to its high-performance products culture, initially offered the radically-improved "higher, faster, farther" Sonic Cruiser. Due to performance oversupply, it was pulled by the market back down to the "better, faster, cheaper" solution of the 787.

Airbus conversely and subsequently responded with its incrementally-improved modified A330 in order to protect its "better, faster, cheaper" low-cost system design. Due to performance undersupply, it was pushed by the market up to the "higher, faster, farther" solution o the A350.

Note that in the final competitive space, it is anticipated that *Boeing's* 787 will be a higher performing, but higher initial cost product than *Airbus'* A350.

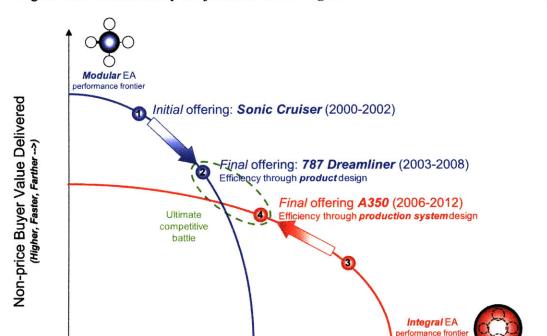

Figure 222: Evolutionary Trajectories of Boeing & Airbus' Recent Product Offerings

Relative Cost Position (Better, Faster, Cheaper -->)

5.5 **Opposing Dynamic Behaviors**

5.5.1 Opposing means to Profit: Top-line Growth vs. Bottom-line Productivity

5.5.2 Opposing Strategies Towards Meeting Demand

"In some industries we find one company whose policies attract the **fluctuating** part of the market demand, whereas another company has policies that attract a **stable** underlying continuity of demand... Differences in policy that tend to differentiate a company on the basis of its dynamic characteristics will be an important aspect of **competitive** models."⁷⁵⁴

As shown conceptually in Figure 223 below, different enterprises have fundamentally different approaches toward demand and strategies for how it is best served. These can be decomposed dynamically into the underlying stable demand and the superimposed fluctuating part.

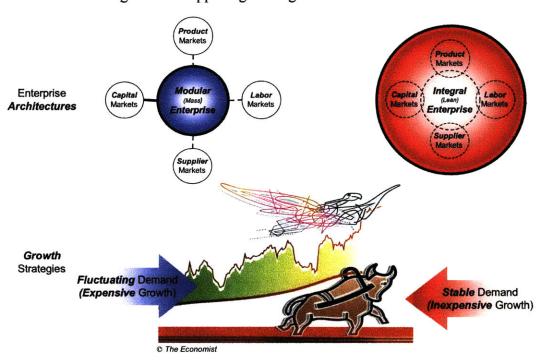

Figure 223: Opposing Strategies Towards Demand⁷⁵⁵

It will be argued later that the strategies chosen to chase the fluctuating part actually contribute to the very existence of the fluctuating part of demand. Additionally, chapter six will later begin to describe under what environmental conditions each growth strategy is more likely to be successful.

⁷⁵⁴ Forrester, J.W. (1961), pp. 336-337.

⁷⁵⁵ Graphic from The Economist.

5.5.3 Opposing Assumptions of Demand Durability

As shown in Figure 224 below, there is a different causal logic used by those firms chasing the fluctuating part of the market demand, than that used by those firms seeking the stable part of the market.⁷⁵⁶

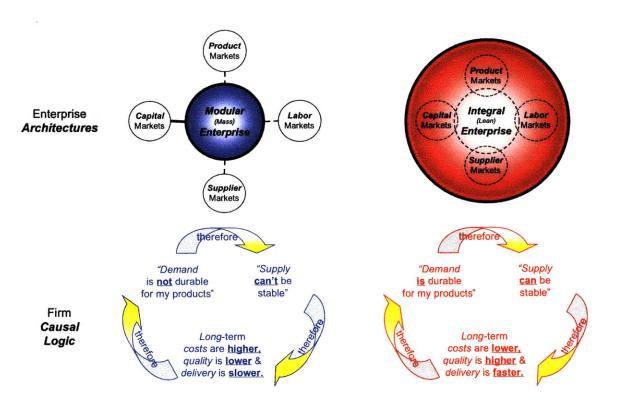

Figure 224: Opposing Assumptions of Demand Durability

"The company that follows the policy of pursuing every possible sale and having product available to **push** into the hands of the customer even in peak periods of demand may find it is unknowingly selecting peaks of demand as its share of the market. This will be especially true if the intrinsic value of the product in the eyes of the customer is less than that of competitors and if the company is taking advantage of sales that come to it because of the unavailability of preferred competitive products. On the other hand, a contrasting company policy could be to establish a preferred position in design, quality, and sales effectiveness so that all production is salable in the periods of lowered market demand. This company might forgo possible higher sales in periods of increased demand in the interest of greater continuity of operations and to prevent dilution of the quality and skill. In this situation the first company has a much higher percentage fluctuation in its operations than has the industry as a whole."⁷⁵⁷

⁷⁵⁶ These relations were obtained empirically from the case studies and will be discussed in more detail later.

⁷⁵⁷ Forrester, J.W. (1961), pp. 336-337.

5.5.4 Opposing Assumptions on Forecasting (managerial cognitive inertia)

"Expectations are usually modeled in system dynamics as adaptive learning processes such as exponential smoothing. Adaptive expectations (single exponential smoothing) outperform many other forecasting methods over the longer time horizons."⁷⁵⁸

As Sterman (2000, pg. 632) points out, various researchers have noted the long-term performance superiority of simple exponential smoothing (Makridakis et al. 1982; Makridakis et al. 1984; Carbone and Makridakis, 1986).

Figure 225 below summarizes the differences between managerial cognitive inertia and decision processes in modular and integral enterprises architectures.

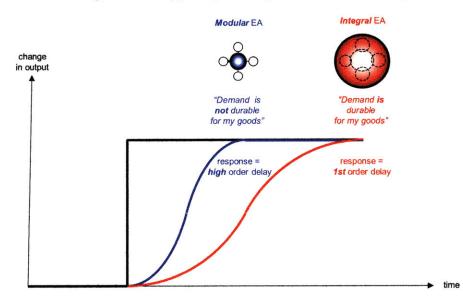

Figure 225: Opposing Assumptions on Forecasting

"In an embedded logic of exchange... on a microbehavioral level, actors follow **heuristic and** *qualitative decision rules*, rather than intensely calculative ones. These factors furnish an alternative mechanism for matching customer demand to production."⁷⁵⁹

⁷⁵⁸ Sterman, J.D. (2000), pg. 632.

⁷⁵⁹ Uzzi, 1997, pg. 61.

5.5.5 Opposing Assumptions of Span of Enterprise Control

Given that the modular enterprise architecture locally optimizes on the performance of the firm, it sees other stakeholders largely as inputs largely beyond their control. As a result, important environmental phenomena like the business cycle are exogenous. More plainly, the business cycle exists because the modular enterprise architecture needs it to - i.e. it creates the instability that it serves.

Conversely, the integral enterprise architecture globally optimizes on the performance of the ecosystem, as it sees other stakeholders largely as inputs largely within their control. As a result, important environmental phenomena like the business cycle are endogenous. More plainly, the business cycle does not exist because the integral enterprise architecture does not want it to.

These two opposing assumptions and therefore managerial cognitive decision sets are summarized stylistically in Figure 226 below.

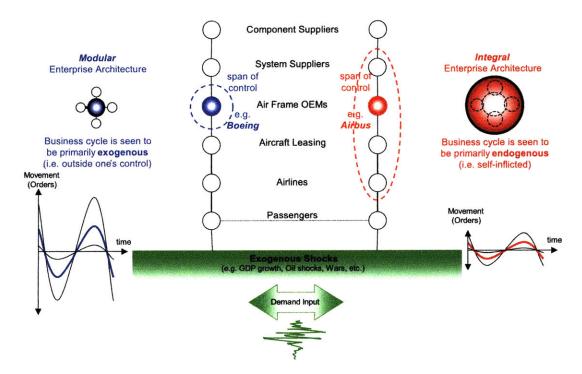

Figure 226: Opposing Assumptions of Span of Enterprise Control

This set of propositions clearly begins to offer problems for positivist science as it is stating that two "realities" exist with respect to what is the nature of the environment of the firm. This observation sits more comfortably with a relativist or interpretivist epistemology.

The question of which of the two "realities" offers competitive advantage will be addressed in chapter six.

5.5.6 Opposing Views of Speed: Short-term vs. Long-term

"The analysis of the limits to growth – the factors determining the **maximum rate of growth** of firms – cannot, in its present formulation at any rate, be tested against the facts of the external world, partly because of the difficulties in expressing some of the concepts in **quantitative terms** and partly because of the impossibility of ever knowing for any given firm what is, or what would have been, its maximum rate of growth. Perhaps some of these difficulties will be overcome in **different formulations** constructed by others..."

The causal mechanisms that underlie the dynamic reference modes can be used to predict and observe the structural dynamics of important macro enterprise response quantities like output. As shown in Figure 227 below which depicts data from the automobile industry, the output quantities can have significantly different dynamic characteristics, depending upon the underlying architectural forms.

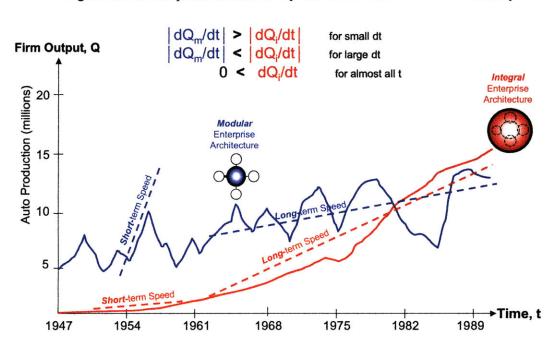

Figure 227: Enterprise Structural Dynamics in the *Automotive* Industry

From the above data, we can note the following observations:

For *short* time horizons, the absolute value of the rate of change of output of the modular enterprises tends to always exceed the rate of change of output of integral enterprises. Mathematically, this can be expressed as:

$$|dQ_m/dt| > |dQ_i/dt|$$
 (for small dt)

⁷⁶⁰ Penrose, E. (1959), pg. 4.

For *longer* time horizons, the absolute value of the rate of change of output of the integral enterprises tends to always exceed the rate of change of output of long enterprises. Mathematically, this can be expressed as:

$$|dQ_m/dt| < |dQ_i/dt|$$
 (for large dt)

Taken together, these two observations comprise the "tortoise vs. hare" dynamic. Note that the hare wins the race given a sufficiently long race, as well as certain environmental race conditions which we will discuss later.

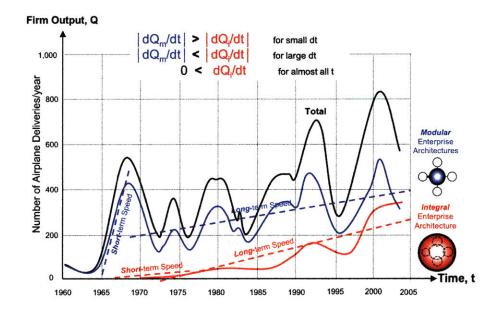

"Slow and steady wins the race."761

In addition, it appears that rate of change of output of integral enterprises tends to not go negative. In other words, integral enterprises are designed to grow at such a rate that they will not have to significantly shrink output. Mathematically, this can be expressed as:

$$dQ_i/dt < 0$$

Causally, this observation can be explained as integral enterprises are in the pursuit of minimizing long-term costs. If competitive advantage arises from lower long-term costs and higher long-term quality, then advantage arises from stability conditions for the workforce in order to avoid degradation of capabilities. This in turn results in continuous learning and improvement. As market share is gained, then learning curve effects, as well as economies of scale drive competitive advantage. The above observations can also be seen in Figure 228 below in the large commercial airplane industry, currently dominated by the incumbent, *Boeing* and the challenger, *Airbus*.

Figure 228: Enterprise Structural Dynamics in the Large Commercial Airplane Industry

⁷⁶¹ From the fables of Aesop.

5.5.7 Opposing Assumptions of Strategic Investment

When putting the enterprise architectural constructs in a head-to-head game theoretic setting, the equilibrium outcomes vary according to the homogeneity or heterogeneity of the duopoly as determined by the relative reaction functions of the firms (Law & Stewart, 1983; Mai & Hwang, 1989; Horowitz, 1991; Cremer & Crémer, 1992; Futagami & Okamura, 1994) as shown below in Figure 229.

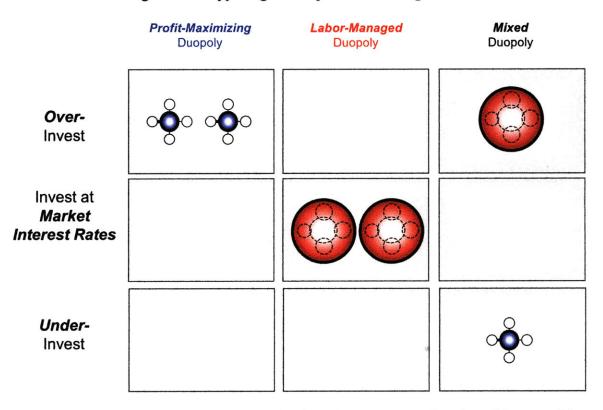

Figure 229: Opposing Assumptions of Strategic Investment

An interesting and counterintuitive result is that the outcomes of each architecture flip to near exact opposites when the composition of the duopoly changes from homogeneous to heterogeneous (or "mixed").

5.5.8 Opposing Financial Strategies

Integral enterprise architectures tend to employ more "conservative" financial strategies than their modular counterparts. Such strategies include maintaining lower debt levels as well as higher levels of cash on hand (Hoffer-Gittell, 2003, pp. 244-247).

"Most people think of us as this flamboyant airline, but we're really very conservative from a fiscal standpoint. We have the best balance sheet in the industry. We've always made sure that we never overreached ourselves. We never got dangerously in debt, and never let costs get out of hand. And that gave us a real edge during [the Gulf War crisis of 1990 to 1994]."⁷⁶²

"At Southwest, the maintenance of **financial reserves** is seen as **integral** to the organization's ability to maintain and even strengthen its relationships in the face of crises... Organizations with plentiful financial reserves in the form of **low debt levels** are better positioned to bolster their relationships by **maintaining commitments... to stakeholders** in times of crisis."⁷⁶³

"A simple analysis of these data shows that prior cash levels did not predict the extent of their layoffs, but their debt-equity ratios predicted the extent of their layoffs with 99 percent certainty."⁷⁶⁴

"Southwest protects its financial reserves by sticking to its policy of gradual steady growth, despite the fact that there is sufficient demand for Southwest's service to permit a far-faster rate of growth. According to John Denison, Southwest's former executive vice president of corporate services: 'We promise the marketplace 10 percent growth, but we are only going to grow as fast as we can manage... But we try to maintain the balance sheet. It is no accident that we are the only single-A rated company in the industry.'"⁷⁶⁵

"Indeed, Southwest's leaders have often had to maintain their conservative financial policies in the face of strong pressures from Wall Street to grow faster. According to Matt Hafner, one of Southwest's regional directors: 'It is nothing new with Southwest. The 'experts' always think we need to expand at a more rapid pace. What these so-called experts express is their desire for Southwest to jump at opportunities at a more rapid clip. Apparently growth excites investors. [But] nobody is pushing us. That could never happen.""⁷⁶⁶

"[Southwest's] conservative approach has been criticized by Wall Street analysts, who have argued that the airline should use its extra cash to make acquisitions or buy back stock. Goldman Sachs analyst Glenn Engel actually calls the balance sheet 'too strong' [though] Engel allows, 'this has meant that when times are tough, they have a lot more flexibility.""⁷⁶⁷

"Southwest's policy stands in contrast to accepted wisdom on Wall Street. Southwest's policy also stands in contrast to the policy of People Express, an airline that, like Southwest, also faced tremendous demand for its services and tremendous pressure from Wall Street to grow rapidly and take advantage of every opportunity. While southwest has experienced 31 years of disciplined, steady, profitable growth, always maintaining plenty of financial reserves to flourish in times of crisis, People Express under the leadership of Donald Burr grew at an exponential rate from 1981 to 1986 and then simply collapsed into its own wreckage."⁷⁶⁸

5.6 Case Study: the Business Cycle (and other "Exogenous" Shocks⁷⁶⁹)

Summarizing and integrating some of the observations from the previous section, this framework posits that the business cycle is not an absolute reality in the positivist science sense, but rather is a socially-constructed phenomena in the interpretivist paradigm. It exists because certain social structures are designed to create them, while other social structures are designed to mitigate them.

"Contemporary management literature contains two significant gaps: it has neglected the strategic problems of the business cycle and it lacks an adequate account of strategic choice."770

One of the best tests to determine an enterprise's architecture is to observe its response to "exogenous" shocks from the environment, most notably the business cycle.⁷⁷¹ As noted by Whittington (1989), the business cycle is a unique litmus test as it teases out the underlying mental models and social constructs of enterprise leaders with respect to their notions of time.

"My contention shall be that the business cycle presents the strategic decision maker with a particularly intriguing, even paradoxical set of problems. The contradiction at the level of the firm is how to balance short-term survival during the recession with the need to preserve long-term competitiveness for the recovery."772

5.6.1 Cross-Industry Examples

We will next explore the behavior of competing firms within four different industries, in their reaction to the business cycle.

5.6.1.1 Appliance industry

In the opening page of his book, Corporate Strategies in Recession and Recovery, Whittington captured the different recession strategies of two rival domestic appliance manufacturers coping with the 1979-81 recession in the UK:

"The director from Exemplar:

When we come out of a recession in England, what happens? You begin to import like fury because everybody has abandoned their production capacity and run down. This cycle has destroyed British industry – this up and down – because no one can afford, due to the tax system et cetera, to develop during the recession. But that's what you've got to do, and that's why we hung on and that's what we did! (Bangs table). "773

"The director from Rose:

⁷⁶⁹ The word "exogenous" is kept in quotes to note later that various enterprise architectures have different degrees of environmental control, and therefore different frames of reference of what constitutes being "exogenous". ⁷⁷⁰ Whittington, R. (1989).

⁷⁷¹ Note however that not all strategy scholars are equally impressed with the importance of the business cycle. Porter (1980), pg. 6 regards the business cycle as being of merely 'tactical' importance, especially when market penetration is deep. ⁷⁷² Whittington, R. (1989), pp. 15 & 19.

⁷⁷³ Whittington, R. (1989), pg. 1.

It is important to preserve things for the future and one would like to do that, and to drive one's way through the recession by investment. But on the one hand the theory is good; but if you are faced with a factory loss this month one has to decide what to do... We cut back heavily."⁷⁷⁴

Whittington notes that these different strategies had very different consequences for firm performance both in the short- and long-term.

5.6.1.2 Automobile industry

"Westerners are resigned to the idea of the business cycle. Like gravity, it's simply there, although nobody quite knows why."⁷⁷⁵

"The issue never arose in Japan. Neither the domestic auto market nor domestic production is cyclical. The Japanese domestic industry has always been able to plow through slumps in export markets by **cutting margins**. Indeed, the largest contraction in production in Japan over the past forty years is smaller than the smallest contraction in North America."⁷⁷⁶

This difference in viewpoint has played out in the global automobile industry over the past 50 years, as was brought to the attention to the academic research and professional communities by Womack, Jones and Roos (1990). As a *General Motors* executive noted:

"When the Japanese producers encounter these gigantic market waves, they will quickly become as **mediocre as we are**. They will have to start **hiring and firing** workers along with suppliers and will **end up as mass-producers** in short order."⁷⁷⁷

This statement reveals the mental models of a leader embedded within an enterprise architecture which enables and constrains what he/she can do. It does not necessarily have to be the case however for other enterprise architectures.

"Some observers have even wondered if the lack of a cyclical market in durable goods in Japan is a direct result of lean production: an inventoryless, highly flexible system that may significantly damp cyclicality."⁷⁷⁸

In fact, some 15 years after the above *GM* quote, *Toyota* went on to systematically dismantle the US mass-producers with its integral enterprise architecture and a view of stability which is impossible for modular enterprise, mass producers.

"We will maintain long-term, stable growth by building a business structure that can respond to market fluctuations." (Fujio Cho, President, Toyota).⁷⁷⁹

⁷⁷⁸ Womack, Jones and Roos (1990), pp. 249.

⁷⁷⁹ Toyota 2004 Annual Report, "President's Message", pg. 11.

5.6.1.3 Airplane industry

A similar story is recorded 20 years later in the airframe and airline industries in the recession of 1999-2001 and the exacerbating exogenous shock of the September 11th terrorist attacks in the US, as the leaders of leading firms in these industries attest:

"I am always a bit surprised by the **speed** with which Americans take decisions: that in three days after the attacks they announce 25,000 lay-offs at Boeing seems to me **totally stupefying**. Airbus has a bigger order book than Boeing and until now **growing market share**, which will allow the bumps to be smoothed out."⁷⁸⁰

"We had to take necessary steps to manage the cycle profitably."781

5.6.1.4 Airline industry

"At Southwest, we manage in good times as though we were in bad times."⁷⁸²

"Nothing kills your company's culture like layoffs. Nobody has ever been furloughed [at Southwest], and that is unprecedented in the airline industry. It's been a huge strength of ours."⁷⁸³

"We are willing to suffer some damage, even to our stock price, to protect the jobs of our people."784

5.6.2 Exogenous vs. Endogenous Views

Modular EA's create the instabilities that they are designed to serve, while integral EA's create the stability that they are designed to serve. In other words, to the firm at the center of the modular EA (with its narrowly-defined span of control) the business cycle is exogenous, outside of its conrol, and the best it can do is to predict it, and "ride" it as tightly and efficiently as possible. Conversely, to the firm at the center of the integral EA (with its broadly-defined span of control) the business cycle is endogenous.

5.6.3 Dominant Firm Behavior

"When the Japanese producers encounter these gigantic market waves, they will quickly become as mediocre as we are. They will have to start hiring and firing workers along with suppliers and will end up as mass-producers in short order."⁷⁸⁵

The mental model of leaders in modular EAs is that while integral EAs may be able to "get away with" being stable as challengers, once they begin to dominate an industry in terms of market share, they must begin to oscillate, just as the modular EAs have done. This research framework posits that such behavior is not necessarily true, which the evidence begins to support.

⁷⁸⁰ Airbus CEO, Noel Forgeard, 20 Sept. 2001.

⁷⁸¹ Boeing executive, post- 9-11.

⁷⁸² Quote from Southwest Airlines employees, as cited in Hoffer-Gittell (2003), pg. 244.

⁷⁸³ Southwest Airlines' Chairman, Herb Kelleher, from Hoffer-Gittell (2003), pg. 243.

⁷⁸⁴ Southwest Airlines' CEO, Jim Parker, from Hoffer-Gittell (2003), pg. 242.

⁷⁸⁵ Womack, Jones and Roos (1990), pp. 249.

An interview with a senior executive in a modular EA prior to being overtaken by their competitor predicted:

"Once [our competitor] *takes more than 50% of the market*, they will have to become unstable, just as we are." ⁷⁸⁶

Deeper probing revealed that the mental model is that the business cycle is a given, and that whoever dominates the supply of that market must swing with it. In a subsequent interview with the same executive three and a half years later (after the data showed that their prediction did not come true), the executive offered the following explanation:

"Once [our competitor] starts behaving rationally, they will have to become unstable, just as we are."⁷⁸⁷

Again the mental model is that the competitor is of the same architecture, therefore if they do not pursue the same policies, they must be behaving irrationally. This research offers that both competitors are highly rational, given their enterprise architectures.

5.6.4 Signal-to-Noise Ratios

The data suggests that as over time, as modular EAs are under pressure from integral EAs, they oscillate more severely, with their signal-to-noise ratios (on output) decreasing.

Conversely, as integral EAs begin to dominate, their signal-to-noise ratios remain high, and in fact they tend to "discipline" the market, giving it a higher signal-to-noise ratio, commensurate with their own behavior.

⁷⁸⁶ Interview took place in January 2002.

⁷⁸⁷ Interview took place in August 2005.

5.7 Symbiotic Inter-species Competition and Mixed Duopoly

Interspecies competition is a relatively new concept which is therefore underrepresented in the economics and sociology literatures. In economics, it takes the form of "Mixed Duopoly" competition, while in sociology (and biology), it takes the form of "Interspecies Competition" between heterogeneous organizational set architectures under the heading of Community Ecology (Astley, 1985).

5.7.1 Inter-species Competition in Community Ecology

"This paper distinguishes between two ecological perspectives on organizational evolution: population ecology and community ecology. The perspectives adopt different levels of analysis and produce contrasting views of the characteristic mode and tempo of organizational evolution. **Population ecology** limits investigation to evolutionary change unfolding within established populations, emphasizing factors that homogenize organizational forms and maintain population stability. Population ecology thus fails to explain how populations originate in the first place or how evolutionary change occurs through the proliferation of heterogeneous organizational types. **Community ecology** overcomes these limitations: it focuses on the **rise and fall** of populations as basic units of evolutionary change, simultaneously explaining forces that produce **homogeneity and stability** within populations and heterogeneity between them."⁷⁸⁸

Even the original classic work on population ecology (Hannan and Freeman, 1977) highlights this important form of competition.

"The greater the unexhausted capacity in the environment, the faster should be the rate of growth of populations of organizations. But the rate at which populations of organizations can expand into unused capacity varies among forms of organization. So there are two distinctive ecological considerations: the capacity of the environment to support forms of organizations and the rate at which populations grow (or decline) when the environmental support changes."⁷⁸⁹

"Up to this point, we have presumed that the limits to growth reflect the finite nature of the environment. It is now time to reintroduce competition. According to Hawley, competition enters indirectly when the competitors lower the fixed supply. We can model this by following the lead of bioecologists and extending the logistic growth model. The two populations are said to compete if the addition of units [of market share] of either decreases the rate of growth of the other. This will be the case when both populations are sustained by the same types of resources."⁷⁷⁰

"If two populations of organizations sustained by identical environmental resources differ in some organizational characteristic, that population with the characteristic less fit to environmental contingencies will tend to be eliminated. The stable equilibrium will then contain only one population which can be said to be isomorphic to the environment."⁷⁹¹

The state of the environment has a significant effect on interspecies competition. Lenox, Rockart and Lewin (2006) develop simulation models to theorize about the nature of environmental interdependencies, and their effects on firm and industry profitability.

⁷⁸⁸ Astley (1985), pg. 224.

⁷⁸⁹ Hannan and Freeman (1977), pg. 941.

⁷⁹⁰ Hannan and Freeman (1977), pg. 942.

⁷⁹¹ Hannan and Freeman (1977), pg. 943.

"For high PIA-industries [Potential for Interdependencies among Activities], we expect a few high performers and a relatively large number of laggards. High levels of PIA produce industries where most firms cluster around low profit levels and a few firms occasionally achieve vastly superior profits."⁷⁹²

"In low PIA-industries, individual firm profits are driven by the ability of all firms to find low cost positions absolutely; while in **high** PIA-industries, individual firm profits are driven by the ability of the best firms to find better cost positions relative to those of rivals."⁷⁹³

"In high PIA-industries the potential exists for an individual firm to discover a highly efficient configuration of business practices relative to rivals and to realize profits well-above the industry average. Thus, the average profits in high-PIA industries are bolstered by the occasional highly successful firm. While the existence of this kind of skewed profit distribution is striking when observed, it remains a relatively infrequent outcome even in high-PIA industries. Paradoxically, it is within these otherwise unattractive industries that we are most likely to observe an outstanding firm that is both high performing and highly profitable."⁷⁹⁴

"Medium PIA-industries, present firms with a real potential for competing for a very long period without becoming competitive."⁷⁹⁵

"The overall result that average industry profits are highest for intermediate levels of PIA proves robust from one extreme of pure innovation to the opposite extreme of pure imitation."⁷⁹⁶

"Our results provide guidance for identifying **likely industries** where competitive advantage accrues to a chosen few firms that have valuable, rare, nonsubstitutable, and hard-to-imitate resources and capabilities that allow for favorable market positions relative to rivals. In this way, **interdependencies** provide an explanation not only for what sustains profit heterogeneity within and across industries, but why it emerges in the first place in some industries more than in others. By recognizing that industries can vary in terms of potential interdependency due to technology and other structural factors, we also see **the beginning of a reconnection of firm-level and industry-level analyses**. To the extent that the potential for interdependency is driven by structural elements of an industry, industry structure [SCP] can be used to explain differences in firms' resources, capabilities, [RBV] and profits."⁷⁹⁷

"There has been a great deal of interest among economists in how firm heterogeneity may affect the structural evolution of industries."⁷⁹⁸

"Perhaps the most promising, those studying industry dynamics may find that a more explicit treatment of interdependency provides new insights into the structural evolution of industries."⁷⁹⁹

5.7.2 Example: Biological Ecosystem

Before investigating *business* ecosystems, the following discussion of the evolution of *biological* ecosystems is used to illustrate the framework. We look at the well-known forest (or Canadian boreal) ecosystem consisting of pine, aspen and spruce species of trees.⁸⁰⁰

As shown in Figure 230 below, the lifecycle of the ecosystem consists of the symbiotic competition between two sets of species, designed to grow in different environments: the jack pine and aspen in post-fire soil which is rich in nutrients, and the black spruce in later pine and aspen environments.

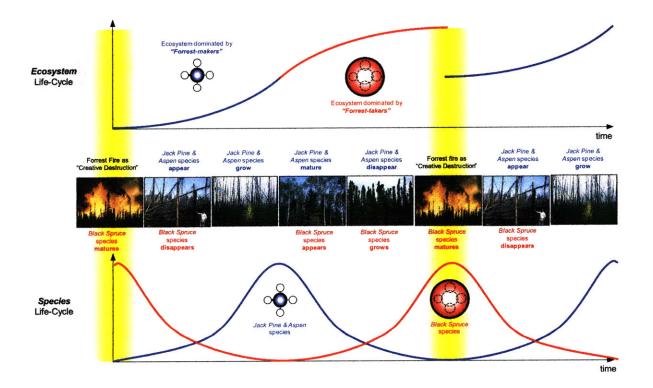

Figure 230: Symbiotic Competition in a Biological (boreal) Ecosystem

⁸⁰⁰ I am indebted to MIT PhD student, Jason Jay for bringing this example to my attention during one of my lectures at the MIT PhD class, *Enterprise Architecting*, in Spring 2006.

The two species do not merely exist, they co-exist symbiotically, i.e. create the conditions for the growth and ultimate destruction of the other species. In other words, they create and destroy their own carrying capacities. The spruce create the conditions for "market-clearing" creative destruction (Schumpeter, 1939) via forest fire; the forest fire creates the clear sunlight and rich soil necessary to grow the "pioneer species", the pines and aspen; the pines and aspen create the environment for the spruce, which ultimately choke off their sunlight. While the two species are in a competitive struggle to the death, they need each other to create the conditions for life.

Note that like the framework presented herein for business ecosystems, this example shows how the biological ecosystem evolves over time from one species of dominance to another, yet it does not describe how the very long-term random processes of variation, selection and retention evolve the species of trees that exist in the forest.

Recall this symbiosis was proved mathematically by the mixed duopoly economics of *profit-maximizing* firms (i.e. pines & aspen) vs. the *labor-managed* firms (i.e. spruce), in which the LM firms grew to slowly to survive in the rich growth environment.

The causal physics of the nonlinear dynamic interplay between the two species will be discussed in subsequent sections under the classical "predator-prey" formulation.

5.8 Modeling Inter-species Competition

The following section discusses various formal simulation models used to understand the competitive interaction between firms embedded within heterogeneous enterprise architectures and the co-evolution with their industry. The formal modeling will be covered in Chapter 7.

5.8.1 Biological Competition within the Mathematical Modeling Tradition

5.8.1.1 Population Growth of Verhulst (1838)

"The **positive loop** corresponds to the tendency of the population to grow at a rate proportional to itself. The **negative loop** corresponds to the growth-limiting effects Verhulst envisioned in conflict and stress. Thus over time **the system changes its own growth tendencies**. In feedback terms, the system shows a **gradual shift in loop dominance**."⁸⁰¹

Verhulst (1838) was the first to model nonlinear mode-switching (between reinforcing and balancing feedback) of a population in an environment having fixed carrying capacity (Richardson, 1990).

5.8.1.2 Predator-Prey Ecosystem of Lotka-Voltera (1925-1926)

"But unquestionably his [Lotka's] most quoted contribution is the model of a closed ecosystem attributed jointly to him and to Volterra (1931)."⁸⁰²

Predator-Prey "competition" within a biological ecosystem was first put forth by Lotka (1925) and Volterra (1926).

5.8.2 Firm Competition within the System Dynamics Tradition

Within the 50-year history of system dynamics, an intellectual thread has developed which has embraced competitive dynamics between firms. After Forrester's original work in the 1960's (Forrester, 1961 and 1968), the thread is picked up again by Sterman (Sterman, 1989; Sterman, 1991; Paich and Sterman, 1993; Sterman, Henderson, Beinhocker, Newman, 1995; Langley, Paich, Sterman, 1999; and Sterman, 2000) and again more recently by researchers in the UK (Sice, Mosekilde, Moscardini, Lawler, and French, 2000; Warren, 2002; Kunc, 2004; Kunc and Morecroft, 2004).

5.8.2.1 Embracing *Macro*-Structures: Forrester (1960-1970)

"If substantially different policies would be desirable for the industry, there then arises the question of what will happen should one company unilaterally adopt these policies. Differences in policy that tend to differentiate a company on the basis of its dynamic characteristics will be an important aspect of competitive models."⁸⁰³

⁸⁰¹ Richardson, G.P. (1990), pg. 33.

⁸⁰² Richardson, G.P. (1990), pg. 36.

⁸⁰³ Forrester, J.W. (1961), pp. 336 and 337.

While Forrester (1961) originally noted the potential for explicit modeling of the competitive dynamics of firms having differing policies, his first research effort focused on understanding the dynamics of an industry composed of homogeneous firms.

"It seems wise to start a study of dynamic characteristics with the **industry as a whole**. Once the nature of the industry is adequately understood, the study of different policies between companies becomes important."⁸⁰⁴

Forrester's subsequent research effort the "Market Growth Model" (1966) also represented the competitive environment passively by specifying the exogenous benchmarks for competitive success. The purpose of this benchmark was not necessarily to simulate the true behavior of competitors, but to represent abstractly the standards that customers judge product attractiveness (Kunc and Morecroft, 2004).

5.8.2.2 Embracing *Micro*-Behaviors: Sterman (1985-2005)

"The playing field is level – the structure and parameters for the firm and its competitor are identical." 805

The focus on firm performance picks up again with the development of management flight simulators looking at specific firms like *People Express Airlines* (Sterman, 1988), and more generally, the *Boom and Bust Enterprises* (Sterman, 1991). The emphasis now was less on industry dynamics but on managerial perceptions and misperceptions using behavioral decision theory. This time, competition is modeled slightly more explicitly and directly, as a matrix of discrete competitor pricing strategies and market environment scenarios.

Paich and Sterman (1993) identify a variety of competitive strategies ranging from "Adaptive" to "Ballistic" in their models of competition to build a market. This dissertation argues that "Adaptive" and "Ballistic" strategies are more advantageous at different phases during the industry lifecycle.

5.8.2.3 Embracing the *Meso*-Interactions: Morecroft (2000-2005)

Recently the system dynamics group at the London Business School (Kunc, 2004; Kunc and Morecroft, 2004), have modeled the dynamic interaction of competition between forms.

"However, not all business dynamics problems can be modeled as individual firms or as aggregate industries. **Industry evolution** is one important exception. During the evolution of industries, the process of mutual adjustment between **heterogeneous firms** is particularly relevant because the actions of individual firms sooner or later influence the responses of other firms in the same industry."⁸⁰⁶

⁸⁰⁴ Forrester, J.W. (1961), pg. 336.

⁸⁰⁵ Paich and Sterman (1993), pg. 1442.

⁸⁰⁶ Kunc and Morecroft (2004), pg. 4.

Also other researchers have explicitly begun to look at duopolistic interations (Sice, Mosekilde, Moscardini, Lawler, and French, 2000).

"The model reflects the essential relationships of **two equivalent competitors** and reveals the possible dynamics of the battle for customers."

5.8.3 Formal Models of Business Ecosystems

5.8.3.1 Bertrand Competition & "The Principle of Competitive Exclusion"

In ecosystem biology and population ecology (Hannan & Freeman, 1977), interspecies competition, is traditionally modeled with rather simple and severe assumptions. "The Principle of Competitive Exclusion" states no two species can occupy the same niche in equilibrium. The underlying assumption to this principle is based on Bertrand (1883) or price-based competition, in which, the winner-takes-all.

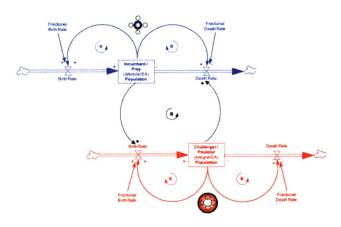

5.8.3.2 Predator - Prey Ecosystem Revisited

It is plausible that the *modular* enterprise architecture, which seeks growth and disregard for its environment can be modeled as a "prey" species, whereas the *integral* enterprise architecture, which seeks stability and harmony with its environment can be modeled as a "predator" species, in the classic population ecological sense.

1

The governing growth dynamics of each population of species are driven separately by S-shaped growth dynamics (Lotka, 1925; and Volterra, 1926).⁸⁰⁷ However, when "competing" together in an ecosystem for resources (e.g. sales revenues), their dynamics are coupled as one provides the carrying capacity for the other. This coupled nonlinear dynamic system generates stable but unpredictable chaotic oscillations as shown in Figure 231 below, the likes of which were discussed in the preceding sections.

⁸⁰⁷ These S-shaped growth dynamics are generated by a reinforcing loop on the inflow and a balancing loop on the outflow of the population; as well as the existence of a carrying capacity which modifies that fractional birth and death rates.

5.8.3.3 Classic System Dynamics Models of Enterprise Architectures

The following section defines the development of a formal model using the system dynamics methodology (Forrester, 1961; Lyneis, 1980; Sterman, 2000) to quantify and simulate the nonlinear dynamic interactions between the firm and its key input providers – its extended enterprise. As shown in Figure 232 below, the key stakeholder interactions that have been modeled in the system dynamics tradition, have tended to focus primarily on the value chain axis of *firm-supplier* interaction (Forrester, 1961) and *firm-market* interaction (Forrester, 1968), although a secondary focus on *firm-employee* interaction and *firm-investor* interactions were also made.

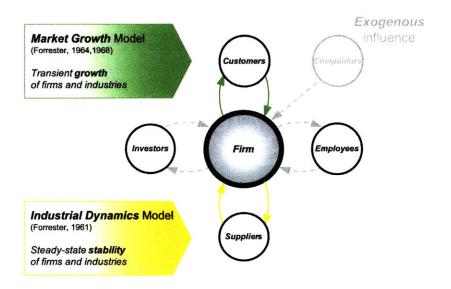

Figure 232: System Dynamics Enterprise Subsystem Diagram

Note that Forrester's two seminal studies have focused on the system goals of steady-state *stability* appropriate to mature industries (Forrester, 1961) and transient *growth* appropriate to new industries (Forrester, 1968) respectively.

"The first phase dealt primarily with the 'steady-state' dynamics of mature industries. The new phase will deal more with transient situations... of industry and company growth."⁸⁰⁸

By way of example of stakeholder interactions, the classic *firm-market* interaction (Forrester, 1964) can be seen in Figure 233 below.⁸⁰⁹ Aside from the information (i.e. orders), material (i.e.

⁸⁰⁸ Forrester, J.W. (1961), pg. viii.

⁸⁰⁹ Other examples of system dynamics firm-environment interactions can be seen from Forrester's "Market Growth" model (1968) and Sterman, Repenning and Kofman's (1997) quality improvement program.

products) and value (i.e. money) flows, the two stakeholders are coupled through competitive signals which importantly define the level of integration between stakeholders.

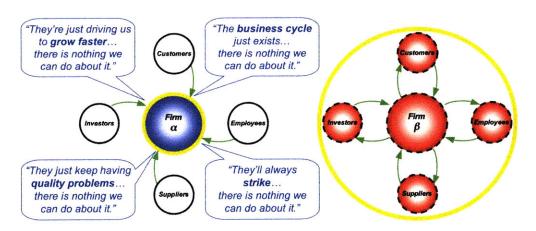

Figure 233: System Dynamics Firm-Market Subsystem Diagram

5.8.3.4 Modeling the Enterprise Archetypes: Modular & Integral

As shown in Figure 234 below, each firm in the mixed duopoly has a fundamentally different view of its relationships with the key stakeholders in its extended enterprise. While the firm at the center of the modular enterprise is an open system, exchanging information, material and value with its environment, it also sees itself as causally open, with little ability to control the strategic interests of the stakeholders in its extended enterprise. While the firm at the center of the integral enterprise is also an open system, exchanging information, material and value with its environment, it sees it self as causally closed (i.e. having many important strategic feedbacks), with significant ability to control the strategic interests of the stakeholders in its extended enterprise. The presence of a feedback rich environment, is both a cause and effect of the fact that an integral enterprise architecture is managed to longer time constants.

Figure 234: Enterprise Archetypes: Modular and Integral

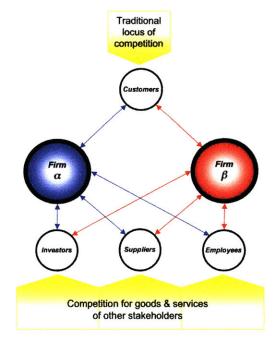

5.8.3.5 Modeling the *Competitor* subsystem

In Forrester's early seminal studies, competition was treated as passively via an exogenous benchmark representing relative attractiveness of the firm's products in the market (Kunc and Morecroft, 2004). The assumption being that the industry structure supports multiple similar competitors engaged in perfect competition. As a result, the feedbacks between competitor decisions are deemed weak and are not assumed to significantly alter the competitive environment over the time horizons of interest in the study (Kunc and Morecroft, 2004). A more detailed survey of the treatment of competition within the system dynamics tradition is shown in Appendix H.

5.8.3.5.1 Competition for Customers

In order to model the competitor subsystem in system dynamics, it is important to first acknowledge which stakeholders will be characterized as territory for competition. While the competitor stakeholder is typically modeled as competing through the customer stakeholder, in principle the "competitive coupling" could take place across all stakeholders as shown in Figure 235 below. In fact, in pursuit of competition for customers (or market share), one could argue that the successful firm will be the one that manages the highest quality providers of investors, employees and suppliers (as an integral part of possessing the best strategy). Note this is where the SCP paradigm begins to meet the RBV paradigm in strategic management. For each stakeholder, there is a spectrum of quality ranging from undifferentiated commodity to differentiated, dedicated asset.

5.8.3.5.2 Competition for *Investors*

While firms are in principle competing for investors or providers of capital, such input can (but not always as we shall discuss later) be seen as an undifferentiated commodity. Although the *quantity* of capital available may be large, the *quality* of capital may not be. Therefore, although an institutional investor may like the structure of a particular industry (e.g. the duopoly structure of the large commercial airplanes industry), they may choose between firms based on a more integrated, dedicated logic.⁸¹⁰

5.8.3.5.3 Competition for *Employees*

In addition, firms are in principle competing for employees or managerial talent, as is occasionally evidenced by the switching of high-profile executives in the automotive industry.

5.8.3.5.4 Competition for *Suppliers*

Finally, firms are in principle competing for suppliers, and not necessarily to create captive supply. Although suppliers in some industries can make parts, subassemblies or subsystems for competing OEMs, recent research (Dyer, 2003) has indicated that it not a given that such supply is commodity. In other words creating a high quality relationship with a supplier who has a low quality relationship with your competitor can be a competitive advantage, in terms of productivity, continuous improvement, etc. Such relationships have "sticky" value.

The primary case study of this research focuses on the *Boeing-Airbus* duopoly which is primarily characterized by a partial coupling between the stakeholders along the value chain – namely the customers and suppliers as shown in Figure 236 below.

Each firm has its own "dedicated", "captive" or non-shared providers of capital and labor. Competition takes place along the value chain for customers (either shared or dedicated) and suppliers (also either shared or dedicated).

⁸¹⁰ Consider for example *EADS* composed of *Daimler*, and *BAE Systems* as institutional investors in *Airbus*.

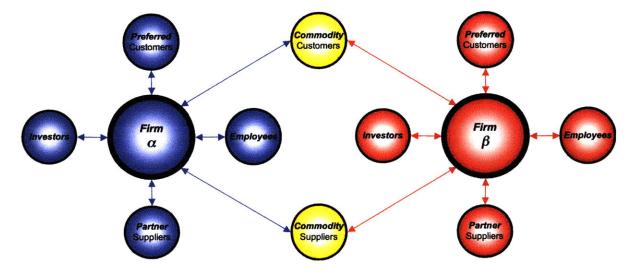

Figure 236: Competitive Coupling between Value Chain Stakeholders

5.9 Tying Structural Dynamics to Valuation and Firm Performance

From above, it appears that modular enterprise architectures are driven by "profitable growth", while integral enterprise architectures are driven by "sustainable growth". *Profitable* growth can be achieved by chasing demand in a market upturn, and releasing capacity (and thus short-term costs) in a market downturn. *Sustainable* growth can be achieved by the opposite strategy, namely, not chasing demand in a market upturn, and maintaining capacity in a market downturn. The following quotations from leaders of various enterprise architectures illustrate the mental models.

"Aiming to achieve sustainable growth, Toyota will implement a financial strategy emphasizing the balance of growth, efficiency and stability." (Ryuji Araki, Executive Vice President, Finance and Accounting, Toyota).⁸¹¹

"I believe, no matter what the era, a company that has lost its appetite for growth cannot develop. In my view, sustained growth drives corporate value." (Fujio Cho, President, Toyota).⁸¹²

⁸¹¹ Toyota Motors 2004 Annual Report, pg. 14.

⁸¹² Toyota Motors 2004 Annual Report, "President's Message", pg. 13.

5.10 Chapter Summary

This chapter was the second of three essays which forms an integrated framework which attempts to explain long-term firm performance. In this chapter, we defined the construct of enterprise structural dynamics, its sources and properties. In addition, we discussed how these dynamics drive the associated performance,

The context for this construct within the framework is shown below in Figure 237. In the following chapter, we will next discuss how firm performance drives and is driven by the evolution of the industry.

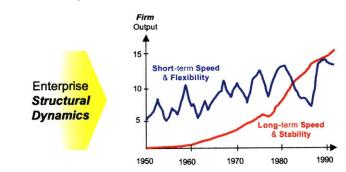

Figure 237: Enterprise Structural Dynamics with Framework

Chapter 6 Industrial Co-Evolution

6.1 Introductory Constructs and Propositions

"Industry evolution takes on critical importance for formulation of strategy."813

Having discussed how the enterprise architectural form drives the enterprise structural dynamic behavior, this section will explore the link between the enterprise's structural dynamic behavior and the financial performance of the "keystone" firm and ultimately with the dynamic evolution of the environment and co-evolution with the firms.

First, we will explore the enterprise's *architectural* evolution from integral to modular, as exploration gives way to exploitation. Second, we will explore the environment's simultaneous *structural* evolution from growth to stability. Third, we will explore industry's simultaneous *architectural* evolution from modular to back to integral as exploitation gives way to a new type of exploration (noting that change now takes place at a population level instead of at a firm level, signaling the birth of a new integral firm in a new environment). This feedback mechanism will attempt to explain the co-evolution of firm's ecosystem with the competitive environment.

"One of the enduring problems facing the field of strategic management is the lack of theoretical tools available to describe and predict the behavior of firms and industries. The fundamental problem is that industries evolve in a dynamic way over time as a result of complex interactions among firms, government, labor, consumers, financial institutions, and other elements of the environment. Not only does industry structure influence firm behavior, but firm behavior in turn can alter the structure of an industry and the contours of competition."⁸¹⁴

6.1.1 Change from a System Perspective

Organizational and environmental change has been profitably expressed and subsequently decomposed from a systems perspective (Bossel, 2007), which are the result of different processes associated with different time constants. The following subsections address three processes each having longer time constants and therefore deeper causality: adaptation, self-organization and evolution as summarized in Figure 238 below.

⁸¹³ Porter, M.E. (1980), pg. 156.

⁸¹⁴ Levy, D. (1994), pg. 167.

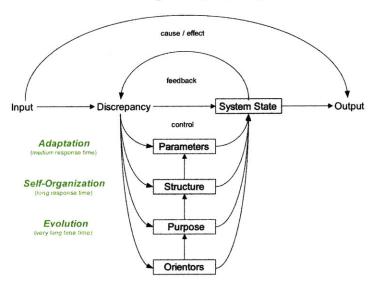

Figure 238: The Structure of Adaptation, Self-Organization and Evolution

6.1.1.1 Adaptation

"Processes of adaptation ... in this case the system maintains its basic influence structure, but parameters are adjusted to adapt to the situation. Adaptation means adjustment to a change in the system environment by changing the system parameters and/or limited structural change."⁸¹⁵

Within the context of this framework, *adaptation* of an enterprise architecture lies in its relatively minor adjustments towards efficiency, while keeping the existing architecture constant.

6.1.1.2 Self-Organization

"On the next higher level we find processes of self-organization in response to environmental challenges. This means structural change in the system. Self-organization denotes the ability of a system to change its system structure and its functions to cope with new challenges."⁸¹⁶

Within the context of this framework, *self-organization* speaks to the change of the underlying structure (and associated functions), for the example, the natural dis-integration (or modularization) of the enterprise architecture.

6.1.1.3 Evolution

"A system may also change its identity in the course of an evolutionary process. This means that its functional characteristics, and hence its system purpose, change with time. Evolution is adaptation and self-organization under fitness competition in a population of similar systems."⁸¹⁷

Within the context of this framework, *evolution* speaks to the change of the deep underlying function and purpose of an enterprise, i.e. the re-integration of the enterprise architecture.

⁸¹⁵ Bossel, H. (2007), pp. 13 and 48.

⁸¹⁶ Bossel, H. (2007), pp. 13 and 49.

⁸¹⁷ Bossel, H. (2007), pp. 13 and 49.

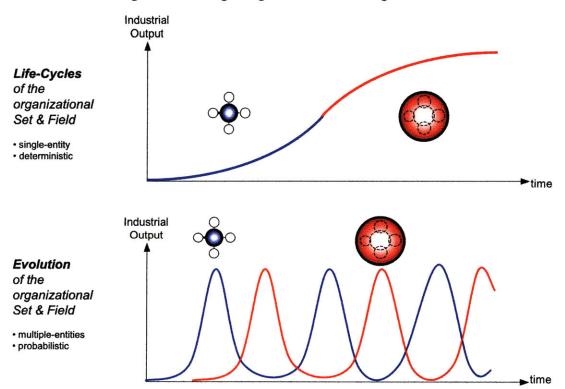

6.1.2 Employing Multiple Views on Change Processes

"It is the **interplay between different perspectives** that helps one gain a more comprehensive understanding of organizational life, because any one theoretical perspective invariably offers only a partial account of a **complex phenomenon**."⁸¹⁸

Van de Ven and Poole (1991 and 1995) conducted an extensive review of the management literature and discovered four distinct theories of change processes: life cycle, teleology, dialectics and evolution (Van de Ven, 1992) – the former two being deterministic and predictive and the latter two being probabilistic and non-predictive.

"Life-cycle, teleology, dialectics and evolution are viewed as abstract ideal types of theories of change processes. These ideal types are based on fundamentally different logics, which represent the underlying generative mechanisms or laws that explain why observed events occur in particular sequence progressions when specific circumstances or conditions exist."⁸¹⁹

The following subsections will briefly describe each, and as is shown in Figure 239 below, essay #3 will explore the change processes which occur in enterprise architectures from the primary viewpoints.

⁸¹⁸ Van de Ven and Poole, (1995), pp. 510-511.

⁸¹⁹ Van de Ven, (1992), pg. 169.

6.1.2.1 *Life-Cycle* theory

"The grandfather of concepts for predicting the probable course of industry evolution is the familiar product lifecycle."⁸²⁰

The mode of change of life-cycle theory is deterministically prescribed and focuses on continuity. The unit of change of life-cycle theory is the single entity, whether in the case of this research, the entity is the enterprise (i.e. organizational *set*) or the ecosystem (i.e. organizational *field*).

"According to life cycle theory, change is imminent; that is, the developing entity has within it an underlying form, logic, program or code that regulates the process of change and moves the entity from a given point of departure toward a subsequent end that is prefigured in the present state."⁸²¹

As Van de Ven (1992) notes, Greiner's (1972) model of organizational growth is rooted in a life-cycle perspective in distinct opposition to a teleological perspective.

"...historical forces [organizational age, size, growth rate, and stages of evolution and revolution] shape the future growth of organizations... the future of an organization may be less determined by outside forces than it is by the organization's history... behavior is determined primarily by previous events and history, not by what lies ahead."⁸²²

6.1.2.2 *Teleological* theory

"A teleology process theory is based on the assumption that the developing entity is **purposeful** and **adaptive**."⁸²³

The mode of change of teleological theory is emergent and focuses on discontinuity. The unit of change of teleological theory is the single entity, whether in the case of this research, the entity is the enterprise (i.e. organizational *set*) or the ecosystem (i.e. organizational *field*). Although teleological theory is rooted in the purposefulness of human actors, this brings up an interesting question: if an organizational set or organizational field are purposeful, who administers this purpose and how?

The primary fields which have supported this theory include *functionalism*, general system theory and strategic planning.

"Unlike life-cycle theory, teleology does not prescribe a necessary sequence of events or specify which trajectory development of the organizational entity will follow."⁸²⁴

The underlying purpose or goal of an enterprise architecture is captured by its objective function, whether maximization of shareholder value or maximization of stakeholder surplus. To the extent that the enterprise architect(s) (e.g. CEO) are purposeful actors, teleological theory applies to our theory of the evolution of business ecosystems. The question becomes, to what

⁸²⁰ Porter, M.E. (1980), pg. 156.

⁸²¹ Van de Ven and Poole, (1995), pg. 515.

⁸²² Greiner, L. (1972), pg. 166.

⁸²³ Van de Ven, (1992), pg. 178.

⁸²⁴ Van de Ven and Poole, (1995), pg. 516.

extent does the enterprise architecture enable and constrain purposeful action and strategic choice?⁸²⁵ And at what stages in the development of an ecosystem do teleological factors dominate?

6.1.2.3 *Dialectical* theory

"Different patterns for resolving dialectical oppositions can push an organization to flow toward equilibrium, to oscillate in cycles between opposites, or to bifurcate far from equilibrium and spontaneously create revolutionary changes."⁸²⁶

The mode of change of dialectical theory is emergent and focuses on discontinuity. The unit of change of dialectical theory are multiple entities, whether in the case of this research, the entity is the enterprise (i.e. organizational *set*) or the ecosystem (i.e. organizational *field*). As will be discussed below, dialectical theory is necessary (along with evolutionary theory) to explan the emergence and disappearance of organizational forms in a community ecology approach.

"Dialectical theory begins with the assumption that the organizational entity exists in a pluralistic world of colliding events, forces or contradictory values that **compete** with each other for domination and control. These oppositions may be **internal** to an organizational entity because it may have several **conflicting goals or interest groups** competing for priority. Also, oppositions may be **external** to the organizational entity as it pursues directions that **collide with the direction of other organizations**."⁸²⁷

Within the enterprise architecture or organizational set, a zero-sum competition between stakeholders for residual cash-flows is a form of dialectic. Also, external competition between organizational sets represents a form of dialectic. The creation of a "win-win" is an example of *thesis* and *anti-thesis* generating *synthesis*, while a "win-lose" is an example of maintenance of *thesis* or replacement with *anti-thesis* (Van de Ven and Poole, 1995, pg. 517). Unpredictable change therefore can result within an organizational set from a power-struggle that results in either the creation or destruction of a "win-win" in the enterprise's objective function. As interenterprise competition is likely to preclude collusion, such unpredictable dialectic change would be less common.

6.1.2.4 *Evolutionary* theory

"The evolutionary model suggests a blurring of the hard lines defining the adaptation-selection debate $."^{828}$

The mode of change of evolutionary theory is probabilistically prescribed (in the sense that variations can be "blind") and focuses on continuity. The unit of change of evolutionary theory are multiple entities, whether in the case of this research, the entity is the enterprise (i.e. organizational *set*) or the ecosystem (i.e. organizational *field*).

⁸²⁵ Recall from the *Airbus* case, the CEO's inablility to implement proposed changes to the enterprise architecture led to his exit in 1996 after only 100 days on the job.

⁸²⁶ Van de Ven, (1992), pp. 179.

⁸²⁷ Van de Ven and Poole, (1995), pp. 517.

⁸²⁸ Scott, (2003), pg. 222.

"Variations, the creations of novel forms of organizations are often viewed to emerge by blind or random chance (Aldrich, 1979; Campbell, 1969). Selection of organization occurs principally through the competition for scarce resources and the environment selects entities that best fit the resource base of an environmental niche. (Hannan and Freeman, 1977). Retention involves forces (including inertia and persistence) that perpetuate and maintain certain organizational forms."⁸²⁹

Evolutionary studies of organizations are comprised by the economics and the sociology traditions (Barron, 2003). These tend to characterize the debate of whether *managerial adaptation* or *environmental selection* dominates organizational change. Both processes can be expressed in evolutionary terms, i.e. based on the processes of variation, selection and retention as shown in Figure 240 below.

"Organizational scholars who adopt **Darwinian** evolution argue that traits are inherited through intergenerational processes; whereas those who follow Lamarck argue that traits are acquired within a generation through learning and imitation. A Lamarckian view on the acquisition of traits appears more appropriate than strict Darwinism for organization and management applications."⁸³⁰

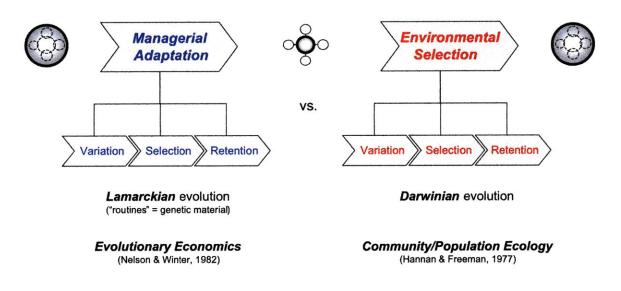

Figure 240: Evolution in Managerial Adaptation & Environmental Selection

6.1.2.4.1 Evolutionary Economics

Nelson and Winter (1982) define "routines" as the underlying genetic material of organizations. Their approach to evolution is Lamarckian as the governing mechanism is the transfer of genetic material across generations via learning.

6.1.2.4.2 Population Ecology

Hannan and Freeman (1977) note that the unit of selection are the organizations themselves within their environment.

⁸²⁹ Van de Ven and Poole, (1995), pg. 518.

⁸³⁰ Van de Ven and Poole, (1995), pg. 519.

6.1.2.5 Combinations of theories

Van de Ven and Poole (1995) assemble the fore aforementioned change theories into combinations of theories to describe how well-known meta-theories are constituted. For example, while population ecology is certainly an evolutionary theory, its more general parent discipline, community ecology is rooted in both evolutionary theory and dialectical theory, thereby allowing for the explanation for the emergence and disappearance of new forms, which population ecology does not focus on.

Figure 241 below summarizes the combination of change theories on the framework. At the enterprise level, change occurs both via life-cycle theory, where organizations (like organisms) go through the sequential stages of birth and death; and via teleological theory, where managerial adaptation can work to disintegrate enterprises.

At the ecosystem level, change occurs both via evolutionary theory, where new organizational forms (like *Toyota*) appear in "blind" *variation*, they are competitively *selected* and their forms are *retained* (like the adoption of "lean"); and via teleological theory, where managerial adaptation via entrepreneurship is evident.

At the interface between enterprise and ecosystem, change occurs via dialectical theory, where thesis and antithesis compete and vie for synthesis.

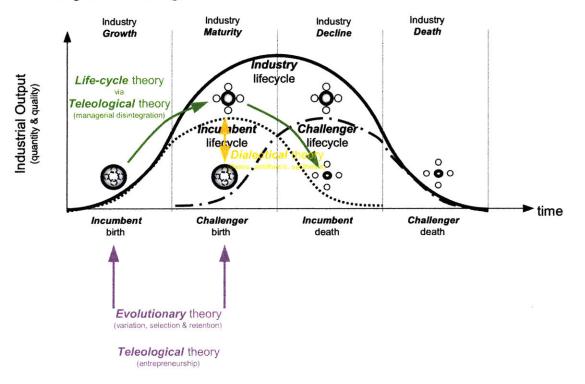

Figure 241: Change Theories and the Evolution of Business Ecosystems

6.2 Theoretical Foundations

"Models that integrate sociological and economic aspects of the environment, or that move beyond traditional life-cycle conceptions of its evolution, are lacking."⁸³¹

As this chapter aims to understand the nature of the evolution of the environment, and it cause and effect on the evolution of the enterprise, I will draw from a diverse set of theoretical traditions spanning economics and sociology.

6.2.1 Economic and Strategic Management Theories

"In classical economic theory... change was within the structure but the structure was always stable. Institutional economists examine institutions that provide economic order, and they study the endogenous forces that cause these institutions to evolve."⁸³²

While *classical* economics is rooted in natural law, *institutional* economics rooted in human organization. The framework derived from this research embraces both epistemologies. Change is described both from the natural law of Newton's tradition, as well as from the human organization of Darwin's tradition.

The most notable and influential economic theories of evolution come from Nelson and Winter (1982). Unlike the sociological view of Darwinian evolution, they are avowedly Lamarckian in their focus on learning routines.

6.2.1.1 Life Cycle of Industry Structure, Technologies & Markets

Oliver Williamson (1975) gave an early economics description of the different stages in an industry's evolution, which predates some of the more established work on this topic in the field of technology and innovation (Abernathy and Utterback, 1978):

"Three stages in an industry's development are commonly recognized: an early exploratory stage, an intermediate development stage, and a mature stage. The first or early formative stage involves the supply of new product of relatively primitive design, manufactured on comparatively unspecialized machinery, and marketed through a variety of exploratory techniques. 'Volume is typically low. A high degree of uncertainty characterizes business experiences at this stage. The second stage is the intermediate development stage in which manufacturing techniques are more refined and market definition is sharpened; output grows rapidly in response to newly recognized applications and unsatisfied market demands. A high but somewhat lesser degree of uncertainty characterizes market outcomes at this stage. The third stage is that of a mature industry. Management, manufacturing, and marketing techniques all reach a relatively advanced degree of refinement. Markets may continue to grow, but do so at a more regular and predictable rate...established connections with customers and suppliers (including capital market access) all operate to buffer changes and thereby to limit large shifts in market shares. Significant innovations tend to be fewer and are mainly of an improvement variety."

⁸³¹ Farjoun, M. (2002), pg. 585.

⁸³² Atkinson G. (2004), pg. 275.

⁸³³ Williamson, O. (1975), pp. 215-216, as cited in Klepper (1997), pp. 146-147.

Subsequently, Gort and Klepper (1982) conducted one of the most extensive studies of industrial evolution in which they examined the life cycles of nearly 50 industries which originated between 1887 and 1960 and which represented a diverse mix of products. As shown in the quote below, they found a number of general (although not universal) patterns in the evolution of the structure of industries along the dimensions of: number of firms, industry output growth, prices, and rate of innovations.

"[Gort and Klepper, 1982]... observed that industries for new products pass through a brief period with few firms, followed by a rapid increase in the **number of firms**, which then falls rapidly to a relatively stable level (p. 639). During the evolution of the industry, [they] also observed that **output** growth is initially high but declines steadily (p. 645); prices fall rapidly but at a decreasing rate (p. 647); and the rate of both major innovations and minor innovations rise, peak, and then remain stable over time, with major innovations peaking earlier (p. 648)."⁸³⁴

While many researchers have focused on the causal mechanisms of scale advantages, recent researchers like Lenox, Rockart and Lewin (2007) have generated numerical simulation models to which use the mechanism of interdependency to demonstrate similar patterns in the evolution of the structure of industries:

"This model is able to recreate the patterns observed in improvements in efficiency (continued but with less-substantial improvement as time passes), industry output (increasing at a decreasing rate), prices (steady decline at a decreasing rate), and industry participation (rapid entry is followed by mass exit, leading to a shakeout and a stable number of competitors)."⁸³⁵

⁸³⁴ Lenox, M.J., Rockart, S.F., Lewin, A.Y. (2007), pp. 600-601.

⁸³⁵ Lenox, M.J., Rockart, S.F., Lewin, A.Y. (2007), pp. 610-611.

6.2.1.2 Life Cycle of Finance and Governance

In advancing a life cycle theory of the firm, Mueller (1972) posited that the distribution of dividends back to investors would follow the traditional life cycle curve as shown in Figure 242 below.

"We therefore expect the growth-maximizing management to undertake-more investment than a stockholder-welfare maximizer, pay equivalently smaller dividends, grow at a faster rate, and have a lower market value for its firm."⁸³⁶

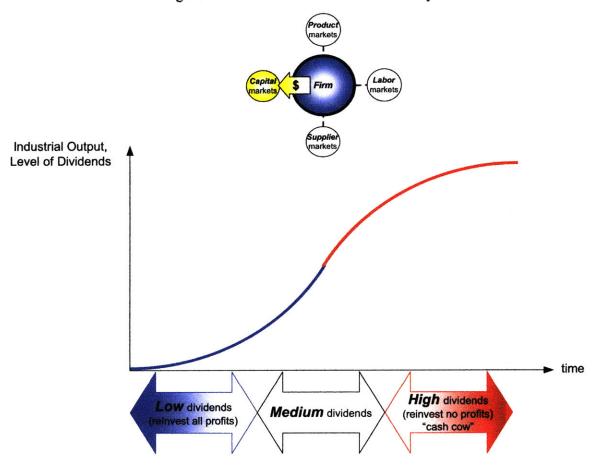

Figure 242: Dividend Distribution Life Cycle

"This paper attempts to fill this void by developing a life cycle theory in which the tendency of managers to pursue growth, rather than stockholder welfare, increases as the firm grows and matures."⁸³⁷

⁸³⁶ Mueller, D.C. (1972), pg. 206.

⁸³⁷ Mueller, D.C. (1972), pg. 199.

Building off of Marris' work (1963), Mueller (1972) also noted that as a market was emerging, with increasing rates of growth, there was no negative trade-off between growth and profitability, therefore principal-agent problems were minimized. However, as the market was maturing, with decreasing rates of growth, there was a negative trade-off between growth and profitability, exacerbating principal-agent problems, as shown in Figure 243 below.

"He postulated the existence of 'young' firms... that had 'taken off' into a process of fast, accelerating growth associated with good profitability. The valuation curve presented no negative trade-off between growth and stock-market value because at this stage the return on retained profits was better than could be obtained elsewhere. Later, as the exceptional circumstances fade, the optimum growth rate for stockholders gradually declines and may finally become negative. During this phase, which may be very long if not indefinite, conflict between managerial and stockholder interests emerges."

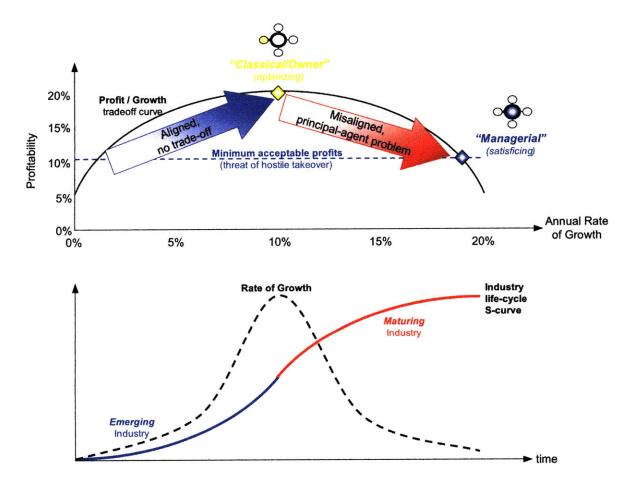

Figure 243: Emergence of the Principal-Agent Problem with Industry Maturity

"Mergers are an obvious way to avoid the slowdown in growth that product maturity brings."839

⁸³⁸ Marris, R. and Mueller, D.C. (1980), pg. 44.

⁸³⁹ Marris, R. and Mueller, D.C. (1980), pg. 45.

"Agency theory predicts that there will be greater divergence between the interests of managers and shareholders in declining industries than in general."⁸⁴⁰

Jensen (1986, 1988) noted that agency theory can be used to explain how and why the interests of principals (investors) and agents (managers) diverge more in maturing or declining industries. He argues that the *value*-driven goals of investors can be incompatible as shown in **Error! Reference source not found.** below.

"Jensen (1988) suggests that the growth-oriented goals of managers during phases of industry growth are compatible with shareholder goals because the opportunities in the industry simultaneously address shareholder wealth maximization and revenue maximization (the latter is one of the more important managerial motives). However, in the decline phase of the industry, these goals are incompatible. Managers would still like to enlarge the firm or reduce risk through diversification, whereas shareholders would rather let the firm shrink so that they can reinvest the capital in better opportunities. Hence, managers may be biased in favor of diversification-oriented acquisitions in the decline and mature stages of a business because such acquisitions represent a feasible path toward growth in such environments."⁸⁴¹

Chandler (1977) argues for the evolution of investor-management relationships as firms grow and evolve. He notes the transition from *personal* enterprise to *family* capitalism to *financial* capitalism to *managerial* capitalism.⁸⁴²

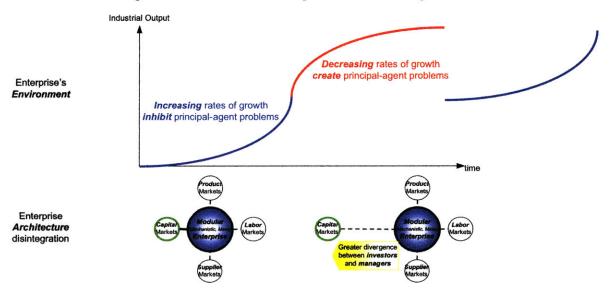

Figure 244: Investor Disintegration in Maturing Industries

"By conservative estimates, **10 percent** of the invested capital in industrialized countries is in industries that are suffering a decline in demand."⁸⁴³

6.2.1.3 Life Cycle of Strategic Management Theories

This framework posits that the dominant theories in strategic management literature would reflect the state of evolution of most major industries of the time.

6.2.1.3.1 Externally-focused SCP

This framework posits that as the majority of industries in the dominant region where strategic management research was being undertaken – i.e. the US – was experiencing a boom of mass production from the 1920's to the 1960's the strategic management literature reflected this industrial phenomenon. As such exogenous industry structural variables would seem particularly relevant. The Industrial Organization school (Mason, 1939; Bain, 1959) reflected this external view of structural variables.

6.2.1.3.2 Internally-focused RBV

Additionally, this framework posits that as the majority of industries in the dominant region where strategic management research was being undertaken - i.e. the US - was experiencing a saturation of the mass production markets from 1960's onwards, the strategic management literature reflected this industrial phenomenon.

As the focus was then on growth in firms and/or industries experiencing limited rates of growth, productivity would then be more important. Economies of scope would replace economies of scale in such industries. Learning and the internal capabilities of the firm would begin to dominate the external strategy schools. The Resource-Based View which initially began with Penrose in 1959 was largely ignored until the mid-1980's (Wernerfelt, 1984).

"The question I wanted to answer was whether there was something inherent in the very nature of the firm that both **promoted its growth** and necessarily **limited its rate of growth**."^{x844}

From Penrose's most fundamental question, one can infer that she was studying a firm that while growing, its rate of growth was slowing down. In graphical terms, this is a firm in the later stages of its "S-curve".

If a firm's rate of growth is in some way limited by the carrying capacity of the firm's environment, then one might posit that Penrose was studying a firm in the later, maturing stages of its development. It turns out that Penrose's classic 1959 book was based on the study of one firm, The Hercules Powder Company, a commodity materials company, which in 1959 could be demonstrated to be in the maturing stages of its industry.

This posited evolution of strategic management theoretical focus may have mapped approximately to the evolution of major US industries as shown in Figure 245 below.

⁸⁴⁴ Penrose, E. (1959).

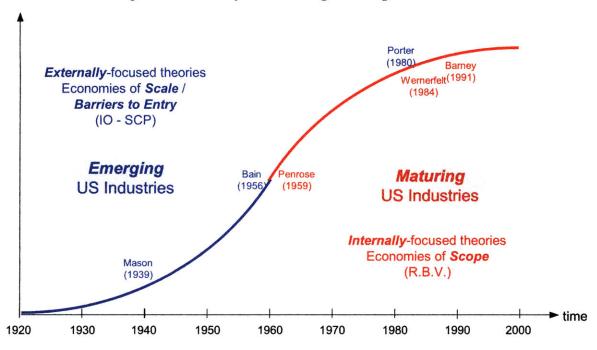

Figure 245: Life Cycle of Strategic Management Theories

6.2.2 Sociology and Organizational Theories

6.2.2.1 Environmental Descriptions

Sociologists and organizational theorists have long characterized the environment within which firms operate, as they have established the environment as a source of critical contingencies with respect to firm performance. The following summarizes some of the most influential in order to situate their theories within the proposed framework.

6.2.2.1.1 Six *Dimensions* (Aldrich)

"Use of a single dimension of an industry's environment to build theory and to test proposed relationships empirically may result in a failure to investigate alternative plausible explanations of observed relationships."⁸⁴⁵

Population ecologists have long identified multiple "dimensions" for characterization of the environment (e.g. Aldrich, 1979, pp. 63-74), the most common of which include:

- Environmental *Capacity*
- Environmental *Homogeneity-Heterogeneity*
- Environmental *Stability-Instability*
- Environmental Concentration-Dispersion
- Domain Consensus- Dissensus
- Turbulence

Other organizational theorists have combined these dimensions into various descriptors of the environment as will be seen below.

6.2.2.1.2 Four Causal Textures (Emery & Trist)

Emery and Trist (1965) identified four 'ideal types' of causal texture, which are briefly summarized below and interpreted within the context of the industry life-cycle S-curve in Figure 246 below.

"Together, the four types may be said to form a series in which the degree of causal texturing is increased." 846

6.2.2.1.2.1 Step #1: Placid, Randomized

The economist's "classical market" corresponds to this type. The firm can be though of as entrepreneurial.

6.2.2.1.2.2 Step #2: Placid, Clustered

⁸⁴⁵ Dess, G.G., Ireland, R.D., and Hitt, M.A. (1990), pg. 16.

⁸⁴⁶ Emery and Trist (1965), pg. 23.

"Organizations tend to grow in size and also to become more hierarchical, with a tendency towards centralized control and co-ordination."⁸⁴⁷

The economist's "imperfect competition" corresponds to this type.

6.2.2.1.2.3 Step #3: Disturbed-Reactive

The economist's "oligopolic market" corresponds to this type. Strategic interaction is now important.

6.2.2.1.2.4 Step #4: Turbulent Fields

"The dynamic properties arise not simply from the interaction of the component organizations, but also from the field itself. The 'ground' is in motion."⁸⁴⁸

Note that other researchers speak of discontinuity. Abernathy et al. (1983) speaks of industrial "de-maturity".

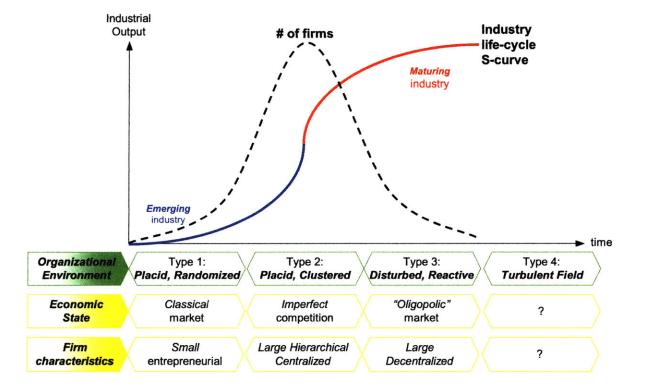

Figure 246: Four Causal Textures and the Industry Life Cycle

⁸⁴⁷ Emery and Trist (1965), pg. 23.

⁸⁴⁸ Emery and Trist (1965), pg. 24.

6.2.2.1.3 Three Dimensions (Dess & Beard)

Aldrich (1979) defined the environment using six dimensions: geographic concentration and heterogeneity, stability and turbulence, and domain consensus and capacity. In a subsequent influential paper, Dess and Beard (1984) condensed these dimensions to three: munificence, dynamism and complexity.⁸⁴⁹

6.2.2.1.3.1 Munificence

Environmental munificence is the scarcity or abundance of resources (e.g. demand) in a given environment. It represents the extent to which the environment can support sustained growth (Starbuck, 1976). In the language of system dynamics, environmental munificence can be considered as environmental "carrying capacity", which may or may not be constant over time.

High environmental munificence creates favorable supply-demand tradeoffs and therefore makes it easier for firms to survive, perform successfully or create profit (Hart and Banbury, 1994). Poorly managed firms can still survive and create profits, discouraging their efficiency levels or improvement capabilities.

Conversely, low environmental munificence makes it harder for firms to perform successfully and therefore forces firms to make more frequent adjustments to access resources from the environment (Koberg, 1987).

"In a high-growth period, productivity can be raised by anyone. But how many can attain it during the more difficult circumstances induced by low-growth rate? This is the deciding factor in the success or failure of an enterprise."⁸⁵⁰

Lean competitors based on integral enterprise architectures tend to make frequent or continuous incremental "kaizen" improvements in response to a mature, saturated anti-munificent environment. The are well-suited to their harsh environment like a cactus in the desert.

6.2.2.1.3.2 Dynamism

Environmental dynamism is the level of change or rate of volatility in the environment. More precisely, it is the extent to which such change is *unpredictable* (Dess and Beard, 1984). An environment having a high level of dynamism has also been described as "unstable" (Mintzberg, 1990).

Note: from a system dynamics perspective, this instablilty mathematically corresponds to dominant positive feedback generating exponential growth or decline.

⁸⁴⁹ Environmental "dynamism" and "complexity" are often combined under the concept of environmental "uncertainty".

⁸⁵⁰ Ohno, T. (1978), pg. 114.

6.2.2.1.3.3 Complexity

Environmental complexity is the number and diversity of "forces" (e.g. stakeholders) with which interaction is required, and the extent to which an organization must have sophisticated knowledge about customers, competitors etc. (Aldrich, 1979).

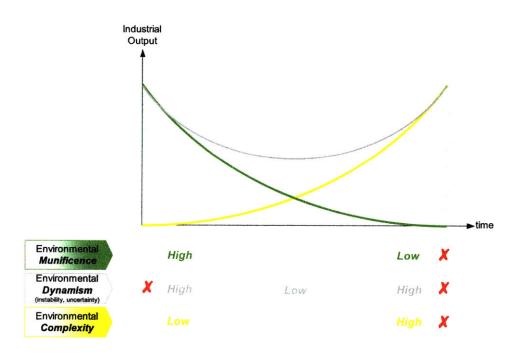

"The environmental contexts in which organizations exist are themselves changing, at an increasing rate, and towards increasing complexity. This point, in itself, scarcely needs labouring."⁸⁵¹

This research posits that environments with high environmental complexity tend to exhibit more boundedly rational behavior (March and Simon, 1958), and therefore present opportunities for integral enterprise architectures to develop.

6.2.2.1.3.4 Discussion

When considering the trajectories of the three dimensions of an organizational environment, it is clear that they have opposite levels (Castrogiovanni, 1996), as shown in Figure 247 below.

Figure 247: Trajectories of the Three Dimensions of Organizational Environments

⁸⁵¹ Emery and Trist, (1965), pg. 21.

One can then begin to map these three dimensions of organizational environment onto the industry life-cycle S-curve. As shown in Figure 248 below, emerging industries tend to exhibit high levels of environmental munificence and dynamism and low levels of complexity, while conversely, maturing industries tend to exhibit low levels of environmental munificence and dynamism and high levels of complexity.

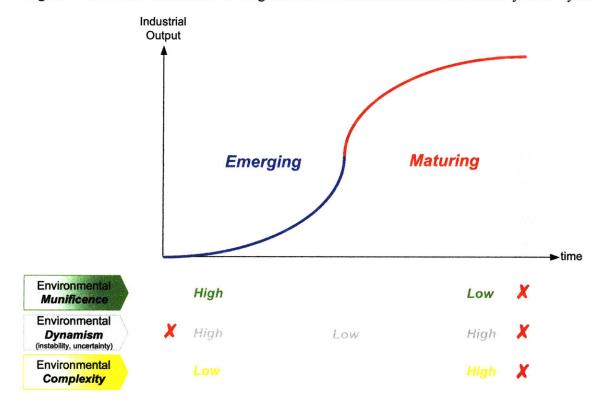

Figure 248: Three Dimensions of Organizational Environment & the Industry Life-Cycle

6.2.2.1.4 Two Dimensions (Burns & Stalker)

In their classic exposition on Contingency Theory, Burns & Stalker (1961) describe the environment as different rates of change in *technical* or *market* variables.

"These extrinsic factors are all, in our view, identifiable as different rates of technical or market change. By change we mean the appearance of novelties: i.e. new scientific discoveries or technical inventions, and requirements for products of a kind not previously available or demanded."⁸⁵²

Burns and Stalker (1961) conceived of their two characterizations of the environment via observing empirically the technical and market conditions for electronics during World War II, which they called "stable", and those conditions after the war, which they called "unstable".

"When novelty and unfamiliarity in both market situation and technical information become the accepted order of things, a fundamentally different kind of management system be comes appropriate from that which applies to a relatively stable commercial and technical environment."⁸⁵³

6.2.2.1.5 Three Dimensions (Chandler)

Chandler (1962) also conceded that different environmental conditions demanded different (strategies and therefore) structures. These conditions were characterized as the rate of environmental change in technology, markets and supply.

"As long as an enterprise belonged in an industry whose markets, sources of raw materials and production processes remained relatively unchanged, few entrepreneurial decisions had to be reached. In that situation, such a weakness was not critical, but where technology, markets and sources of supply were changing rapidly, the defects of such a structure became more obvious."⁸⁵⁴

6.2.2.1.6 Two Dimensions (Lawrence & Lorsch)

In their classic exposition on Contingency Theory, Lawrence and Lorsch (1967a, pg. 157) describe two external variables: *certainty* and *diversity* of the environment.

6.2.2.1.6.1 Certainty (Dynamic-Stable)

Lawrence and Lorsch (1967a, pg. 151-152) describe environmental *certainty* as either *dynamic* (*i.e. uncertain* or *unstable*) or *stable* (*i.e. certain*). Their empirical sample covered three different industrial environments: plastics, packaged foods and standardized containers, ranging from most dynamic to most stable. The following excerpt illustrates their definition of a stable environment.

"One important consideration was to select industries with slower rates of environmental change. We therefore sought one industry whose rates of growth and change were very slow... the most stable

⁸⁵² Burns, T. and Stalker, G.M. (1961), pg. 96.

⁸⁵³ Burns, T. and Stalker, G.M. (1961), pg. vii.

⁸⁵⁴ Chandler, A. (1962), pg. 41.

environment. Here the rate of sales increase was only slightly higher than the growth in national population."855

6.2.2.1.6.2 Diversity (Diverse-Homogeneous)

Lawrence and Lorsch (1967a, pg. 151-152) describe environmental *diversity* as either *diverse* (*heterogeneous*) or *homogenous*. The following excerpt illustrates their definition of a homogeneous environment.

"Even more important, no significant new products had been introduced in the past 20 years."856

6.2.2.1.6.3 Critique

It appears that Lawrence and Lorsch's two characterizations of the environment - i.e. *certainty* (or *stability*) and *diversity* (or *heterogeneity*) correspond roughly to the two dimensions in this research (i.e. *quantity* and *quality*).

It also appears that these two external variables are meant to be used together, and therefore define the "diagonal" states where dynamic (unstable) and diverse (heterogeneous), or stable and homogeneous go hand in hand. It is not clear if they intended to cover the "off-diagonal" cases of dynamic (unstable) and homogeneous or stable and diverse (heterogeneous). In a similar way, the two external variables used in this research are meant to be used together although not necessarily coincident temporally. Therefore the rate of change in quantity of output has similar mapping to the rate of change in quality of output.

It is very important to note however that (unlike this research), Lawrence and Lorsch do not appear to posit a continuous evolution between the two different environmental states, e.g. that dynamic/diverse environments precede stable/homogeneous environments in the typical S-curve of environmental development.

6.2.2.1.7 Environmental Uncertainty

While Aldrich (1979) and Dess (1984) have focused on six and three dimensions respectively characterizing the environment, other researchers have combined these and other variables into a notion of environmental uncertainty. Some researchers have combined Dess' environmental "dynamism" and "complexity" into the concept of environmental "uncertainty".

"Uncertainty appears as the fundamental problem for complex organizations, and coping with uncertainty, as the essence of the administrative process."⁸⁵⁷

Anderson and Tushman (2001) observed empirically the mortality rates of firms in longitudinal studies of two industries.⁸⁵⁸ Instead of using Dess' three dimensions of munificence, dynamism and complexity, they used the three dimensions of munificence, *uncertainty* and complexity and

⁸⁵⁵ Lawrence, P.R. and Lorsch, J.W. (1967a), pg. 85.

⁸⁵⁶ Lawrence, P.R. and Lorsch, J.W. (1967a), pg. 85.

⁸⁵⁷ Thompson, J.D. (1967), pg. 159.

⁸⁵⁸ The industries were the US cement industry (1888-1980) and the minicomputer industry (1958-1982).

found that *uncertainty* is the key dimension which determines organizational mortality. While firms can slowly adapt to changes in environmental munificence and complexity, it is rather more difficult to respond quickly to unpredictable changes in the quantity and quality of demand.

Moberg and Koch (1975, pg. 115) observe that such a contingency variable as environmental uncertainty has been operationalized in many different ways: Dill (1958) uses "homogeneous-heterogeneous", Thompson (1967) uses "stable-shifting" and Lawrence and Lorsch (1969) use "clarity of environment related information", "degree of certainty of cause-effect relationships" and "time span of definitive feedback."

6.2.2.1.8 Rates of Environmental Change

"Perhaps the most ubiquitous force leading to structural change is a change in the long-run industry growth rate. Industry growth is a key variable in determining the intensity of rivalry in the industry."⁸⁵⁹

Various researchers in fields ranging from economics to sociology – specifically, strategy (Porter, 1980; Levinthal and Myatt, 1995) and organizational theory (Burns and Stalker, 1961; Chandler, 1962; Lawrence and Lorsch, 1967a) – have argued that the rates of change of the environment impact the development of organizations. These have typically been applied to technological and market changes.

"Perhaps the most basic attribute of the markets and customers served that will impact the development of the firm's capabilities is their growth rate. Is the firm serving customers and market segments that are growing rapidly and thereby can provide a rich experience base for the firm? Similarly, consider the co-evolution of a firm's capabilities when the industry is in decline. As markets shrink, so does reinvestment in equipment. This yields a vintage effect on the firm's production capabilities."⁸⁶⁰

Researchers (e.g. Levinthal and Myatt, 1994) have posited the beneficial effects of positive feedback in the generation of capabilities, and thus identify the underlying growth rate of markets as a driver of success. It is interesting to note that this point of view is valid for modular enterprise architectures as "market makers" in growing markets, while it is also valid for integral enterprise architectures as "market takers" who grow by taking market share off incumbents and therefore build capabilities, even when underlying growth rates of markets are low.

Lawrence and Lorsch (1967a, pg. 19) focus on the rates of *technological* change in both products and processes.

Chandler (1962), as reported in Lawrence and Lorsch (1967a, pg. 197-198), focuses on rates of change in "technology, markets, and sources of supply".

Burns and Stalker (1961), as reported in Lawrence and Lorsch (1967a, pg. 187), focus on "rates of change in the *scientific techniques* and *markets*".

⁸⁵⁹ Porter, M.E. (1980), pg. 164.

⁸⁶⁰ Levinthal, D. and Myatt, J. (1994), pg. 48.

6.2.2.2 Theories of Firm Evolution

Organizational researchers have long posited theories of firm evolution: Scott (1971), Greiner (1972) in Van de Ven, (1992).

6.2.2.3 Open Systems Theory

"The environment sets conditions that help shape the organization even as the organization shapes and influences its environment."⁸⁶¹

One of the most fundamental theoretical assumptions used is that of firms as *open systems*. A considerable amount of open systems theories have proliferated, some of the most noteworthy include: structural contingency theory (Burns and Stalker, 1961; Woodward, 1965; Thompson, 1967; Lawrence and Lorsch, 1967), institutional theory (Selznick, 1957), population ecology (Hannan and Freeman, 1984), economic theories of organizations (e.g. transaction cost economics), resource dependence theory, and network theory.⁸⁶²

"There is no one best way to organize ... any way of organizing is not equally effective."863

Heuristic 3a:

The enterprise performance is contingent upon: the environment's evolutionary state, the architectural form (i.e. its effectiveness), and the structural dynamics (i.e. its efficiency).

Contingency theorists Lawrence and Lorsch (1967), highlight the opposing forces of *differentiation* and *integration*. Other organization theorists (Scott, 2002) introduce the notions *rational* and *natural* systems. The rational (differentiation) perspective sees conflict as something unhealthy to be resolved, while the natural (integration) sees conflict as part of the healthy negotiation process of attaining consensus. These support the following propositions:

Heuristic 3b:

The modular enterprise architecture is based primarily on differentiation and rational optimization. The integral enterprise architecture is based primarily on integration and natural compromise⁸⁶⁴.

6.2.2.4 Structural Contingency Theory

Structural contingency theory has been an important mode of explanation of firm performance in the organizational theory literature using *context-structure-performance* relationships.

One of the important contributions of structural contingency theory is the notion of "fitness" of an organization with its environment. Not only does Van de Ven (1979) enumerate four

⁸⁶¹ Lawrence and Dyer (1983), pg. 295.

⁸⁶² As noted in Smelsner and Swedborg (1994), pg. 537.

⁸⁶³ Galbraith, J. (1973).

⁸⁶⁴ Simon referred to cognitive global suboptimization as "satisficing".

different conceptual definitions of "fit, he also (Drazin and Van de Ven, 1985), considers three different notions of "fitness".

"Recently a systems approach to contingency theory has emerged. Advocates of this approach assert that the understanding of context-structure performance relationships can only advance by addressing simultaneously the many contingencies, structural alternatives and performance criteria that must be considered holistically to understand organization design."⁸⁶⁵

6.2.2.5 Population (Organizational) Ecology

Within the field of sociology, population ecology explores the evolution (i.e. the birth, growth and death rates) of populations of firms.

"Organizational ecology, unlike strategic management or industrial organization economics, models competition as an explicitly dynamic phenomenon. Ecologists see competition and environmental characteristics as having an interactive effect on the success of a given strategic approach."⁸⁶⁶

Boeker (1991) notes that strategic management researchers have classified *strategy* typologies/taxonomies in much the same was as organizational ecology researchers have classified *organizational forms* typologies/taxonomies.

6.2.2.5.1 Natural Selection

Selection works best in a static population, and is disguised by rapid growth of the population.⁸⁶⁷

6.2.2.5.2 Structural Inertia

Hannan and Freeman (1977 & 1984) notably espoused the contruct of structural inertia, which inhibits organizational change. They do not claim that adaptation does not occur, but that it merely occurs at rates that are slower than the demands from the environment.

6.2.2.5.3 Co-Evolutionary Dynamics

Recently, a proliferation of research on the co-evolution of firm and environment has come out of the "Rotterdam school" Volberda and Lewin (2003).

6.2.2.6 Structuration

An enterprise architecture is a socially-enacted structure which simultaneously and recursively enables and constrains, but does not determine human action. This duality of structure is called "structuration" by its proponents (Giddens, 1979; Whittington, 1992; Yates, 1997).

"Giddens resists post-modernist pessimism as to the possibility of humanly engineered progress. Nevertheless, he concedes that control within an organization is unlikely to be complete."⁸⁶⁸

⁸⁶⁵ Drazin and Van de Ven (1985), pg. 519.

⁸⁶⁶ Boeker, W. (1991), pg. 614.

⁸⁶⁷ *The Economist*, December 24th 2005, pg. 12 of "A Survey of Human Evolution".

⁸⁶⁸ Whittington, R. (1992), pp. 695.

6.2.3 Technology and Innovation Theories

6.2.3.1 *Product* Life Cycle

"Organisms are depicted as proceeding through distinct cycles in their life as they age (Bonner, 1993, pp. 15-35). Can the same be said for **industries**? Is it meaningful to talk, as has been done, about a **product** life cycle that captures the way many industries evolve? If so, what are the characteristics of this life cycle?"⁸⁶⁹

Product life cycles were postulated more than fifty years ago by a variety of authors including Dean (1950), Levitt (1965), Vernon (1966), Cox (1967) as a means for firms to exploit deterministic continuity of industrial evolution to their advantage.

6.2.3.2 *Industry* Life Cycle

The industry life-cycle gained acceptance in strategic management as a dominant model for analyzing the external environment as a dynamic extension of Porter's (1980) five forces model.⁸⁷⁰ Both were derived from the Structure-Conduct-Performance (SCP) paradigm of the Industrial Organization (IO) economics tradition.

6.2.3.3 Technological Discontinuities

[Technological discontinuities] "...command a decisive cost or quality advantage that strike not at the margins of the profits and the outputs of existing firms, but at their foundations and their very lives."⁸⁷¹

Like Schumpeter before them, researchers Tushman and Anderson focused on the technological aspects of the organization's environment as a key determinant of environmental change. They authored two influential papers (briefly discussed below) which define *technological discontinuities* and their relationship to the other key punctuating event in the evolution of a technology, the *dominant design*.

"Discontinuities predictably affect environmental uncertainty, munificence, and organizational growth rates."⁸⁷²

Tushman and Anderson (1986) noted that major technological breakthroughs or "discontinuities" increase both environmental uncertainty and munificence. They noted that such discontinuities can both enhance and destroy firm competence, with new firms (challengers) typically initiating competence-destroying discontinuities which have increased environmental turbulence (or uncertainty) and existing firms (incumbents) typically initiating competence-enhancing "discontinuities" which have decreased environmental turbulence (or uncertainty).

⁸⁶⁹ Klepper, S. (1997), pg. 145.

⁸⁷⁰ Farjoun, M. (2002), pp. 565.

⁸⁷¹ Schumpeter, J. (1942), pg. 84.

⁸⁷² Anderson, P. and Tushman, M.L. (1990), pg. 606.

More recently, Anderson and Tushman (1990) further clarify, refine, develop and extend their concepts of technological discontinuities, particularly with vis à vis dominant designs, in their cyclical model of technological change.

"Technological discontinuities (innovations that dramatically advance an industry's price vs. performance frontier) trigger a period of ferment that is closed by the emergence of a dominant design. A period of incremental technical change then follows, which is, in turn, broken by the next technological discontinuity."⁸⁷³

Furthermore, they began to quantify further relationships, namely:

"Sales always peak after a dominant design emerges. Discontinuities never become dominant designs, and dominant designs lag behind the industry's technical frontier."⁸⁷⁴

From these two complementary pieces of research, one can begin to infer an internally consistent set of propositions represented in Figure 249 below.

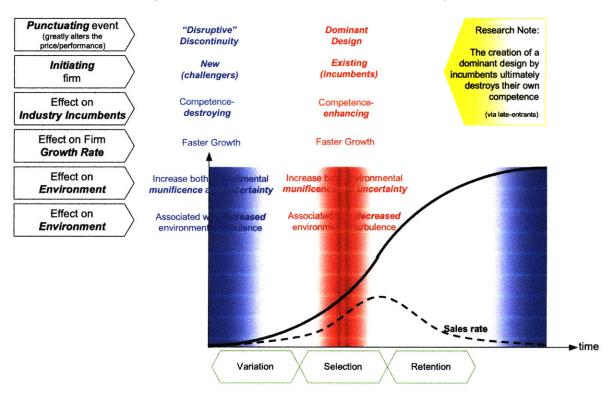

Figure 249: Discontinuities and Dominant Designs

6.2.3.4 Disruptive Technologies

An important endogenous mechanism whereby firm performance feeds back to shape the industrial evolution is the over-serving existing markets and the subsequent creation of disruptive innovations (Christensen and Bower, 1996; Christensen, 1997).

⁸⁷³ Anderson, P. and Tushman, M.L. (1990), pg. 604.

⁸⁷⁴ Anderson, P. and Tushman, M.L. (1990), pg. 604.

6.2.3.5 Dominant Designs (Products)

"Linking technology cycles and dominant designs to organizational architectures and competencies is a way to get more deeply to the roots of dynamic organizational capabilities. Much exciting theoretical and empirical work remains in coupling dominant designs and technology cycles to environmental conditions and organizational evolution."875

Research on dominant designs have productive developed this construct for thirty ranging from Abernathy and Utterback (1978) to Tushman and Murmann (1998).

"We argue that the search for a dynamic theory of strategy and for a link between the productmarket and resource-based views may be incomplete without an explanation of the evolution of the technology that underlies products and heterogeneous firm capability. The evolution determines what kinds of products (low cost, niche or differentiated) can be offered at each stage of evolution."870

Researchers have demonstrated a life-cycle theory of product and process innovation, with the establishment of a "dominant design" as the catalyst marking the tipping from one regime to the other. This literature has evolved through the following theoretical phases:

- Product-Process evolution (Utterback & Aernathy, 1975)⁸⁷⁷
- Dominant Designs (Abernathy & Utterback, 1978) ٠
- Technological discontinuities & political processes (Tushman & Anderson, 1986)
- Dominant designs on firm entry & exit (Utterback & Suarez, 1993) ٠

The concept of a "dominant design" is itself fluid and evolving. The following for example summarizes the claims in the automotive industry:

- Ford Model T in 1908 (Abernathy & Utterback, 1978)
- GM's Automatic transmission in 1940 (Abernathy, Clark & Kantrow, 1983, pg. 115) ٠
- Dodge all-steel closed body in 1923 (Utterback & Suarez, 1993)
- Ford Model T in 1908 (Klepper & Simons, 1997)⁸⁷⁸ ٠

Attempts have been made recently to numerically model the interactions between products and processes (Milling and Strumpfe, 2000), albeit over relatively short time horizons, and not over the evolution of industries.

Table 19 below summarizes some of the research in this space.

⁸⁷⁵ Tushman, M. and Murmann (1998).
⁸⁷⁶ Afuah and Utterback (1997), pg. 184.

⁸⁷⁷ Note that product & process innovation was typically measured by *number* of innovations ("transilience") and note level of product or process performance.

⁸⁷⁸ Klepper and Simons (1997) pg. 448 noted a potential error in Utterback & Suarez's dataset.

Year	Citation	Empirical Basis	Notes
1966	Fabris (PhD dissertation)	US Auto.	Empirical basis of product innovationa and demography for much of Abernathy-Utterback research.
1974	Utterback (paper)		Presents a model of <i>product</i> evolution: performance- maximization, sales-maximization & cost minimization
1975	Abernathy & Townsend (paper)		Presents a model of <i>process</i> evolution; uncoordinated, segmental, and systemic.
1975	Utterback & Abernathy (paper)	5 industries in 120 firms (Myers & Marquis)	Model of <i>product</i> and <i>process</i> evolution. ("Rate of innovation" means number of innovations, not product performance). No mention of "Dominant Design".
1978	Abernathy (Productivity Dilemma)	US Auto.	
1978	Abernathy & Utterback (paper)	Electric light bulb, auto., airplane	"Dominant Design" mentioned for the first time. Examples given: Model T in 1908 and DC-3 in 1935. Three phases identified: Fluid, Transitional & Specific.
1983	Abernathy, Clark & Kantrow (Industrial Rennaissance) (pp. 109-118)	US Auto. (see Appendix D)	"Dominant Design" term used, but not explained. "Transilience" used to define competitive effects of technology. "Revolutionary change with the closed steel body in the mid-1920's in the 1940s, the dominant design was completed."
1985	Abernathy & Clark (paper)	US Auto.	Summary of 1983 book. 1908 Model T \rightarrow 1913 moving line \rightarrow 1923 closed steel body \rightarrow 1965 sports car.

6.3 Industrial Evolution

"The desired dynamic characteristics of the management structure depend on the kind of markets, **rate** of technological change, and the other characteristics of the industry. Different organizational forms are seen to favor different classes of products. The management attitudes that work well in one situation falter in another because the life cycle of the product is longer or shorter, the ratios of the times needed to develop a product in comparison with the time for putting it into production are different, or the market is more sensitive to certain of its characteristics and less sensitive to others."⁸⁷⁹

The final construct shown in Figure 250, the industry life-cycle (or S-curve)⁸⁸⁰ has its theoretical underpinnings in the following literatures: the management of technology (Utterback, 1994), evolutionary economics (Nelson, 1991), organizational ecology (Hannan and Freeman, 1989) and strategic management theory (Porter, 1980).⁸⁸¹ It is used to help describe and understand the longitudinal, evolutionary nature of the forces driving the dynamics of industrial evolution.

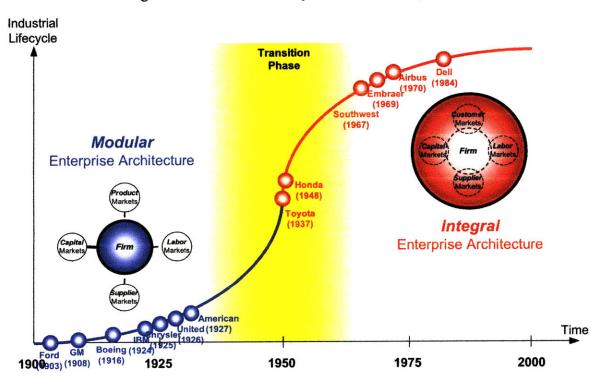

Figure 250: Industrial/Ecosystem Evolutionary Dynamics

Lawrence and Lorsch (1967) argued that the amount of uncertainty, and the *rate of change*⁸⁸² of an environment impacts the development of the internal structure of the organization. From the

⁸⁷⁹ Forrester, J. (1961), pg. 329.

⁸⁸⁰ Also known mathematically as the "logistic" function based on the Lotka-Volterra model.

⁸⁸¹ As described in Agarwal, Sarkar, and Echambadi, R., 2002.

⁸⁸² Note that 'rates of change" can refer to the industry *quantitatively* (i.e. amount of industrial output and *qualitatively* (type of industrial output).

stylized S-curve of industrial output, it can be seen that rates of change in *quantitative* output increase up to the dominant design, and diminish thereafter. Uncertainty, however in the *qualitative* output (i.e. when will the dominant design emerge, and what will it be?) or when will the discontinuity emerge, and what will it be?) decrease up to the dominant design and increase thereafter.

"To cope with these various environments, organizations... have differing structural features...including planning time horizon."⁸⁸³

While the dynamics of industrial consolidation or shakeout can arise from a number of exogenous sources including technological, regulatory and geographic discontinuities, this research focuses on the traditional Schumpeterian technological discontinuity as the primary driving force behind industrial shakeout.

While the population ecologists have theorized and demonstrated that the success rate of new entrants diminishes as the industry matures along its life-cycle, and the total number of firms diminishes during a "shake-out", this theory suggests a nuanced observation:

Heuristic 3c:

While the success rate of new entrants into a post-dominant design industry may be diminished, it is likely that these new entrants possess the modular enterprise architectures of the incumbents. Those few who survive are likely to have an integral enterprise architecture, which will significantly challenge the incumbent modular architectures. Therefore incumbent inertia, once thought to be a strength in selection, is now a potential weakness.⁸⁸⁴

"Rumours of the death of the old-style big businesses are greatly exaggerated...big old businesses have great staying power."⁸⁸⁵

"Very often the individual companies in an industry are similar. The conspicuous manifestations are those of the industry as a whole rather than those uniquely marking one company. Other industries are characterized by the evident differences between the companies, but this is more apt to be in the earlier parts of the life cycle of an industry. In the older more mature industries we often find similarity of companies, a rather highly competitive environment, and often a marked degree of industry instability."⁸⁸⁶

⁸⁸³ Scott, R. (2002), pg. 89.

⁸⁸⁴ It is important to note that due to "survivor bias", the number of integral enterprises born pre-dominant product design is unknown, due to their hypothesized early mortality.

⁸⁸⁵ Whittington and Mayer (2000), pg. 49.

⁸⁸⁶ Forrester, J. (1961), pp. 340.

6.3.1 Industry Maturity Assessment Metrics

Recall that population ecologists have long identified multiple "dimensions" for characterization of the environment (e.g. Aldrich, 1979, pp. 63-74), the most common of which include:

- Environmental Capacity
- Environmental Homogeneity-Heterogeneity
- Environmental Stability-Instability
- Environmental Concentration-Dispersion
- Domain Consensus- Dissensus
- Turbulence

6.3.1.1 Environmental Capacity

"...those firms that possess more skill and/or luck in anticipating changes in demand and technology will be able to earn above average profits (Kirzner, 1973)."⁸⁸⁷

When characterizing the evolutionary state of the industry, this research will adopt multiple dimensions, in an effort to ensure greater internal validity. Two exogenous variables will be discussed herein: the ecosystem carrying capacities in terms of *quantity* (e.g. demand or population size of consumers) and *quality* (e.g. ability of consumers to absorb technological innovation. The existences of these exogenous variables, define logistic growth functions or S-curves which define the growth trajectories of the industry life-cycle summarized in Figure 251 below.

More importantly, the rates of change of these two S-curves will be demonstrated to define key dynamics in the evolution of business ecosystems.

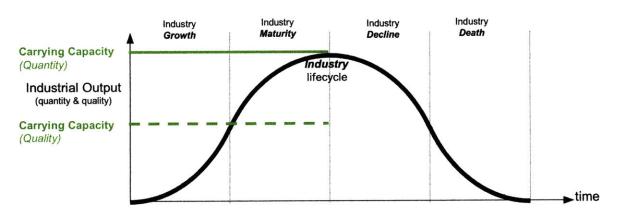

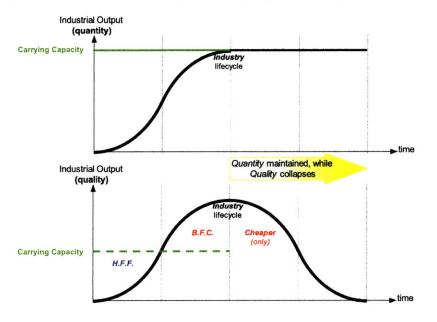

Figure 251: Dual S-Curves (tight-coupling assumption)

⁸⁸⁷ McWilliams, A. (1993).

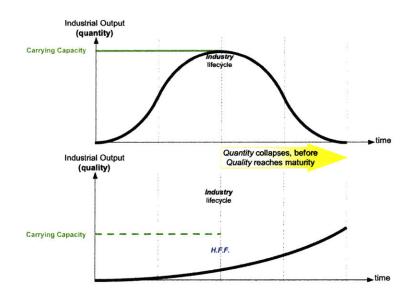

The depiction of the above figure may imply that as industries evolve, their quantity and quality grow and mature at identical rates, i.e. that there is tight-coupling between these two environmental variables relating to carrying capacity. However, in order to present a more generalizable framework, one must allow the two sub-dimensions to uncouple as is summarized in Figure 252 below, which is characteristic of mature commodities.

Another example of such loose-coupling of the quantity-quality space is illustrated in Figure 253 below, where the quantity diverges before full-exploitation of the quality space, due to say, the invasion of a disruptive new innovation.

Figure 253: Dual S-Curves (loose-coupling) Quantity precedes Quality

6.3.1.1.1 Quantity of Output

By way of example from the airline industry, empirical data shown in Figure 254 below shows the state of maturity in quantity space by plotting global available seat kilometers (ASK's) over time.

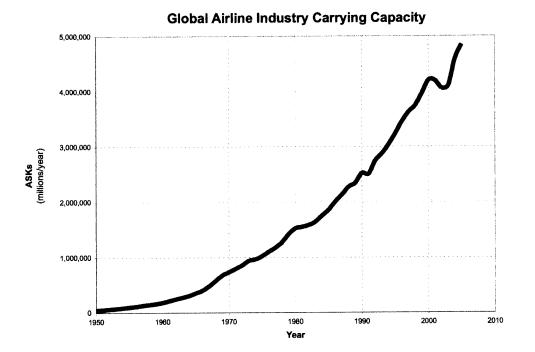

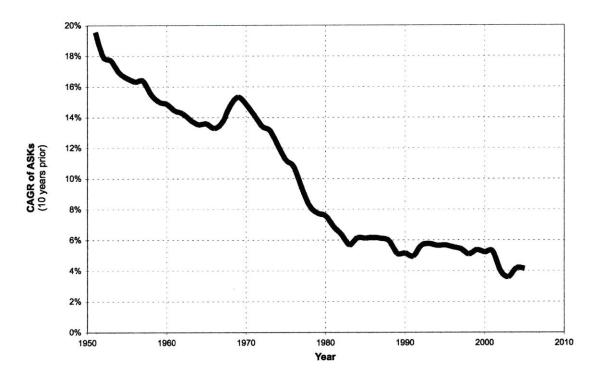

Figure 254: Carrying Capacity of the Global Airline Industry

As can be seen, the carrying capacity is clearly growing, but what is not evident is the rate of change of growth. For this, we need either the first derivative of the underlying growth, or the compound annual growth rate (CAGR) to determine if growth is speeding up or slowing down. Again from Figure 255 below, we can see that the industry is growing but at a decreasing rate, apparently converging toward a long-term growth rate in global GDP.⁸⁸⁸

⁸⁸⁸ Note, the significant increase in global ASK CAGR that occurred in the late 1960's is due to the extremely high production of new jet aircraft, relative to the small stock of jets in existence at the time. In other words, the temporary technological emergence of the "jet age."

Figure 255: Rate of Change of Carrying Capacity of the Global Airline Industry

Global Airline Industry Carrying Capacity

6.3.1.1.2 Quality of Output

Although the quality of output tends to grow as industries evolve, the rate of change of output quality tends to go from fast to slow, which can be modeled as logistic growth.

"Sahal (1981, pg. 32) noted that... once a branch of industry is established, the core technology on which it was founded remains largely unchanged. Modifications that are made tend to be, from a design standpoint, only incremental, even if thay are highly significant improvements from a cost standpoint. Sahal cites as examples the farm tractor, airplane, and electric motor industries, all of which rely on core technologies introduced over a half century ago. These technologies have undergone a great deal of cost improvements since then, but such progress has occurred only through a gradual refinement of essentially invariant patterns of design. Moreover, as Kuznets (1930) and others have noted, gradual modifications and improvements in a given basic form of technology can only go so far. The marginal returns of further innovative advances inevitably decrease as their marginal costs increase. The development of a technology eventually reaches certain dead ends, with little prospect for further advances in its capability."⁸⁸⁹

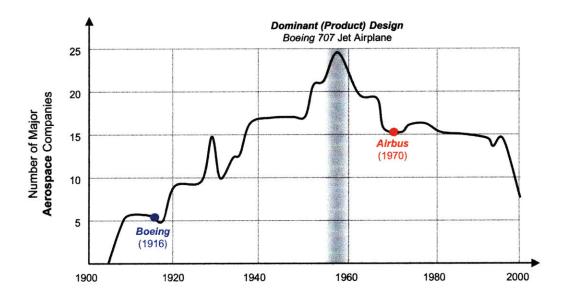

⁸⁸⁹ Astley, W. G. (1985), pg. 224.

6.4 Evolution of Population Density: Firm Entry and Exit

From the previous section, growth rates (in both quantity and quality) are deemed to be important in defining the state of the environment. There is also considerable empirical evidcence to suggest that such variables are important in defining firm entry and exit, as well as their inherent birth and death rates.

"Industry profitability does not seem to have any significant effect on entry and exit, which are instead positively correlated with industry growth."⁸⁹⁰

Figure 256 below illustrates the population density in the large commercial airplane industry. Note that *Airbus*, entered the market long after the consolidation process began.

⁸⁹⁰ Dosi, G., Malerba, F., Marsili, O., Orsenigo, L. (1997), pp. 7-8.

Figure 257 below illustrates the population density in the automotive industry. Note that *Toyota*, entered the market long after the consolidation process began.

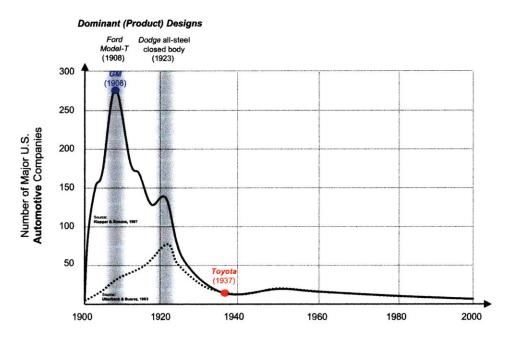

Figure 257: Population Density in the Automotive Industry

Figure 258 below illustrates the population density in the automotive industry. Note that *Southwest*, entered the market long after the consolidation process began.

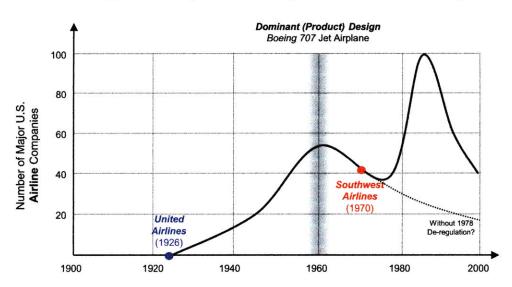

Figure 258: Population Density in the US Airline Industry

Much empirical data from population ecologists demonstrate that late entrants have high mortality rates. The research in this dissertation empirically demonstrates that late entrants of a different species not only have low mortality rates, but they go on to dominate the market. These K-strategists enter late into maturing environments, having lower rates of growth in market and technology space. In this sense this research is not about *population* ecology, but about *community* ecology, as shown in Figure 259 below.

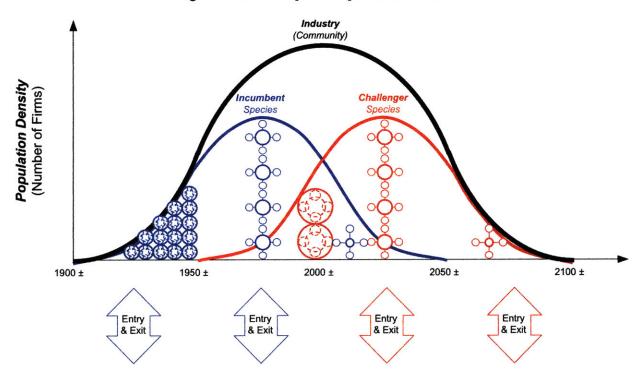

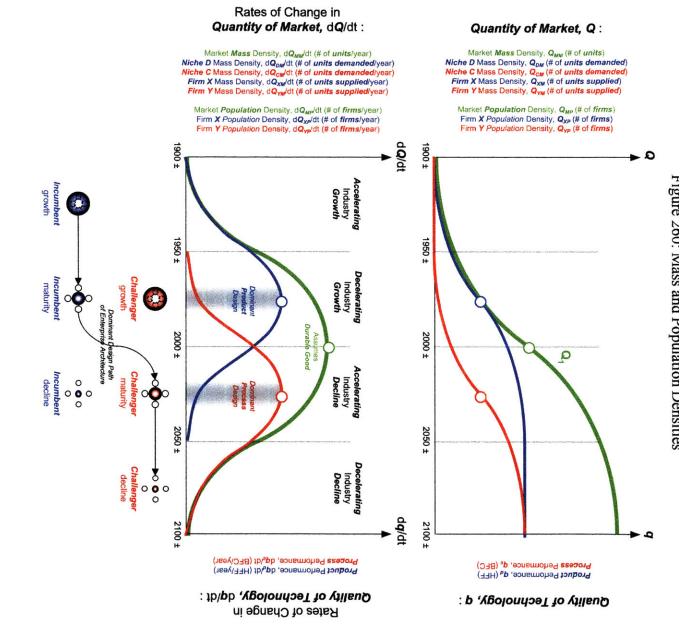

Figure 259: Conceptual Population Densities

Finally, by applying the theoretical framework, we can compare the environmental maturity in quanity and quality space with population densities, mass densities as shown in Figure 260 below.

6.5 Evolution of "Landscapes"

Fitness landscapes evolve over time from rugged, multi-peak to smooth, single-peak, and back to rugged, multi-peak. Due to the complex interdependencies associated with integral architectures, these correspond to integral, modular and integral enterprise architectures.

Figure 261 below shows the two-phase equivalent, whereby landscape smoothness is increasing with each time-step in the first phase, and subsequently landscape smoothness is decreasing with each time-step in the second phase.

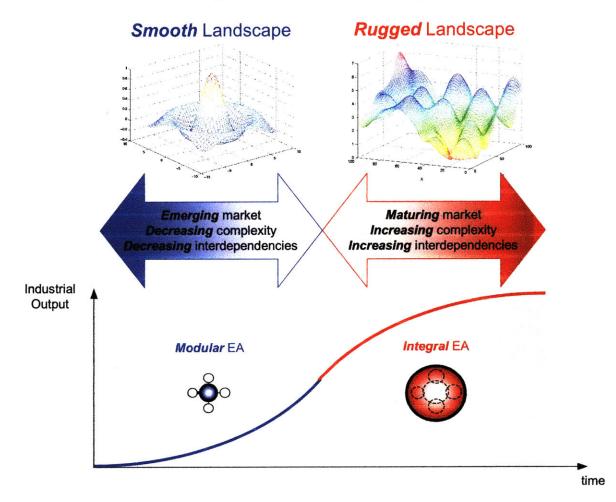

Figure 261: Evolution of Landscapes

6.6 Evolution of Dominant Factor of Production

As can be seen in Figure 262 below, the environment defines the dominant factor of production in the extended enterprise. In the growth phase of the industrial evolution, the capital markets are the dominant factor of production where the focus is on quickly building capacity. Conversely, in the maturity phase, the labor markets are the dominant factor of production, where the focus is on slowly growing capability.

It is important to note that this implies that the firm objective function or "teleological pull" changes, with dramatic implications on enterprise form, structure and behavior.

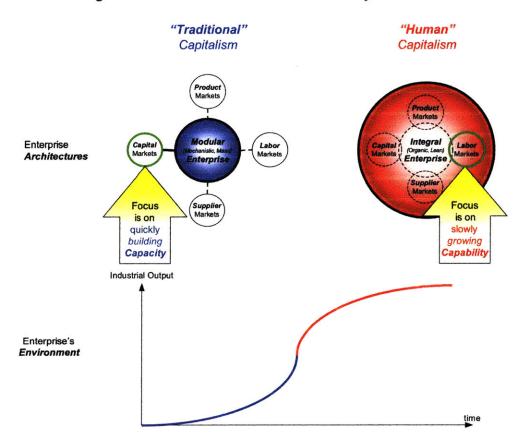

Figure 262: Evolution of Dominant Factor of Production

6.6.1 Traditional capitalism

"This period [the 1980s] also corresponded to the growing numbers and power of institutional investors and the declining numbers and power of trade unions. Capital became more important than labor, whether in the public mind or the productivity equation."⁸⁹¹

"Practically speaking, the change in climate for American corporate executives started in the mid-1980s, due to an extraordinary wave of hostile take-over bids, in which profitable companies, such as Gillette and Disney, were targeted by raiders who thought that these companies could be **even more profitable** in their hands (Ward, 1997). The message to corporate executives was stunningly clear: 'Your days of **satisficing** are over; from now on, you must **maximize**. If you don't we will.' At the same time, institutional investors held larger shares of major companies (Useem, 1996), and these powerful owners exerted more pressure for financial performance."⁸⁹²

6.6.2 Human capitalism

"A growing body of scholarly research shows the relationship between **profitability** and the good treatment of **employees and customers** or between financial success over time and an emphasis on **all stakeholders**."⁸⁹³

⁸⁹¹ Kanter, R.M. (2005), pg. 94.

⁸⁹² Hambrick, D.C. (2005), pg. 106.

⁸⁹³ Kanter, R.M. (2005), pg. 95.

6.7 Evolution of Dominant Production Strategy

Researchers (Poire and Sabel, 1984; Womack, Jones and Roos, 1990) have posited the evolution of dominant production strategies: ranging from *craft* to *mass* to *lean* production. This can be mapped onto the industrial S-curve as shown in Figure 263 below in order to posit that rates of growth enable and constrain certain production technologies.

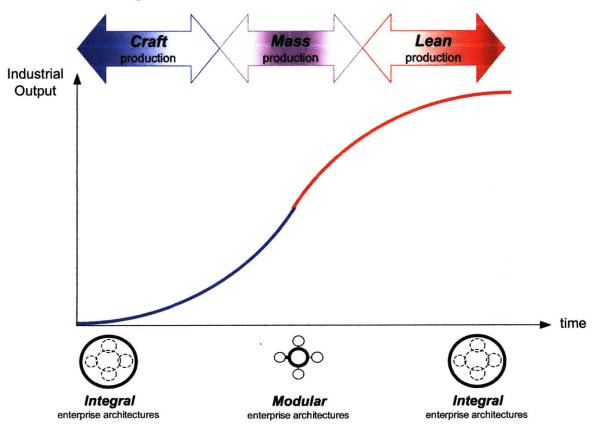

Figure 263: Evolution of Dominant Production Strategy

6.7.1 Craft production

Here *product* innovation is important which requires experimentation and close collaboration with manufacturing. As innovation is best served by integral organizational structures, one would expect to see integral internal design-produce functions as well as integral enterprise architectures.

6.7.2 Mass production

"Mass production is, in fact, a system ideally suited to the survival of large enterprises in a highly cyclical economy. Both workers and suppliers are considered variable costs. The problem with the

*American pattern is that it is extremely corrosive to the vital personal relationships at the core of any production process.*⁸⁹⁴

Here rapidly ramping up production capacity in order to access mass markets is important. This requires economies of scale in production, and a clear division of labor internally between the design-produce functions as well as modular enterprise architectures.

6.7.3 Lean production

Here process innovation is important which requires experimentation and close collaboration with manufacturing (Womack, Jones and Roos, 1990). Like craft production, as innovation is best served by integral organizational structures, one would expect to see integral internal design-produce functions as well as integral enterprise architectures.

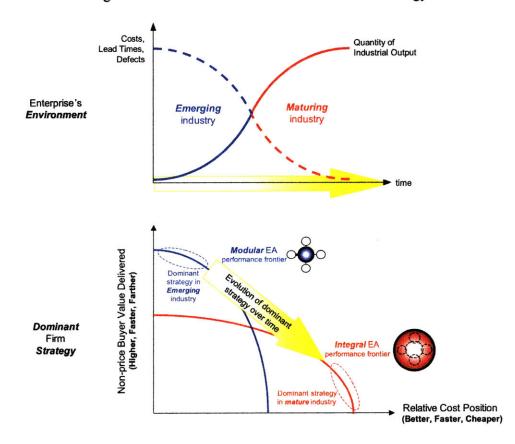

⁸⁹⁴ Womack, Jones and Roos (1990), pp. 247-248.

6.8 Evolution of Dominant Product Strategy (Position)

Miles and Snow's (1978) classic typology identified four different configurations which could theoretically be equally successful in different environments: *defenders, prospectors, analyzers* and *reactors.* Subsequent researchers, however have identified that different environmental conditions produce different successful configuration types. Hambrick (1983a) for example found that *defenders* consistently outperformed *prospectors* on profitability and cash flow metrics in all markets, while *prospectors* performed better than *defenders* in market share change in markets with high product innovation.

Researchers Kim and Lim (1988) found that high-performing differentiators and highperforming cost-leaders were more likely to compete in different environments. More explicitly, Miller (1988) found that successful firms pursuing a strategy of differentiation were more likely to compete in unstable environments, while successful firms pursuing a strategy of costleadership were more likely to compete in stable environments.

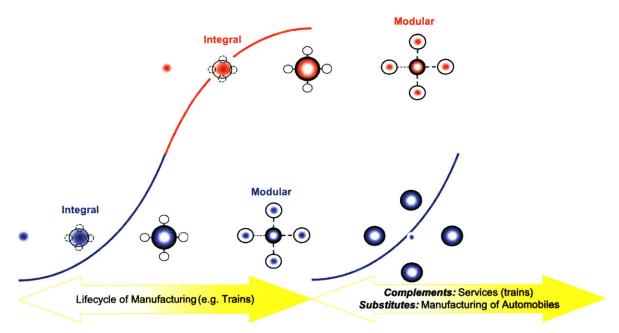

As shown in Figure 264 below, this research finding, coupled with the proposition that enterprise architectures are built to excel at different tasks, helps to explain how firms having different enterprise architectures will fare in different environmental settings.

6.9 Evolution of Dominant Economic Offering

Once a competitive landscape matures, often another is born. Typically, these can take the form of either complements or substitutes to the original competitive landscape as is shown in Figure 265 below.

6.9.1 Co-Existence of Complements

Once an S-curve has begun to end, and an existing industry is beginning to decline, a new growth opportunity exists in the form of complementary products or services. For example, going from agriculture to manufacturing; or going from manufacturing to services, etc.

6.9.2 Co-Existence of Substitutes

Once an S-curve has begun to end, and an existing industry is beginning to decline, a new form of competition – substitutes - emerges that does not directly challenge the old (Porter, 1980). Substitutes exist as competition on a higher level of abstraction. For example, when rail travel reached market saturation, it was overtaken by another form of indirect competition, automobiles.

6.10 Evolution of Dominant Levels of Cognitive Inertia

As was discussed in essay #2, each form of enterprise architecture is driven by a different level of managerial cognitive inertia. As shown in

Figure 266 below, it is posited that the state of environmental evolution - i.e. the rate of environmental change - drives the dominant level of cognitive inertia. Specifically, when the environment is speeding up, managers must think and act quickly, that is they must have low cognitive inertia. Conversely, when the environment is slowing down, managers must think and act more slowly, that is they must have higher levels of cognitive inertia.

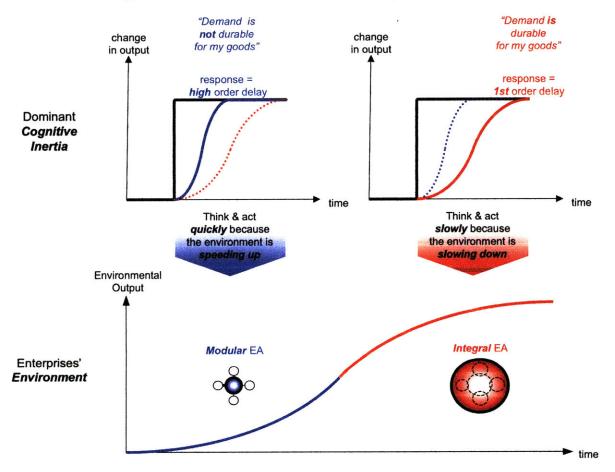

Figure 266: Evolution of Dominant Levels of Cognitive Inertia

6.11 Evolution of Dominant Growth Strategy

"Jensen (1988) suggests that the growth-oriented goals of managers during phases of industry growth are compatible with shareholder goals because the opportunities in the industry simultaneously addres shareholder wealth maximization and revenue maximization (the latter is one of the more important managerial motives). However, in the decline phase of the industry, these goals are not compatible. Managers would still like to enlarge the firm or reduce risk through diversification, whereas shareholders would rather let the firm shrink so that they can reinvest the capital in better opportunities. Hence, managers may be biased in favor of diversification-oriented acquisitions in the decline and mature stages of a business because such acquisitions represent a feasible path toward growth in such environments."

Here, we examine which species grows *organically*, when and why. We also examine which species grows *inorganically*, when and why.

6.11.1 Organic Growth

Late-entrant integral enterprise enterprise architectures (e.g. *Toyota, Southwest* and *Airbus*) appear to grow organically in their own niche. When they approach the carrying capacity of their own markets, they largely appear to diversify organically (i.e. without significant M&A activity). For example, *Toyota's* current market dominance in the automotive industry comes after a successful (organic) diversification from another manufacturing sector, textiles (Sako, 2006, pg. 94).

6.11.2 Inorganic Growth (M&A)

We note that moduar enterprise architectures tend to grow inorganically, either to diversify or to consolidate. The success of these two strategies is dependent upond the maturity of the environment (Anand and Singh, 1997).

"Our results indicate that **consolidation**-oriented acquisitions **outperform diversification**-oriented acquisitions in the **decline** phase of their industries in terms of both ex ante (stock market based) and ex post (operating) performance measures."⁸⁹⁶

When facing a maturing or declining market, a firm and its enterprise is faced with a dilemma: should it stay (and *fight*), or should it exit (and *take flight*) towards an existing market with higher rates of growth and more favorable competitive dynamics, or even create a new market. This decision is particularly problematic if a clear integral competitor has begun to grow.

Different enterprise architectures will face this maturing market in different ways. The modular enterprise (which is built for rapid short-term growth), is faced with the dilemma: is it easier to change oneself (i.e. re-architect the enterprise architecture towards more integrality) or to change the environment (i.e. create the next discontinuity)?

⁸⁹⁵ Anand, J. and Singh, H. (1997), pg. 101.

⁸⁹⁶ Anand, J. and Singh, H. (1997), pg. 99.

If the modular enterprise architecture remains in tact with its demands for high short-term growth rates from the investor stakeholder group, it often grows inorganically via mergers and acquisitions.⁸⁹⁷ As was discussed earlier, agency theory predicts the further "disintegration" of the relationship between shareholders and managers (principals and agents). The question then becomes, if growth is to come via acquisition, should one have a strategy of consolidation or diversification? Consolidation can be thought of as being a proxy for "fighting" (i.e. staying, maintaining focus on existing markets, attempting re-architecture with stakeholders to enable long-term focus on cost and productivity, etc.). Diversification can be thought of as being a proxy for "taking flight" (i.e. maintaining the modular architecture and exiting a low-growth environment).

As a mature or declining market will tend to have overcapacity, it is necessary for the industry to extract some competitors. The natural inclination of the ecosystem is to consolidate (as verified by data from population ecologists who have noted the number of firms fall after the emergence of a dominant design). One would therefore postulate that modular architectures that "go with the forces of the ecosystem" and acquire for consolidation in a maturing industry would perform better than those who do not or even who try to diversify out. In fact, one would expect that firms attempting to grow via consolidation acquisitions while the industry is pre-dominant design, while the number of firms entering the industry is still growing would perform worse than those that do not or that diversify in the hopes of securing what will ultimately be the dominant design.

"Although firms in declining industries may not have good prospects within their own industry, they cannot enhance their value by diversifying to escape the unattractiveness of their own industry."⁸⁹⁸

These propositions can be summarized as follows and as shown in Figure 267 below.

Heuristic 3d:

In growing industries, modular firms that grow via *diversification* acquisitions will perform better than firms who do not, or firms who grow via consolidation acquisitions.

In *maturing/declining* industries, modular firms that grow via *consolidation* acquisitions (i.e. who stay and fight) will perform better than firms who do not, or firms who grow via diversification acquisitions (i.e. who take flight).

⁸⁹⁷ The strategic management literature on the value/performance of acquisitions is rich, led by Rumelt (1974).

⁸⁹⁸ Anand, J. and Singh, H. (1997), pg. 113.

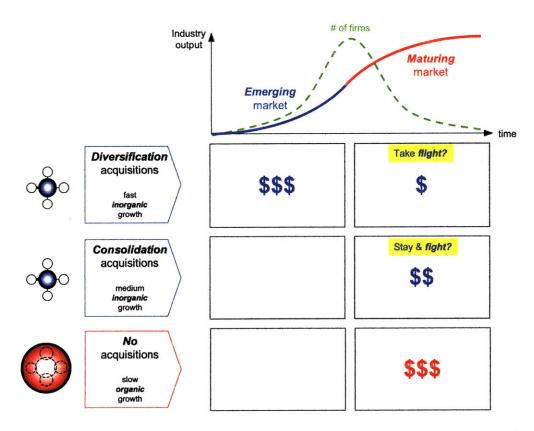

Figure 267: Diversification and Consolidation Strategies and the Industrial Evolution

Recent and rare empirical research on strategies in declining industries by Anand and Singh (1997) indicate that for industries in the US defense sector between 1981-1992, the above propositions appear to be valid.⁸⁹⁹

In a twenty year study of acquisition policies in a representative declining industry - the US defense sector between 1978-1996 – Anand and Singh (1997) noted that consolidation oriented acquisitions outperformed diversification oriented acquisitions, both in terms of *ex ante* stock market valuations and *ex post* operating performance metrics.

This lends some credence to the "fight" stance in the question of "fight or flight" strategies of incumbent modular architectures that find themselves in harsh environments for which they are not suited.⁹⁰⁰

⁸⁹⁹ It is interesting to note their "inverted" findings: namely *given* that a firm wants to consolidate, it will be more successful doing so in a mature/declining industry; while *given* that a firm wants to diversify, it will also be more successful in a mature/declining industry, but consolidating will be even more successful in a mature/declining industry.

⁹⁰⁰ Hambrick and Schecter (1983) highlight similar findings for "mature industrial-product business units".

6.12 Evolution of Dominant Intra-firm Structure

6.12.1 Mechanistic vs. Organic structure

Much work in contingency theory deals with intra-firm structures which only have indirect references to a theory of evolution which focuses on *continuity*, as opposed to *discontinuity*. Burns and Stalker (1961) predicated their version of contingency theory not based on a natural continuous logistic growth model of the technical and commercial environments, but rather on a model of discontinuous change, which for their empirical dataset arose when the "stable" environment of World War II supported *mechanistic* organizational structures, was displaced by the "unstable" discontinuity of the war ending, producing an *organic* organizational structure. As a precursor to the much later organization ecologists (e.g. Hannan & Freeman, 1977), Burns & Stalker observed that transition of organizational structures between ideal types is difficult:

"The first question is why some concerns – indeed most of those which took part in the studies – did not change their management system from mechanistic to organic as the general context, technical and commercial, of their operations changed from relative stability to fairly rapid change."⁹⁰¹

In fact, like the entropy proposition generated in this research, in which all enterprise architectures tend toward dis-integration, Burns & Stalker observed a similar trend:

"A mechanistic system is more economical of the individual's effort. Commitments to the working organization are more prescribed the closer the approximation to mechanistic form. The tendency is for most individuals to oppose extending such commitments and to try to reduce them, and thus to exert pressure towards a mechanistic system. If conditions are stable, this means that overall economy in human resources may be effected. If conditions are unstable, a mechanistic system becomes extravagant in numbers of persons employed each with his limited commitment to the working organization."⁹⁰²

6.12.2 Functional vs. Project structure

At approximately the same time, another systems scientist, Jay Forrester made similar claims regarding the difficulty in organizational change from one form to another.

"[In the **functional** subdivision], the stress is on *efficiency* within each of the separate functional specialties. It is an organizational form having advantages in a very slowly changing product situation. The functional organization runs into difficulty as the product life cycle becomes short. In the project organization, top management takes a view that is longer than the individual project. The dynamics of the long-term evolution of management structure are interesting in that most small new companies begin with the project form. As they grow, they break into the functional subdivision driven by a desire to achieve an apparent gain in effectiveness. This gain may be short-term, lasting but a few years. The functional organization provides a poor training ground for the type of man necessary for project or top-management leadership, so that the transition back [to project organization] becomes less and less possible as the organization ceases to regenerate the kind of wide-ranging leaders necessary for preceiving the interactions of all facets of an enterprise.""

⁹⁰² Burns, T. and Stalker, M. (1961), pg. 210.

⁹⁰³ Forrester, J.W. (1961), pp. 329-331.

6.13 Evolution of *Dominant Designs* in Enterprise Architectures

The notion of a "dominant design" is well-established in the field of product and technological innovation (Abernathy, 1978; Abernathy and Utterback, 1978), and their effects on both technological and organizational evolution have been noted.

Dominant designs have been demonstrated to end periods of radical change (ferment) and initiate periods of incremental change. Tushman and Murman (1998) observe that dominant designs have been linked by various researchers to: shifts in innovation types, product and firm performance, firm entry and exit rates, organizational fate, shifting industry structures, and industrial and organizational evolution.

What this research aims to discover is that there are dominant designs at the inter-firm organizational level or enterprise level.⁹⁰⁴ The definition of the dominant design of enterprise architectures will be discussed within the context of industry and technology cycles. Recent researchers (Sigouris, 2007, pg. 334) have called this "the Piepenbrock Hypothesis."

This research posits that there are "dominant designs" in enterprise architectures which arise at different times and for different reasons. Specifically, it is hypothesized that the modular enterprise architecture is the dominant design when the industry is going through its rapid growth phase, while the integral enterprise architecture is the dominant design when the industry is going through its maturing phase (i.e. when the rates of growth are diminishing over time). As shown in Figure 268 Utterback and Suarez (1993), postulate the existence of a new dominant design in organizations which centers on value chain integration.

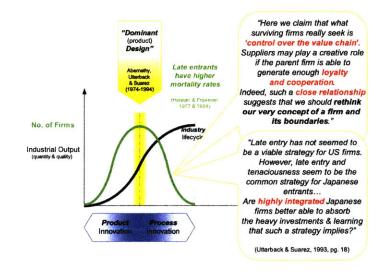

Figure 268: Dominant Designs in Enterprise Architectures

⁹⁰⁴ The field of Organizational Design has historically tended to focus on "intra-firm" design. This research however focuses on enterprise or "inter-firm" design. Prof. Michael Tushman, specialist in organization design, exclaimed at a June 2005 lecture at the London Business School, "Design died 20 years ago...the last great work on design was Thompson (1967)."

"New patterns of behavior that emerge fall within **recognizable categories** – they are similar to but never the same as previous patterns of behavior. In this sense, **history repeats itself** but **things are never the same**."⁹⁰⁵

A number of researchers have recently hypothesized the oscillatory dynamic evolution of product and supply chain architectures from integral to modular and back to integral (Schilling, 2000). Fine (1998) refers to this as the "double helix", Chesbrough (2003) alludes to "a cyclical model" of the dynamics of modularity, and finally Christensen et al. (2004) develop the theory of "Value Chain Evolution".

"Product architectures are dynamic and unstable as they continually migrate toward or away from increased modularity. Given the evolutionary nature of the relationships between technologies, firms and industries, changes in product architectures are both driven by and have significant repercussions on organizational and industry structures." 906

From system dynamics theory, this primary mode of architectural oscillation implies that there is a dominant mode consisting of negative or balancing goal-seeking behavior with delays.

Heuristic 3e:

The enterprise architectural forms (modular vs. integral) will evolve over time from integral to modular (i.e. the process of *disintegration*). The dominant architectural form from an industry population perspective will evolve over time from integral, to modular and back to integral – i.e. re-integration occurs at a population level, not at firm level.

"Speciation is a property of populations (organisms do not speciate), while extinction [a sorting process] is often a simple concatenation of deaths among organisms."⁹⁰⁷

The capability of a firm to evolve (through strategic choice or environmental determinism) the architecture of its extended enterprise under competitive pressures from rival enterprises is governed by the amount of structural inertia it possesses.

"It should not be taken as given that the strategic shifts required to compete successfully in a maturing industry should be attempted at all, in view of the substantial and perhaps new types of skill that may be required."⁹⁰⁸

The debate on whether or not it is possible for an enterprise's architecture to evolve is joined by the normative question of whether or not firm leaders *should* attempt the evolution.

"Industry leaders may or may not be in the best position to make the adjustments required by transition if they have substantial **inertia** built into their strategies and strong ties to the strategic requirements of the **growth phase** of the industry's development...a **new firm entering the industry during the transition phase**, possessing financial and other resources but no ties to the past, is often able to establish a **strong position**."⁹⁰⁹

⁹⁰⁵ Stacey, R.D. (1995), pg. 483.

⁹⁰⁶ Eytan Lasry (University of Toronto, working paper).

⁹⁰⁷ Gould, S.J. (1989), pg. 122.

⁹⁰⁸ Porter. M.E. (1980), pg. 246.

⁹⁰⁹ Porter. M.E. (1980), pp. 246-247.

Figure 269 below illustrates the co-evolutionary feedback dynamics defined by the theory.⁹¹⁰ Note how the enterprise architecture drives the enterprise structure, which drives the firm performance, which shapes the evolution of the industrial environment. Also note how the feedback switches from integral to modular and back to integral again. This will be discussed further in subsequent sections.

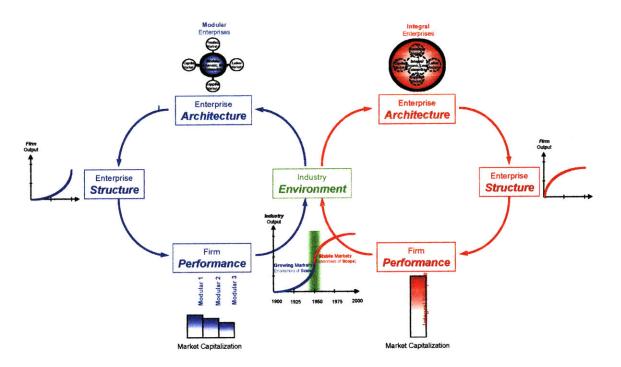

Figure 269: Co-Evolutionary Feedback Dynamics of the "Double Helix"

⁹¹⁰ Kunc, M. and Morecroft, J. (2004).

6.14 Evolution of Ecosystem Entropy ("The Architect's Dilemma")

"A social system left to itself gravitates toward equilibrium – maximum entropy so to speak. All efforts to avoid this death must aim at lowering the barriers that impede communication between the discipline-oriented and the [customer]-oriented wings of the [organization]."⁹¹¹

As shown in Figure 270 below, there appears to be a natural drift toward disintegration of enterprise forms, that is a trajectory from integral to modular forms as it is hard to maintain *centripetal* forces in the face of *centrifugal* forces. This drift towards disintegration marks the process of *creative destruction* (Foster and Kaplan, 2001). This inevitable and steady deterioration of a system is not unlike the concept of entropy.

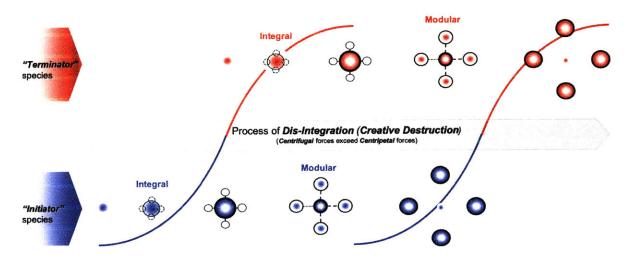

Figure 270: The Evolutionary Trajectories of Architectures

Enterprise architectures are not static, but rather dynamic or more precisely evolutionary constructs. In this sense, the enterprise architecture can be seen as a DNA coding specific to a species. The "species' that grows in *emerging* markets can be thought of as the *initiator* species. It begins with an integral architecture and over time begins to disintegrate, or become more modular.

Through the processes of variation, selection and retention, the environment selects an enterprise form that has the DNA of the species that initiated the industry, but which is now too "efficient" to begin to bring innovation in processes. The environment again selects an integral enterprise form that grows in *maturing* markets and can be thought of as the *terminator* species.

"Scope, permeability and modularity are the crucial factors for success. By judiciously adjusting them over time, a business can remain competitive even as its industry matures."⁹¹²

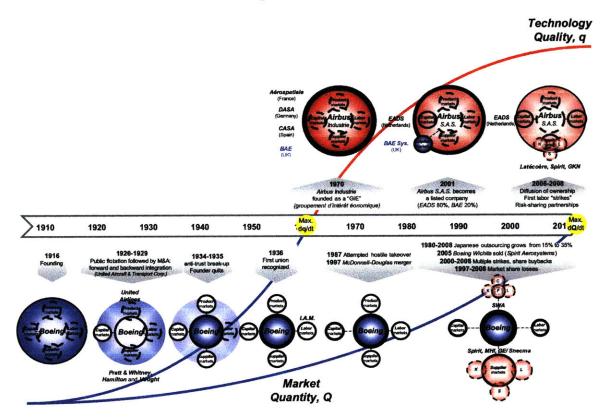

⁹¹¹ H. Simon (1967).

6.14.1 Example: Commercial Airplane Industry

The following example shown in Figure 271 below, chronicles the phased trajectories of disintegration of *Boeing* and *Airbus* in the large commercial airplane industry. Key events or phases are summarized chronologically for each enterprise in the subsections below, with particular attention paid on the effects on the enterprise architectures.

Figure 271: Evolution of Dominant Designs in Enterprise Architectures in the Commercial Airplane Industry

6.14.1.1 Boeing (1916): Founding

On July 15, 1916, founder Bill Boeing incorporated the *Pacific Aero Products Company*, which would subsequently be changed to the *Boeing Airplane Company* with the US Navy as *Boeing's* first customer as a result of World War I. As will be discussed in the following subsection, the US government would also be the first customer for *Boeing's* imminent commercial business.

The Navy contract for 50 Model C airplanes, was worth \$575,000. Prior to winning its first contract, *Boeing* had invested its own money building and testing a total of seven airplanes.

6.14.1.2 Boeing (1925-27): Airplanes/Airlines (forward integration)

Less than a decade after *Boeing* was founded, the U.S. Post Office required a new mail plane, for which *Boeing* built its first commercial airplane, the Models 40 and 40A. Congress subsequently passed the Contract Air Mail Act (a.k.a. the Kelly Act) in 1925, which privatized airmail. That *Boeing's* first commercial customer was the US government would begin a long and symbiotic relationship.

The *Boeing Airplane Company* (BAC) forward-integrated into airlines by establishing a subsidiary, *Boeing Air Transport* (BAT) on February 17, 1927 that purchased *Boeing* 40A airplanes from its BAC parent.

Soon thereafter, *Boeing* purchased a competitor to BAT, named *Pacific Air Transport* (PAT). By the end of 1928, BAT was carrying 30 percent of the US's mail and passenger traffic (Sterling, 1992, pg. 16).

6.14.1.3 *Boeing* (1928): Public Flotation (owner-manager dis-integration)

On November 1, 1928, *Boeing* became listed on the New York Stock Exchange. The capital raised allowed expansion via acquisitions and the formation of a holding company a few months later.

6.14.1.4 *Boeing* (1928-31): *Vertical* Acquisitions (value chain integration)

A holding company, United Aircraft and Transport Corporation (UATC) was founded on February 1, 1929 with the merger of engine manufacturer, Pratt and Whitney (who themselves had bought out two propeller companies: Hamilton and Standard Steel), and Chance Vought, a manufacturer of naval aircraft.

UATC then went on to acquire *Stearman Aircraft*, which made light biplanes, *Northrop Aircraft*, which made military trainer aircraft, and *Sikorsky*, which made amphibian aircraft.

Between 1929 and 1931, UTAC increased its purchases of airlines, including: Varney, Stout Airlines, and National Air Transport, combining them into a subsidiary called United Air Lines, Inc.

In addition, UATC established the *Boeing School of Aeronautics* to train pilots and mechanics, *Boeing of Canada* to build aircraft, and an aircraft export subsidiary.

6.14.1.5 *Boeing* (1934-35): Government Break-up (value chain dis-integration)

Amidst charges that the high profits of the largest US carriers were an abuse of public funds, the US Congress passed the Air Mail Act (a.k.a. the Black-McKellar Act) On September 28, 1934 which dis-integrated the aviation industry into airplane manufacturers and airlines (Lawrence and Thornton, 2005, pp. 15-16).

6.14.1.6 *Boeing* (1936-48): Labor Unions Established (labor dis-integration)

Boeing recognized its firs union in 1936, the Local Lodge 751 of the International Association of Machinists (IAM).

In 1948, the IAM initiated a strike over seniority rights which lasted 140 days and which also resulted in the creation of a union for engineers, called the Seattle Professional Engineering Employees Association (SPEEA).

Since its first strike in 1948, the IAM has staged six strikes approximately every ten years over the past 60 years. The strikes occurred at or slightly after the bottom of the ten-year airplane delivery cycle, precisely at the time when labor was in a strong political position, facing large impending production schedules.

6.14.1.7 Boeing (1970): Patient Finance (customer integration)

6.14.1.8 Boeing (1987): Hostile Takeover Bid (investment horizon shortened)

"Throughout the 1980s, the giants of American industry had been cut to shreds by **aggressive** young investment bankers and junk bond merchants of Wall Street who had taken it upon themselves to revitalize what they considered the **tired**, **struggling dinosaurs** of the country's commercial establishment... 'Some Wall Street executives say Boeing's characteristics make it a particularly good candidate for **recapitalization** that could yield a bonanza for shareholders,' reported the Wall Street Journal. To the stockbrokers the argument was simple: Boeing was **sitting on a pile of cash** – about \$3 billion – which it had set aside for developing new planes."⁹¹³

In 1987, *Boeing* (like much of corporate America in the mid-1980s) was beginning to feel the pressures of another quality of stakeholder in the capital markets, one optimized in the name of efficiency to very narrow boundaries of stakeholder space and time, an outlier on the spectrum of impatient capital, known generally as the "corporate raider" and in this particular case, as T. Boone Pickens. Having identified a cash reserve on *Boeing's* balance sheet, which - given his assumptions of stakeholder space and time - was logically and rationally computed to be inefficient, Pickens allegedly launched a hostile takeover bid. Instead of responding to this new stakeholder in *Boeing's* enterprise with a narrow and constrained solution space (i.e. focusing exclusively on financial strategies), *Boeing* responded by more degrees of freedom in stakeholder space and time.

"[Washington] State lawmakers, meeting in emergency session, overwhelmingly approved antitakeover legislation today to help the Boeing Company fend off unwanted suitors such as T. Boone Pickens.... The legislation [was] sought by the aerospace giant, the state's leading employer. The majority brushed aside critics who called the measure unconstitutional and against free enterprise. Sponsors called it a wise step to protect the 85,000 Boeing jobs in the state. 'The company is very, very appreciative,' said Boeing's chief lobbyist, Forrest Coffrey."⁹¹⁴

In response to the unfriendly takeover bid, senior managers at *Boeing* co-opted a broad stakeholder group including state and federal government (i.e. political markets) as well as labor markets. Although a modular enterprise architecture exchanges with its environment, it tends to do so in an emergency, short-term, ad-hoc way. An integral enterprise architecture conversely

⁹¹³ Lynn, M. (1997), pp. 184-187.

^{914 &}quot;State Passes Bill for Boeing," The New York Times, August 11, 1987.

interacts with its relevant environment in a sustained, longer-term and systematic way. Through *Boeing's* "architectural" actions with it's stakeholders, it chose the *quality* of capital that it wanted in its enterprise, and in the process it defined the goals and objectives of the enterprise. In system dynamics parlance, the system chose *stability* over *growth*, or more precisely *stable* growth over *unstable* growth.

"But even without a Pickens bid, the Texan had done them [Airbus] a valuable service. The Boeing management was looking nervously over its shoulders before it made a decision, and could only become **more cautious** and more financially conservative... The takeover scare died, but the challenge from Airbus did not, and Boeing was **now in a weaker position** from which to fight."⁹¹⁵

This non-sustained integration episode would have longer term implications for the future disintegration of *Boeing's* enterprise architecture, as it seeks alternate ways to finance investments for growth (i.e. without having cash sitting idle to attract impatient investors), like "risk-sharing" partnerships with suppliers.⁹¹⁶

6.14.1.9 Boeing (1997): Horizontal Acquisition (inorganic growth)

In 1997, *Boeing* merged/acquired one of its long time competitors, *McDonnell Douglas*, and in doing so, brought the large commercial airplane industry down to a global duopoly with *Airbus*.

Unlike the major *vertical* acquisitions of customer (i.e. airline) and supplier (i.e. engine manufacturer) that took place 70 years earlier to create a vertically integrated company with diversified market power in a rapidly growing an uncertain environment, this major *horizontal* acquisition of its competitor was done in a maturing industry, primarily (on the commercial side) for *consolidation* reasons.

The merger could be argued both on the grounds of *consolidation* in a maturing (commercial aircraft) industry, or *diversification* in a growing/changing (defense) industry, as *McDonnell Douglas* had both commercial and defense businesses, for which empirical research demonstrates different success outcomes (Anand and Singh, 1997).

6.14.1.10 *Boeing* (2005): Risk-sharing Partners (value chain dis-integration)

"Hearing in June 2005 that Boeing has just announced another 10 million US\$2.7bn share buy back scheme does not square with the requirement for major product investment. As the aerospace analyst Scott Hamilton notes, the money Boeing has spent buying back its own stock – more than US\$9 billion since December 2000 – could easily have funded an entirely new airplane."⁹¹⁷

As shown in Figure 272 below, *Boeing* has begun to outsource more to the supply base in recent years for a number of reasons, not the least of which is the access to investment capital from

⁹¹⁵ Lynn, M. (1997), pg. 187.

⁹¹⁶ Note, *Southwest Airlines*' more integral enterprise architecture has by definition a more sustained dialogue with key stakeholders, allowing it to have carry more debt to manage in difficult times (e.g. cyclical downturns). See Hoffer-Gittell (2003), pp. 244-247.

⁹¹⁷ Lawrence and Thornton (2005), pg. 151.

their suppliers. This has been pursued under the strategy rubric of "large-scale systems integration".

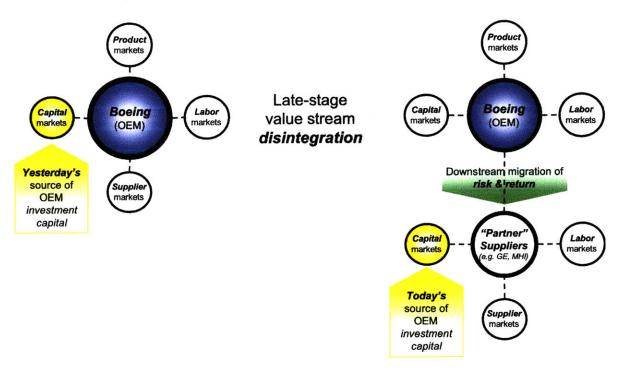

Figure 272: Value Chain Disintegration (for "Risk-Sharing")

"Remember, we're all on the same system. So we understand the design parameters and design specifics on a real-time basis as well with our partners as we do in our own engineering shops. So we are very agile and very quick in terms of being able to go back and put resources on some of that. Other things we're doing, there has been some production process help we've given a couple of suppliers as they're setting up new facilities and needed some boundary-less kind of collaboration between our production people and theirs to move it along a little faster. It's all the kinds of thing we anticipated. It's all the kinds of things that you do when you share a supply chain with people who have a lot of skin in the game with you. But the good news about a lot of skin in the game is we are both incented to get it done. It is not us pointing at them and them pointing at us. It's us getting together..."⁹¹⁸

Three years later as *Boeing's* vision for its new supply-chain model was beginning to take shape, comments from suppliers began to reveal how modular this intendedly integral architecture really was:

"As a supplier to the 787 program, I see a problem that hasn't gotten a lot of press. The partner model is seriously flawed. In the perfect world, each parner performs their tasks in lockstep with the others analogous to a rowing team. The reality is that each partner is lashed to its own suppliers in a sort of three legged race against the other partners. The problem is that no one wants to win - everyone wants to come in second to last. Losing, or being the one holding up the schedule, draws international embarrassment, so no one wants to lose. But, completing the assigned task more than a week or so before the slowest partner means holding very expensive (Smillions) inventory. This has created a stage for all sorts of theatrics. The partners can see, often more easily than Boeing managers, who is going to be holding up the program (keeping in mind that this race is like the Tour de France, where there are dozens of race segments.) But no partner is going to tell Boeing, 'We aren't going to hit our promise

⁹¹⁸ Jim McNerney, CEO, The Boeing Company. Q3 2006 Earnings Call.

dates because we know that the spoilers will be late.' Instead, they brick wall over a 'spec change.' Or, they tacitly conspire to tangle fastener procurement to the point of non-functionality (FUBAR might be better used here.) Or, they find a Boeing selected single source supplier in their ranks and hobble that supplier so that a delay in the partner schedule is traceable back to Boeing. (The way they do it is like a kid tripping his little brother every time mom looks away and then claiming the little brother can't walk.) Boeing managers have dismissed the theory because they do not believe that the partners are sufficiently clever to perpetrate such schemes. But the partners had schedules requiring them to build hundreds of millions of dollars worth of assemblies yet they knew they wouldn't be paid for months, even years. The partners had to figure a way out of that trap. The partners resorted to all sorts of shinanigans at the level of the minute details with the ultimate effect of deliberately misleading Boeing at all levels. The latest side body join problem may be entirely encompassed by Boeing's internal communication loop. But, the entire program has been rife with deceptions vigorously advanced from low levels at the partners to low levels at Boeing over small details. This creates context for senior partner managers to rationalize delays to senior Boeing managers. The delays appear fixable to Boeing management because they are presented as quantifiable technical or commercial problems. Boeing still hasn't realized that those problems were created and have been nurtured as the partners means of controlling the schedule and thus, their cash flow. The problems won't get solved until the partners decide to let them be solved (or Boeing decides to take and pay for each deliverable on each partner's schedule.) The thing about airplanes is that they don't fly until the last bolt is torqued down and the last i is dotted. The devil really is in the details. Boeing's internal communications are based almost exclusively, because of the partner model, on communications from the partners. Who knows? Boeing may not be able to avoid making garbage out of good information. I do know that Boeing is not clever enough to make good information of the garbage that is coming in. "919

6.14.1.11 Boeing (2005-2009) 787: "The Game-Changer"

Boeing (2008) Departure of "The Red Queen" 6.14.1.12

"It takes all the running you can do, to keep in the same place."920

The vice-president and general manager of airplane programs at Boeing Commerical Airplanes, until her retirement in December 2008, was was Carolyn Corvi. She was acknowledged as fundamental in leading Boeing's "lean" efforts, resulting in significant productivity gains over the years. Her passion for executive learning in general, and her sponsorship of this research project (commonly referred to at Boeing as "Red-Blue", short for Integral-Modular) in particular, lead to her reputation within Boeing Commercial Airplanes as "The Red Queen."

Her rather abrupt departure (giving two weeks notice) was announced on Dec. 11, 2008, on the day that Boeing announced its fourth delay to its 787. Although a "retirement" she was only 58. As the leader of Boeing's Integral Enterprise Architect, her departure can be interpreted as a further disintegration of Boeing's Enterprise Architecture.

⁹¹⁹ Blog posted by "Mel", on Flightblogger, 10 July 2009 in "Commentary: Its Time for Boeing to Talk. To Itself" (Jon Ostrower). ⁹²⁰ Quote from "The Red Queen" in Carroll, L. (1871).

6.14.1.13 *Airbus* (1970): Founding (enterprise co-option and integration)

"American industry spills out across the world primarily because of the energy released by the American corporation. [This is a] highly organized economic system based on large units, financed and guided by national governments. Most striking of all is the strategic character of American industrial penetration. One by one, U.S. corporations capture those sectors of the economy with the highest growth rates."⁹²¹

European sentiment in the late 1960's was driven to emulate what it assessed as the driving success behind American industrial dominance: integrated corporate and national interests (Servan-Schreiber, 1967), or portions of an integrated enterprise architecture. It was in this spirit that *Airbus Industrie* was formally founded in December, 1970.

"Airbus was a 'groupement d'intérêt économique', a form of commercial partnership established in French law in the mid-1960's, which was mainly intended to help wine growers. A GIE, as it is known, is a flexible and user-friendly form of corporate structure, although it tends to baffle Anglo-Saxons – and Americans in particular – used to the rigid structure of the limited company. A GIE is not a company, and escapes many of the obligations of a company. For example, it does not have to pay taxes, unless it chooses to do so. It simply pools the capital contributed by its members, and its results are taken out of the books of its member companies in proportion to their share of the enterprise."⁹²²

Airbus Industrie was initially founded as a "groupement d'intérêt éonomique" (GIE), a flexible "corporate" structure that co-opts the stakeholder environment (Selznick, 1948). One of the key architectural features of this enterprise was the function-sharing of the stakeholders: e.g. the governments (i.e. political markets) served as investors (i.e. capital providers). The suppliers also served as the capital markets as well as securing access to customer markets.

"Beteille [CEO] was serious in his desire to widen the Airbus consortium...it was crucial to get as many of the European powers involved with Airbus as possible. Only as a strong, united European force could the consortium be a success. A sure way of increasing sales was to rope more countries into the consortium. Negotiations with the Spanish in 1971 showed how fruitful this could be."⁹²³

6.14.1.14 *Airbus* (1974-77): Strategy (low cost & financing, stable production)

"The A300 was not a very innovative plane in terms of aeronautical engineering, and was never intended to be; in terms of financial engineering, however (like all subsequent Airbus planes), it was one of the most innovative machines ever built. It was competing mainly against the DC-10 and the Lockheed L-1011 Tristar, but it was much smaller than both, and cheaper. Boeing was too wrapped up in the 747 to consider that section of the market, and Douglas too involved in the DC-10, and both thought it too small a market to be of much interest."⁹²⁴

Airbus started out offering only a single product, the A300, aimed at a very narrow and relatively unattractive niche in the market. Competing against the other modular enterprise architectures of *Boeing*, *McDonnell Douglas* and *Lockheed*, which offered "higher-faster-farther" products,

⁹²¹ From Servan-Schreiber (1967), quoted in Lynn, M. (1997), pg. 103.

⁹²² Lynn, M. (1997), pg. 113.

⁹²³ Lynn, M. (1997), pp. 111 and 115-116.

⁹²⁴ Lynn, M. (1997), pp. 110, 115 and 121.

Airbus offered a "better-faster-cheaper" product to over-served customers like *Eastern Airlines*. In addition, *Airbus* offered innovative low risk, low cost financing. And finally, *Airbus* kept long-term stable production in the absence of short-term demand.

"The months wore on without any new orders. And planes were still being produced. It was during that year that the term "whitetails" became part of the industry jargon."⁹²⁵

6.14.1.15 *Airbus* (2000-01): Public Flotation (owner-manager dis-integration)

"The German [industrial] side accepted the large French [state] shareholding very reluctantly. In announcing the agreement at the time [2000], the other EADS co-chairman, Manfred Bischoff, who was also chief executive at DASA, described the concession to the French [state] as 'the toad that we had to swallow' to create EADS."⁹²⁶

The creation of *Airbus's* parent organization, the *European Aeronautic Defense and Space Company (EADS)* as a publicly listed company in 2000 was the product of industrial and political compromise between French, German and Spanish business and governments. The decomposition of ownership of *EADS* was as follows:

- Dutch Law "Contractual Partnership" (65.5% stake in EADS)
 - 30% by the French holding company, SOGEADE
 - 15% by the Lagardère Group
 - original owner of Matra, now the merged Aérospatiale Matra
 - 15% by the French state
 - former owner of Aérospatiale
 - 30% by German "interests"
 - 30% by the German company, *DaimlerChrysler*
 - owner of DASA Aerospace division
 - o 5.5% by the Spanish state holding company, SEPI
 - owner of Construcciones Aeronáuticas, CASA
- European Stock Markets free float (34.5% stake in *EADS*)

"'Some people consider today [2006] that this pact doesn't give enough power to the [French] state because I remind you that in this pact, concluded in 2000, it was the industrial shareholders, Lagardère and DaimlerChrysler, who assumed operational control, 'Mr. Breton [the French finance minister] said. 'The state was there to only validate strategic options.'"⁹²⁷

"'Today, the French state only has an advisory role,' he [a spokesman for Lagardère, Jean-Pierre Joulin] said."⁹²⁸

⁹²⁵ Lynn, M. (1997), pg. 118.

⁹²⁶ Clark, N. "France Seeks More Control of Airbus Parent," International Herald Tribune, June 20, 2006.

⁹²⁷ Clark, N. "France Seeks More Control of Airbus Parent," International Herald Tribune, June 20, 2006.

⁹²⁸ Clark, N. "France Seeks More Control of Airbus Parent," International Herald Tribune, June 20, 2006.

Soon after the formation of *EADS* in 2000, *Airbus* became a single fully integrated company in 2001, incorporated under French law as a simplified joint stock company or Société par Actions Simplifiée (S.A.S.). Its relatively concentrated ownership had the following composition, which is summarized in Figure 273 below:

- EADS (80% stake in Airbus)
- BAE Systems (20% stake in Airbus)

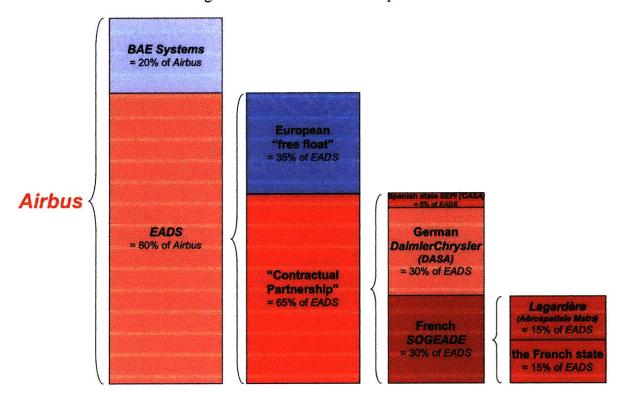

Figure 273: Airbus' "ownership" in 2001

6.14.1.16 Airbus (2001): Shareholders and the Response to 9-11

Just as *Airbus* had dis-integrated its capital stakeholder, a severe exogenous shock placed demands on the new enterprise. One might conjecture that having myopic shareholders would drive *Airbus* to make significant downsizings to reflect the downturn in the airline industry as a result of 9-11. However, unlike *Boeing* which did downsize immediately after 9-11, *Airbus* did not. This *may* serve as an indication of the relative patience of the capital-providers of *Airbus* vis a vis *Boeing*.

6.14.1.17 Airbus (2006): Evolutionary Diffusion of "Ownership"

Six years after the creation of *EADS* in 2000 and the public flotation of *Airbus* in 2001, the ownership of *Airbus* began to become slightly more diffuse, with sell-offs both from *EADS* and from *BAE Systems*.

6.14.1.17.1 Russian State Banks buy *EADS* shares

In September 2006, the Russian state-controlled bank, *Vneshtorgbank (VTB)* purchased a 5% stake in EADS from the available free float. Although it did not get a seat on the board of directors, it did seek to formalize industrial partnerships, for example the conversion of A320 passenger aircraft into cargo planes.⁹²⁹

Over one year later, after VTB was privatized, its investors began to complain that the EADS shares were losing value.⁹³⁰ In response, VTB sold its shares to another state-owned bank, Russia's Bank of Development.

6.14.1.17.2 BAE Systems sells shares to EADS

On October 13, 2006, *BAE Systems* sold off its 20% stake in *Airbus* to *EADS*, giving *EADS* 100% ownership of *Airbus*. The reason that *BAE Systems* gave for its sale of *Airbus*, was that it wanted to focus on it core business of defense, particularly on future potnential acquisitions in the US defense market. It is noteworthy that *BAE Systems* only received an estimated 50% of the value of their stake due to short-medium term valuation reductions due to problems with the A380.

"'The fact that BAE is selling its stake should not come as a surprise' Gustav Humbert, the chief executive of Airbus, said last week. 'This is a business decision, not an industrial one.' Its departure could be transformational for Airbus, which is seeing its ownership – and decision making – structure evolve."⁹³¹

The architectural differences in *Airbus*' two shareholders (*EADS* and *BAE Systems*) is evident, and these differences transcend national boundaries, where the UK's *BAE Systems* took a relatively short-term, arm's length approach to *Airbus*, while the French/German/Spanish *EADS* took a relatively long-term, collaborative approach to investment in *Airbus UK*. It was *EADS* of continental Europe which invested over the long term in developing UK capabilities, not the UK's *BAE Systems*:

"[Roger Berry]: 'Do you think that BAE Systems sold out on the future of UK civil aerospace?' [lain Gray, Managing Director, Airbus UK]: 'BAE Systems had a strategy which was progressively to move out of civil aerospace... They were an arm's length shareholder. Over the last five years we have

⁹²⁹ Approximately one year later, *VTB* explored selling its stake ("Russian Bank Exploring Sell of EADS Stake", *International Hearald Tribune*, July 11, 2007).

⁹³⁰ Robertson, D. "VTB Sells EADS Stake to Another Russian Bank," The Times, December 28, 2007.

⁹³¹ Clark, N. "BAE Turns Toward U.S. as it Ends Airbus Ties," International Herald Tribune, May 24, 2006.

seen significant investments coming into Filton and Broughton [UK] through EADS's commitment to Airbus.'"932

"[Lindsay Hoyle]: 'Do you think the [EADS] board would allow a [future] partnership with BAE in composite technology?' [Iain Gray, Managing Director, Airbus UK]: 'I would not envisage that being the outcome. I do acknowledge that BAE Systems are a supplier to Airbus.'"⁹³³

6.14.1.17.3 Dubai International buys EADS shares

Dubai Internaional Capital LLC bought 3.12% of *EADS*' free float shares on July 5, 2007. The move could be interpreted as a form of backward integration, as *Dubai International* owns *Emirates Airlines*, the largest customer for *Airbus*' A380. They, however have no plans to take a board seat or an active role at *EADS*.

"'They clearly have their interpretation of where the business is going,' said Harry Breach, an analyst with JP Morgan in London. 'They see material upside in the long term.'"⁹³⁴

6.14.1.17.4 Future Posssible Diversification

6.14.1.17.4.1 German Bank, KfW to buy half of Daimler/Chrysler's stake

When *Daimler/Chrysler* sells half of its stake, the German government (initially through its development bank *KfW*, or even through the Hamburg city government) is rumored to purchase it.

6.14.1.17.4.2 French Government to buy half of Lagardère stake

When *Lagardère* sells half of its stake, the French government is rumored to purchase it, leaving the following owernship structure in place.

"'EADS is starting to go from being a **minority** floated company to a **majority** floated company,' Aboulafia said. 'That ultimately changes your **comportment**.'"⁹³⁵

⁹³² "Recent Developments with Airbus," Uncorrected transcript of oral evidence to be published as HC427-i, UK Parliament, House of Commons, Trade and Industry Committee, March 27, 2007.

⁹³⁵ Clark, N. "BAE Turns Toward U.S. as it Ends Airbus Ties," International Herald Tribune, May 24, 2006.

- Dutch Law "Contractual Partnership" (reduced to 50.5% stake in EADS)
 - o 22.5% (reduced by 7.5%) by the French holding company, SOGEADE
 - 7.5% by the Lagardère Group (sells 7.5%)
 - original owner of Matra, now the merged Aérospatiale Matra
 - 15% by the French state
 - former owner of Aérospatiale
 - o 22.5% (reduced by 7.5%) by German "interests"
 - 15% by the German company, DaimlerChrysler (sells 7.5%)
 - owner of DASA Aerospace division
 - 7.5% by the German bank, *KfW* (buys 7.5% from *DaimlerChrysler*?)
 - o 5.5% (unchanged) by the Spanish state holding company, SEPI
 - owner of Construcciones Aeronáuticas, CASA
- European Stock Markets free float (49.5% stake in EADS)
 - o 5% by Russian State Bank, VTB (then to the Russian Development Bank)
 - o 3.1% by Dubai International Capital LLC

This new ownership structure is summarized in Figure 274 below.

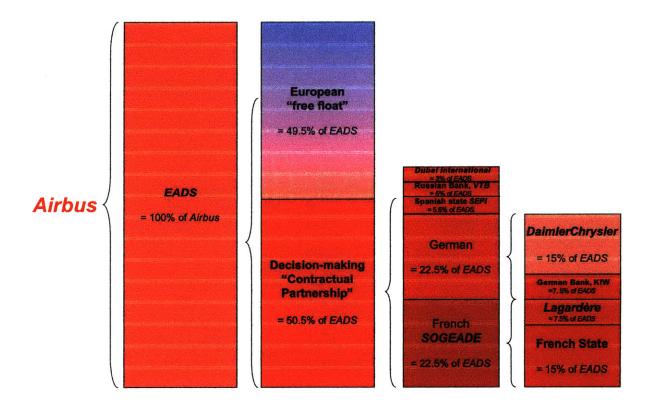

Figure 274: Airbus' "ownership" in 2007

6.14.1.18 Airbus (2006): CEO transitions

In the wake of announced production delays on the A380 in the summer of 2006, *Airbus* CEO Noel Forgeard resigned. Christian Humbert, the first German *Airbus* CEO took over, and resigned one year later in July 2006.

Christian Streiff took over and proposed significant structural changes to *Airbus* within his first few months in control, which included a rebalancing of work and power within the delicately-balanced political consortium. The *EADS* board did not support his recommendations and after only 100 days on the job, he resigned.

"I progressively came to the conviction that the governance of Airbus did not allow my plan to succeed."⁹³⁶

Streiff was succeeded as *Airbus* CEO by *EADS* co-chair, Louis Gallois who occupied both jobs. Gallois is a Frenchman with significant experience in French aerospace industry (formerly with both *Aerospatiale* and *SNECMA*).

Streiff apparently tried to use conventional firm-bounded logic to transition *Airbus* away from its core strength as a world-class political-economic enterprise into a "rational" profit-maximizing firm. His stakeholder ecosystem apparently rejected his efforts to "rationalize" or narrow down the boundaries of the enterprise too much too soon. In our parlance, *Airbus's* integral enterprise architecture (with its strong enterprise stability) resisted attempts to dis-integrate too rapidly, and rejected its "modularizing" architect.

The theory predicts that enterprises disintegrate over time (which *Airbus* and *Boeing* both appear to be doing). The point of question seems to be the rate at which this will happen for *Airbus*. The data seems to continue to support the view that *Airbus'* disintegration will continue at a slower rate than would be expected by a modular incumbent. Does *Airbus* have (short-term) *efficiency* problems? Certainly. Are they abandoning their (long-term) *effectiveness* platform to solve these problems? Apparently not. Gallois appears to be a more natural integral architect, and his dual-appointment as CEO of both *Airbus* and *EADS* appears to be a return to the integrality that made *Airbus* successful.

Certain elements of the popular business press were beginning to observe the differences between Streiff and Gallois as "architects", and the resulting success.

"Considering that Airbus, before its latest difficulties, managed to become number one in the industry suggests that there is nothing wrong with the model. If anything, it has become a **template for success**. In short, for such a model to work, you need a **skilful architect** who has all the plans in his head, knows what needs to be done, and can keep politics and meddling shareholders out of the factory."⁹³⁷

In July 2007, *EADS* ended the bi-national management structure that it began with at its inception: dual French and German CEOs as well as chairmen, in an effort to streamline

⁹³⁶ Reuters, Monday, October 9, 2006.

⁹³⁷ Financial Times, October 12, 2006.

decision making. Frenchman, Lois Gallois went from being *EADS* co-CEO (with German, Thomas Enders) and *Airbus* CEO, to *EADS*' sole CEO, while Enders gave up his *EADS* co-CEO job to become the sole *Airbus* CEO. Finally, German Ruediger Grube became the sole *EADS* chairman.

6.14.1.19 *Airbus* (2007): Supply Chain Restructuring

The new CEO, Louis Gallois moved to restructure *Airbus*' production facilities in order to improve cost-competitiveness in the "Power 8" program. This included the proposed sale of a number of internal factories, "layoffs" (or hiring freezes) and the increase in risk-sharing partnerships. The proposal resulted in "tensions" between France and Germany as well as between management and labor. Former *Airbus* chief Jean Pierson expressed his concerns as well as his confidence in this new architect:

"This system cannot continue. EADS is a company which is up against the wall. I cannot see who will agree to make concessions. This Franco-German rivalry cannot continue, this environment is noxious and the system ungovernable... "I am not familiar with the current cost cutting plan, but I know [Airbus chief executive] Louis Gallois. I do not doubt that this plan will be both serious and reasonable in industrial and social terms and that it will also be balanced."⁹³⁸

In response to Gallois' balanced proposal, German Chancellor Angela Merkel and French President Jacques Chirac came to an agreement:

"The competitiveness of Airbus is the most important factor in the company's restructuring, German Chancellor Angela Merkel said on Friday. 'The competitiveness of the company is the top priority for us.""⁹³⁹

While such measures appear to be a drastic dis-integration or modularization of the firm-supplier link, closer inspection reveals a much more slow and modest dis-integration. The announced "layoffs" were in reality more akin to "announced attrition" – something unheard of in Liberal Market Economies. The "strikes", while new to *Airbus*, were different in both quantity and quality to those experienced in modular enterprise architectures like *Boeing*. Instead of lasting continuously for weeks or months, they were organized as a series of one-hour walkouts staged every few weeks. The integral nature of labor and capital was exercised with "voice" used over "exit" (Hirshman, 1970).

Similarly, capital remained "patient", with major partner investors sharing negative "rents" with the ecosystem:

"Lagardere recently reported a 57% drop in 2006 profit, due largely to the poor performance of its 7.5% stake in EADS. Chief executive Arnauld Lagardère, who also co-chairs EADS, also ruled out the sale of the company's stake in EADS when announcing his annual results. 'I will play my role and I want to carry on being part of EADS's growth,' he told Le Monde. So concerned was Lagardère that he vowed to return any upcoming dividend back to the company. 'The Airbus situation has affected everyone, the

⁹³⁸ Former Airbus chief, Jean Pierson, in Les Echos, Thursday 22 February 2007.

⁹³⁹ Reuters, February 23, 2007.

employees above all, but also the shareholders and the small investors who have suffered from the drop in shares, 'he said." 940

Finally, with regards to outsourcing major work to "risk-sharing" partners as *Boeing* had "pioneered" on its new 787 program, *Airbus* began to pursue a similar strategy, albeit at a much more measured pace:

"It is not exactly Boeing but it is radically different. It's about halfway to Boeing and that is pretty radical for Airbus."."^{994]}

Although *EADS* looked to sell some of its assets to the US's *Spirit Aerosystems*, it decided at the last minute to sell UK plants to *GKN*, a UK firm; German plants to *OHB Technology Aerospace*, a German firm; and French plants to *Latecoere*, a French firm.

"In the end, we just couldn't close a business case that met both our customer requirements and our shareholder requirements."⁹⁴²

"The three partners had better offers commercially and technically, were more aggressive than Spirit in the last round of negotiations. Politics had no influence." "943

6.14.2 Example: Automotive Industry

Figure 275 below, illustrates the evolution of dominant designs in enterprise architectues in the automobile industry.

Figure 275: Evolution of Dominant Designs in Enterprise Architectures in the Automobile Industry

6.14.2.1 General Motors (1916): Incorporation

The General Motors Corporation was incorporated in 1916, succeeding the General Motors Company.

6.14.2.2 General Motors (1926): Vertical Integration of Fisher Body

The classic textbook case study for vertical integration to reduce opportunistic "hold-up" is *General Motor's* 1926 acquisition of one of its auto body suppliers, *Fisher Body* (Klein, Crawford and Alchian, 1978).

The case has created alternate viewpoints, however in that vertical integration can in fact create, not reduce, hold-up (Freeland, 2000); and that vertical integration was simply done to improve coordination, not reduce opportunism (Casadesus-Masanell and Spulber, 2000).

6.14.2.3 General Motors (1999): Vertical Dis-integration of Delphi

In 1999, *General Motors* spun off its internal parts manufacturer, *Delphi*, which is *GM's* chief supplier, and the largest U.S. auto parts supplier. *Delphi* struggled since it was spun off and ultimately filed for bankruptcy less than six years later in 2005.

In a related move, *Ford* spun off its internal parts manufacturer, *Visteon* in 2000. It, too struggled on its own, with *Ford* still accounting for 70% of its business, it filed for bankruptcy in 2005.

6.14.2.4 General Motors (2005): Vertical "Re-integration" of Delphi

As both *GM* and *Ford* struggled to revive their critical parts suppliers which included important contract renegotiations from the United Auto Workers labor unions, *Ford's* CFO clearly stated the resolve of the modular enterprise architecture:

"Our goal is to approach a true arms-length relationship with Visteon."944

Recent data suggests that investors are interested in taking over these former internal suppliers from public to private equity settings.

6.14.2.5 Daimler & BMW (1994-2007): Acquitision & Divestiture of Rivals

In addition to the above examples of the divestiture of internal divisions from modular enterprise architectures, there is also evidence of acquisition and immediate divestiture of rival OEMs in the cases of *Daimler-Chrysler* and *BMW-Rover*.

"Bayerische Motoren Werke AG, experienced a serious cash shortage in 1999 following the disastrous acquisition of the British carmaker Rover Group Ltd. five years earlier... CEO Joachim Milberg responded to the crisis by selling off the loss-making Rover and Land Rover units and refocusing the company's core business of producing and marketing premium cars."⁹⁴⁵

"DaimlerChrysler moved to undo the **most expensive** and one of the **least successful mergers** in auto industry history Monday as it agreed to essentially **pay to dump** the money-losing Chrysler unit which it paid \$37 billion for nine years ago. A private investment firm like Cerberus will provide management with the opportunity to focus on their long-term plans rather than the pressures of shortterm earnings expectations."⁹⁴⁶

6.14.2.6 General Motors (2008-9): Becomes No. 2 & Bankruptcy Protection

After approximately 90 years dominating the global automobile market, *General Motors* finally ceded its number one position to the late entrant *Toyota*.

⁹⁴⁴ "Ford to Take Back 24 Ailing Visteon Plants", Dee-Ann Durbin, Associated Press, May 26, 2005.

⁹⁴⁵ Raisch and Krogh (2007), pg. 69.

⁹⁴⁶ CNN.com May14, 2007, "Daimler pays to dump Chrysler".

Soon thereafter, *General Motors* found it very difficult to weather the global financial crisis of 2008-2009 and sought bankruptcy protection. In an effort to save the company from bankruptcy, the highly modular and disintegrating enterprise architecture attempted a radical attempt at "re-integration" when two unlikely shareholders, the US Government and the United Auto Workers union became some of the largest investors.⁹⁴⁷ While the *structure* of this move may appear to be a move toward integrality, the *function* of this new stakeholder set re-configuration may not necessarily be integral or long-term, trust-based.

6.14.2.7 Toyota (1937): Founding through Organic Diversification

In August, 1937 Toyota Motor Co. Ltd. was established as an internal or organic diversification away from Toyoda Automatic Loom Works, Ltd.

6.14.2.8 Toyota (1949): Spin-off of Nippondenso (value chain dis-integration)

While GM and Ford spun-off their largest internal parts divisions (a.k.a. Delphi and Visteon) in 1999, Toyota made a similar move literally 50 years earlier, by spinning-off Nippondenso (now Denso) in 1949.

"Denso began life as a spin-off division of Toyota in 1949, and over time grew into one of the largest auto-parts manufacturers in the world."948

Toyota however, maintained a significant equity stake in Denso, which in 1999 it was 25%.

6.14.2.9 Toyota (1950): Recession, Lay-offs, Strikes, Bankruptcy & Bailout

"The resulting **recession**, however, led many large firms to **reduce their work force** and produced bitter labor confrontations. The three dominant truck producers Toyota, Nissan, and Isuzu – all underwent **strikes**. Toyota faced **bankruptcy** due to **inventory mismanagement**, until it was **bailed out** by Bank of Japan."⁹⁴⁹

In 1950, after the post-war recession, *Toyota Motor Corporation Ltd.* fired approximately one quarter of its workforce. The resulting strikes, led to near-bankruptcy and a bank bail-out. A precondition of this bail-out was the separation of sales from its production operations, by creating the *Toyota Motor Sales Co. Ltd.*

6.14.2.10 Toyota (1982): Reintegration of Sales and Operations Companies

In 1982, after 32 years of forced separation between sales and production functions, *Toyota* reintegrated these companies into the new *Toyota Motor Corporation*.

6.14.2.11 *Toyota* (1988): Vertical Integration in Auto Electronics

⁹⁴⁷ I am indebted to Charlie Fine, for pointing out this fact.

⁹⁴⁸ Smitka, M.J. (1990), pg. 165..

⁹⁴⁹ Smitka, M.J. (1990), pg. 165..

Having apparently vertically disintegrated in automotive electronics in 1949, by spinning off *Nippondenso*, *Toyota* reintegrated in auto electronics in 1988, not by inorganically repurchasing the world-leading *Denso*, but by organically opening its Hirose plant, which is the location of four electrical engineering divisions.

At a time when *GM* and *Ford* were disintegrating or considering selling off it internal parts divisions, *Toyota* appeared to be on the opposite trajectory. Researchers have posited theoretical explanations for this architectural move, by synthesizing governance-based transaction cost economics explanations with learning based explanations (Ahmadjian and Lincoln, 2001).

6.14.2.12 Toyota (1995-99): Vertical Integration with Daihatsu

In 1995, *Toyota* increased its equity stake in *Daihatsu* from 17% to 33%, and again in 1999 to 50%, making it a legal subsidiary (Ahmadjian and Lincoln, 2001).

6.14.2.13 Toyota (2008): First Annual Loss

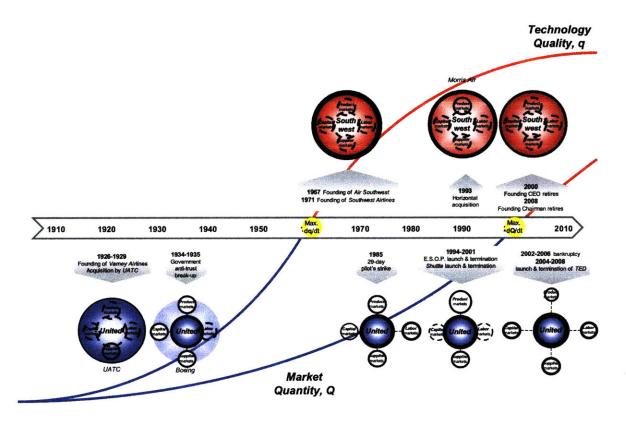

In 2009, *Toyota* recorded it first annual loss for 2008 in 71 years amid the global financial crisis. Note that this exogenous event, which affected all auto manufacturers seemed to negatively impact *Toyota's* modular competitors (e.g. *General Motors* and *Chrysler*) more severely as they not only reported massive losses, they were forced to seek bankruptcy protection and/or merger possibilities.⁹⁵⁰

⁹⁵⁰ Fiat proposed a takeover of Chrysler as well as the purchase of General Motor's European brands.

6.14.3 Example: Airline Industry

The following chronicles the evolutionary trajectories of two enterprise architectures: an incumbent, *United Airlines*⁹⁵¹, and a challenger, *Southwest Airlines*⁹⁵², as shown in Figure 276 below.

Figure 276: Evolution of Dominant Designs in Enterprise Architectures in the US Airline Industry

6.14.3.1 United Airlines (1928-30): Pre-founding (value chain integration)

In 1928, Boeing Airplane - Transport Corporation (BATC) is incorporated in Delaware and acquires Boeing Air Transport (BAT), Pacific Air Transport (PAT), and the Boeing Airplane Company (BAC) as subsidiaries.

In 1929, BATC subsequently changes its name to United Aircraft and Transport Corporation (UATC), and it acquires other subsidiaries, including Pratt & Whitney Aircraft, Hamilton Standard Propeller Company. and Chance Vought Corporation.

⁹⁵¹ Much historical information on United Airlines was obtained from its website: www.united.com.

⁹⁵² Much historical information on Southwest Airlines was obtained from its website: www.southwest.com.

In 1930, UATC acquires National Air Transport (NAT) and Varney Airlines.

6.14.3.2 United Airlines (1931): Founding (value chain dis-integration)

United Air Lines Incorporated (UAL) is incorporated as a management corporation to coordinate operations of UATCs airline subsidiaries.

6.14.3.3 United Airlines (1931): Formation of Labor Unions

A few days after the official incorporation of UAL, pilots organize the *Air Line Pilots Association* (ALPA), which affiliates with the *American Federation of Labor* (AFL). The airline industry's first labor agreement with pilots is signed Oct. 8, 1940.

6.14.3.4 United Airlines (1975-85): Labor Strikes (labor dis-integration)

In 1975, IAM-affiliated mechanics and related crafts employees stage 16-day strike at *United*. Four years later, in 1979, the same organizations stage a 58-day strike at *United*.

In 1985, members of the Air Line Pilots Association (ALPA) stage a 29-day (six-week) strike at United. Members of the Association of Flight Attendants (AFA) stage a sympathy walkout.

6.14.3.5 United Airlines (1994): ESOP (attempted re-integration)

(Lowenstein, 2002).

6.14.3.6 United Airlines (2001): Bankruptcy (dis-integration)

6.14.3.7 United Airlines (2003): Launch of Ted (inorganic diversification)

In an attempt to compete with *Southwest Airline's* low cost model, *United Airlines* created a low cost airline, *Ted* within it corporate boundaries. While it attempted to mimic many of *Southwest's* features, it did not replicate *Southwest's* underlying integral enterprise architecture, and was unsustainable.

6.14.3.8 Southwest Airlines (1971): Founding

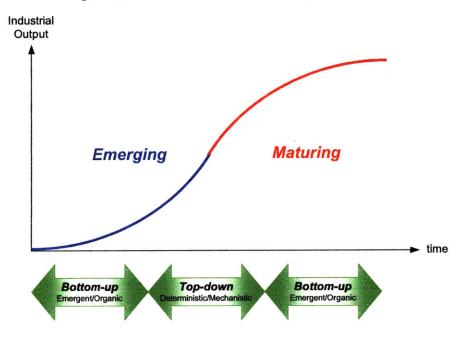

6.14.3.9 Southwest Airlines (2001): Response to 9-11

6.14.3.10 Southwest Airlines (2008): Quarterly Losses

6.15 Evolution of Architecting Processes

"A pure top-down process cannot succeed in the early phases of a technology or industry. Thus as technologies mature, the active choices are pushed lower and lower, ultimately to the component level."⁹⁵³

The process of system architecting evolves over time to suit the demands of the environment. As shown in Figure 277 below, the process switches from a bottom-up process in the early phases of an industry to a top-down process in the middle phases of an industry, and finally back to a bottom-up process, or more explicitly whereby the top-down architecting enables bottom-up process.

⁹⁵³ Whitney et al. (2004), pg. 4.

6.15.1 Enterprise Architectural States (Fit) and Paths (Change)

6.15.1.1 Enterprise Architectural Fit⁹⁵⁴

"The ultimate object of design is form. The form is the solution to the problem; the context defines the problem. Fitness of the system is the degree to which the system and its context are 'mutually acceptable'."⁹⁵⁵

From this construct, the co-evolution of firm and industry architectural dynamics can be developed. It is here that the framework closes the feedback loop whereby the dynamics of the enterprise architecture can be seen to have "fit" with the environmental dynamics. This architectural notion of enterprise-environmental fit is well understood in classical architectural theory (Alexander, 1964).

In addition, this notion of fit is seen to be a source of competitive advantage (Powell, 1992), as was made influential by the organizational contingency theorists (Burns and Stalker, 1961; Lawrence and Lorsch, 1967). The *consonance hypothesis* is stated as follows:

"Those organizations that have structures that more closely match the requirements of the environment are more effective than those that do not."⁹⁵⁶

In fact, as Stinchcombe (1965) famously observed, there are long-term, path-dependent, lock-in effects associated with the firm's "birth". The environmental imprint on the firm at the time of its founding encodes a form of DNA that has a lasting influence on the structure of the firm. This begins to explain the structural inertia associated with firms in the evolution of industries.

It is in this way that architectural fit can be seen as a meta-strategic framework which mediates between the external competitive positioning view of strategy and its counterpart, the internal resource-based view of strategy.

Heuristic 3f:

The enterprise architectural forms will grow and prosper in different industrial competitive regimes, where they have better growth-fit characteristics. Modular enterprise architectures will grow and prosper in pre-dominant design regimes, where competition is based on *discontinuous radical product* innovation (a.k.a. "higher, faster, farther" regime). Integral enterprise architectures will grow and prosper in post-dominant design regimes, (populated by shake-out survivor modular architectures) where competition is now based on *continuous incremental process* innovation (a.k.a. "better, faster, cheaper" regime).

"In the later developing states there was, often, a much readier sponsorship accorded to approved associations who were thereafter co-optated, in the case of labour unions, brought into the corporate structure of the sector or firm (Loveridge, 1983). Thus what is seen as the more tightly socially

⁹⁵⁴ In Organizational Behavior, the notion of "fit" has surfaced primarily in *structural contingency* theory and *complexity* theory (e.g. "fitness" landscapes).

⁹⁵⁵ Alexander, C. (1964), pp. 15 and 19.

⁹⁵⁶ Pfeffer (1982). pg. 148.

integrated systems of later developing national business systems has much to do with the management of the process of institutionalization."⁹⁵⁷

Heuristic 3g (advanced refinement):

The enterprise architectural forms will grow and prosper in different industrial competitive regimes, where they have better growth-fit characteristics. Integral enterprise architectures will grow and prosper where industry rates of growth are relatively slow and stable, where competitive capabilities center on *exploration* and competition is based on *innovation* in product (and ultimately process). On the contrary, modular enterprise architectures will grow and prosper where industry rates of growth are relatively fast and unstable, where competitive capabilities center on *exploration*.

Heuristic 3h:

The two types of technological change which facilitate the conditions for integral enterprise architectures are: the emergence of a discontinuous technological change in which integrality is needed for *product* innovation, and the emergence of a dominant product design in which integrality is needed for *process* innovation.

Heuristic 3i:

The successful birth rate of integral architectures post-dominant design is dependent on the clockspeed of the industrial development. As integral architectures tend to take existing markets in a low-cost, high quality world, via a strategy based upon human capitalism, based on stability in order to deliver continuous improvement, some industries may evolve too quickly to allow for stability to be a viable mechanism. In other words, Schumpeter's "winds of creative destruction" may be too rapid and frequent for human capitalism to take hold.

Heuristic 3j:

There is an optimum rate of firm growth that is contingent upon where in the industrial evolution cycle the firm operates. The optimum growth rate is governed either by the competitive dynamics associated with building of capacity or the growing of capability. For the predominant design regime, the optimum rate of growth is near the fastest possible, while for the post-dominant design regime, the optimum rate of growth is significantly slower than the maximum possible.

"As to what is the maximum efficient rate... a too rapid expansion will introduce so many disharmonious elements that efficiency will be destroyed."⁹⁵⁸

*"Virtually all natural systems including organizations have intrinsically optimal rates of growth, which is far less than the fastest possible."*⁹⁵⁹

"The Toyota Production System can be realized only when all the workers become tortoises. Speed is meaningless without continuity. Just remember the tortoise and the hare".⁹⁶⁰

⁹⁵⁷ Loveridge, R. (2003).

⁹⁵⁸ Robinson (1932).

⁹⁵⁹ Senge, P. (1990), pg. 62.

⁹⁶⁰ Ohno, T. (1978), pg. 63

Heuristic 3k:

The enterprise's structural dynamics (growth vs. stability), judged within the context of the environment or industry's structural dynamics will contribute to the mechanism defining long-term financial performance of the firm.

"Perhaps the most **ubiquitous force** leading to structural change is a **change in the long-run industry** growth rate. Industry growth is a key variable in determining the **intensity of rivalry** in the industry and it sets the pace of expansion required to maintain share, thereby influencing the supply and demand balance and the inducement the industry offers new entrants."⁹⁶¹

"In a high-growth period, productivity can be raised by anyone. But how many can attain it during the more difficult circumstances induced by low-growth rate? This is the deciding factor in the success or failure of an enterprise." ⁹⁶²

Finally, it is worth noting that some research exists to challenge the notion of contingent fit as a source of organizational efficiency. Nickerson and Zenger (2002), for example observe that "being efficiently fickle" via modulation between centralization and decentralization, can in some instances lead to higher efficiencies – independent of what the environment dictates. The logic of such apparent oscillatory "fickleness" appears to lie in the physics of control theory, namely the presence of a balancing loop with delays.

⁹⁶¹ Porter, M.E. (1980), pg. 164.

⁹⁶² Ohno, T. (1978), pg. 114.

6.15.1.2 Enterprise Architectural Change

There are two distinct mechanisms for architectural change in the face of environmental change: managerial *adaptation* or environmental *selection*. The degree to which each mechanism governs the change process is defined by the amount of *architectural inertia* within the organization or enterprise. Each change process will be discussed in turn.

"Theories typically placed in the adaptational camp include contingency theory (Woodward 1965, Lawrence & Lorsch 1967), resource dependence theory (Pfeffer & Salancik 1978, Burt 1983, 1992), institutional theory (Meyer & Rowan 1977, DiMaggio & Powell 1983), and transaction cost economics (Williamson 1975, 1985). Theories residing in [the selection camp] include organizational ecology (Hannan & Freeman 1977, 1989) and, on occasion, evolutionary economics (Nelson & Winter 1982)." 963

6.15.1.2.1 (Managerial) Adaptation

As the enterprise architecture both enables and constrains but does not determine action, there is room for both the mechanisms of managerial adaptation as well as environmental selection. This research intends to present a balanced explanation for which mechanisms govern and when.

Managerial adaptation is underpinned by the notions of free-will (Burrell and Morgan, 1979), strategic choice and strategic renewal (Volberda and Lewin, 2003). The change process theories that underpin it are those that are *predictive*, e.g. life-cycle and teleological (van de Ven, 1992).

"I agree with the main content of your research. My difficulty has more to do with the **slightly fatalist** tone of the work. I understand what you are trying to do, but it is hard for me to accept the **determinism** of the blue-red duality. Then again, my perspective is tainted with the **engineering mindset of being able to fix anything if you try hard enough**. Yes, you have to make tough decisions, and you have to approach the problem from a systems perspective on many fronts at the same time, you have to dismantle old value systems, and attack cultural problems, and realign incentives, and have an integrated strategy that considers all major stakeholders and you need a good plan to implement it, but I still think you can do it. It is very difficult, but I don't think it is impossible. **Maybe I'm being overly optimistic...**" ⁹⁶⁴

Throughout the process of creating the grounded theory in this proposed framework, constructive criticism frequently came back from the knowledge co-creators that (some presentations of) the framework came across as too fatalistic and deterministic, that it understated the power of management. These viewpoints were very valuable in the creation of the theory, and the proponents tended to have similar backgrounds: relative inexperience with leading in large, complex enterprises, and relatively little exposure to the theories of structural inertia of the environmental schools.

This framework does not intend to understate the power of human agency, but in fact to do the opposite; that is to state that such adaptation, while rare is very possible, but it requires a very special and rare type of leadership – *architectural* leadership.

⁹⁶³ Barnett and Carroll, 1995, g. 218.

⁹⁶⁴ Critique of framework from MIT PhD student. Received via email on 18 May 2006.

6.15.1.2.1.1 Re-integration to Fight or for Flight?

When faced with a maturing industry, is it easier/better for an incumbent to stay and fight by reintegrating itself around *process* innovation in order to fit more with the new evolving demands of the environment or is it easier/better to take flight by re-integrating itself around new *product* innovation? An example of the former might be *Chrysler* in the early 1990's under the direction of Thomas Stallkamp in which re-integrated supplier networks around quality, cost and delivery metrics brought new success (Dyer, 2000), while an example of the latter might be *IBM* in the 1990's under the direction of Lou Gerstner in which a re-integration around services took place (Gerstner, 2002).⁹⁶⁵

In either case, re-integration of a modular (and dis-integrating) enterprise is not straightforward, as it often appears to require the re-building of trust with existing stakeholders, which is often harder than new integral enterprise starting from scratch.

6.15.1.2.1.2 Dis-integration to Fight or for Flight?

Finally, is it easier/better for a modular incumbent in a maturing industry to continue to disintegrate and either: stay and fight by "integrating" competitors via consolidation or is it easier/better to take flight by continuing to exploit and "diversify" and re-deploy capital (i.e. to exit)? As was discussed earlier, post-dominant design dis-integrating enterprises are successful when they consolidate as opposed to diversify.

6.15.1.2.2 (Environmental) Selection

Environmental selection is underpinned by the notions of determinism (Burrell and Morgan, 1979). The change process theories that underpin it are those that are *explanatory*, e.g. dialectic and evolutionary (van de Ven, 1992).

⁹⁶⁵ I am indebted to Prof. Charlie Fine for suggesting these to me, and for his own development of these hypotheses in his own research.

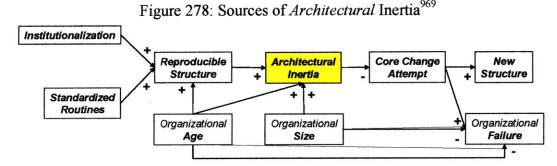

6.15.1.3 Enterprise Inertia Part II: Architectural Inertia

"Grant me the serenity to accept the things I cannot change, the courage to change the things I can, and the wisdom to know the difference."⁹⁶⁶

"Wisdom is the ability to see the long-run consequences of current actions, the willingness to sacrifice short-run gains for long-run benefits, and the ability to control what is controllable and not to fret over what is not. Therefore the essence of wisdom is the concern for the future. It is not the type of concern with the future that the fortune teller has; he only tries to predict it. The wise man tries to control it." ⁹⁶⁷

The notion of organizational inertia is well-established in the fields of sociology and organizational behavior (Hannan and Freeman, 1984). It accounts for the reason that there is a time delay in an organization's ability to adapt to *environmental* change. For this reason, the framework adopted herein refers to *architectural* inertia.

As shown in Figure 278 below, architectural inertia, as asserted by the population ecologists is a function of a number of organization attributes, including: age, size and reproducible structure (which is derived from institutionalization and standardized routines).⁹⁶⁸

Although the notion of inertia was derived over 300 years ago in the physical sciences, in that setting, mass or inertia was typically seen as a constant in most problems of physics. In an organizational setting, inertia is a function of organization age (as shown above), and is therefore not a constant but variable with respect to time. This makes the dynamic equations of motion coupled and therefore nonlinear.

Architectural inertia constrains timely evolution of enterprises in response to environmental shifts. As shown in Figure 279 below, architectural inertia presents difficulty for modular enterprises which are post-dominant design and competing with integral enterprises; as well as for integral enterprises which face the discontinuity of creative destruction.

⁹⁶⁶ Attributed to Boethius, 5th century Roman philosopher.

⁹⁶⁷ Ackoff, R. (1999). pg. 99.

⁹⁶⁸ Kelly and Amburgy (1991).

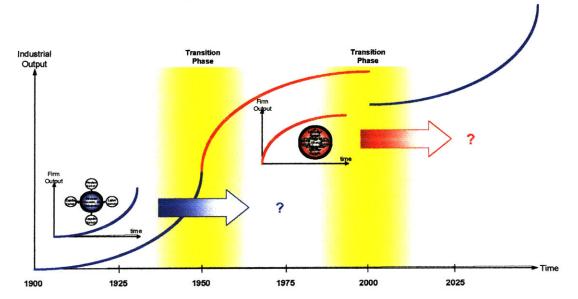

⁹⁶⁹ Kelly and Amburgy (1991).

Architectural inertia impacts the nature and importance of strategy as the firm evolves over time. In other words, is architectural inertia low enough that strategic choice is possible, or is it high enough that environmental pressures dominate?

Heuristic 31:

Dominant designs in enterprise architectures grow unchallenged for most of the industry lifecycle, acquiring architectural inertia, before a new architectural form emerges, making it very difficult to change its form.

As each enterprise architectural form typifies the initiation of a particular competitive regime (e.g. modular architectures initiate discontinuities and dominate until the establishment of a dominant product design, while integral architectures dominate once the dominant design is established until the next discontinuity is created⁹⁷⁰), it will have a significant amount of time to age (i.e. approximately half the duration of the industry S-curve) to grow architectural inertia, making it very difficult to change when a new enterprise architecture is created.

Heuristic 3m:

Enterprise architectures that become out-of-fit with their environments, do not rapidly adjust and can continue to exist (albeit in a less competitive state) long after the emergence of a dominant design or a technological discontinuity due to architectural inertia.

⁹⁷⁰ At this stage, the discussion assumes a two-stage modular-integral evolution, as opposed to the three-stage form discussed later.

Architectural inertia, while seemingly a function of organization age and size, have different subdeterminants depending upon whether they are modular or integral.

Modular enterprise architectures are highly flexible and adaptable to environmental change due to their modular "plug-and-play" interfaces with stakeholders. However architectural inertia grows over time due to their age, size and routine development.

Heuristic 3n:

Modular enterprise architectures develop architectural inertia over time due to age, size and routine development, in spite of their inherent flexible, adaptable design.

Integral enterprise architectures are highly inflexible to environmental change due to their high commitment to stakeholders around a specific environmental regime (e.g. a stable, saturated market). From architectural design theory, integral architecture forms are highly optimized to minimize risk and uncertainty in the external environment.

Heuristic 30:

Integral enterprise architectures also develop architectural inertia over time due to age, size and routine development, which supplements their inherent inflexible environment-specific form.

"Integrated structures reduce a system's flexibility and ability to adapt to environmental changes thus increasing architectural inertia." 971

Heuristic 3p:

As the nature of technological discontinuities tends to consist of large, rare, discrete stepchanges, the "loading function" on the enterprise tends to be a pulse, in the spirit of Shumpeter's "creative destruction."⁹⁷²

Finally, using the theory developed thus far, one can begin to explain why change often does not occur, even long after the environment has begun to change. Do managers not see the environmental change? Do they see it, but the inertia is too high making change very slow?

If modular enterprise architectures are built to thrive in growing environments, and integral enterprise architectures are built to thrive in a less munificent environments, why do modular architectures continue to pursue their strategies long after the inflection of the environment? The answer may lie (at least for dynamically complex industries, which exhibit significant "boom and bust" cycles) in the fact that although the underlying "signal" of the S-curve has long saturated, there is a second mode "boom and bust" oscillation that is superimposed on the saturated market (i.e. "noise").

In other words, even though the commercial airplane market (with its current 10-year "boom and bust" cycle) may have started to saturate fifty years ago, *Boeing* is still modular because every five years there is a tremendous growth opportunity. Modular architectures built for rapid

⁹⁷¹ Eytan Lasry (University of Toronto, working paper).

⁹⁷² The enterprise response spectra therefore tend to be *shock spectra*, Piepenbrock, T. (2004).

growth stay modular, because rapid growth opportunities still exist as shown schematically in Figure 280 below.

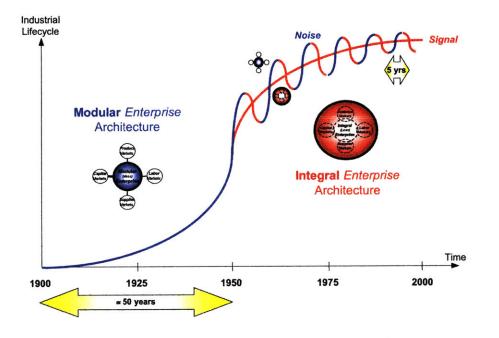

Figure 280: Cyclical Growth Spurts in a Maturing Industry Inhibit Architectural Change

6.15.1.4 Punctuated Architectural Change: Exploration and Exploitation

Tushman and Romanelli (1985) argued that punctuated organizational change will occur if the following three conditions are present:

- The pressure to change is high (i.e. poor performance).
- The ability to change is high (i.e. low structural inertia).
- Environmental misfit is perceived (i.e. visionary leadership).

Sastry (1997) developed a formal system dynamics model of these punctuated change processes which has been modified as shown in Figure 281 below to adapt to the framework.

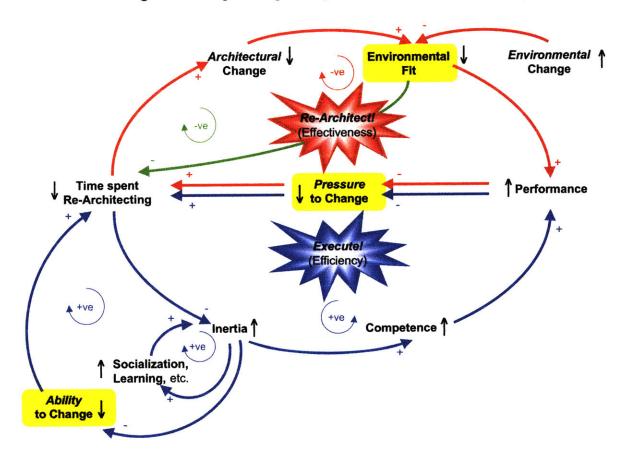

Figure 281: Exploit-Explore Dynamics of Architectural Change

From this figure, one can see the competing dynamics of change in the face of poor performance as being either:

- Execute faster and harder (bottom reinforcing loop).
- Realign to achieve environmental fit (top balancing loop).

When not facing poor performance, these mechanisms can translate into the well-known mechanisms of *exploitation* and *exploration*.

As can be seen, time spent executing builds inertia, which prevents future change if/when the environment changes. Therefore, the best way to "dissolve" the inertia or at least keep the effects of inertia at bay is to continuously take frequent but incremental forays up into the top balancing loop (mapping out a figure eight around the causal loops) to ensure fit and/or to explore. This appears to be what *Toyota* has done well. This may also explain how modular enterprise architectures which tend toward short-term exploitation, grow significant structural inertia, making the infrequent attempts at architectural change less successful.

In addition, if there are time delays in determining and implementing architectural change in response to environmental change, this will result in a worse-before-better tradeoff and oscillation due to the existence of delays on a balancing loop, which again is a problem associated with modular enterprise architectures.

6.15.2 Profiles in Courage: Why Re-Integration is Difficult

"This book is about that most admirable of human virtues – courage. 'Grace under pressure,' Ernest Hemmingway defined it. And these are the stories of the pressures experienced by eight United States Senators and the grace with which they endured them – the risks to their careers, the unpopularity of their courses, the defamation of their characters, and sometimes, but sadly only sometimes, the vindication of their reputations and their principles.

These problems do not even concern politics alone – for the same basic choice of courage or compliance continually faces us all, whether we fear the anger of constituents, friends, a board of directors or our union, whenever we stand against the flow of opinion on strongly contested issues. A man does what he must – in spite of personal consequences, in spite of obstacles and dangers and pressures – and that is the basis of all human morality.

To be courageous, these stories make clear, requires **no exceptional qualifications, no magic** formula, no special combination of time, place and circumstance. The stories of past courage can define that ingredient – they can teach, they can offer hope, thay can provide inspiration. But they can not supply courage itself. For this each man must look into his own soul."⁹⁷³

"Few men are willing to brave the **disapproval** of their fellows, the **censure** of their colleagues, the **wrath** of their society. **Moral courage is a rarer commodity than** bravery in battle or **great intelligence**. Yet it is the one essential, vital quality for those who seek to change a world which yields most painfully to change."⁹⁷⁴

Based on thousand of hours of interviews and ethnographic observation with the top management teams in the primary case study, one of the striking constructs which emerged from coding and analysis of the data, is that of "courage."

"If I understand what you are speaking about, you are likely to find [in your research] that the key to our transformation is **courage** – which is a rare commodity [in our company] these days – and I wish you the best of luck."⁹⁷⁵

"How dare you insult me - of course we know this [research] is correct! The reason we don't implement it is that we **don't have the courage to**!"⁹⁷⁶

"Between the *idea* and the *reality*, between the *conception* and the *creation*, falls the *shadow*. This is the way the world ends; Not with a *bang* but a *whimper*."⁹⁷⁷

There are many examples in the theoretical sample of unsustained re-integration attempts. In the automotive industry: the establishment of Saturn with General Motors; Thomas Stallkamp's re-integration of supplier relationships at Chrysler (Dyer, 2000). In the airline industry, the Employee Stock Ownership Program at United Airlines (Lowensiten, 2002). In the commercial airplanes industry, Carolyn Corvi's re-integration of *Boeing Commercial Airplanes*.

6.16 Chapter Summary

This chapter was the third of three essays which forms an integrated framework which attempts to explain long-term firm performance. In this chapter, we defined the construct of industrial evolution, and how it co-evolves with the performance of firms.

The context for this construct within the framework is shown below in Figure 282. Going back to Essay #1, we can now begin to see how different enterprise architectures are born or created in different states of the environment or industrial evolution.

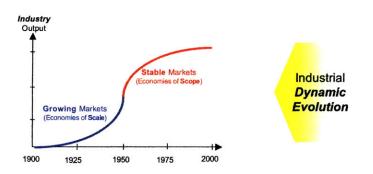

Figure 282: Enterprise - Environment Evolution and Co-Evolution within Framework

Part III: INTEGRATING THE THEORY

Chapter 7 Mathematical Model and Numerical Simulation

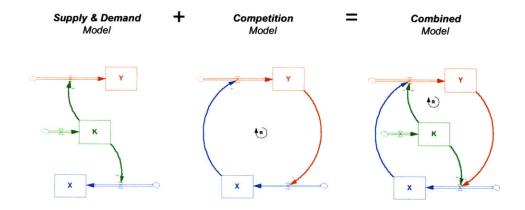

Equations of Motion. The evolution of business ecosystems will be expressed formally by a system of *coupled simultaneous nonlinear* differential equations,⁹⁷⁸ where the state variables, X_n are stocks which accumulate net flows (dX_n/dt) over time.

$$\begin{split} dX_1/dt &= f_1(X_1, X_2, ..., X_n) \\ dX_2/dt &= f_2(X_1, X_2, ..., X_n) \\ & \cdot \\ dX_n/dt &= f_n(X_1, X_2, ..., X_n) \end{split}$$

Note that such equations form a feedback system that generates system dynamics endogenously, via information from the various state variables, which feed back to influence their own rates of change.⁹⁷⁹ When formulating these equations of motion, we aim for parsimony, i.e. the least amount of causal structure to explain the most salient features of the dynamic behavior of the evolution of business ecosystems.⁹⁸⁰ Clearly more detailed models can (and eventually hopefully will) add more precise insights into this dynamic phenomena.

Conceptual Formulation. The combined model represents a predator-prey interaction, with two firm "predators" in interspecies competition for a market "prey" evolving into two niches. The organization-environment ecosystem model will consist of four primary state variables. The market environment K will be represented in the two dimensions of quantity (i.e. the state of *diffusion*) and quality (i.e. the state of *commoditization*). The competitive environment will be represented in two dimensions represented in the two dimensions of early entrant "market-maker" X and later entrant "market-taker" Y. The basic ecological interactions between organization and environment are shown in Figure 283 below.

Figure 283: Constituent Elements of Conceptual Model

⁹⁷⁸ In the traditions of the general system theory (e.g. Von Bertalanffy, 1950), cybernetics (e.g. Ashby, 1952), system dynamics (e.g. Forrester, 1961); as well as organizational ecology (e.g. Hannan and Freeman, 1977).

⁹⁷⁹ System dynamics has been used for many years to model firm competition - See Appendix G for a brief summary. Most formulations are made with operational managerial decisions, while this research uses a higher-level ecological system formulation.

First, we present a model of supply and demand interaction. Most theories of the firm are unsurprisingly firm-centric and take the product/service offering as representing "supply" to a market of customers representing "demand". This ecosystem model focuses its lens on the carrying capacity of the market as representing "supply" of revenues to a market of competing firms representing "demand" for that revenue. Crucially, by allowing the market K to vary over time in terms of amount and type of product/service demanded/supplied, we lay the theoretical foundations for the emergence of heterogeneous competing organizational species X and Y. Note that the market K size (a stock) positively affects the growth rates (flows) of the competitors.

Second, we present a model of inter-species competition. Here we note simply that in a market of finite carrying capacity, one firm's amount of market, say X (a stock), negatively impacts or reduces the growth rate of its competitor's (a flow), in what is known in the ecological sciences as "exploitation" (as opposed to) "interference" competition. This simple formulation endogenously links the competitor organizations with their environment in closed-loop feedback. Unlike the classic Lotka-Volterra predator-prey equations in which the closed loop is negative or balancing generating oscillations, here the feedback is positive or reinforcing, resulting in the unstable "principle of competitive exclusion." We seek however, a nonlinear parametization of the model which will enable the inter-species dominance-switching observed empirically.

Model Build-Up. In the following sections, the model will be constructed progressively, each time adding a higher level of sophistication in order to more clearly understand the underlying assumptions, parameters, structure and behavior of the model at each stage of complexity.⁹⁸¹ The following partial models will be analyzed and discussed sequentially:

Section 7.1	 <i>Constant</i> (Unchanging) Market <i>Intra</i>-species Competition in a Constant Market <i>Inter</i>-species Competition in a Constant Market
Section 7.2	 <i>Diffusing</i> Market (Quantity) <i>Intra</i>-species Competition in a Diffusing Market <i>Inter</i>-species Competition in a Diffusing Market
Section 7.3	 <i>Commoditizing</i> Market (Quality) <i>Intra</i>-species Competition in a Commoditizing Market <i>Inter</i>-species "Competition" in a Commoditizing Market
Section 7.4	 <i>Diffusing, Commoditizing</i> Market (Quantity and Quality) <i>Intra</i>-species Competition in a Diffusing, Commoditizing Market <i>Inter</i>-species Competition in a Diffusing, Commoditizing Market
Section 7.5	 Advanced Topics <i>Firm</i>-sector Topics <i>Market</i>-sector Topics

⁹⁸⁰ Although the mathematical notation used in this chapter is slightly modified from that used in the Executive Summary at the beginning of this document, the underlying structure and dynamics remain unchanged.

⁹⁸¹ I would like to thank Ventana Systems Inc., for the generous use of their dyamic simulation software, Vensim,

7.1 Competition in a Constant (Unchanging) Market Environment

7.1.1 Single Firm Growth in an Infinite Market

First, we assume a monopolist operating under increasing returns to scale. This assumption captures a variety of business phenomena including economies of scale, learning curve effects, etc. Under this reinforcing feedback, the more market the firm accumulates, the faster it continues to be accumulated.

Second, we assume initially that the firm exists in a market of unlimited growth potential – unlimited carrying capacity. The firm then is able to grow at its maximum fractional rate, r which is assumed to be constant and is determined by a number of goals and constraints which might include the rate of return on residual cash flows promised to risk bearers.⁹⁸²

Most models in organizational ecology focus on population size or density - expressed as number of organizations - as the primary state variable, which accumulates net flows of organizational entries and exits (e.g. Hannan and Freeman, 1977). Population size is of lower importance in these formulations. This paper however focuses instead on organizational size as approximated by the amount of environmental resources an organization accumulates, or more specifically in the case of business ecosystems, the amount of a market a firm possesses. In this way, a population could consist of a spectrum of organizations ranging from a large number of equally sized firms, each possessing the same percentage of the total market; to a single firm operating as a monopolist possessing the entire market. We will derive equations of motion for a firm accumulating market, X over time.⁹⁸³

The following differential equation captures this simple reinforcing feedback:

$$dX/dt = AR_X = r_X X \tag{1}$$

Where:

- X = firm X's acquired market
- dX/dt = the rate of change of firm X's market acquisition
- $AR_X = \text{firm X's acquisition rate of market (the inflow into X)}$
- $r_X = firm X$'s maximum fractional acquisition rate of market

Constants. The model has one active "constant", r_X which is undoubtedly a time-dependent variable. This will be enforced in the next formulation.

⁹⁸² This is actually the fractional net growth rate, and has the units of percent of market growth per unit of time.

⁹⁸³ For the present discussion, we assume that the firm converts demand into supply instantaneously or without any delays associated with order backlogs, inventory backlogs etc. Such delays in a balancing loop can account for cyclical oscillatory behavior. As the time horizon of interest in this evolutionary research is measured in centuries, the oscillations which manifest themselves over timeframes of decades are of secondary importance.

Figure 284 below illustrates the causal structure⁹⁸⁴ of this *linear* first-order formulation, which results in unrestrained exponential growth of the firm's market acquisition.

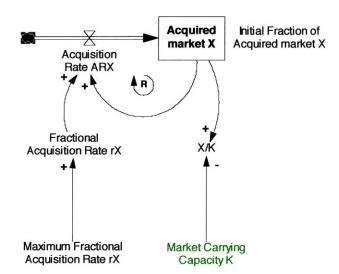

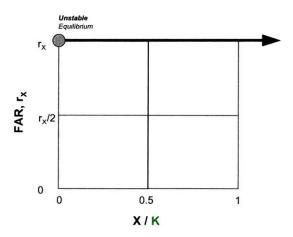

Figure 284: Model Structure of Single Firm Growth in an Infinite Market

Figure 285 below shows the relationship between the firm's Fractional Acquisition Rate, r_X and the amount of the available market that it has taken. In this simple model of the firm, r_X is assumed to be constant and independent of the market availability.

Figure 285: Fractional Acquisition Rate of Firm in an Infinite Market

Organisms and organizations which maintain a constant r_X are known as "opportunist" species or r-strategists (Brittain and Freeman, 1980) that build – or take – ecosystems at high rates of growth and then exit them once the underlying growth opportunities diminish to find new opportunities in other ecosystems.

⁹⁸⁴ In the diagrammatic representations of the differential equations, the "box" variables represent stocks or accumulations, while the variables below the "valves" represent rates or flows in and out of the stocks.

A firm starting out in a new ecosystem or market with constant r_x exists in an unstable equilibrium and exhibits unsustainable exponential growth that ultimately exceeds the carrying capacity of the ecosystem. The dynamic behaviour of such a firm is illustrated in Figure 286 below.

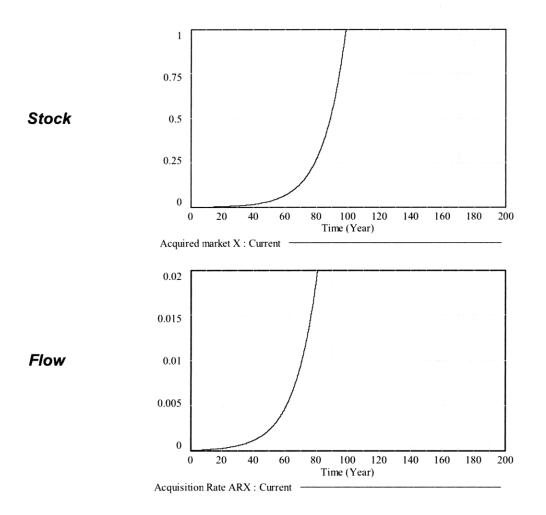

Figure 286: Dynamic Behavior of a Single Firm in an Infinite Market

One can either view this formulation as firm growth in an unlimited market, or as the early growth of a firm in a finite market, when its accumulated quantity of market, X is far from the carrying capacity of the market. What happens to this firm as it approaches the carrying capacity of the ecosystem will be covered in the subsequent section.

7.1.2 Single Firm Growth in a Constant, Finfite Market

As no firm exists in an infinitely rich resource environment, we next constrain the model by imposing finite but constant market carrying capacity, K, which might represent the size of population of potential customers or sales. The model now needs another feedback, this time a balancing loop which enables the firm growth to begin to slow down as it approaches the ecosystem's carrying capacity.

We therefore extend the previous differential equations to capture the mode-switching from reinforcing to balancing feedback as the firm approaches the carrying capacity of the market. This new logistic equation is shown below:⁹⁸⁵

$$dX/dt = AR_X = r_X X (1 - X/K)$$

$$= r_X X - r_X X^2/K$$
(2)

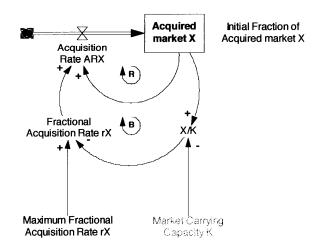

Where:

• K = the market carrying capacity of the ecosystem⁹⁸⁶

Constants. The model has two "constants", K and r_X which are undoubtedly time-dependent variables. For example, exogenous factors influencing the market carrying capacity K are consumer population size and wealth per capita, both time-dependent variables. A firm's maximum fractional acquisition rate r_X is also influenced by exogenous factors like stakeholder goals, resource access, etc. each of which may also be time-dependent variables.

Figure 287 below illustrates the causal structure of this *linear* first-order formulation, which results in logistic growth of the firm's market acquisision. Note that since there is only in inflow to the stock of Acquired market X (which is controlled by both reinforcing and balancing loops) the value of the stock can only ever increase.

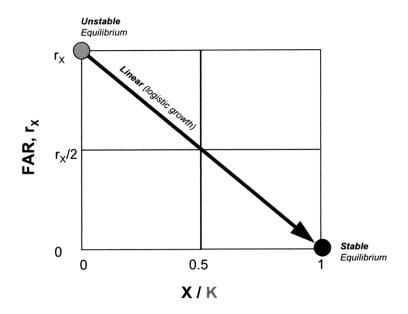

Figure 287: Model Structure of Single Firm Growth in a Constant Market

⁹⁸⁵ This was first formulated in social systems by Verhulst (1838) in his logistic population growth model.

Figure 288 below shows the relationship between the firm's Fractional Acquisition Rate, r_X and the amount of the available market that it has taken. In this simple model of the firm, r_X is assumed to vary linearly with the the market availability. The assumption here is that, as the firm acquires more of the finite market, K, the rate of firm growth, r_X begins to reduce linearly⁹⁸⁷, making the organization's rate of growth dependent upon the proportion of the carrying capacity that remains unexploited⁹⁸⁸.

Organisms and organizations which vary their underlying growth rate r_X in response to the market carrying capacity, K are known as "equilibrium" species or K-strategists (Brittain and Freeman, 1980) that build – or take – ecosystems at slower rates of growth and then await for other ecosystems to be built by r-strategists before they move into that new market.

A firm starting out in a new ecosystem or market with linearly declining r_x exists in an unstable equilibrium and exhibits logistic growth towards the carrying capacity of the ecosystem.

Figure 289 below illustrates the dynamic behavior of this *nonlinear* first-order formulation, which results in sigmoid or S-shaped growth of the firm's market capture.

⁹⁸⁶ Note: K need not be constant nor homogeneous. We will explore each in subsequent sections.

⁹⁸⁷ This linear relationship, which produces logistic growth, will be relaxed in subsequent sections which explore interspecies competition.

⁹⁸⁸ This is called "mass dependence" in the organizational ecology literature.

⁹⁸⁹ Note that the two axes of this figure represent the two exogenous factors in the model structure: the Maximum Fractional Acquisition Rate (vertical axis) and the amount of available market remaining (horizontal axis).

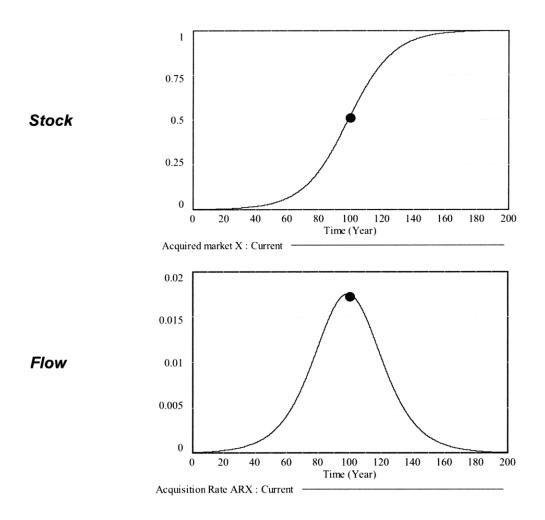

Figure 289: Dynamic Behavior of a Single Firm in a Constant Market

Note that *differentiation* of the stock (i.e. the slope of the line tangent to the curve), yields the flow or rate values, with the maximum rate (i.e. steepest slope) occurring at year 100. Conversely, note that *integration* of the flow (i.e. the area under the curve), yields the stock values, with the maximum stock occurring at year 200.

7.1.3 Intra-species Competition in a Constant Market⁹⁹⁰

In most markets, no firm exists without competition; we therefore need to next introduce competition between firms for customers in a common market. At this point, we assume two identical isomorphic competitors, X1 and X2 having homogeneous enterprise architectures occupying the same mathematical point niche. We therefore extend the previous differential equation (2) to account for the simple fact that the addition of sales to either competitor decreases the rate of growth of the other competitor.⁹⁹¹ Both competitors are now connected via a reinforcing loop that amplifies differences in market share resulting in an unstable equilibrium.⁹⁹² The new, coupled system of differential equations is shown below:⁹⁹³

$$dX_{1}/dt = AR_{X1} = r_{X1}X_{1} (1 - X_{1}/K - X_{2}\alpha_{12}/K)$$

$$= r_{X1}X_{1} - r_{X1}X_{1}^{2}/K - r_{X1}X_{1}X_{2}\alpha_{12}/K$$
(3a)

$$dX_{2}/dt = AR_{X2} = r_{X2}X_{2} (1 - X_{2}/K - X_{1}\alpha_{21}/K)$$

$$= r_{X2}X_{2} - r_{X2}X_{2}^{2}/K - r_{X2}X_{2}X_{1}\alpha_{21}/K$$
(3b)

Where:

- $\alpha_{12} = \text{firm } X_1$'s competition coefficient
- $\alpha_{21} = \text{firm } X_2$'s competition coefficient

The competition coefficient defines the intensity of competition. If firm X_1 competes directly in the same market or niche as firm X₂, then its competition coefficient $\alpha_{12} = 1$. This is the implicit assumption of the model formulation at this point. Later, we will explore the opposite case, where the competition coefficient $\alpha = 0$, that is competition in heterogeneous (commodifizing) market environments, in which niches develop that are suited to different species of organiztions.

Figure 290 below illustrates the causal structure of this nonlinear second-order formulation, which results in sigmoid or S-shaped growth of each competitor's market capture. Provided that both firms have identical forms and occupy the same market niche, no two-firm (or more generally, two-population) equilibrium can be stable - any exogenous shock to the system will result in the elimination of one of the firms (or populations).994

⁹⁹⁰ By definition, in *intra*-species competition each stock represents a firm (or collection of firms having similar growth rate characteristics) but not an entire species. ⁹⁹¹ In ecology, this is called "exploitation" (vs. "interference") competition (Brian, 1956). Other dynamic models

formulate competition using more operational variables (Sterman, Henderson, Beinhocker and Newman, 2007).

⁹⁹² This severe "winner-takes-all" competitive assumption is akin to Bertrand (price) competition, rather than the weaker form of Cournot (quantity) competition where the market is shared in proportion to relative firm growth rates. Under this assumption, the "competition coefficients", α_{12} and α_{21} equal 1.

⁹⁹³ This system of equations formed the basis for modeling competition within the seminal organizational ecology framework (Hannan and Freeman, 1977: 942). It is based on the classic Lotka-Volterra equations for competing populations, after Lotka (1925) and Volterra (1931). Note that this is different from the classic Lotka-Volterra equations for *predator-prey* populations which generate chaotic oscillation due to a central *balancing* loop. ⁹⁹⁴ This is known in ecosystem theory as the "principle of competitive exclusion" (Gause, 1934).

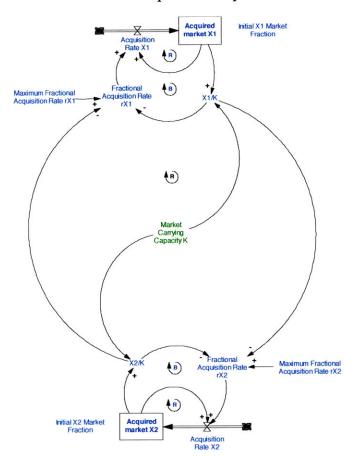

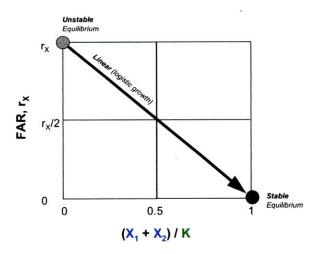

Figure 290: Model Structure of Intra-species Competition in a Constant Market⁹⁹⁵

Figure 291 below shows the relationship between the competing firms' Fractional Acquisition Rates, r_{X1} and r_{X2} and the amount of the available market that they have collectively taken.

Figure 291: Fractional Acquisition Rates of Competing Firms in a Constant Market

⁹⁹⁵ Note that the only exogenous variables are the maximum growth rates, These are a function of a variety of factors, as will be discussed in subsequent sections.

Figure 292 below illustrates the dynamic behavior of intra-species competition between homogeneous firms in a constant market. In this case, both firms unsurprisingly split the market 50%-50%. Their peak acquisition rates are also unsurprisingly half the acquisition rate of a monopolist. What might be surprising is that the peak aquisition rates of the competitors occurs before that of a single monopolist, due to the fact that each acquisition impacts both the firm and its competitor, i.e. the reinforcing loop that now links competitors.

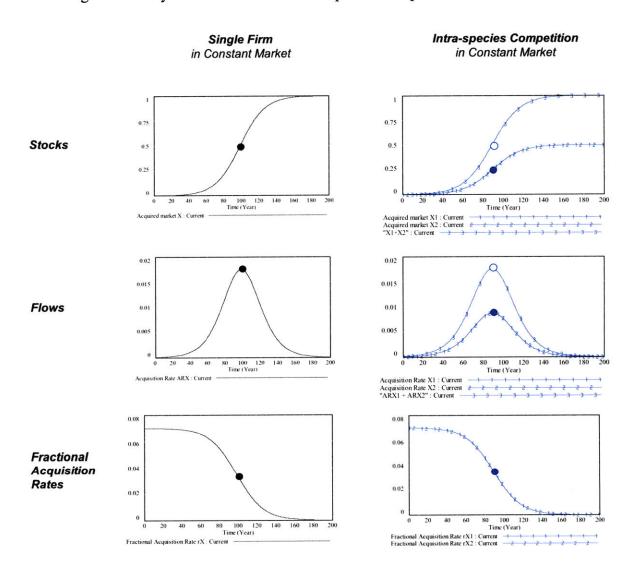

Figure 292: Dynamic Behavior of Intra-species Competition in a Constant Market

7.1.3.1 Parametric Study: Initial Conditions

Figure 293 below illustrates the dynamic behavior of intra-species competition between two firms having differing initial acquired markets – one firm having twice the initial acquired market than the other. This formulation assumes that both firms are equally efficient, however one firm has greater luck or initial endowments.

Here, a simple linear relationship exists between the initial endowment of a firm (as expressed by its initial acquired market) and its success. Specifically, a doubling of the initial fraction of acquired market, results in a doubling of the acquired market – here a 67% to 33% split of the acquired market.

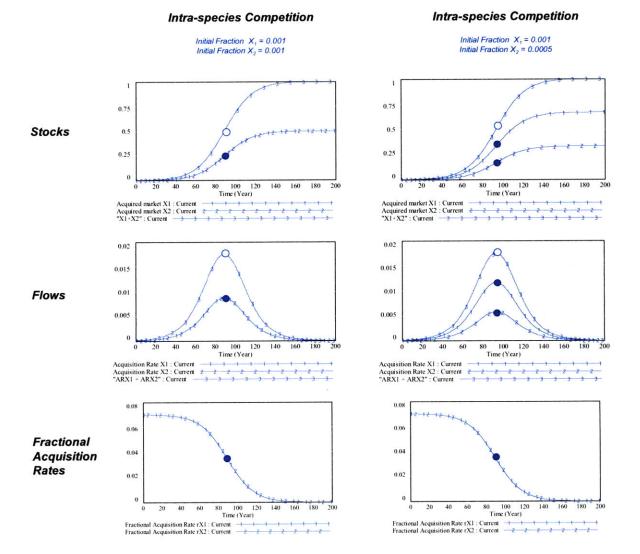

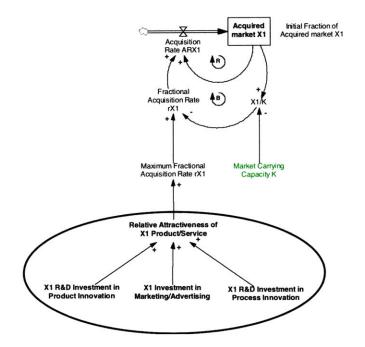

Figure 293: Dynamic Behavior of of Competing Initial Acquired Markets

7.1.3.2 Parametric Study: Fractional Acquisition Rates

Next, we explore intra-species competition between two firms having different efficiencies, which is reflected in their maximum fractional acquisition rate, capturing the relative attractiveness of a firm's products and services (see for example, Paich & Sterman, 1993). Although not explicitly part of the model presented herein, a number of operational factors can impact a firm's efficiency or maximum fractional acquisition rate, including its investment in R&D in product innovation, process innovation, or its investment in marketing/advertising as illustrated in Figure 294 below.

Figure 294: Model Structure of Relative Attractiveness of a Firm's Products/Services

The relationship between competing firm's fractional acquisition rates and their acquired market relative to the market carrying capacity is illustrated in Figure 295 below.

Figure 295: Fractional Acquistion Rates of Firms in Intra-species Competition

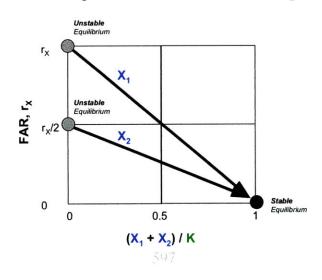

Figure 296 below illustrates the dynamic behavior of intra-species competition between two firms having differing fractional acquisition rates - one firm having twice the factional acquisition rate than the other. This formulation simply assumes that one firm is more efficient than the other.

Here, the *principle of competitive exclusion* operates, namely that a nonlinear relationship exists between the efficiency of a firm (as expressed by its maximum fractional acquisition rate) and its success. Specifically, a doubling of the maximum fractional acquisition rate, results in a greater than doubling of the acquired market – here a 95% to 5% split of the acquired market. What is slightly counter-intuitive, is that the slower, less-competitive firm peaks sooner than the faster, more-competitive firm.

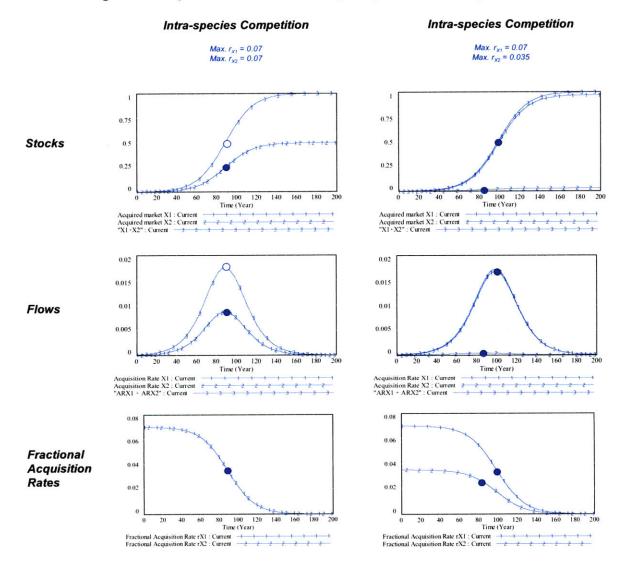

Figure 296: Dynamic Behavior of Competing Fractional Acquisition Rates

7.1.4 Inter-species Competition in a Constant Market

We will next cover the case of *inter*-species competition in a constant, unchanging environment. This case is weak theoretically because significant sustained environmental variation is required in order to produce and sustain significant variation in organizational species. Inter-species competition in a constant market could be a special parametric study when exploring interspecies competition in a logistic growth market, in which the market diffusion rate is much greater than the competitor growth rates.

The new, coupled system of differential equations is shown below:

$$dX/dt = AR_{X} = r_{X}X (1 - X/K - Y\alpha_{XY}/K)$$
(4a)
$$= r_{X}X - r_{X}X^{2}/K - r_{X}XY\alpha_{XY}/K$$
(4b)
$$= r_{Y}Y - r_{Y}Y^{2}/K - r_{Y}YX\alpha_{YX}/K$$
(4b)

The incumbent species, X which builds the market is known in bio-ecology as an *r-strategist*, and the late-entrant challenger species, Y which takes the market is known as a *K-strategist* (MacArthur and Wilson, 1967). The primary difference between this formulation and the previous, is that each competitor's fractional net growth rates are no longer linearly density-dependent, with the (*Modular*) *r-strategist* growing faster when the environment is experiencing rapid growth, and the (*Integral*) *K-strategist* growing faster when the environment's rate of growth is slowing down, as shown in Figure 297 below.

$$r_{X} > r_{Y} \text{ when } (X+Y) < K/2$$

$$r_{Y} < r_{Y} \text{ when } (X+Y) > K/2$$

$$(4c)$$

$$(4d)$$

Figure 297: Fractional Acquisition Rates of Firms in Inter-species Competition

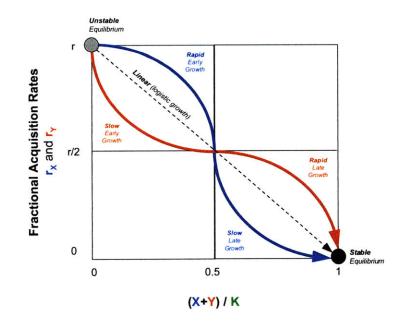

Figure 298 below illustrates the causal structure of this nonlinear second-order formulation, which results in *non-sigmoid* S-shaped growth of each competitor's market capture.

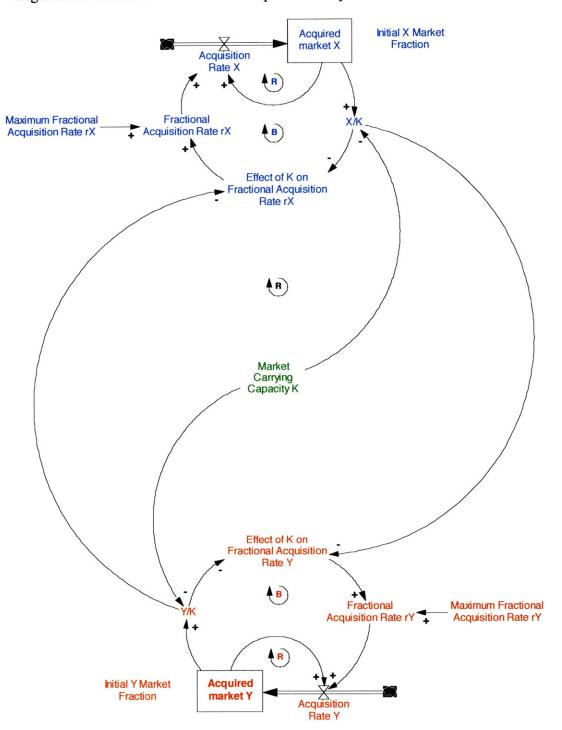

Figure 298: Model Structure of Inter-species Competition in a Constant Market

Figure 299 below illustrates the dynamic behavior of inter-species competition between heterogeneous firms in a constant market. First, note that the non-linear fractional acquisition rates result in non-logistic growth in the stocks and asymmetric flow diagrams. Second, note that their peak acquisition rates occur at different times, with X occurring before and Y occurring after the case of intra-species competition. Third, note that in spite of the fact that the maximum flow rates are different and occur at different times, the areas under the respective rate curves are similar, meaning that both firms ultimately split the market 50%-50%. Finally, note that X's factional acquisition rate time history is a *single* reverse S-curve which is steeper than the intra-species case, and that Y's factional acquisition rate time history is a *double* reverse S-curve.

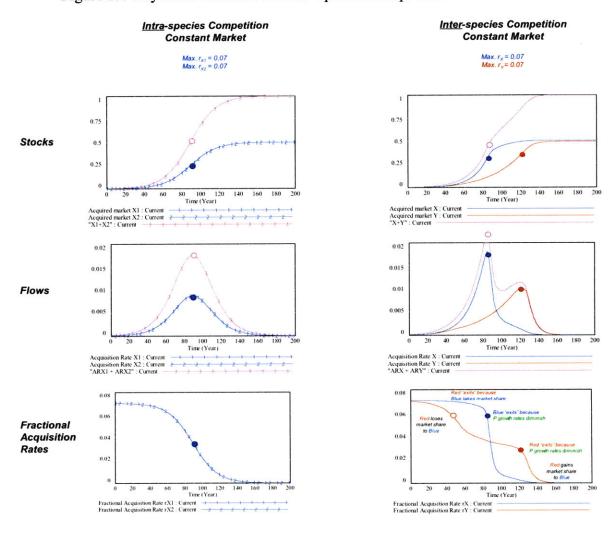

Figure 299: Dynamic Behavior of Inter-species Competition in a Constant Market

7.2 Competition in a Diffusing Market (Quantity)

7.2.1 Diffusing Market (Quantity)

Next, we relax the assumption of a constant carrying capacity of the market or resource environment, K (Brittain, 1994). Instead, we permit sigmoid growth as it approaches its own inherent carrying capacity.⁹⁹⁶ This assumption captures the scenario of a new product/service that either:

1) diffuses logistically throughout a constant population of potential consumers (Bass, 1969), or

2) diffuses instantaneously through a logistically-growing population of potential consumers (Verhulst, 1838), or

3) some combination of the two.

7.2.1.1 First-Order Two-Stock Logistic Growth

Previously, we modeled a firm's logistic growth with one stock and two loops, reinforcing and balancing. We now demonstrate that this structure can be represented more intuitively for a market as a two-stock, two-loop structure by introducing a complementary variable, the potential market, P.

The new, coupled system of differential equations is shown in its most simple form below:

	$dP/dt = -DR = -r_dA (1 - A/K)$	(5a)
noting $P = K - A$	$= -r_{d}PA/K$	
	$dA/dt = DR = r_dA (1 - A/K)$	(5b)
noting $P = K - A$	$= r_d PA/K$	

Where:

- P = potential market
- A = adopted market
- dP/dt = the rate of change of the potential market
- dA/dt = the rate of change of the adopted market
- DR = diffusion rate of market (the inflow into A, outflow from P)
- $r_d = maximum$ fractional diffusion rate of the market

The equivalence of these two market growth model structures is shown in Figure 300 below.⁹⁹⁷

⁹⁹⁶ For simplicity, we model a linear relationship between the diffusion rate and available carrying capacity, which results in logistic growth.

⁹⁹⁷ Note this model structure is the same as modeling *chronic* infectious diseases, where the susceptible population all eventually becomes infected – also known as the SI model. See Sterman (2000), pp. 300-301.

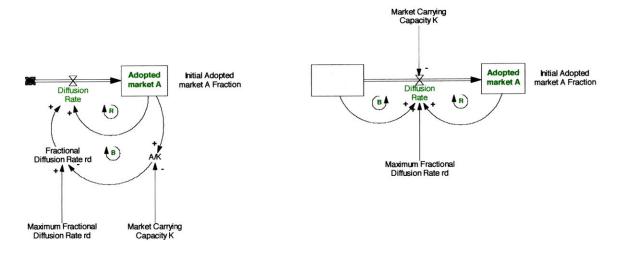

Figure 300: Equivalence of Logistic Market Growth Model Structures

7.2.1.2 Bass Industry Diffusion Model

Although the above model captures the basic diffusion of a technology, product or service into a market, it suffers from a subtle modeling problem, namely how does the dis-equilirium momentum get started? A simple way around the problem is to give the Adopted market A stock an initial positive value, which is shown above as the "Initial Adopted market A Fraction" and is formalized as a small fraction of the Carrying Capacity, K. While this mathematically solves the "start-up" problem, it implies that at time zero, there was already an existing diffused market, no matter how small.

A more appealing formal model of the start-up problem was used by Bass (1969), in which an additional balancing loop is used on the outflow from the Potential market P to initiate the model momentum. Bass conceived this operationally as an advertising function which generated market or product awareness. We add this additional structure to the model, with the new, coupled system of differential equations is shown in its most simple form below:

	$dP/dt = -DR = -r_dA (1 - A/K) + r_{ds}P$	(5c)
noting $P = K - A$	$= -(\mathbf{r}_{d}\mathbf{P}\mathbf{A}/\mathbf{K}+\mathbf{r}_{ds}\mathbf{P})$	

$$dA/dt = DR = r_d A (1 - A/K) + r_{ds} P$$
(5d)
noting P = K - A = r_d PA/K + r_{ds} P

Where:

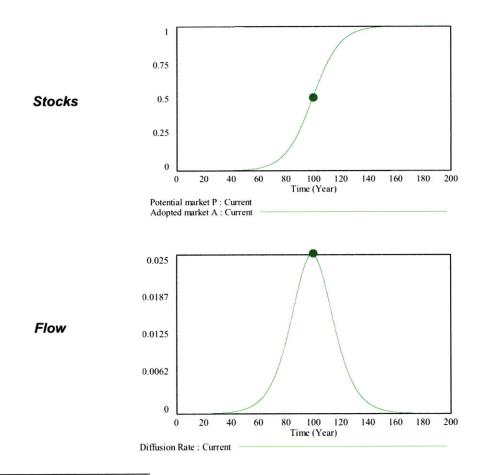

• r_{ds} = maximum fractional *start-up* rate of the diffusing market

The Bass diffusion model formulation is shown in Figure 301 below and compared with the previous diffusion model.

The Bass diffusion model is now applied not to individual products, but instead to aggregations of products or services at the industry level. The dynamic behavior of the Bass model is shown in Figure 302 below.⁹⁹⁸

Figure 302: The Dynamic Behavior of a Bass Industry Diffusion Model

⁹⁹⁸ Note: the diffusion rate is comprised of both components due to advertising and word of mouth. As the Fractional Diffusion Start-up Rate is so small, its effects (i.e. a declining logistic curve) are not visible on the figure above.

7.2.1.3 Bass Industry Diffusion Model with Replacements

The above industry diffusion model assumes that once a unit of market is captured, it remains captured (or adopted) forever. This implies that the market consists of durable goods, with an infinite product life.

In order to make the model more generalizable or more applicable to a wider range of products and services covering a continuum of average product lives, we introduce the notion of replacements to the Bass industry diffusion model.

The new structure of the model requires a new outflow from the Adopted market A back towards the Potential market P, in which a new balancing loop on the outflow which controls the replacement rate.⁹⁹⁹ The resulting behavior of this local structure is exponential decay.

The new, coupled system of differential equations is shown in its most simple form below:

$$dP/dt = RR - DR = A/L - (r_dA (1 - A/K) + r_{ds}P)$$
(5e)

$$= A/L - (r_dPA/K + r_{ds}P)$$
(5e)

$$dA/dt = DR - RR = (r_dA (1 - A/K) + r_{ds}P) - A/L$$
(5f)

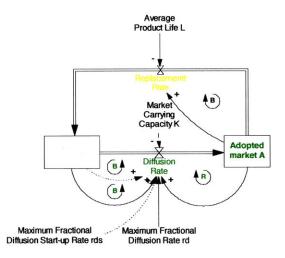

$$= (r_dPA/K + r_{ds}P) - A/L$$
(5f)

Where:

- RR = replacement rate of market (the inflow into P, outflow from A)
- L = Average product life

The industry diffusion model with replacements is shown in Figure 303 below.

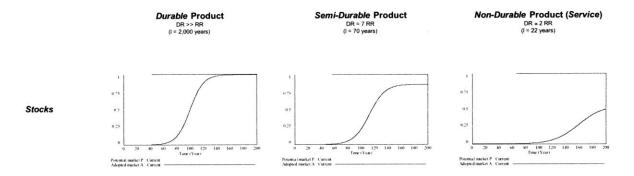

Figure 303: Bass Industry Diffusion Model with Replacements

⁹⁹⁹ Note, the primary model structure (two flows, three loops: balancing, reinforcing & balancing) is similar to the modeling of *acute* infectious diseases, where the susceptible population (Potential market P) can move to an infected state (Adopted market A) before they move towards a recovered state (Potential market P) – also known as the SIR model. See Sterman (2000), pg. 303.

Figure 304 below illustrates the dynamic behavior of the stocks in this nonlinear *first*-order formulation. The results of a parametric study of durability of offering (decreasing from left to right) indicate sigmoid or S-shaped growth for the resource environment, albeit with inflection and peaking occurring later with decreasing durability. This occurs because the lower the durability, the more time spent producing replacement market (and the higher percentage of the Potential market P, that remains potential).

The results of a parametric analysis of the rates in a diffusing market are presented in Figure 305 below. As the derivative (slope) of the stocks, equals the value of the rates, it is clear that the peak rates of change in the stocks decline as the durability decreases.

Dissecting the rate of change of Available market A (i.e. dA/dt) into its constituent flows of diffusion and replacement rates, reveals that: 1) the replacement rates grow logistically and increasingly as durability decreases, 2) the diffusion rates maintain their peaks, but these peaks are delayed with decreasing durability, and the shape moves from bell-shaped to S-shaped; 3) the diffusion and replacement rates approach each other as durability decreases – the definition of a service.

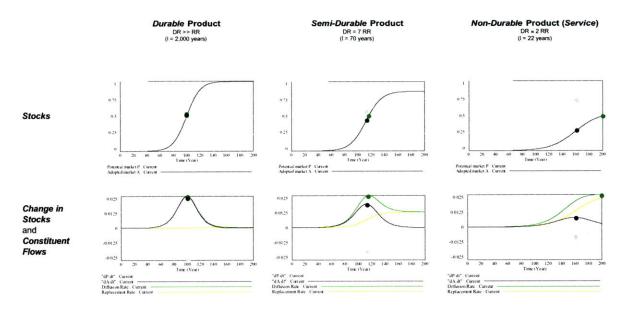

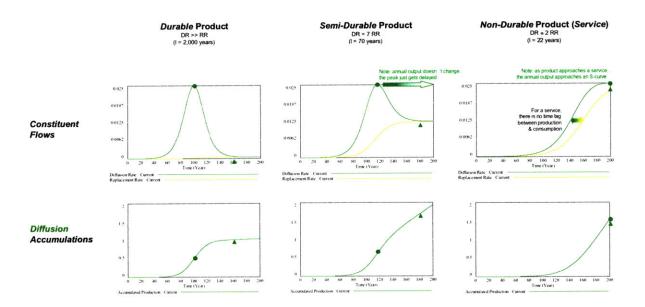

Figure 305: Dynamic Behavior of Changes in Stocks and Constituent Flows

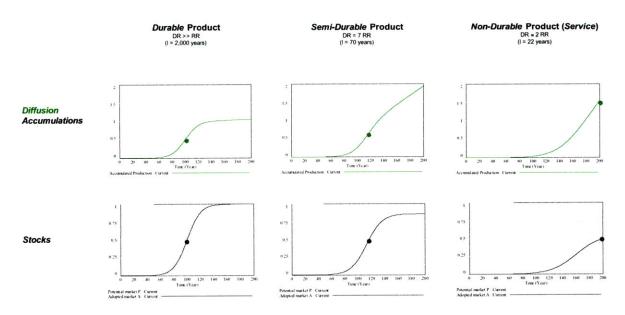

The results of a parametric analysis of the accumulated diffusion in market with replacements are presented in Figure 306 below. When the diffusion rates and replacement rates eventually meet in equilibrium, the accumulated diffusion continues to grow at that constant equilibrium rate. Finaly, while durable product industries may diffuse relatively fast, their total market size is smaller than service industries, which diffuse relatively slowly, but which have larger total markets.

Finally, coming full circle, the results of a parametric analysis of the accumulated diffusion in market with replacements are presented in Figure 307 below. For a durable product, the accumulated diffusion is the same as the Adopted market A, as there are no retirements. For decreasing durability, the meaning of the Adopted market A loses some relevance.

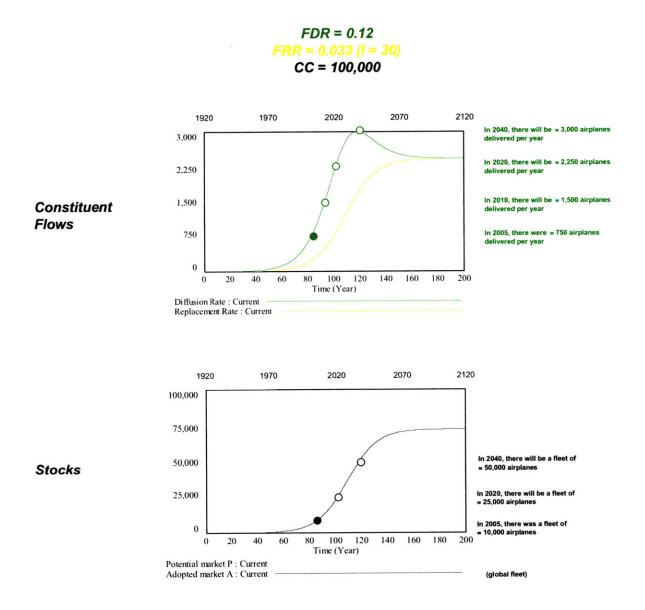

Figure 307: Dynamic Behavior of Accumulated Diffusion & Stocks

7.2.1.4 Industry Studies of Diffusing Markets

This section demonstrates how the diffusing market model can be applied conceptually to a series of industries.¹⁰⁰⁰ Figure 308 below demonstrates how the diffusing market model is applied to the commercial airplane industry.

Figure 308: Diffusing Market in the Commercial Airplane Industry

¹⁰⁰⁰ The purpose of this section is not to offer detailed calibrated models, but merely a series of conceptual models.

Figure 309 below demonstrates how the diffusing market model is applied to the global airline industry.

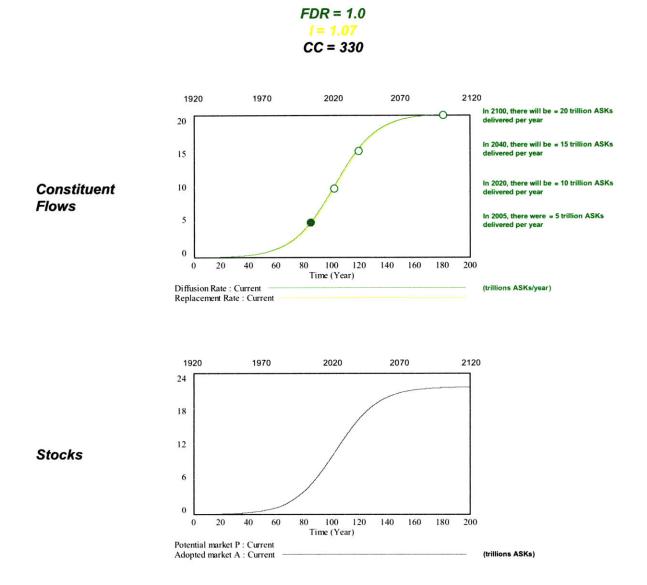

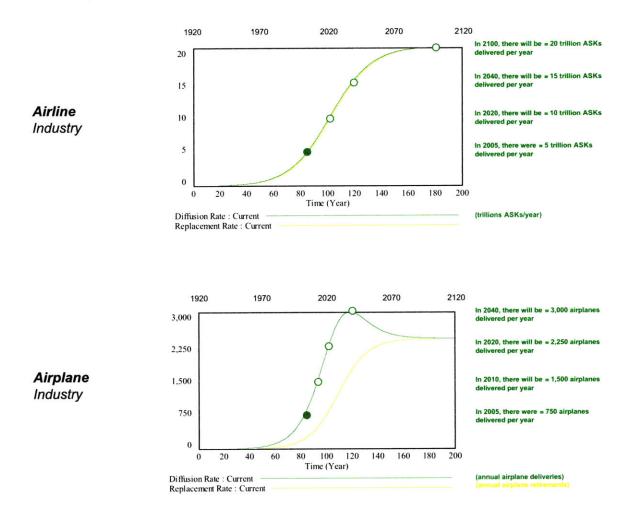

Figure 309: Diffusing Market in the Global Airline Industry

Finally, when comparing the dynamics of a value chain, Figure 310 below demonstrates how the diffusing market model is applied to the global airline and commercial airplane industry.

Intuitively, one may think of airplanes (having 30 year product lives) as being relatively durable goods. But from the previous figures, their annual production rates do not exhibit the classic "bell-shaped curve" associated with the first derivative of an S-shaped stock. What this demonstrates, however, is that the notion of product "durability" is relative to the diffusion rate of the industry. For example, if we kept the product life of an airplane as 30 years, but had the the diffusion of air transport increase say four-fold, we would begin to see the classic "bell-shaped curve" as shown in Figure 311 below.

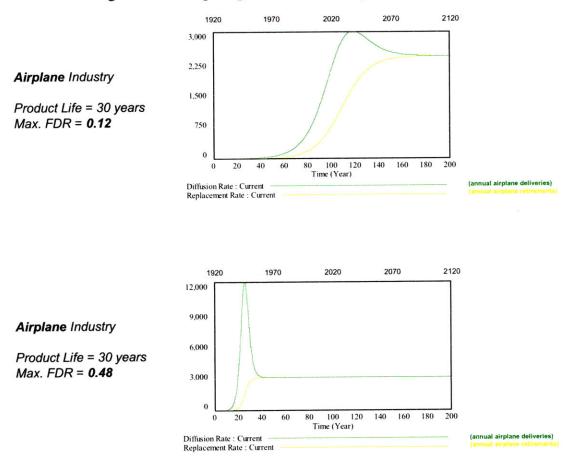

Figure 311: Comparing Product Durability vs. Market Diffusion Rate

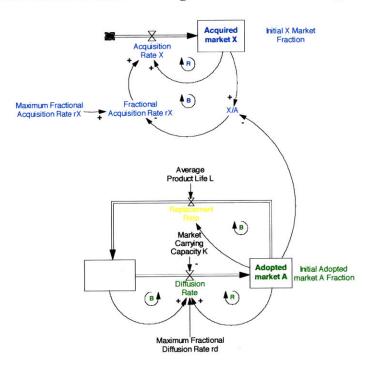

7.2.1.5 Market Diffusion & Obsolescence

Having produced a model of how a market "grows" or diffuses, we will explore how a market "dies" or becomes overtaken by a substitute market. Instead of discussing this here, it will be treated as a special case covered in section 7.5 under "Advanced Topics."

7.2.2 Single Firm Growth in a Diffusing Market

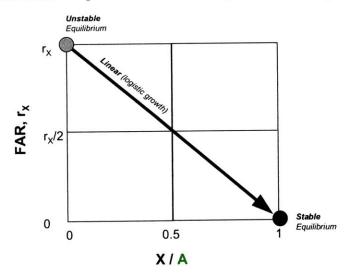

Next, we study how a single firm grows in a diffusing market, before we proceed to investigate competition in a diffusing market. The model structure is shown in Figure 312 below.

Figure 312: Model Structure of Single Firm Growth in a Diffusing Market

The Fractional Acquisition Rate of a Single Firm X is assumed to be a linear function of the carrying capacity of the market A, as shown in figure Figure 313 below. We will relax this assumption later, when we investigate inter-species competition.

The dynamic behavior of a single firm in a diffusing market is summarized in Figure 314 below. From left to right, we explore the effects of increasing maximum Fractional Acquisition Rates.

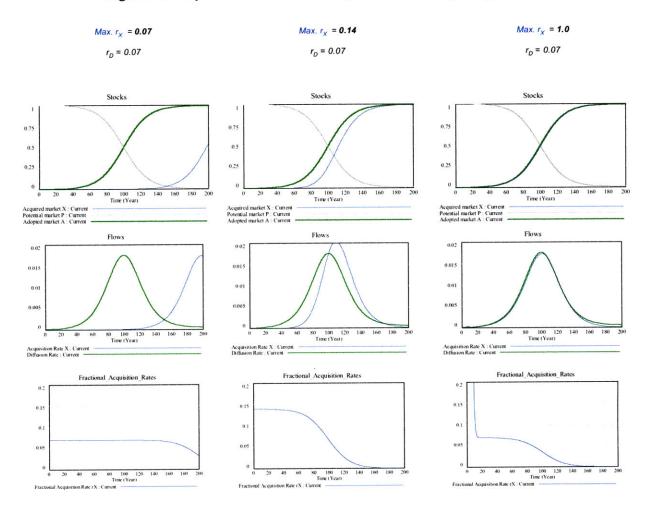

Figure 314: Dynamic Behavior of Single Firm in a Diffusing Market

As can be seen, when the firm grows at the market diffusion rate (left column), there is a considerable time lag before it penetrates the market fully. However, when the firm grows at twice the market diffusion rate (center column), the time lag is greatly reduced and the firm begins to follow the market diffusion. Finally, when the firm grows very fast relative to the market diffusion rate (right column), it essential tracks the market diffusion.

7.2.3 Intra-species Competition in a Diffusing Market

Next, we reintroduce two members of the same species, competing for the logistically growing market. The new, coupled system of differential equations is shown in its most simple form below:

$$dX_{1}/dt = AR_{X1} = r_{X1}X_{1} - r_{X1}X_{1}^{2}/K - r_{X1}X_{1}X_{2}\alpha_{12}/K$$
(6a)

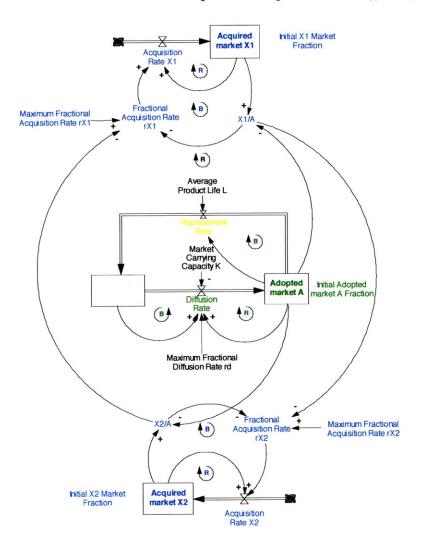

$$dX_2/dt = AR_{X2} = r_{X2}X_2 - r_{X2}X_2^2/K - r_{X2}X_2X_1\alpha_{21}/K$$
(6b)

$$dP/dt = \frac{RR}{DR} - DR = A/L - (r_d P A/K + r_{ds} P)$$
(6c)

$$dA/dt = DR - RR = (r_d PA/K + r_{ds}P) - A/L$$
(6d)

Figure 315 below illustrates the causal structure of this nonlinear *third*-order formulation, which again results in sigmoid or S-shaped growth for both the resource environment and the dominant firm (or population of firms) that created it.

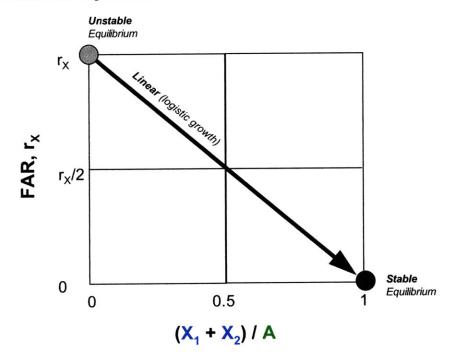

Figure 315: Model Structure of Intra-species Competition in a Diffusing Market

Although this refinement of Hannan and Freeman's (1977) classic does not itself add new insights into the behavior of competing organizations or populations, it is a necessary building block for the next step of the formulation of the evolution of business ecosystems, namely, it establishes the condition necessary for the establishment of interspecies competition, resulting in an extension of the theory of competitive exclusion (Gause, 1934).

Figure 316 below illustrates the fractional acquisition rates r_X as a function of the available carrying capacity of two homogeneous competitors (i.e. both are equally efficient) engaged in intra-species competition.

Figure 316: Fractional Acquisition Rates of Homogeneous Firms in Intra-species Competition

The previous dynamic behavior of a single firm in a diffusing market is compared (on the left) with intra-species competition in a diffusing market (on the right) in Figure 317 below. As can be seen, a single firm having a maximum Fractional Acquisition Rate of 0.14 exhibits the same behavior at two identical competitors (splitting the market) and each having a maximum Fractional Acquisition Rate of 0.14.

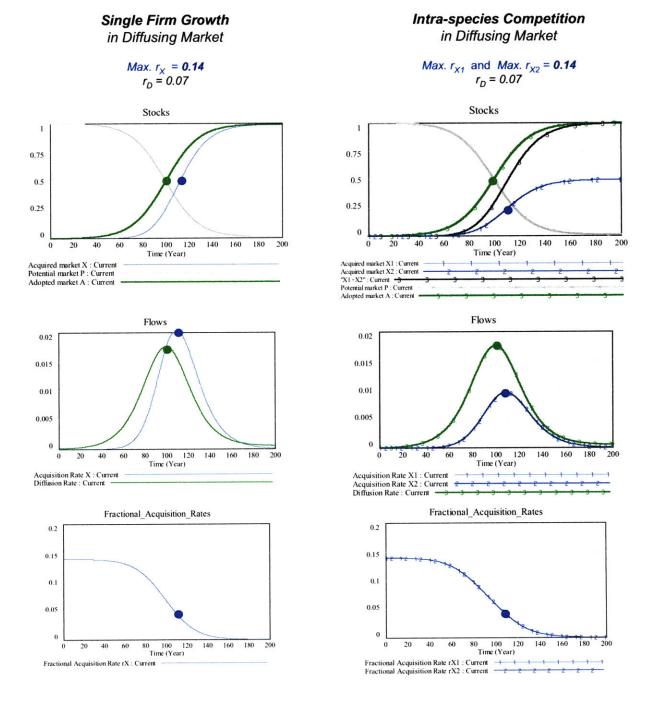

Figure 317: Dynamic Behavior of a Single Firm and Intra-species Competition in a Diffusing Market

Figure 318 below illustrates the dynamic behavior of intra-species competition between homogeneous firms in a logistically diffusing market, having identical but increasing maximum fractional acquisition rates, r_x . First in looking at the stocks, note that identical competitors continue to split the market 50%-50%. Next in looking at the stocks and flows, note that a phase lag develops between demand and supply, i.e. the Adopted market A, and the sum of the competitors' Acquired markets X, when the firms' maximum fractional acquisition rates are relatively low. Finally note that when firms' Fractional Acquisition Rates are very high (i.e. 1.0), the FARs initially drop very fast, because initially the firms are growing much faster than the market is diffusing, in order to make up for the initial gap made by the finite A at time 0 (a start-up problem).

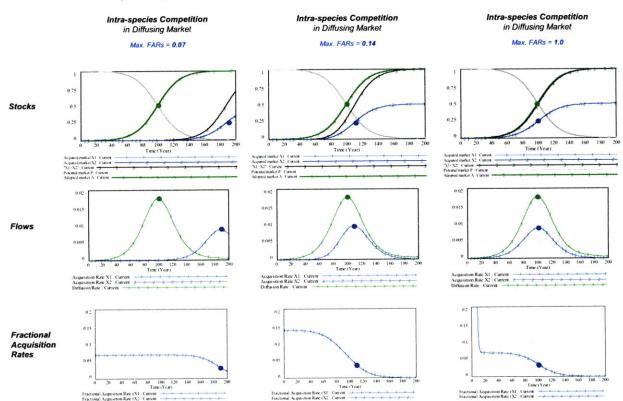

Figure 318: Dynamic Behavior of *Intra*-species Competition in a *Diffusing* Market (with Increasing Homogeneous Maximum Fractional Acquisition Rates)

Figure 319 below illustrates the fractional acquisition rates r_X as a function of the available carrying capacity of two heterogeneous competitors (i.e. one is more efficient than the other) engaged in intra-species competition.

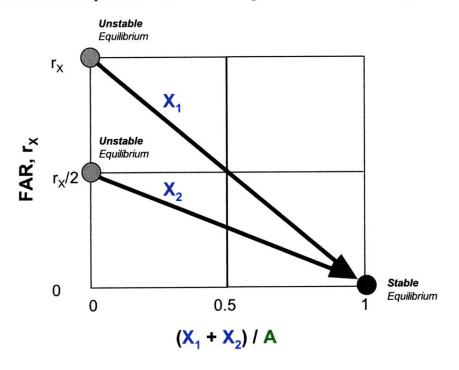

Figure 319: Fractional Acquisition Rates of Heterogeneous Firms in Intra-species Competition

Figure 320 below illustrates the dynamic behavior of intra-species competition between homogenous firms in a logistically diffusing market, having heterogeneous maximum fractional acquisition rates, r_x . Here, when the firms have heterogeneous Maximum Fractional Acquisition Rates, the principle of Competitive Exclusion again occurs.

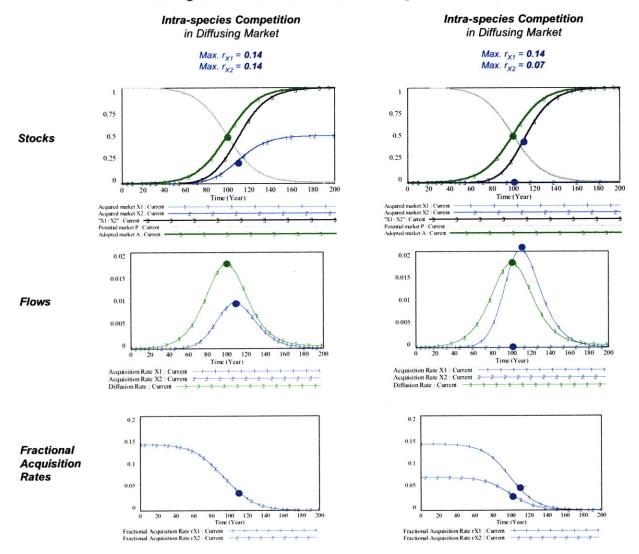

Figure 320: Dynamic Behavior of *Intra*-species Competition in a *Diffusing* Market (with Heterogeneous Maximum Fractional Acquisition Rates)

7.2.4 Inter-species Competition in a Diffusing Market

Since in the previous stage, we have allowed the environment to grow logistically, we can now acknowledge the possibility of variation in organizational forms as a consequence of variation in environmental rates of growth. This gives rise to the potential for dominance switching: i.e. the late entry of a new species of organization, and the associated early exit of the incumbent species. The two types of competing organizational species modeled therefore reflect either increasing rates or decreasing rates of environmental growth.

The new, coupled system of differential equations is shown below:

$r_X > r_Y$ when $(X+Y) < K/2$	$dX/dt = r_X X - r_X X^2 / \mathbf{K} - r_X X \mathbf{Y} \alpha_{XY} / \mathbf{K}$	(7a)
	$dY/dt = r_Y Y - r_Y Y^2/K - r_Y XY \alpha_{YX}/K$	(7b)
	$dP/dt = RR - DR = A/L - (r_dPA/K + r_{ds}P)$	(7c)
	$dA/dt = DR - \frac{RR}{R} = (r_d PA/K + r_{ds}P) - A/L$	(7d)

The incumbent species, X which builds the market is known in bio-ecology as an *r-strategist*, and the late-entrant challenger species, Y which takes the market is known as a *K-strategist* (MacArthur and Wilson, 1967). The primary difference between this formulation and the previous, is that each competitor's fractional net growth rates are no longer linearly density-dependent, with the (*Modular*) *r-strategist* growing faster when the environment is experiencing rapid growth, and the (*Integral*) *K-strategist* growing faster when the environment's rate of growth is slowing down, as shown in Figure 321 below.

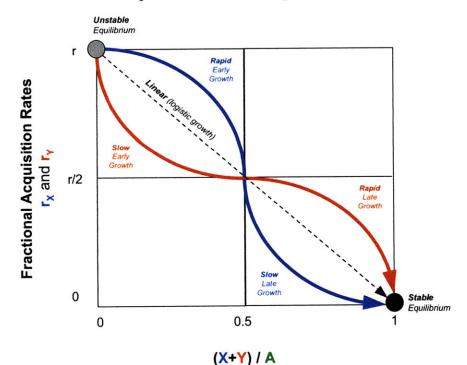

Figure 322 below summarizes the causal structure of this nonlinear *third*-order formulation which results in S-shaped (but no longer logistic) growth for the competitor's state variables. Crucially note that the r-strategist tends to exit when the growth rate of the market begins to drop below its own growth objectives. Environmental variance therefore produces variance in the architectures of the organizational sets, which creates symbiotic inter-species competition, with a more complex theory of competitive exclusion.

Figure 322: Model Structure of Inter-species Competition in a Diffusing Market

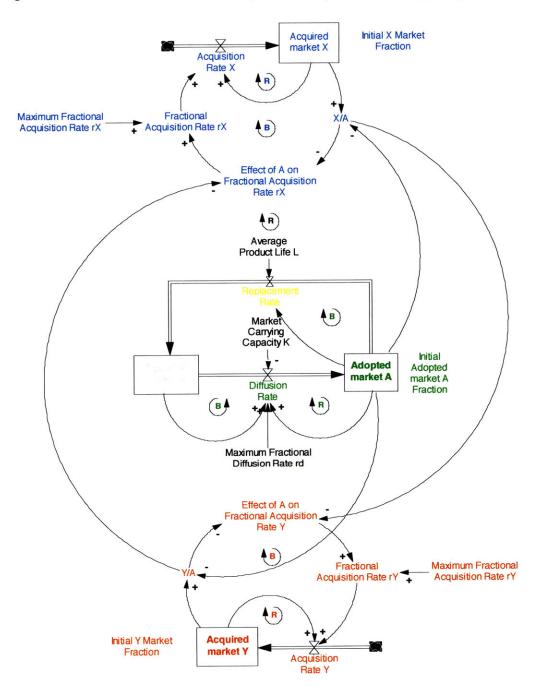

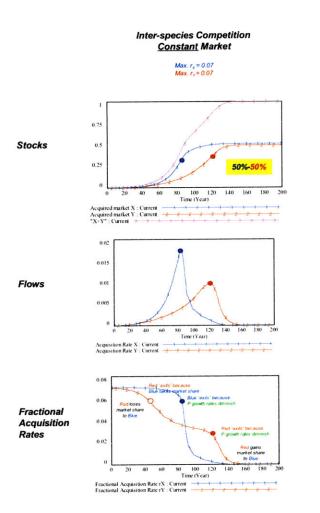

Figure 323 below compares the dynamic behavior of inter-species competition between heterogeneous firms in constant and diffusing markets.

Figure 323: Dynamic Behavior Comparing Inter-species competition in Constant & Diffusing Markets

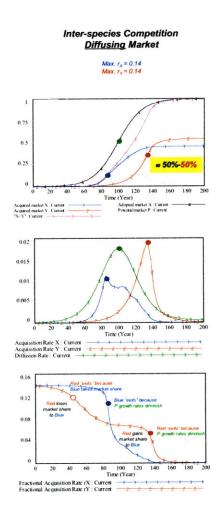

Figure 324 below illustrates the dynamic behavior of of inter-species competition between heterogeneous firms in a diffusing market, in which both competitors have the same maximum fractional net growth rates.

Max. r_x = 1.0 Max. r_y = 1.0

7.3 Competition in a *Commoditizing* Market (Quality)

7.3.1 Commoditizing Market (Quality)

Having permitted the carrying capacity of the market, K to grow logistically, we now go back to a constant market assumption, but instead allow the *quality* of the market customer preferences to diffuse (or commoditize) from high-performance *differentiated* products and services towards *low-cost* products and services (Abernathy and Utterback, 1978; Christensen, 1997). This in effect allows market niches to evolve, which has the potential to shape the entry and exit of different species of organizational sets or enterprise architectures.

In the model of market diffusion discussed previously, the potential market is assumed to decay *logistically* (and the associated adopted market is assumed to grow logistically). This makes some intuitive sense, as market growth initially builds slowly with increasing speed, as the customers become more aware of the product/service, and as the suppliers build capacity/capabilities on an increasing returns basis. These increasing rates of growth eventually give way to slowing rates of growth due the approach of the finite carrying capacity of the market. Such causal structure generates logistic behavior.

A legitimate question arises however regarding the commoditization in a market, namely does the supply/demand for high-performance differentiated goods/services decay exponentially, or logistically (like quantity growth). Do the rates of commoditization initially begin at their maximum, or is there initially a slow period of commoditization (caused by entrepreneurially innovative inertia) before the onset of commoditization?

In order to build a model of such commoditization, we begin with a simple, single-loop (balancing) producing exponential decay of the differentiated products niche, before we move onto a more complex double-loop (balancing and reinforcing) producting logistic decay of the differentiated products niche. The governing causal logic will ultimately be determined via careful longitudinal empirical data collection and analysis.

7.3.1.1 Single-Loop *Exponential* Decay

The differential equations defining exponential decay are shown below:

$$dD/dt = -CR = -r_cD$$
(8a)

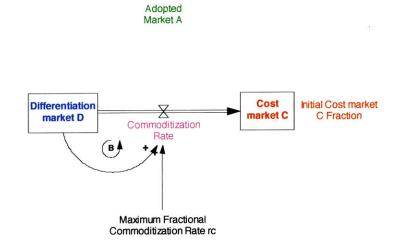

$$\frac{dC}{dt} = \frac{CR}{cR} = r_c D \tag{8b}$$

Where:

- D = the market for *differentiated* products & services
- C = the market for *cost-leadership* in products & services
- dD/dt = the rate of change of the market for *differentiated* products & services
- dC/dt = the rate of change of the market for *cost-leadership* in products & services
- CR = commoditization of market (the outflow from D, the inflow into C)
- r_c = maximum fractional commoditization rate of the market

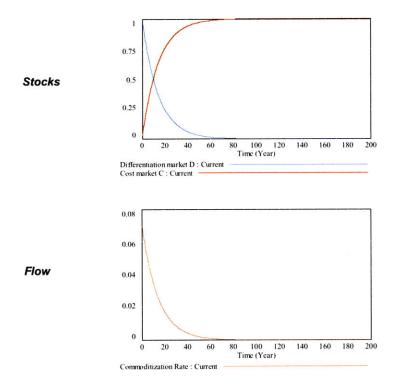

The basic single-loop commoditization model is shown in Figure 325 below. Note that the carrying capacity of the adopted market, A plays no role here, with the fractional commoditization rate r_c not being reduced.

Figure 325: The Structure of a Commoditizing Market (with Exponential Decay)

The dynamic behavior of a commoditizing market with exponential decay of the original differentiation niche is shown in Figure 326 below.

Figure 326: Dynamic Behavior of a Commoditing Market (with Exponential Decay)

7.3.1.2 Double-Loop Logistic Decay

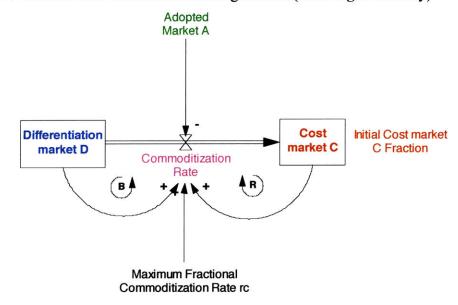

Next, we add a reinforcing loop on the inflow to the cost market. The differential equations defining logistic decay are shown below:

$$dD/dt = -CR = -r_cC(1 - C/A)$$
(8c)

noting D = A - C $= -r_c DC/A$ $dC/dt = CR = r_c C (1 - C/A)$ $= r_c DC/A$ (8d)

The double-loop commoditization model is shown in Figure 327 below.

Figure 327: The Structure of a Commoditizing Market (with Logistic Decay)

The dynamic behavior of a commoditizing market with logistic decay of the original differentiation niche is shown in Figure 328 below. The behavior of this nonlinear *first*-order formulation, again results in sigmoid or S-shaped growth for the transforming resource environment.¹⁰⁰¹ Note, the addition of a reinforcing loop acts to slow down the commoditization, by reducing the fractional commoditization rate, r_c as the cost market, C approaches the carrying capacity of the adopted market, A.

¹⁰⁰¹ Again, as in the characterization of the diffusing market, the commoditizing market's sigmoid growth is assumed to proceed logistically, for analytical simplicity.

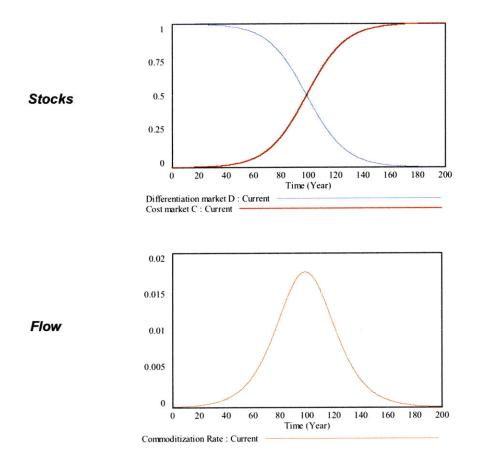

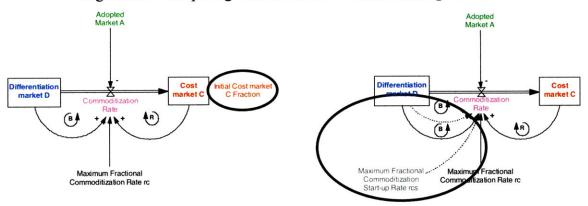

Figure 328: Dynamic Behavior of a Commoditizing Market (with Logistic Decay)

7.3.1.3 Bass Industry Commoditization Model

Finally, in order to avoid the start-up problem, as we did in the formulation of the industry diffusion model, we add another balancing loop which captures the effects of awareness. The two model structures are compared in Figure 329 below.

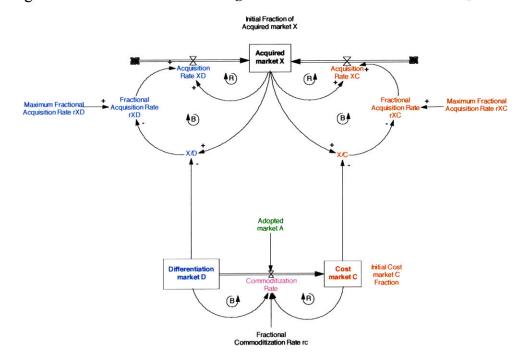

7.3.2 Single Firm Growth in a Commoditizing Market

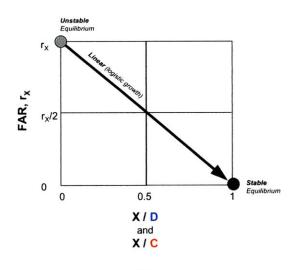

Next, we study how a single firm grows in a commoditizing market, before we proceed to investigate competition in a commoditizing market. The model structure is shown in Figure 330 below.

Figure 330: Model Structure of Single Firm Growth in a Commoditizing Market

The Fractional Acquisition Rates of Firm X are assumed to be a linear function of the carrying capacities of the two market niches D and C, as shown in Figure 330 below. We will relax this assumption later, when we investigate inter-species competition.

Figure 331: Fractional Acquisition Rate of a Single Firm in a Commoditizing Market

The dynamic behavior of a single firm in a commoditizing market is summarized in Figure 332 below, where the maximum Fractional Acquisition Rates for market niches D and C are assumed to be identical (i.e. the firm is equally efficient in acquiring Differentiated niches as it is in acquiring Cost niches). From left to right, we explore the effects of increasing pairs of maximum Fractional Acquisition Rates.

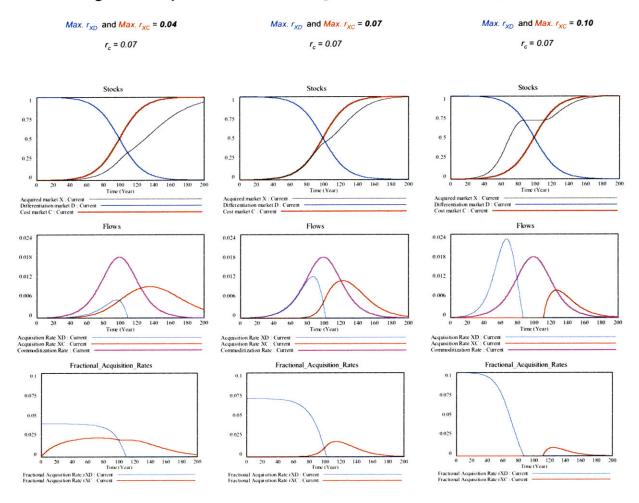

Figure 332: Dynamic Behavior of Single Firm in a Commoditizing Market

As can be seen, when the firm grows *slower* than the commoditization rate (*left* column), the stock of X market acquired begins to approximate a *single* logistic curve, as it expands into the *Cost market C*.

Conversely, when the firm grows *faster* than the commoditization rate (*right* column), the stock of X market acquired begins to approximate *double* logistic curves, as it expands rapidly first into D, and then rapidly into the *Cost market* C (after it develops).

The dynamic behavior of a single firm in a commoditizing market having differing abilities to acqhire a Differentiated market D is summarized in Figure 333 below. From left to right, we explore the effects of increasing maximum Fractional Acquisition Rates for the Differentiated market, D, while holding the maximum Fractional Acquisition Rates for the Cost market, C constant.

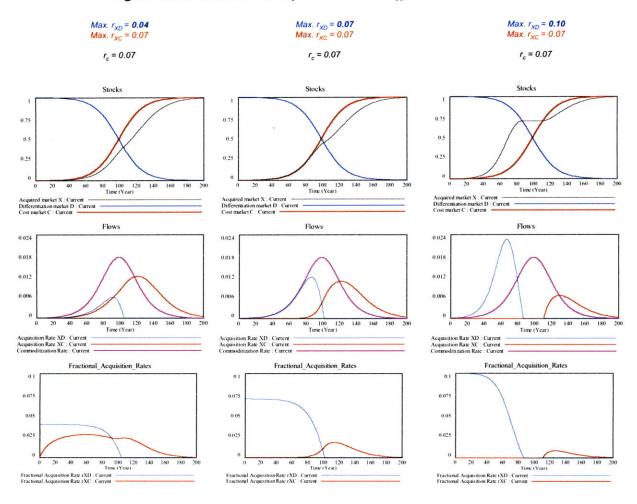

Figure 333: Parametric Study of FARs on Differentiation Market

As can be seen, when the firm grows *slower* than the diffusion rate (*left* column), the stock of X market acquired is shifted initially to the right of the *Cost market C*.

Conversely, when the firm grows *faster* than the diffusion rate (*right* column), the stock of X market acquired is shifted initially to the left of the *Cost market* C.

The dynamic behavior of a single firm in a commoditizing market having differing abilities to acqhire a Cost market C is summarized in Figure 334 below. From left to right, we explore the effects of increasing maximum Fractional Acquisition Rates for the Cost market, C, while holding the maximum Fractional Acquisition Rates for the Differentiated market, D constant.

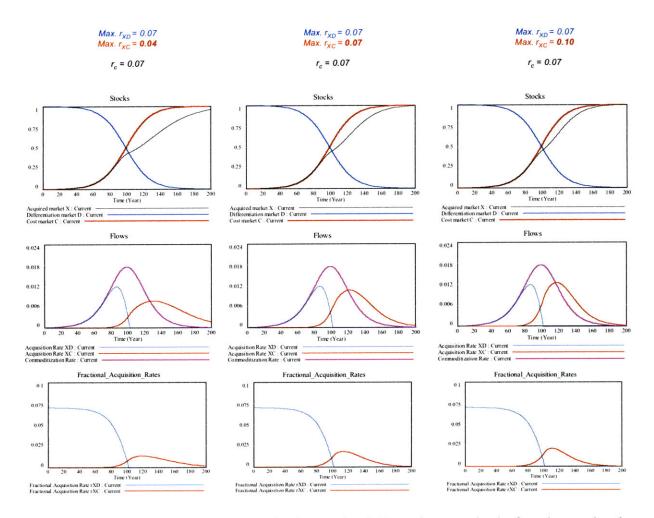

Figure 334: Parametric Study of FARs on Cost Market

Here the effects are most clearly seen in the stock of X market acquired after the market has developed a stock of Cost market C, (i.e. in the second half of the industry lifecycle).

7.3.3 Intra-species Competition in a Commoditizing Market

In the previous stage, the resource environment was characterized as existing in one dimension: the rate of change of *market* growth, dK/dt. This formulation extends the model to include a second dimension: the rate of change of *technology* commoditization, dC/dt. This captures the construct of a *dominant design* in the product offering (Abernathy and Utterback, 1978), which marks the shift in market demand from increasing rates of change of improvement in product performance, where competition is based on *product* innovation, to increasing rates of change of improvement in product cost, where competition is based on *process* innovation.¹⁰⁰² In order to control for the previous effects of market growth, we hold the market size, K constant.¹⁰⁰³ The new coupled system of differential equations is shown below:

$$dX_{1}/dt = r_{X1}X_{1} - r_{X1}X_{1}^{2}/D - r_{X1}X_{1}X_{2}\alpha_{12}/(D + C)$$
(9a)

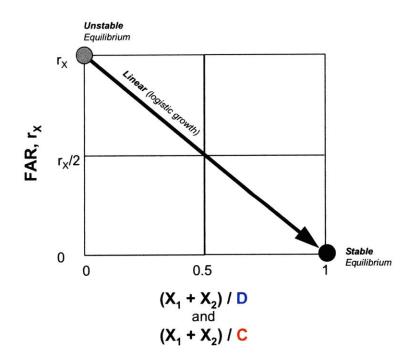

$$dX_2/dt = r_{X2}X_2 - r_{X2}X_2^2/C - r_{X2}X_2X_1\alpha_{21}/(D + C)$$
(9b)

$$dD/dt = -r_c C (1 - C/A)$$
(9c)

$$dC/dt = r_c C (1 - C/A)$$
(9d)

Figure 335 below illustrates the fractional acquisition rates r_{X1} and r_{X2} as a function of the available carrying capacity of the two competitions engaged in *intra*-species competition.

¹⁰⁰² Although a "dominant design" is often seen as a *discrete* event, the market is modeled as a *continuously* evolving.

¹⁰⁰³ This control will relaxed in the next section, where both market size, K and type, C will grow logistically.

Figure 336 below summarizes the causal structure of this nonlinear *third* order formulation¹⁰⁰⁴ which results in sigmoid or S-shaped transition from a market dominated by sales of products/services based on *differentiation*, D to a market dominated by sales of products/services based on *cost*, C. This this formulation represents *direct* competition between organizations within the environment. Note the two system-wide reinforcing loops operating on each niche.¹⁰⁰⁵

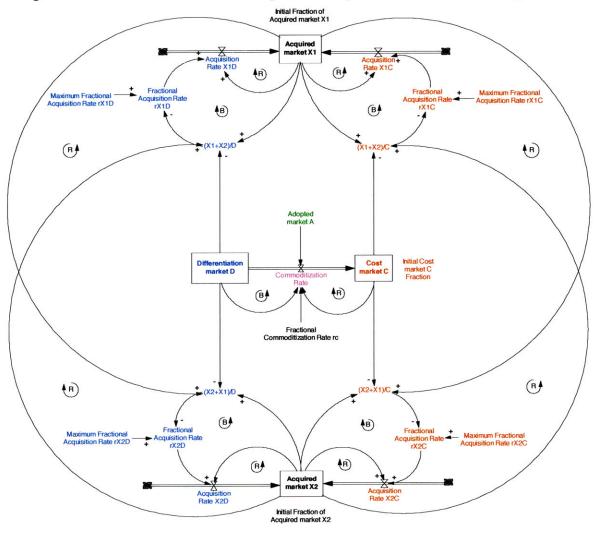

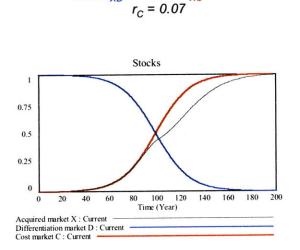

Figure 336: Model Structure of Intra-species Competition in a Commoditizing Market

Figure 337 below illustrates the previous dynamic behavior of a single firm in a commoditizing market (on the left) with *intra*-species competition in a *commoditizing* market (on the right). As can be seen on the right, although X1 and X2 separately grow at the commoditization rate of 0.07 (traking the red Cost market C curve), together they grow faster than the red curve taking the market at a rate of 0.14.

¹⁰⁰⁴ The addition of two state variables is only a first-order addition as one is completely determined by the other. ¹⁰⁰⁵ Note that the causal arrows representing competition are drawn from stocks X_1 and X_2 to the respective competitor's available market quotient. Although this is a different visual formulation from previous pages (where the causal arrows linked available market quotient to available market quotient), the mathematics are the same.

7.3.4 Inter-species "Competition" in a Commoditizing Market

In the previous stage, both competitors were assumed to be of the same species, and therefore broadly able to compete in both the differentiation-based and cost-based niches (i.e. the competition coefficients α were at or near 1) – for example both intra-species competitors, *GM* and *Ford* can transition from a differentiated product focus towards a cost focus. However, the emergence of a new species, having an integral enterprise architecture (like *Toyota*) is much better suited towards cost-leadership, making their competition coefficient α approach zero. In this extreme case of inter-species competition, each species focuses on the niche that they are best suited to, and "competition" takes on a symbiotic nature, due to the presence of architectural inertia and its impact on the enterprise's efficiency frontiers.¹⁰⁰⁶ The new coupled system of differential equations is shown below:

$$dX/dt = r_X X - r_X X^2/D$$
(10a)

$$\frac{dY}{dt} = r_Y Y - r_Y Y^2 / C \tag{10b}$$

$$dD/dt = r_c D (1 - D/A)$$
(10c)

$$dC/dt = r_c C (1 - C/A)$$
(100)

Figure 339 below illustrates the fractional acquisition rates r_X and r_Y as a function of the available carrying capacity of the two competitions engaged in inter-species competition.

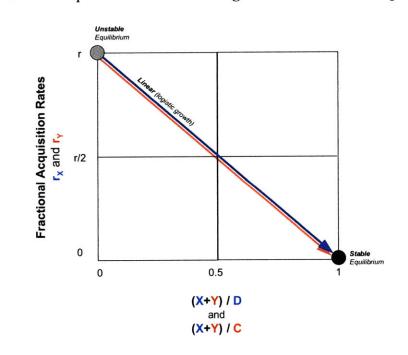

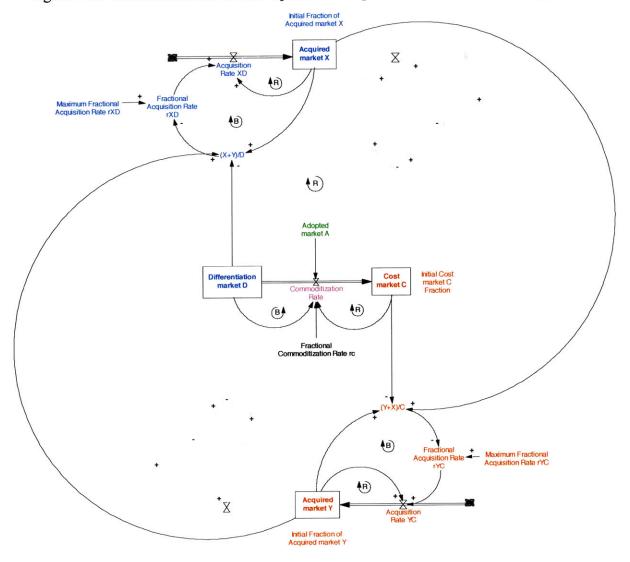

Figure 339: Fraction Acquisition Rates of Heterogeneous Firms in Inter-species Competition

¹⁰⁰⁶ Although in inter-species competition in *quantity* space, where we had nonlinear FAR functions with respect to available carrying capacities, here we revert back to linear FAR functions, and differentiate inter-species competition in *quality* spcae as niche-specific only. The combination of *quantity* and *quality* interspecies competition will be covered later.

Figure 340 below summarizes the causal structure of this nonlinear *third* order formulation¹⁰⁰⁷ which results in sigmoid or S-shaped transition from a market dominated by sales of products/services based on *differentiation*, D to a market dominated by sales of products/services based on *cost*, C. Note that in the limit, when the competition coefficients go to 0 - that is, one species is far superior than the other in a particular niche, this formulation represents *indirect* competition between organizations occupying different niches within the environment,

Figure 340: Model Structure of Inter-species "Competition" in a Commoditizing Market

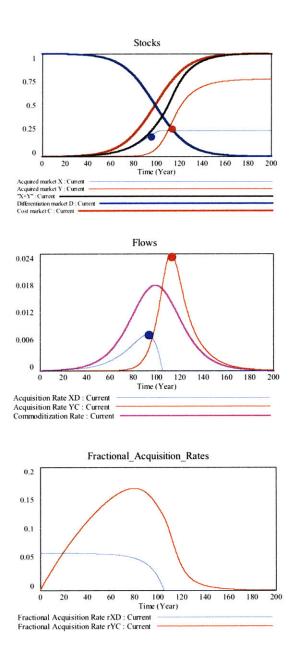

¹⁰⁰⁷ The addition of two state variables is only a first-order addition as one is completely determined by the other.

Figure 341 below illustrates the dynamic behavior of *inter*-species competition in a *commoditizing* market.¹⁰⁰⁸

Figure 341: Dynamic Behavior of Inter-species Competition in a Commoditizing Market

¹⁰⁰⁸ The Maximum Fractional Acquisition Rates, $r_X = 0.06$ and $r_Y 0.34$ were chosen to approximate production rates of *Boeing* and *Airbus* in the commercial airplanes duopoly. Note that these prarameter choices also generate 25% and 75% final market shares respectively.

Note that X's Acquired market plateaus before it reaches the Differentiation market D. This is because Y's Acquired market has begun to take some of the commoditized Cost market C, thus reducting the Adopted market A for both X and Y. We can see that when X+Y hits D, then X plateaus, and later when X+Y hits C, then Y plateaus.

By observing the Fractional Acquisition Rate time histories (at the bottom of the figure), we can see that X's FAR remains relatively unchanged for the first 80 years, until D rapidly falls toward X, coupled with Y's growth in taking C (which also reduces A for both). The resulting FAR time history is only half of the classic "reverse S-shape".

Conversely, Y's FAR does not start with a classic flat plateau, but instead starts at 0 and begins to build up towards it Maximum FAR of 0.34. Y's FAR starts at 0 because X, Y and C begin at 0, making X+Y/C = 1, the stable equilibrium. As C grows faster, earlier than X and Y, X+Y/C approaches 0, the unstable equilibrium. After 80 years, Y's FAR time history begins to look like the classic "reverse S-shape."¹⁰⁰⁹

¹⁰⁰⁹ Note: under extreme conditions tests (Sterman, 2000, pg. 869), if X is parameterized to grow faster than C, then X+Y/C > 1, which is past the stable equilibrium, where Y's FAR would become negative under linear assumptions (which is unrealistic). Therefore, in order to ensure that Y remains non-negative, we introduce a bi-linear relationship with a MIN function. Similar logic applies to X.

7.4 Competition in a Diffusing, Commoditizing Market (Quantity and Quality)

7.4.1 Diffusing, Commoditizing Market (Quantity and Quality)

We now combine the previous two descriptions of the market environment, where the *quantity* of the market, K grows logistically (Bass, 1969), while simultaneously, the *quality* of the market customer preferences diffuses from high-performance *differentiated* products and services towards *low-cost* products and services (Abernathy and Utterback, 1978). This allows the entry and exit of different species of organizational sets for two reasons: the rate of change in market *quantity* and the rate of change in technological *quality* enable market niches to evolve.

7.4.1.1 Comparing Single- vs. Double-loop Diffusing, Commoditizing Models

The new, coupled system of differential equations is shown below:

$$dP/dt = -r_d A (1 - A/K)$$
(11a)

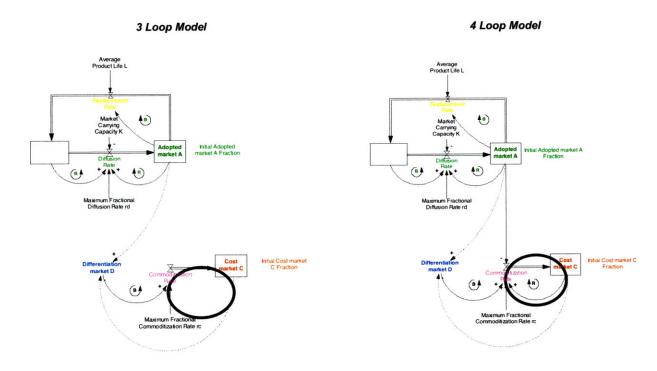

$$dA/dt = r_d A (1 - A/K)$$
(11b)

$$dD/dt = -r_c C (1 - C/A)$$
(11c)

 $dC/dt = r_c C (1 - C/A)$ (11d)

Figure 342 below compares the two different causal structures of this nonlinear *second*-order formulation, developed previously.

Figure 342: Comparing Model Structures of Diffusing, Commoditizing Markets

The dynamic behavior of a diffusing, commoditizing market is illustrated below in Figure 343.

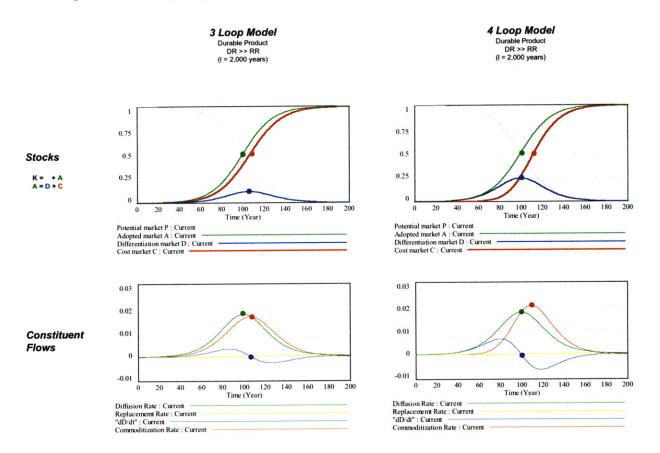

Figure 343: Comparing the Dynamic Behavior of Diffusing, Commoditizing Markets

Note that in the 3-loop model (on the left), without a reinforcing loop on C, D exponentially decays, which has the effect of *increasing* commoditization. Metaphorically, this is like a cold bathtub warming to room temperature.

Conversely, in the 4-loop model (on the right), with a reinforcing loop on C, D logistically decays, which has the effect of decreasing commoditization. Metaphorically, this is like a cold bathtub with ice warming to room temperature. The extra reinforcing loop represents the power of entrepreneurially innovative supply markets.

7.4.1.2 Comparing Diffusion vs. Commoditization Rates

Figure 344 below illustrates the model structure comparing the relative effects of *diffusion*, vs. *commoditization* rates.

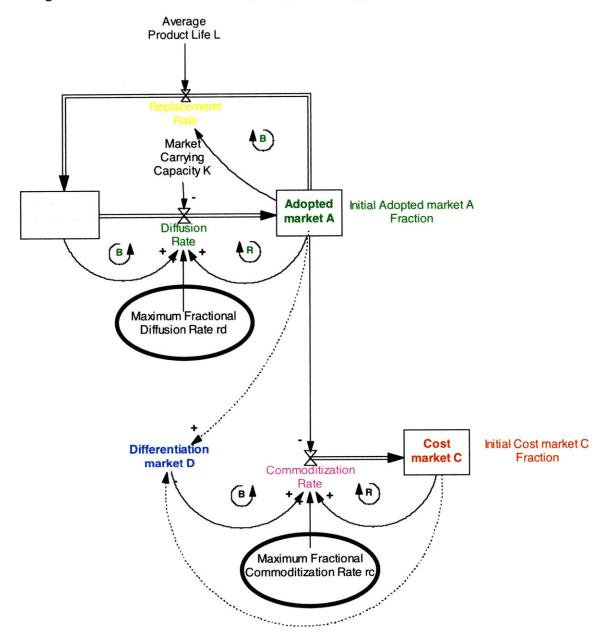

Figure 345 below illustrates the dynamic behavior of a parametric study comparing the relative effects of *diffusion* vs. *commoditization* rates.

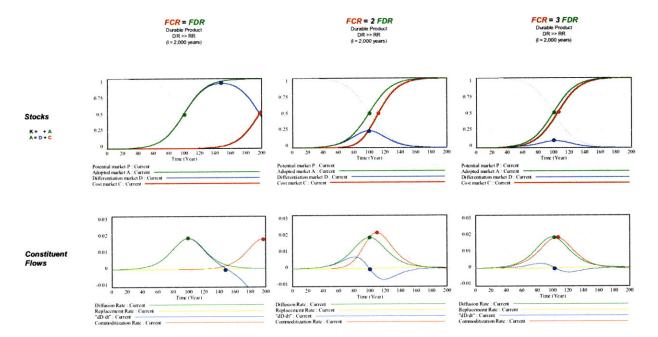

Figure 345: Dynamic Behavior of Diffusion vs. Commoditization Rates

Although the Adopted market, A results in logistic sigmoid or S-shaped growth, niche D rises and falls, while niche C rises in S-shaped growth to eventually characterize the entire market. The Cost market C is a double logistic, i.e. it is logistic growth into a logistically diffusing market A. Note, however that if the maximum fractional diffusion rate, $r_d >>$ than the maximum fractional commoditization rate, r_c , then the behavior approaches that in a commoditization-only market.

It is important to remember when looking at the flow diagrams (at the bottom), that these are not annual firm production curves (which obviously could not become negative). But in the case of D market, which goes negative, it merely illustrates the shifting preference of the market. For example when looking at the stocks (across the top) at time = 100 years, we can see that on the left, of the say 50 people who want widgets, everyone wants Differentiated or high-performance widgets; in the middle, of the say 50 people who want widgets, 25 people want Differentiated or high-performance widgets, while 25 people want to buy based on Cost; on the right, of the say 50 people want widgets, 5 people want Differentiated or high-performance widgets, while 45 people want to buy based on Cost.

7.4.1.3 Parametric Study: Product Durability

Figure 346 below illustrates the model structure examining product durability in a diffusing, commoditizing market.

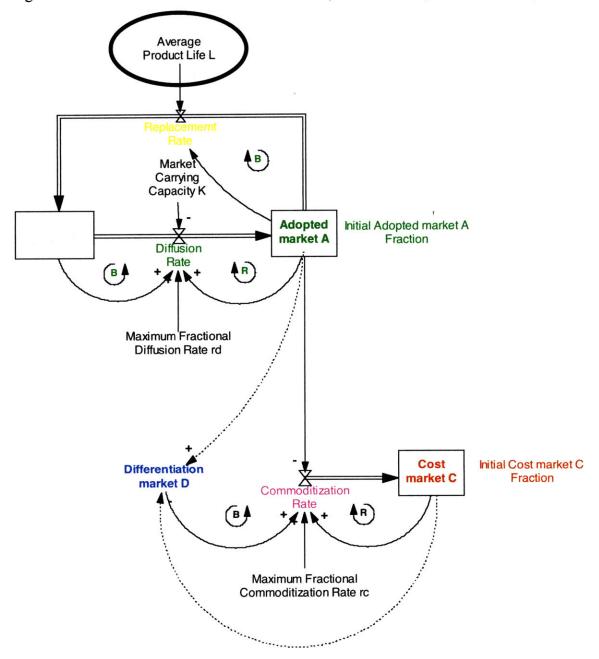

Figure 346: Model Structure of Product Durability in a Diffusing, Commoditizing Market

Figure 347 below illustrates the dynamic behavior of parameterized study investigating product durability in a diffusing, commoditizing market.

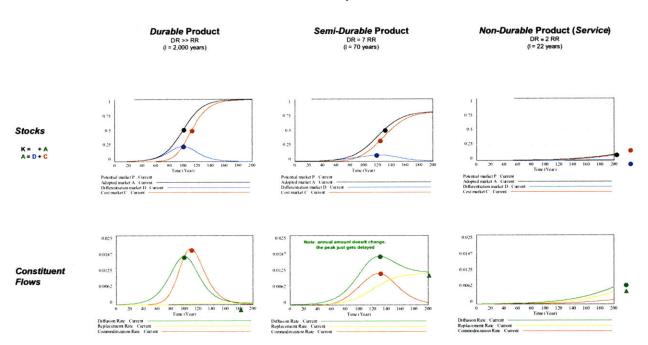

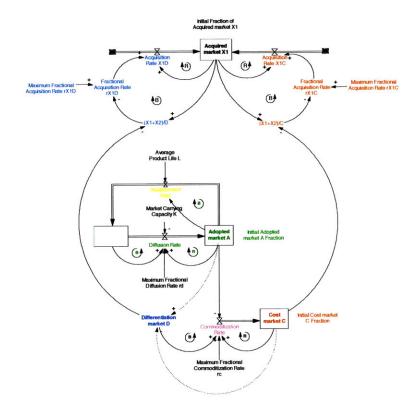

Figure 347: Dynamic Behavior of a *Diffusing, Commoditizing* Market with Varying Product Durability

7.4.2 Single Firm Growth in a Diffusing, Commoditizing Market

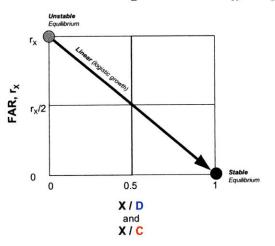

Next, we study how a single firm grows in a diffusing, commoditizing market, before we proceed to investigate competition in a diffusing, commoditizing market. The model structure is shown in Figure 348 below.

Figure 348: Model Structure of Single Firm Growth in a Diffusing, Commoditizing Market

The Fractional Acquisition Rates of Firm X are assumed to be a linear function of the carrying capacities of the two market niches D and C, as shown Figure 349 below. We will relax this assumption later, when we investigate inter-species competition.

Figure 349: Fractional Acquisition Rate of a Single Firm in a Diffusing, Commoditizing Market

The dynamic behavior of a single firm in a diffusing, commoditizing maket is summarized in Figure 350 below, where the maximum Fractional Acquisition Rates for market niches D and C are assumed to be identical (i.e. the firm is equally efficient in acquiring Differentiated niches as it is in acquiring Cost niches). We compare the behavior of a single firm in only a commoditizing market (from before) to the behavior in a diffusing, commoditizing market.

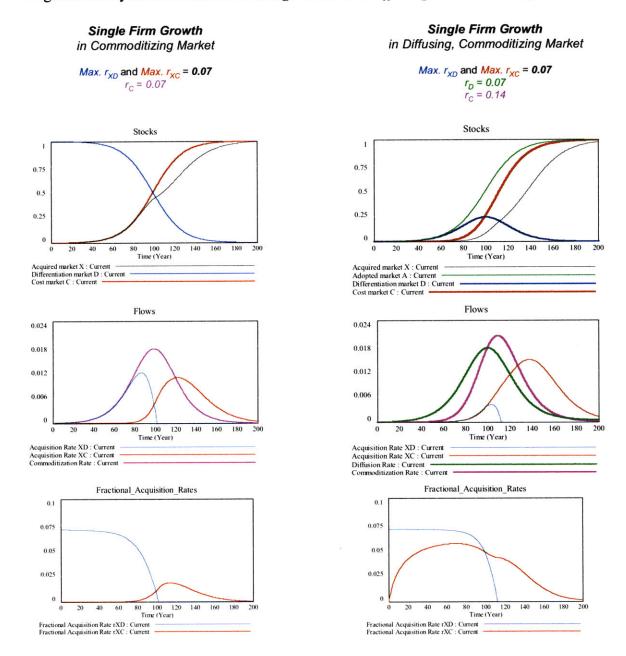

Figure 350: Dynamic Behavior of a Single Firm in a Diffusing, Commoditizing Market

As can be seen by comparing the stocks (top graphs), the Differentiation market, D now grows and shrinks, making X's acquisition rate lower (middle graphs). Also, as X is not acquiring D early, X's FAR for C is much higher, much earlier (lower graphs).

7.4.3 Intra-species Competition in a Diffusing, Commoditizing Market

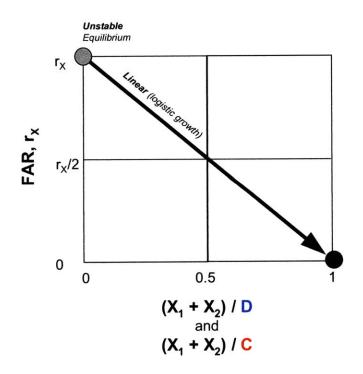

The model now has two different ways of defining the state of evolutionary maturity of the environment: *quantity* and *quality* – that is, *how much* product is produced/consumed, and *what type* of product is produced/consumed. This section therefore combines these two characterizations of the market environment into one model, where two firms of the same species (characterized by the architectures of their respective extended enterprises) compete. The extent of competitive intensity is defined by the ability of each firm to overcome architectural inertia and transition from niche D to niche C as the market evolves. A summary of the coupled system of differential equations is shown below.

$dX_{1}/dt = r_{X1}X_{1} - r_{X1}X_{1}^{2}/D - r_{X1}X_{1}X_{2}\alpha_{12}/K - r_{X1}X_{1}X_{2}\alpha_{12}/(D + C)$	(12a)
$dX_2/dt = r_{X2}X_2 - r_{X2}X_2^2/C - r_{X2}X_1X_2\alpha_{21}/K - r_{X2}X_2X_1\alpha_{21}/(D + C)$	(12b)
$dK/dt = r_d K (1 - K/CC)$	(12c)
$dD/dt = -r_c D (1 - D/K)$	(12d)
	(10)

$$\frac{dC}{dt} = r_c C \left(1 - C/K\right) \tag{12e}$$

The Fractional Acquisition Rates as a function of the available carrying capacies of the two market niches D and C are illustrated in Figure 351 below.

Figure 351: Fractional Acquisition Rates of Homogenous Intra-species Competitors in a Diffusing, Commoditizing Market

The causal structure of this nonlinear *fourth*-order formulation is summarized in Figure 352 below.

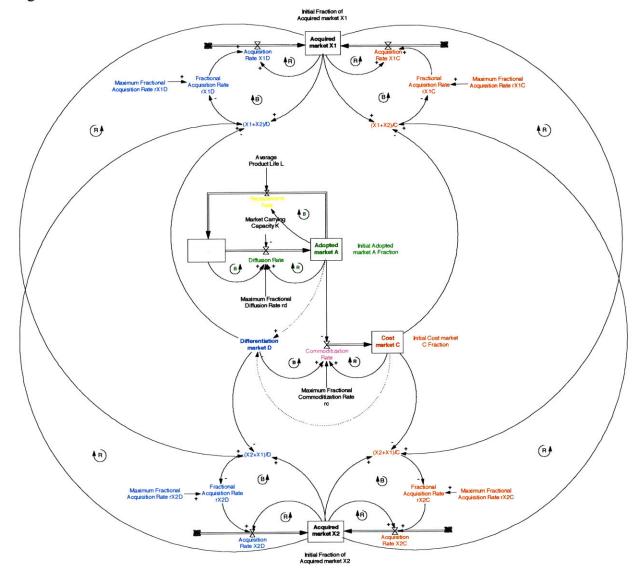

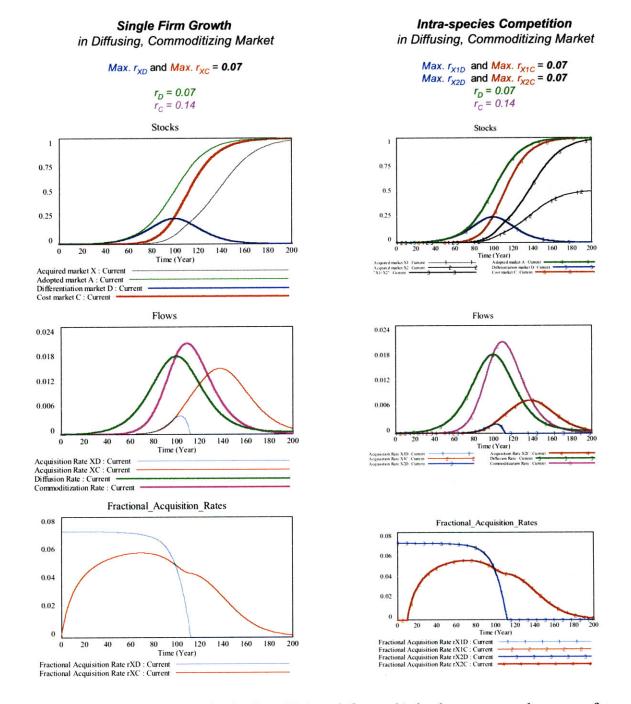

Figure 352: Model Structure of Intra-species Competition in a Diffusing, Commoditizing Market

Figure 353 below compares the dynamic behavior of a single firm (on the left) with *intra*-species competition (on the right) in a *diffusing, commodizing* market.

Figure 353: Dynamic Behavior of a Single Firm and Intra-species Competition in a Diffusing, Commoditizing Market

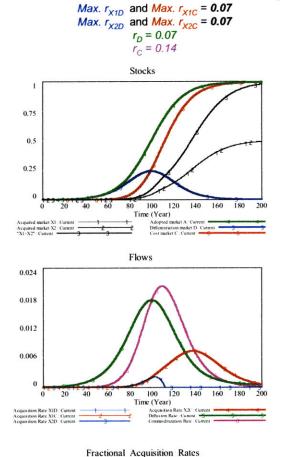

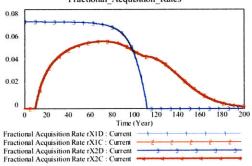

Note how the behavior of a single firm X (top left graph) is the same as the sum of two competitors X_1 and X_2 who split the market 50%-50% (top right graph), with the X's FAR's (middle, left graph) being twice that of the FAR's of X_1 and X_2 .

Next, we compare the maximum Fractional Acquisition Rates of X_1 and X_2 in intra-species competition, as can be seen in Figure 354 below. On the left, both competitors are identical and therefore split the market 50%-50%, while on the right, X_1 is more efficient than X_2 in all the market niches, leading to competitive exclusion.

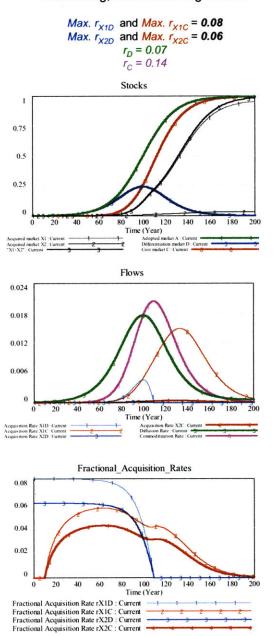

Figure 354: Parametric Study of FARs in *Intra*-species Competition in *Diffusing, Commoditizing* Markets

Intra-species Competition in Diffusing, Commoditizing Market

Intra-species Competition in Diffusing, Commoditizing Market

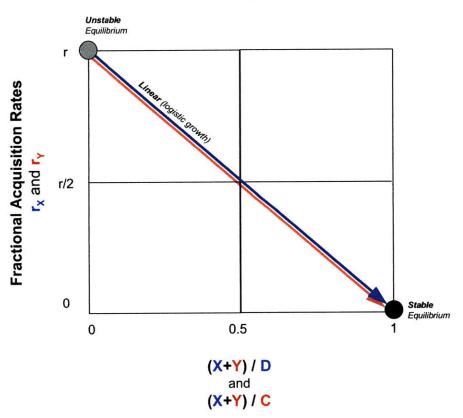

7.4.4 Inter-species Competition in a Diffusing, Commoditizing Market

The model now has two different ways of defining the state of evolutionary maturity of the environment: *quantity* and *quality* – that is, *how much* product is produced/consumed, and *what type* of product is produced/consumed. This final section therefore combines these two characterizations of the market environment into one model, where two different species of firms (characterized by the architectures of their respective extended enterprises) compete. The extent of competitive intensity is defined by the ability of each firm to overcome architectural inertia and transition from niche D to niche C as the market evolves. A summary of the coupled system of differential equations is shown below.

$r_X > r_Y$ when $(X+Y) < K/2$	$dX/dt = r_X X - r_X X^2/D - r_X X Y \alpha_{XY}/K$	(13a)
$r_X < r_Y$ when $(X+Y) > K/2$	$dY/dt = r_Y Y - r_Y Y^2/C - r_Y XY \alpha_{YX}/K$	(13b)
	$dK/dt = r_d K (1 - K/CC)$	(13c)
	$dD/dt = -r_c D (1 - D/K)$	(13d)
	$\frac{dC}{dt} = r_c C \left(1 - C/K\right)$	(13e)

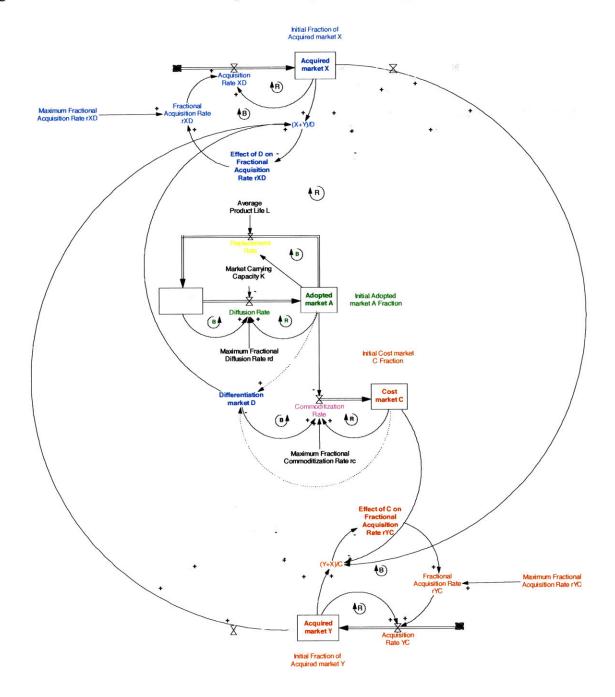

The Fractional Acquisition Rates as a function of the available carrying capacities of the two market niches D and C are illustrated in Figure 355 below.

The causal structure of this nonlinear *fourth*-order formulation is shown in Figure 356 below. Note, we have added a nonlinear relationship between Fractional Acquisition Rates and Available Market, which is represented by the variables: "Effect of D (or C) on Fractional Acquisition Rate r"¹⁰¹⁰

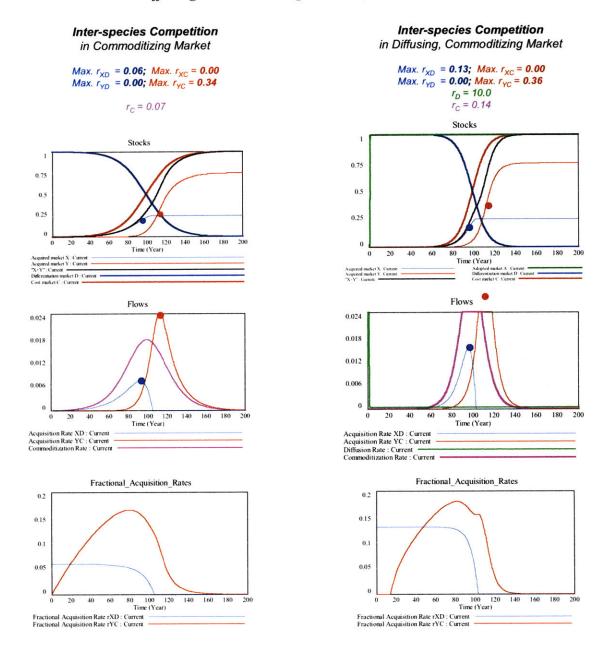

Figure 356: Model Structure of Inter-species Competition in a Diffusing, Commoditizing Market

¹⁰¹⁰ In Vensim, the system dynamics modeling software, this is known as a "look-up table".

Figure 357 below compares the dynamic behavior of *inter*-species competition in a *commoditizing* market with that in a *diffusing*, *commoditizing* market (with diffusion suppressed).

Figure 357: Comparing Dynamic Behavior of *Inter*-species Competition in a *Commoditizing* Market and a *Diffusing*, *Commoditizing* Market (with Diffusion suppressed)

We test the inter-species competition model in a diffusing, commoditizing market (right column), by first ensuring that it generates similar results as for the simpler commoditizing market (left column). We do this by imposing extremely rapid diffusion (on the right column), and note that by slightly modifying parameters, one can generate similar behaviors in both scenarios, with X taking 25% of the market, and Y taking 75% of the market.

Next, we compare both models of inter-species competition having identical parameters in commoditizing-only market and diffusing, commoditizing markets, (so that diffusion is no longer suppressed) as is shown in Figure 358 below.

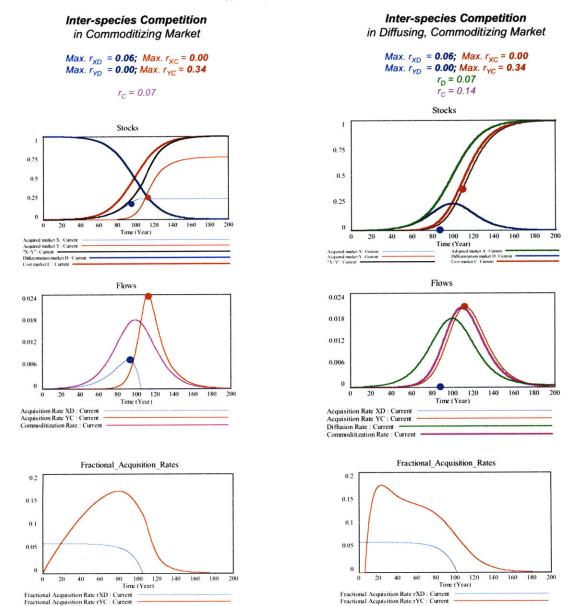

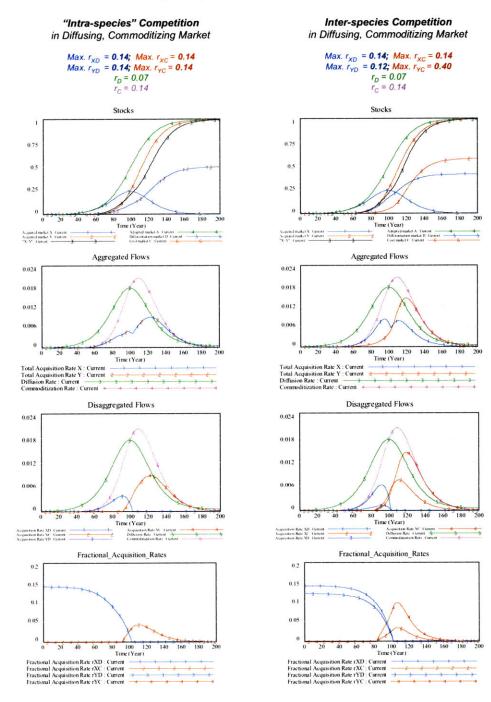

Figure 358: Comparing Dynamic Behavior of Inter-species Competition in a Commoditizing Market and a Diffusing, Commoditizing Market

As can be seen, when we let the Adopted market A diffuse (in the right column of figures), the D market no longer starts out large, and in fact is too small (given the parameters) for X to grow. Competitor Y no longer takes 75% of the market (left), now it takes 100% of the market.

Next, we compare a case where two identical "intra-species" competitions in a diffusing, commoditizing market with to subtly different inter-species" competitors, having different growth capabilities in different niches, as shown in Figure 359 below. Again note, that even subtle differences in parameters can cause late "entry" and early "exit".

Figure 359: Comparing Dynamic Behavior of Intra-species and Inter-species Competition in a Diffusing, Commoditizing Market

Finally, we explore the more general condition of inter-species competition in diffusing, commoditizing markets, where the Fractional Acquisition Rates can be a nonlinear function of the available market as is shown in Figure 360 below. In fact, in this exploration, we do not restrict X growth to niche D only, nor do we restrict Y growth to niche C only.

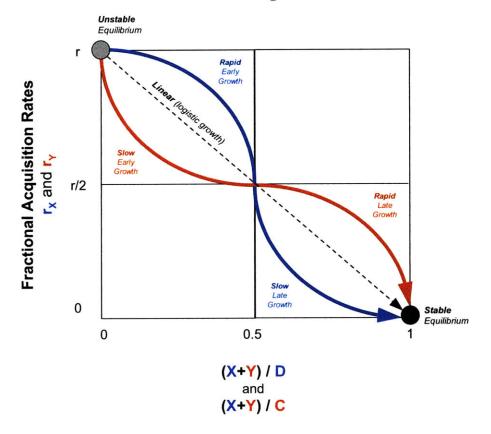

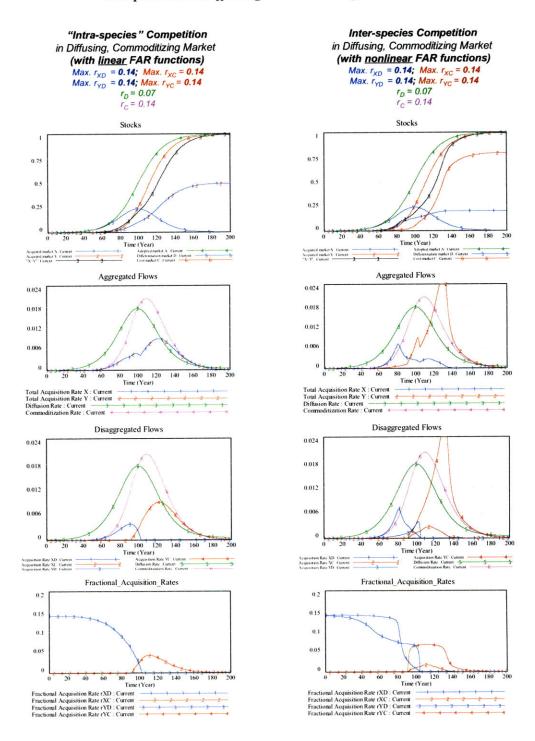

Figure 360: Fractional Acquisition Rates of Inter-species Competition in a Diffusing, Commoditizing Market

First we compare homogeneous intra-species competition in a diffusing, commoditizing market having identical linear Fractional Acquisition Rate functions, with inter-spacies competition having identical maximum FARs in each niche, however, having different shaped functions. The dynamic behavior is shown in Figure 361 below.

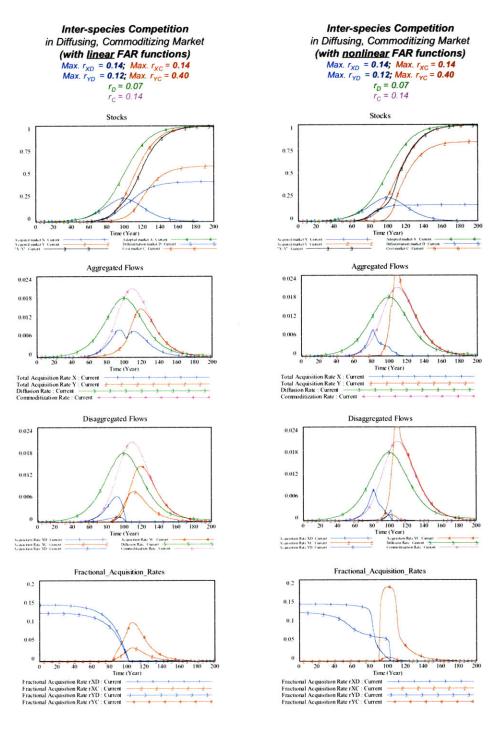

Figure 361: Comparing the Dynamic Behavior of Intra-species Competition and Inter-species Competition in Diffusing, Commoditing Markets

As can be seen on the left, identical intra-species competitors split the diffusing, commoditing market equally, as is to be expected. However, just by changing the growth profiles of each competitor, without changing the maximum Fractional Acquisition Rates, results in late-entry of Y, and early exit of X, with Y taking 75% of the market.

Finally, when we compare inter-species competition on the basis of varying Maximum FARs only with inter-species competition on the basis of varying Maximum FARs plus nonlinear, "mass-dependent" FARs, we see an even more exaggerated difference in dynamic behavior as illustrated in Figure 362 below.

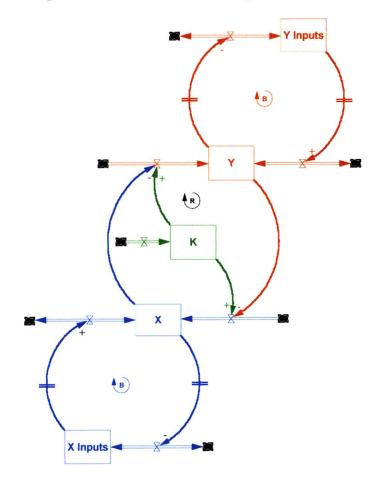

7.5 Advanced Topics

7.5.1 Firm-sector Topics

7.5.1.1 Oscillation: Demand and Supply Lags

Until now, we have considered only the acquiring of market, which implies the winning of sales or orders. This quantity may be considered to equate to a firm's production output, assuming that there are no time delays or lags between market demand and firm supply (or conversely firm demand for revenues and market supply of revenues). A new causal structure is now required which explicitly captures the equilibrating of demand and supply – a balancing loop. If such delays do exist and are large enough relative to the dynamics under consideration, they can result in an oscillation mode of behavior which is superimposed onto the underlying growth modes that we have already discussed. In addition, additional reinforcing feedbacks may exist between the markets of demand and supply which can act to amplify any oscillatory behavior. Figure 363 below illustrates the conceptual model of oscillation.¹⁰¹¹

Figure 363: Conceptual Model Structure of a Single Firm Growth and Oscillation

¹⁰¹¹ Based on Sterman (2000).

7.5.1.1.1 Single Firm Experiencing Undamped Oscillation

Figure 364 below illustrates the causal structure of this linear *second*-order formulation, which results in *undamped* oscillation of the firm's production output.

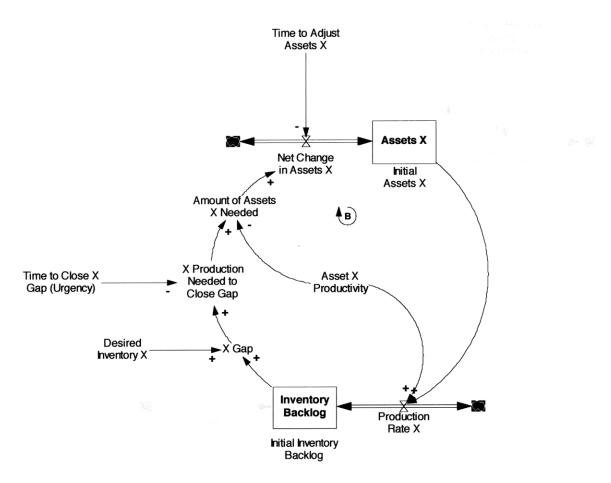

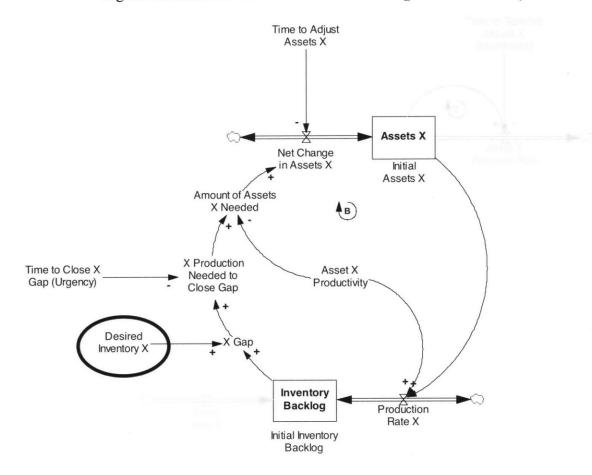

Figure 364: Model Structure of a Single Firm Undamped Oscillation

As can be seen, the causal structure forms a closed-loop structure, with balancing feedback. The presence of an second stock accumulating time delays causes oscillation of the system.

In the following sections, to better understand the model, we will explore the dynamic behavior of this model via parametric analyses of Goal Setting (of desire inventory) and of Asset Productivity.

7.5.1.1.1.1 Parametric Study of Goal-Setting

Next we exlopre the effects of goal-setting. The specific part of the model structure which we will investigate is the desired inventory as shown in Figure 365 below.

The dynamic behavior is shown in Figure 366 below. As can be seen, decreasing the goal (moving down the figures) decreases the amplitude of oscillation of both stocks of inventory (left hand column) and assets (right hand column), without changing its period or damping. Note that the two stocks of Inventory and Assets are out of phase, not unlike displacement and velocity in a pendulumn.

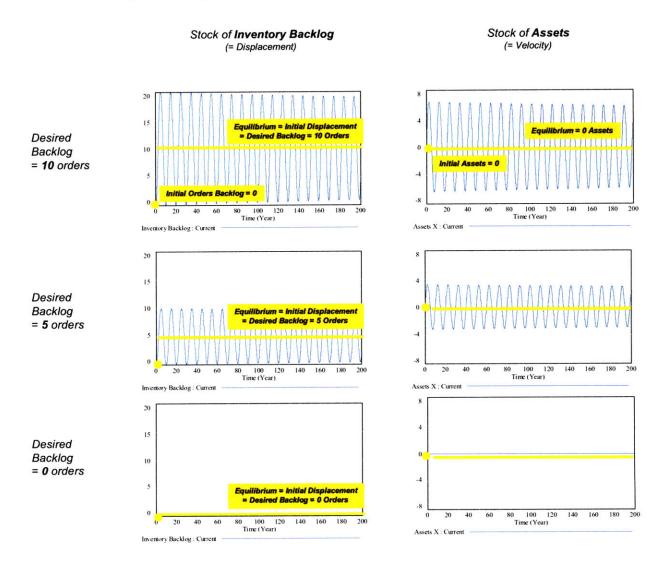

Figure 366: Dynamic Behavior of the Goal-Setting Parametric Study

7.5.1.1.1.2 Parametric Study of Productivity

Next we exlopre the effects of productivity. The specific part of the model structure which we will investigate is the asset productivity as shown in Figure 367 below.

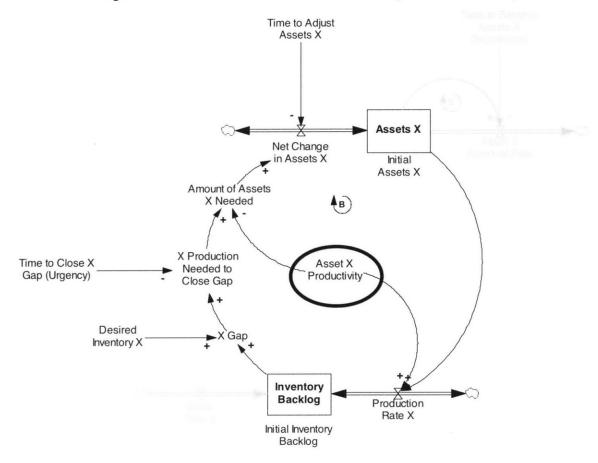

Figure 367: Model Structure of the Productivity Parametric Study

The dynamic behavior is shown in Figure 368 below. Note that if the asset productivity increases (going downward through the figures), then firm X can product the same amount (i.e. Stock of Inventory Backlog in the left hand column) with fewer assets (right hand column). Again, note that the two stocks of Inventory and Assets are out of phase, not unlike displacement and velocity in a pendulumn.

Changing the asset productivity does not affect the period or damping, just the amplitude of the stock of assets.

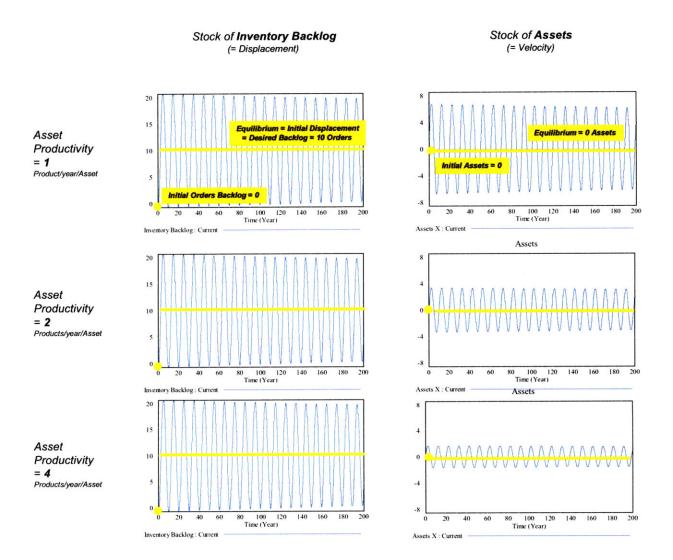

Figure 368: Dynamic Behavior of the Productivity Parametric Study

7.5.1.1.2 Single Firm Experiencing Damped Oscillation

Figure 369 below illustrates the causal structure of this linear *second*-order formulation, which results in damped oscillation of the firm's production output.

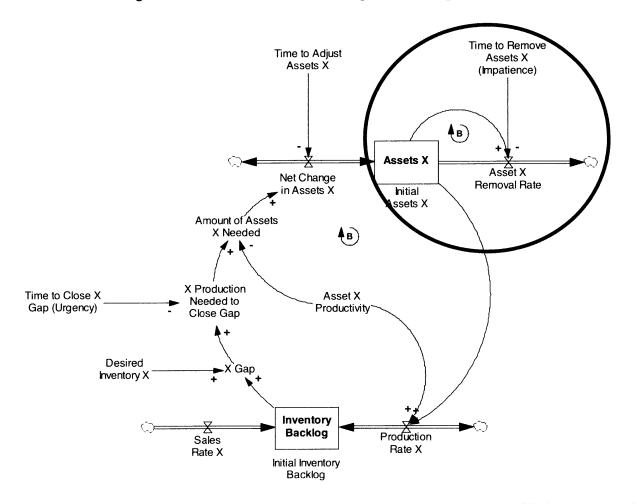

Figure 369: Model Structure of a Single Firm Damped Oscillation

Previously, we saw that a balancing loop with a delay resulted in oscillation. Here the additional outflow on the stock of assets, acts to potentially remove energy from the system, via damping. The more patient the enterprise architecture, the shorter the time to remove Assets, the larger the outflow. This effectively turns off the demand-supply balancing loop so that Sales Rate = Production Rate.

The dynamic behavior of this causal structure is shown in Figure 370 below, where we compare a range of responses from undamped (top) to highly damped (bottom).

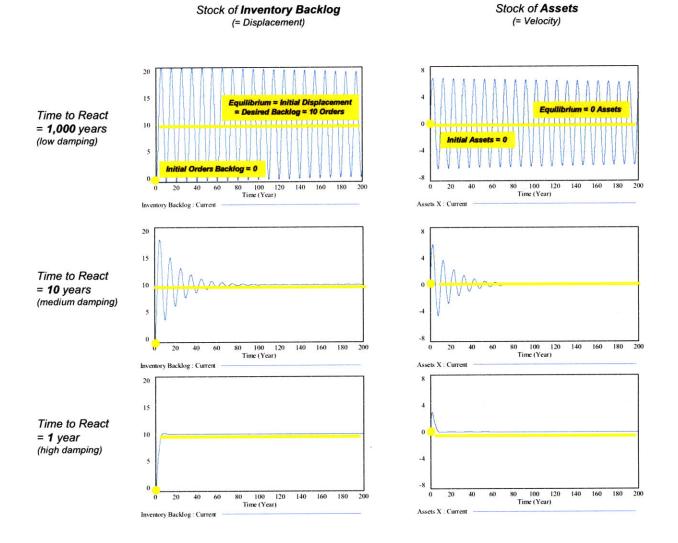

Figure 370: Dynamic Behavior of Damping in an Oscillating System

7.5.1.1.3 Single Firm Experiencing Growth and Damped Oscillation

Figure 371 below illustrates the causal structure of this linear *second*-order formulation, which results in logistic growth of the firm's market acquisition and oscillation of the firm's production output. In the firm *growth* portion of the model, the presence of only an inflow on the stock of acquired market (which is controlled by both reinforcing and balancing loops) results in firm growth only. In the *oscillation* portion of the model, however inflows and outflows on the stocks of both the assets and inventory results in a balancing loop with a delay – the structure responsible for producing the behavior or oscillation.

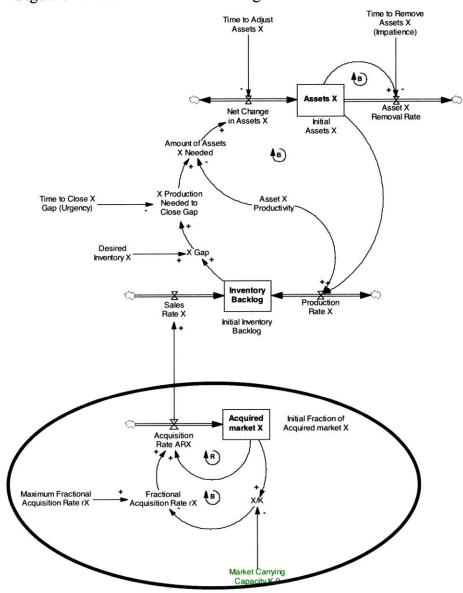

Figure 371: Model Structure of a Single Firm Growth and Oscillation

Finally, we compare the dynamic behavior of firms experiencing long term (e.g. 100 year) market growth, which serve that demand with medium term (e.g. 10 year) oscillatory cycles, as shown in Figure 372 below.

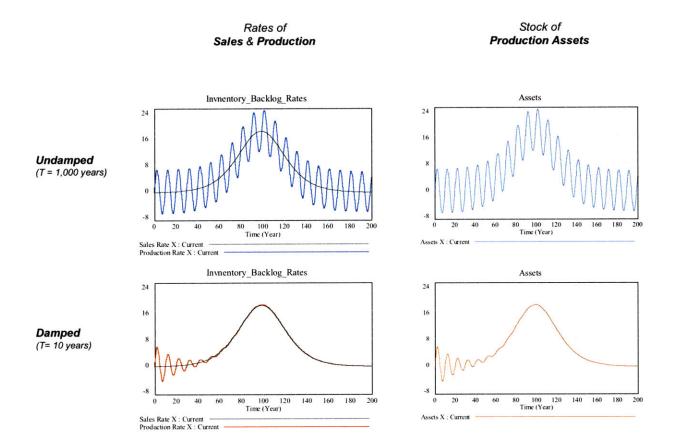

Figure 372: Comparing Damping in Firm Growth with Oscillation

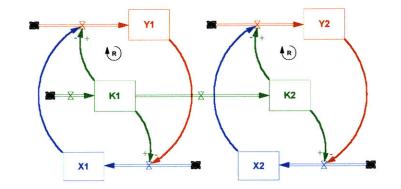

7.5.2 Market-sector Topics

7.5.2.1 Market Diffusion and Obsolescence

Having described earlier how markets *grow* in the model of market *diffusion*, we now begin to describe how markets "*die*" or are substituted for by new technologies in a model of market *obsolescence*. Clearly, this an ambitious task, as the origins of radical innovation are generally seen to be random at best, the causes are undoubtedly exogenous to our current parsimonious model, and the resulting dynamic behavior described as "discontinuity". Given this, we will begin to lay the foundations for such a model by building from the endogenous model presented thus far.

Figure 373 below illustrates the conceptual model, whereby one market K_1 (which is supplied by the species X_1 and Y_1) gives way to a subsequent market K_2 (which is supplied by the species X_2 and Y_2).

We will now focus however on how market K_1 diffuses and is subsequently rendered obsolete by market K_2 . Previously in the diffusion model, the Potential market P diffused into the Adopted market A in a logistic manner, controlled by both a balancing and reinforcing loop. Now, we add another stock, L representing the Lost market. In this way we have now gone from a two-stock model where the entire Potential market P eventually becomes Adopted market A (which is akin to the SI model of *chronic* infectious diseases, where the entire population eventually gets infected) to a three-stock model where the Adopted market A may not realize its full potential P (which is akin to the SIR model of *acute* infectious diseases, where the entire population may not become infected).

Next, we must define the causal structure that controls the *obsolescence* rate from Adopted market A to Lost market L. Here we could model a single balancing loop on the outflow of Adopted market A, which would generate exponential deacay in A, with rapid initial losses (i.e. it does not take time for the new market to gain momentum). Or conversely, we could model balancing and reinforcing loops as was modeled in the P-A diffusion model, which would generate logistic decay in A (i.e. it takes time for the new market to gain momentum).

7.5.2.1.1 Three-loop Representation (S-I-R)

First, we represent obsolescence as a simple balancing loop on the outflow of the Adopted market, A. This formulation is similar to the S-I-R model of *acute* infectious diseases. Figure 374 below compares the model structures and dynamic behaviors of the two-stock diffusion and three stock, one-loop diffusion-obsolescence models. As we can see, the behavior of the stock of Adopted market, A is not symmetric. As we will see when we compare this model to one in which an additional reinforcing loop is added, this formulation represents a rather severe exodous from the Adopted market, A as there is no feedback reducing the fractional substitution rate, r_s .

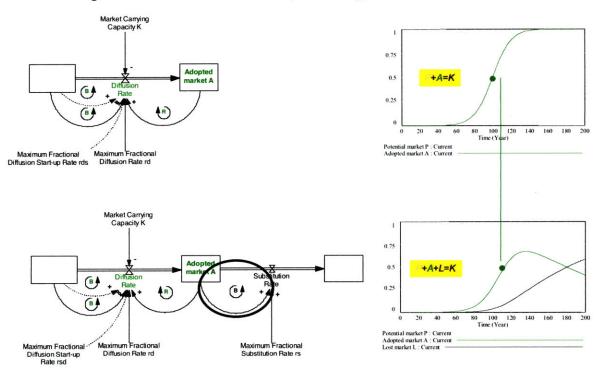

Figure 374: Market Diffusion & (Three-loop) Diffustion-Obsolescence

In Figure 375 below, we present a parametric study of the relative effects of maximum fractional diffusion rates r_d and maximum fractional substitution rates r_s . As can be seen, there exists a "tipping point", or a critical ratio of maximum fractional diffusion rate r_d to maximum fractional substitution rate r_s , where the balacing loops dominate the reinforcing loop, which acts to inhibit the development of the Adopted market, A.

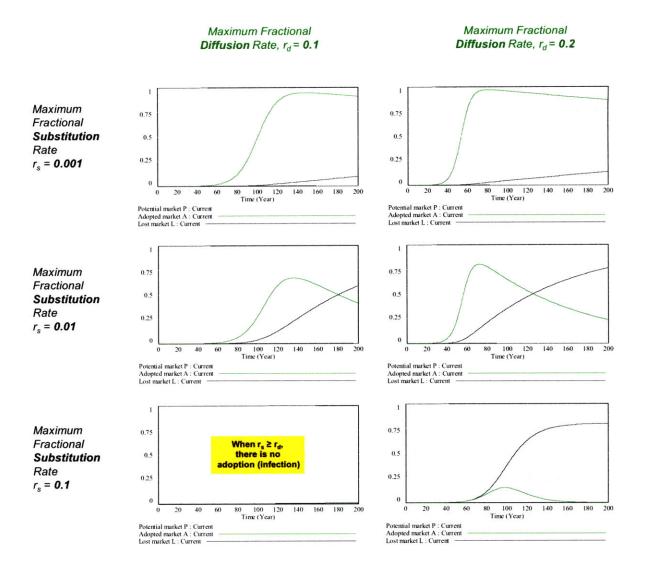

Figure 375: Parametric Analysis comparing Diffusion and Substitution Rates

7.5.2.1.2 Four-loop Representation (Single Bass)

Next, we represent obsolescence as a balancing loop on the outflow of the Adopted market, A plus a reinforcing loop on the Lost market, L. (Note, however that we do not avoid the "start-up problem" with a Bass formulation, this will be demonstrated in the following section.) Figure 376 below compares the model structures and dynamic behaviors of the two-stock diffusion and three stock, two-loop diffusion-obsolescence models. As we saw when we compared this model to one without the additional reinforcing loop, this formulation represents a less severe exodous from the Adopted market, A as there is now feedback reducing the fractional substitution rate, r_s .

Market Carrying 0.75 Adopted 0. market A Dif • Rate 0.25 (.) 100 120 Time (Year) 140 160 180 ential market P : Curren Maximum Fractional Maximum Fractional Adopted market A : Current Diffu Diffusion Start-up Rate rds sion Rate rd Market Carrying Cap city K Initial Lost market L Fraction 0.75 Adopted market A 0.5 Diffusion Sub • 0.25 0 (R) 6 180 20 40 60 80 100 120 140 Time (Year) 160 200 Potential market P : 0 Adopted market A : 0 Fost market L : Curr Maximum Fractional actiona Start-up Rate rsd Substitution Rate rs Diffusion Rate rd

Figure 376: Market Diffusion & (Four-loop) Diffustion-Obsolescence

In Figure 377 below, we present a parametric study of the relative effects of maximum fractional diffusion rates r_d and maximum fractional substitution rates r_s . Note, the maximum fractional substitution rates r_s are an order of magnitude faster than presented in the one-loop model. Note that as the maximum fractional substitution rates r_s increases, the peak Adopted market, A reduces and occurs earlier in time.

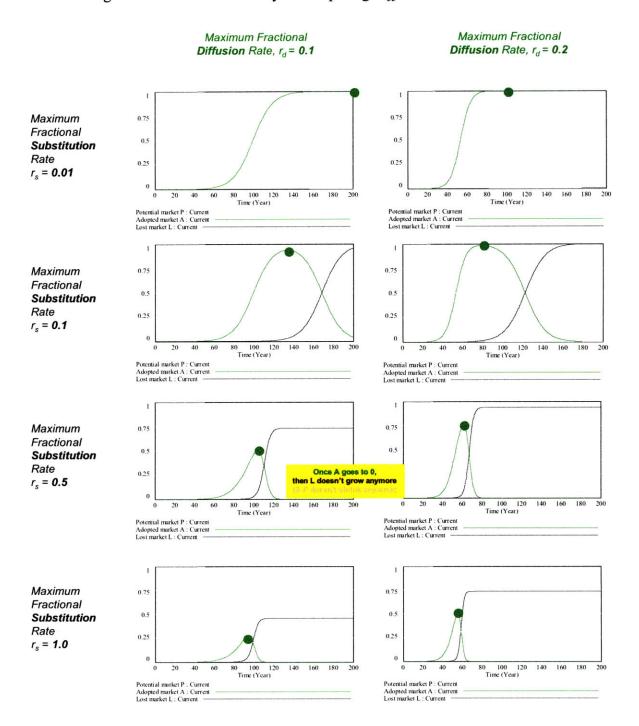

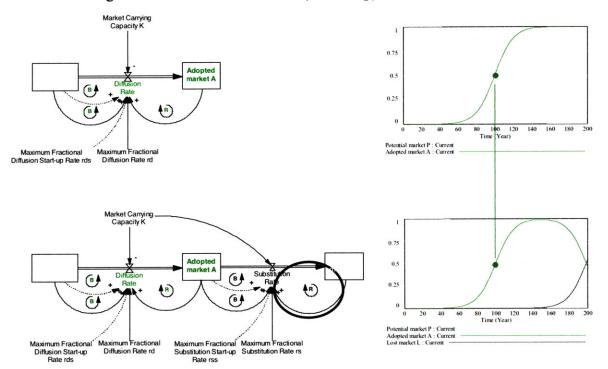

Figure 377: Parametric Analysis comparing Diffusion and Substitution Rates

7.5.2.1.3 Four-loop Representation (Double Bass)

Finally, we represent obsolescence as a balancing loop on the outflow of the Adopted market, A plus a reinforcing loop on the Lost market, L. Now, however that we avoid the "start-up problem" with a Bass formulation. Figure 378 below compares the model structures and dynamic behaviors of the two-stock diffusion and three stock, two-loop (Bass) diffusion-obsolescence models. Again, as we saw when we compared this model to one without the additional reinforcing loop, this formulation represents a less severe exodous from the Adopted market, A as there is now feedback reducing the fractional substitution rate, r_s .

Figure 378: Market Diffusion & (Four-loop) Diffustion-Obsolescence

In Figure 379 below, we present a parametric study of the relative effects of maximum fractional diffusion rates r_d and maximum fractional substitution rates r_s . Again note, the maximum fractional substitution rates r_s are an order of magnitude faster than presented in the one-loop model. Note that as the maximum fractional substitution rates r_s increases, the peak Adopted market, A reduces and occurs earlier in time. As expected, there are no significant differences in the dynamic behavior of the models with or without a Bass start-up, there is merely a difference in theorical justification.

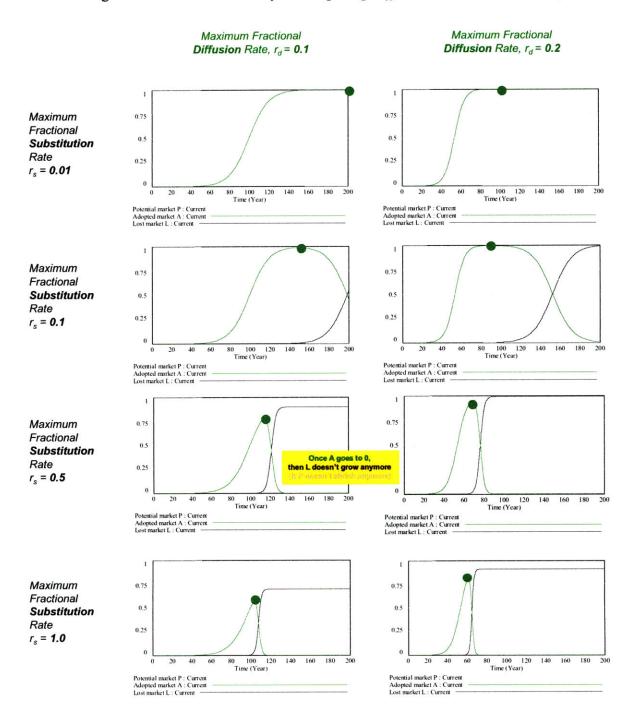

Figure 379: Parametric Analysis comparing Diffusion and Substitution Rates

7.5.2.1.4 Summary of Parametric Study

Finally, Figure 380 below summarizes the comparison of the three causal structures of market diffusion and obsolescence that we presented previously.

Figure 380: Summary of Model Structures of Market Diffusion and Obsolescence

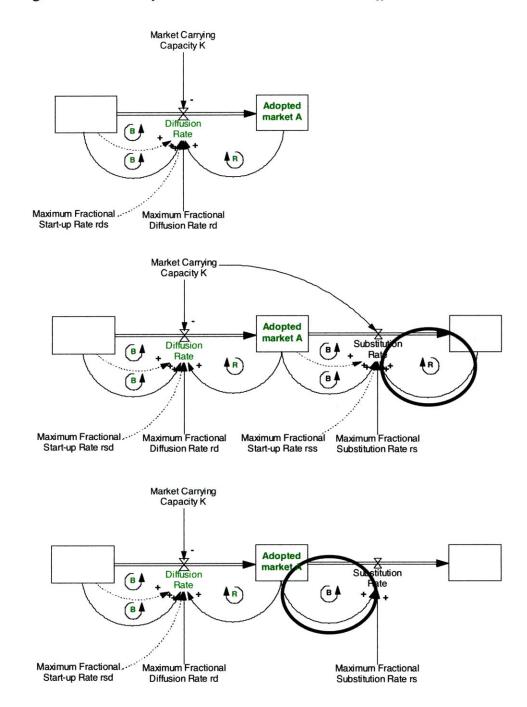

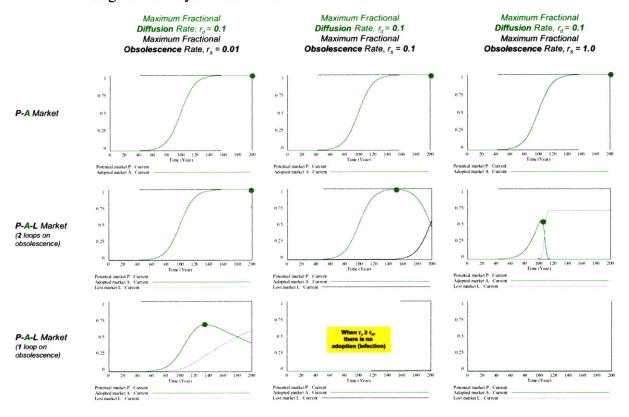

Figure 381 below illustrates the dynamic behavior of the model structures under the parameters of varying fractional diffusion and obsolescence rates. As can be seen, the two loop obsolescence structure begins to limit the peak size of the Adopted market A (relative to the P-A model), while the balancing loop only obsolescence structure is much more severe on A, as it can prevent A's emergence entirely.

7.5.2.2 Overshoot and Collapse: 200-year Global Market

Previously, in the market diffusion model, we assumed the scenario of a new product/service that either:

1) diffuses logistically throughout a constant population of potential consumers (Bass, 1969), or

2) diffuses instantaneously through a logistically-growing population of potential consumers (Verhulst, 1838), or

3) some combination of the two.

Since the world population of potential adopters for a specific global product produced by global suppliers (e.g. commercial airplanes or automobiles) is not constant over the evolutionary times scales of interest (e.g. 1900-2100), we need to capture the growth (and possible decay) of this population. One can then combine a bass diffusion of a technology into a population of consumers, which itself is diffusion into its own environment (the earth) having its own ecosystem carrying capacity. Figure 382 Below illustrates the dynamic behavior of two scenarios of complex system dynamics model (Meadows et al., 1972, 1992, 2004) which illustrates the population and industrial growth from 1900-2100.

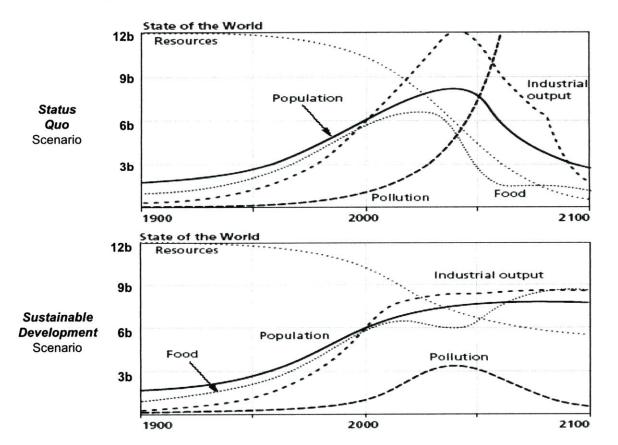

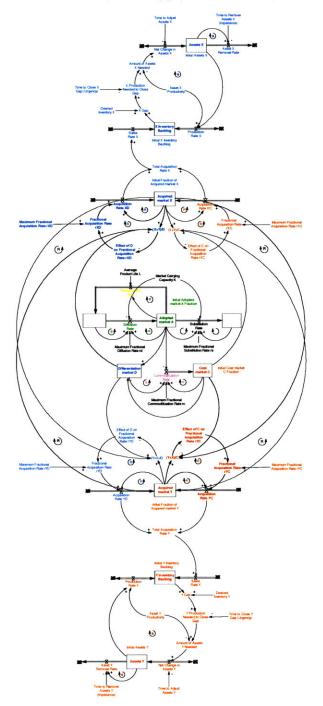

Figure 382: Global Carrying Capacity into which Global Technologies Diffuse

7.5.3 Summary

Having defined various firm and market (organization and environment) interaction sector models, we can now summarize the model as shown in Figure 383 below.

Figure 383: Full Model Structure of *Inter*-species Competition in a *Diffusing, Commoditizing* Market (with Supply-Demand Lags)

Chapter 8 Summary and Conclusions

8.1 Framework Summary

Chapters three to six described the four constructs and potential linking propositions, which form the basis of the theoretical framework. Chapter seven attempted to bring mathematical clarity to the expression of the framework, with *quantitative* modeling to demonstrate how evolution of business ecosystems might work. This chapter is a *qualitative* summary of the theoretical framework.

The theoretical framework endogenously traces the evolution from its system properties of *fit*, *form* and *function* (or *ecology*, *morphology* and *physiology*) using the evolutionary processes of *variation*, *selection* and *retention* as shown in Figure 384 below.

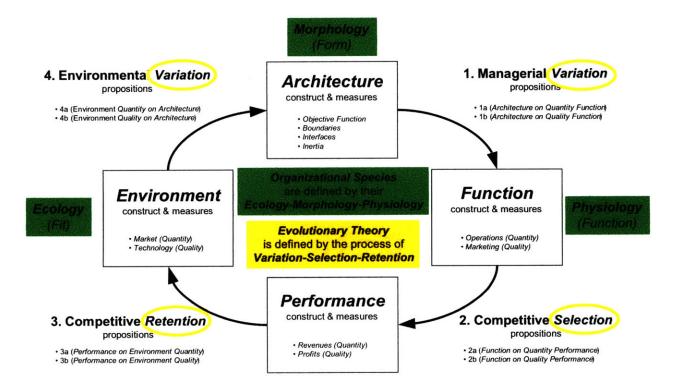

Figure 384: Summary of the Theoretical Framework as *Evolutionary Ecology*

The framework decomposes and characterizes the evolution of business ecosystems along two dimensions: market quantity (what type), and technological quality (what type), as shown in Figure 385 below.

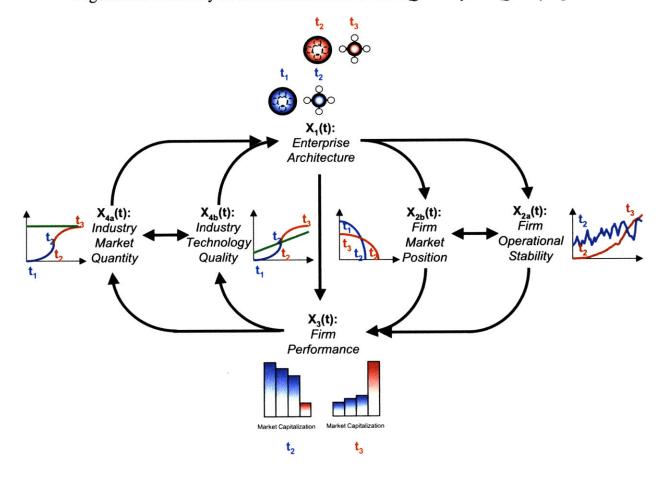

Figure 385: Summary of Theoretical Framework in Quantity and Quality Space

We now show each loop separately, with quantity in Figure 386 and quality in Figure 387 below. Figure 386: Theoretical Framework in *Quantity* Space

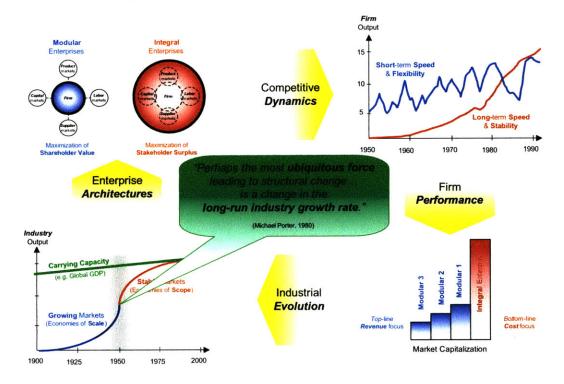

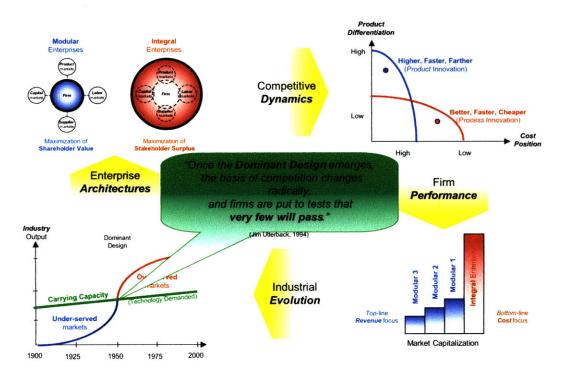

Figure 387: Theoretical Framework in Quality Space

In Figure 388 below, the path of evolution is traced longitudinally, mapping out the first half of the "double helix" corresponding to the *growth* phase of an industry's development.

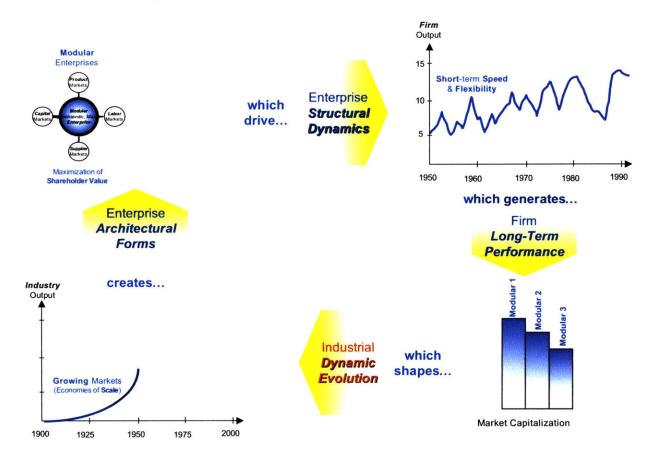

Figure 388: Growth Phase of the Industry-Firm Evolution

In Figure 389 below, the path of evolution is traced longitudinally, mapping out the second half of the "double helix" corresponding to the *maturity* phase of an industry's development.

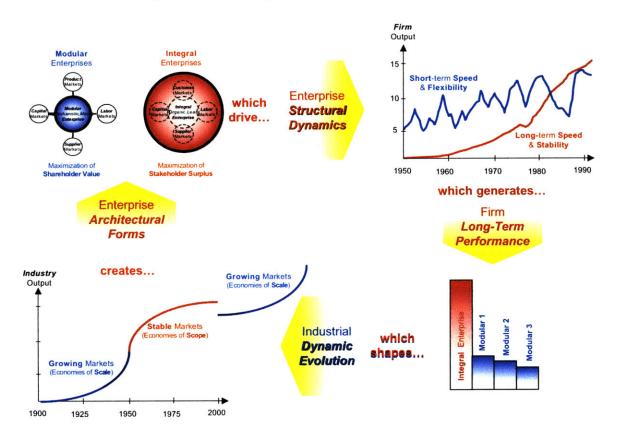

Figure 389: Maturity Phase of the Industry-Firm Evolution

The previous two figures can be combined into one figure, which traces out a "double helix" as shown in Figure 390 below.¹⁰¹²

 $^{^{1012}}$ The notion of "double helix" is borrowed from Fine, C.H. (1998).

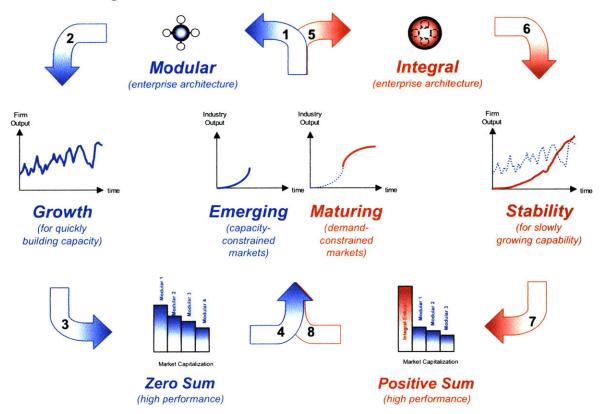

Figure 390: The Two-Phase Framework as a "Double Helix"

Again, returning the design theory metaphor in the design of an enterprise to win a motor sport race, one can see how the two-phase framework produces a double helix as shown in Figure 391 below. At first, exponentially-growing markets are those whose rate of change of output (i.e. speed) are increasing each time period. This is like a fast, smooth racetrack. The architectural form is therefore simply an enterprise that has high speed and low torque, like a racehorse (or hare, to use a literary metaphor). The actual execution of this concept takes the reality of a racecar – well-suited to the racetrack. In order to win in this environment, to capture the most of rapidly-growing markets, one must design, build and operate a system or enterprise that can move fast.

Subsequently, after much racing, the racetrack begins to slow down, either endogenously as the competing cars wear down the surface and deposit tire debris, or exogenously as the rain and other elements outside the control of the competitors begin to turn the racetrack into a mud bog. This will create the second half of the industrial S-curve, in which the market is no longer exponentially-growing, but is now saturating. The rate of change of output (i.e. speed) is now decreasing with each time period. The architectural form best suited to this environment is simply an enterprise that has low (short-term) speed and high torque, like an ox (or tortoise, to use the literary metaphor). The actual execution of this concept takes the reality of a tractor. In order to win in this environment, to capture the most of saturating markets, one must design, build and operate a system or enterprise that can move slowly but powerfully.

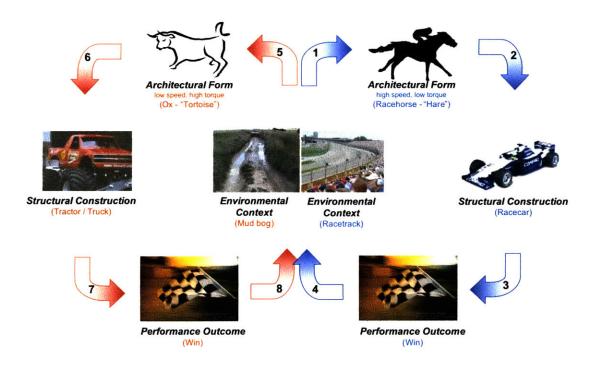

Figure 391: Conceptualization of the Two-Phase Framework as a "Double Helix"

Fine (1998) put forth an interesting and compeling causal mechanism - known as the "double helix" - relating how industries evolve (or integrate and disintegrate) over time. The research herein complements Fine's original work, in focusing the research lens not on a collection of industries or value chain, but rather on a single industry as firms enter and exit.

8.2 Theory Evaluation

Phil Rosenzweig (2007) offers a compelling list of nine "business delusions" which not only plague managers, but research in management. The following is a brief description of each followed by a brief explanation of how the theory presented herein attempted to mitigate the delusions.

8.2.1 The Halo Effect

The halo effect refers to the tendency to make inferences about specific traits on the basis of a general impression. For example, when a company appears to be successful, most, if not all of its attributes (e.g. leadership, culture, strategy, operations) are deemed to be successful as well – it can do no wrong.

In order to counter this, the logic of this research endogenously builds and destroys "halos" over long time horizons. Not every aspect of a successful firm needs to be successful, and the firms success raises and falls over time, endogenously, without changing theories to explain both phenomena.

8.2.2 *The Delusion of* Correlation and Causality

Correlation is relatively easy to demonstrate, while causality is rather more difficult, especially, when in most complex systems the causality is bi-directional.

In order to counter this, this research uses circular, closed-loop feedback logic, with co-evolution of the organization and its environment.

8.2.3 *The Delusion of* Single Explanations

Most theories emphasize one causal link, whereas in most complex phenomena, multiple, concurrent causes are interacting and equally important.

In order to counter this, this research uses multiple, concurrent causality, highlighting the two broad dimensions of quantity and quality in the characterization of the environment and the organizations within it.

8.2.4 *The Delusion of* Connecting the Winning Dots

Searching for what a group of successful companies have in common, will not yield compelling causal mechanisms unless they are compared with less successful companies.

In order to counter this, this research compares pairs of successful and unsuccessful companies over time. Clusters of incumbent (now modular) companies are compared with clusters of their challenger (now integral) companies over time.

8.2.5 The Delusion of Rigorous Research

Low quality data, no matter how high the quantity will yield low quality theories.

In order to counter this, this research uses multiple methods and triangulates over stakeholder space and time to secure high quality data.

8.2.6 The Delusion of Lasting Success

Almost all high-performing outliers regress to the mean over time.

In order to counter this, this research explains the rise and fall of high-performing companies.

8.2.7 The Delusion of Absolute Performance

Company performance is relative to its rivals, not absolute.

In order to counter this, this reseach explains why high-performing companies both can improve and simultaneously lose relative to their rivals.

8.2.8 The Delusion of the Wrong End of the Stick

Noting that focused or committed companies outperform flexible companies, does not factor in the relatively high risk of these strategies. When numbers of firms in each category are included, a different conclusion may be drawn.

In order to counter this, this research explains how a large number of Foxes (or r-strategists) and a small number of Hedgehogs (or K-strategists) can dominate an industry at different phases of its evolution.

8.2.9 The Delusion of Organizational Physics

Business organizations are so complex, that their performance can't be predicted with the certainty of deterministic physics.

In order to counter this, this research is a theory of chaos: deterministic order within stochastic "orbits."

8.3 Further Research

"Now this is not the end. It is not even the beginning of the end. But it is, perhaps, the end of the beginning."¹⁰¹³

8.3.1 Past Empirical Case Studies

Few empirical studies have attempted to define and measure enterprise architectures, and none have done so longitudinally. One notable exception is Schilling and Steensma (2001), which tests previous theory of organizational modularity Schilling (2000). Schilling and Steensma first define modular organizational forms as those which empirically possess greater contract manufacturing, alternative work arrangements and alliances. They then demonstrate that in a wide range manufacturing industries, modular organizational forms flourish when supply and demand are heterogeneous, particularly in the presence of industry standards, technological change and competitive intensity.

"In many industries, integrated hierarchical organizations have been replaced by **nonhierarchical** entities that are permeable, interconnected and modular. Other industries, however, maintain relatively high levels of integration. We use the logic of general systems modularity to explain why in some industries there is greater use of modular organizational forms, including contract manufacturing, alternative work arrangements, and alliances, than in other industries. This model was tested using data from 330 U.S. manufacturing industries."¹⁰¹⁴

Their description of modular organizational forms as: "nonhierarchical entities that are permeable, interconnected" as well as their chosen measures of: greater contract manufacturing, alternative work arrangements and alliances might ironically refer to what we describe herein as late entrant integral enterprise architectures. Their paper seems to describe how incumbent integral enterprise architectures disintegrate towards more modular enterprise architectures.

The following is a brief critique of Schilling and Steensma (2001) relative to our research efforts.

- 1) It is one of the few papers that attempts define and measure "organizational modularity" empirically.
- 2) It deomonstrates which industries (as specified by their heterogeneity of supply and demand) are likely to have more modular organizations.
- 3) It is not explicitly longitudinal, and therefore does not demonstrate "disintegration" or "modularization". It only infers such disintegration in that "integrated hierarchical organizations have been replaced by entities that are modular". By replace do they imply disintegration or replacement through changing mortality and founding rates?
- 4) It doesn't have firm performance as a dependent variable. Therefore although it attempts to explain the conditions under which modular organizations exist, it doesn't explicitlyly demonstrate whether or not they are the high or low performing firms. For example, a late entrant integral enterprise architecture like *Toyota Motors* or *Southwest Airlines* could be outperforming the population of modular competitors.

8.3.2 Future Empirical Case Studies

While the present study has been confined to three pairs of incumbent-challenger companies in as many industries (*GM-Toyota, United-Southwest, Boeing-Airbus*), future research on industries representing extremes of the enterprise architecture typology may include those shown in Figure 392 below, where enterprise architectural differences may account for more variance in long-term firm performance than merely that associated with differences in strategy or operations.

Integral Modular **Enterprise Architecture Enterprise Architecture** Product narkets Product markets Labor Capital Capital Labor Firm Firm narkets markets market narkets Supplie Supplie narkets Lkhd. McD. Boeing Airbus Bombardier Embraer Ford GM Chrysler Daimler/Chrysler Honda Nissan Toyota (1990s) Lufthansa Singapore Southwe United British Jet Blue Airlines Airways Airlines Airways Airlines **IBM** Dell FedEx UPS Walmart Costco Hershevs Mars

Figure 392: Future Empirical Case Studies

Examples of existing research which can be used to test, refine and extend this framework include:

- Fiat and Alpha Romeo. Locke, R.M. (1992).
- Microsoft. Cusumano & Selby (1995)
- Honda and Nissan. Sako, M. and Helper, S. (1998).
- Chrysler. Dyer, J. (2000).
- Lufthansa and British Airways. Lehrer, M. (2001).
- Singapore Airlines. Heracleous, L., Wirtz, J., and Pangarkar, N. (2005).
- John Deere, William J. Holstein, (Strategy+Business) Booz Allen Hamilton Inc., (2008).

Examples of companies include:

Automotive Industry:

• *BMW & Porsche*: early entrant (to the automobile industry) integral explorers, moving from niche to niche.

Airline Industry:

- *People Express:* a late entrant r-strategist (with initial aspirations for integral enterprise architecture, but rapidly disintegrating / modularizing)
- British Airways vs. Singapore/Virgin Atlantic: late entrants
- *RyanAir*: a late entrant r-strategist, modular exploiter focused on the mass market).

Airplane Engine Industry:

• *General Electric*: An early entrant integral-turned-modular exploiter moving from niche to niche and from field to field. Now possibly attempting re-integration? Note that *GE/Snecma* appears to be late-entrant integral.

Computer Industry:

- *Apple:* an early entrant (to the PC hardware & software industry) integral explorer focused on niches.
- *Dell:* a late entrant (to the PC hardware industry) modular exploiter focused on the mass market.
- *Microsoft:* an early entrant (to the PC software industry) integral explorer-turning modular exploiter focusing on the mass market. Cusumano notes that *Microsoft* has much in common with *Toyota*'s process, not product innovation, etc. This may refer to their genotypic integral forms.
- *Intel:* an early entrant (to the semiconductor industry) integral-turning-modular exploiter focusing on the mass market.

US steel industry:

• US Steel (1901) modular vs. Nucor (1940) integral Global steel industry:¹⁰¹⁵

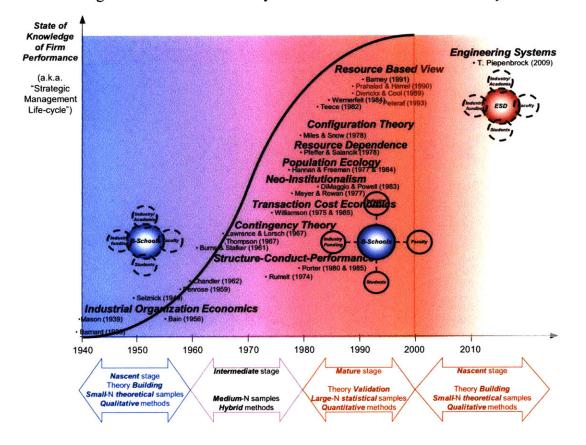

• Mittal: a late entrant (to the steel industry) modular exploiter focused on the mass market.

8.4 Toward a Theory of the Evolution of Research Ecosystems

"While your research project represents the raison d'être of our school – and of all business schools in general – the architecture of our enterprise, to use your lexicon – does not enable, and in fact constrains us to not solve the fundamental problems that are at the core of our disciplines. We have become too disintegrated, too functionally specialized, to short-term... What we will need is an entirely new integral organizal form, lead by a bold, ambitious vision..."

Although the theory presented herein is focused on the evolution of business ecosystems, it can be reflexively applied to a theory of the evolution of research ecosystems, which study business ecosystems. As the intellectual environment of strategic management is in a rather mature state, populated by once integral research organizations (business and management schools) that are now modularized into functional or discipline-based silos, incented toward short-term goals, under contractual arrangements, there are opportunites for new integral organizational forms of research enterprises which are multi-disciplinary, long-term relationally-based, and possess the possibility of radically transforming the competitive landscape in terms of knowledgedevelopment and dissemination, as illustrated in Figure 393 below. I have been privileged to have been a part of such an integral enterprise architecture, in a mature environment.

¹⁰¹⁶ Conversation with anonymous professor.

8.5 Conclusions

"Our hope and intention has not been to state eternal truths, but to focus theoretical and empirical attention on organizational action by stating as forcibly as possible **the need to study organizations in toto** and, for that purpose, the significance of the **open system approach** and the **certainty/uncertainty dimension**."¹⁰¹⁷

The research set out to address the origins and mechanisms of competitive advantage and longterm firm performance from both economic and sociological perspectives, attempting to resolve the micro-macro debates within both fields. The *economic* questions centered on explanation for firm performance residing within the firm or its environment, while the *sociological* questions centered on explanation of strategic choice as resident within the firm (free-will) or the environment (determinism).

In the process, a meta-theoretical framework has been constructed which attempts to link the firm and its environment in a co-evolutionary way, using dual meso-level constructs of *enterprise architecture* coupled with *structuration theory*.

The answer to the above debates appears not to lie either in macro- or micro- explanations, but in an explanation which covers both at different times and for different reasons. In fact, the one place the answer does not reside, is in the middle of the extremes (see Figure 394 below).¹⁰¹⁸

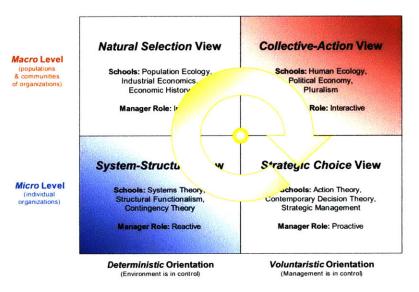

Figure 394: Resolving the Central Debates

This however does not point to a compromise centrist solution. Unlike traditional linear, static, positivist, reductionist thinking which collapses complexity into a neat weighted average "centroid", the framework presented herein takes a nonlinear, dynamic, interpretivist, holistic thinking approach.

¹⁰¹⁷ Thompson, J.D. (1967), pg. 163.

¹⁰¹⁸ This fact is not evident in the figure, as time is not represented.

This dissertation attempted to contribute toward the building of a theory of the evolution of business ecosystems. In the process, it addressed a question that has been posed by evolutionary theorists in the economics and sociology literatures for decades: "Why do firms in the same industry vary *systematically* in performance *over time*?" Seeking a *systematic* explanation of a *longitudinal* phenomenon inevitably required characterizing the evolution of the industrial ecosystem, as both the organization (firm) and its environment (industry, markets and institutions) are co-evolving. This question was therefore explored via a theoretical sample in three industrial ecosystems covering manufacturing and service sectors, with competitors from the US, Europe and Japan: commercial airplanes, motor vehicles and airlines. The research was based primarily on an in-depth seven-year, multi-level, multi-method, field-based case study of both firms in the large commercial airplanes industry *mixed* duopoly as well as the key stakeholders in their extended enterprises (i.e. customers, suppliers, investors and employees). This field work was supplemented with historical comparative analysis in all three industries, as well as nonlinear dynamic simulation models developed to capture the essential mechanisms governing the evolution of business ecosystems.

A theoretical framework was developed which endogenously traces the co-evolution of firms and their industrial environments using their highest-level system properties of *form, function* and *fitness* (as reflected in the system sciences of *morphology, physiology* and *ecology*), and which embraced the evolutionary processes of *variation, selection* and *retention*. The framework captures the path-dependent evolution of heterogeneous populations of enterprise architectures engaged in *symbiotic inter-species competition* and posits the evolution of *dominant designs* in enterprise architectures that oscillate deterministically and chaotically between *modular* and *integral* states throughout an industry's life-cycle. Architectural innovation – at the extended enterprise level – is demonstrated to contribute to the failure of established firms, with causal mechanisms developed to explain tipping points.

This research lies at the intersection of the intellectual domains of strategic management, organization science and complex systems theory. It aimed to contribute to fundamental debates in these fields regarding the sources of superior long-term performance. Specifically, do the sources reside within the firm or in the firm's environment (i.e. industry structure)? What are the roles of managerial adaptation and environmental selection in the creation and sustainment of such performance? Furthermore, how does this shape our understanding of strategic leadership? Our empirical findings suggest that sources of superior firm performance lie neither exclusively within the firm, nor in its industrial environment, but in *how* the firm interacts with its environment – i.e. in the network *architecture* of the firm's extended enterprise. It appears that these enterprise architectures, which both enable and constrain managerial agency and adaptation through spatially and temporally bounded rationality, give rise to architectural inertia and the power of environmental selection, as shown in Figure 395 below. Finally, the data suggest that the qualities of strategic leadership, which maximize firm performance over the industry's evolution, are architectural: namely the definition and maintenance of enterprise objective functions, boundaries and interfaces.

B. Sources of Profitability: Industry vs. Firm

A number of recent empirical studies have attempted to quantify the sources of firm profitability (Hansen and Wernerfelt, 1989; Rumelt, 1991; Powell, 1996; Roquebert et al., 1996; McGrahan and Porter, 1997; Hawawini et al., 2003). These are summarized in Figure 396 below:

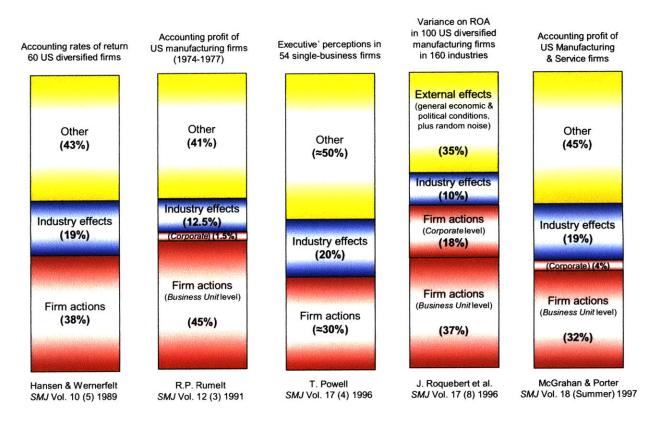

Figure 396: Sources of Firm Profitability: Empirical Studies

C. Placement of Research within the Strategic Management Field

The following table highlights those works (in bold) of the 50 most cited publications in strategic management (Ramos-Rodriguez and Ruiz-Navarro, 2004) that have had the greatest impact on this dissertation.

Of the thirteen most influential works highlighted, four represent the field of economics, and in particular two schools of the resource-based tradition: the "dynamic" school (Penrose, 1959; Dierickx and Cool, 1989) and the evolutionary school (Nelson & Winter, 1982)

The remaining nine represent the field of sociology, particularly the contingency theorist (Burns and Stalker, 1961; Lawrence and Lorsch, 1967; Thompson, 1967) and population ecologists (Hannan and Freeman, 1977, 1984).

D. Literature Review of Mixed Duopoly Economics

The literature on firms with an objective function other than the classical "profit-maximizing" (PM) is recent and sparse, namely 'labor-managed" (LM). Much of it comes from recent work on comparing "mixed" duopoly studies which are summarized in Table 22 below:

Date	Authors	uthors Title		Key Take-away		
1983	Law & Stewart	"Stackelberg Duopoly with an Illyrian & PM Firm."	Cournot- Stackelberg			
1989	Mai & Hwang	"Export Subsidies & Oligopolistic Rivalry Between LM & Capitalist Economies."	?			
1991	Horowitz	owitz "On the Effects of Cournot Rivalry Between Entrepreneurial & Cooperative Firms."				
1991	Stewart	"Strategic Entry Interactions Involving PM and LM Firms."	?			
1991	Stewart	Stewart "Management Objectives and Strategic Interactions among Capitalist and LM Firms."				
1992	Cremer & Crémer	"Duopoly with Employee-controlled & PM Firms: Bertrand & Cournot Competition."	Cournot & Bertrand			
1994	Futagami & Okamura	"Strategic Investment: the LM Firm & the PM Firm."	?			
1995	Delbono & Scarpa	"Upward-Sloping Reaction Functions Under Quantity Competition in Mixed Oligopolies."	Cournot	LM dissuades PM from increasing output by matching - making prices fall.		
1995	Lambertini & Rossini	"Are LM Firms Really Able to Survive Competition with PM Firms?"	Cournot	LM can't survive competition with PM when starting from scratch. It won't enter.		
1996	Neary & Ulph			PM profitability implies LM profitability; not conversely.		
1995	Lambertini "Cournot vs. Stackelberg Equilibria Enterpreneurial and LM Firms."		Cournot- Stackelberg & Bertrand Cournot	PM's lead & LM's follow in Cournot competition. Both follow in Bertrand competit.		
1998	Lambertini & Rossini	1		PM firm under-invests while LM firm over-invests.		
2002	De Fraja & Delbono	5		LM firms can increase social welfare for governments.		

Table 22: Literature Review of Mixed Duopoly Economics

E. Literature Review of System Dynamics Modeling of Firm Competition

System Dynamics has been developed and used over the past 50 years to model complex feedback dynamics in social and socio-technical systems. Many of the early seminal works considered the performance of firms and industries (Forrester, 1961, 1966), however the treatment of competition between firms was not captured explicitly and endogenously. More recent research has begun to explicitly model competition between firms explicitly and endogenously, and of importance to this research dissertation, has begun to model firm heterogeneity. Table 23 below summarizes some of the key research efforts in this area.

SD Model		Competition	Market-	Insights / Summary	
	Industry Types Structure (heterogeneity		How Modeled		
<i>Industrial</i> <i>Dynamics</i> Forrester, 1961	Many competitors, small feedbacks	Homogeneous (Het. discussed) (pg. 336-37, 340- 41)	Not		Oscillation between value chain firms
<i>Market</i> <i>Growth</i> Forrester, 1968	Many competitors, small feedbacks	Homogeneous	Implicitly / Exogenously via benchmark	Delivery delay	<i>Growth</i> failure, even in unlimited market
Sys. Pathology of Organizatns. Hall, 1976	Many competitors, small feedbacks	Homogeneous	Implicitly / Exogenously via benchmark		<i>Growth</i> failure, even in unlimited market
Corporate Planning Lyneis, 1980	Many competitors, small feedbacks	Homogeneous	Implicitly / Exogenously via benchmark	Production, Availability & Price	
B&B Enterprises Paich & Sterman, 1993	Duopoly, large feedbacks	Heterogeneous?	Explicitly / Endogenously	Price & Availability?	Market dynamic complexity defines successful strategy
<i>Duopoly</i> <i>Competition</i> Sice & Mosekilde, 2000	Duopoly, large feedbacks	Homogeneous (pg. 116)	Explicitly / Endogenously	Product quality	Faster reactions lead to limit cycles & chaos
Dyn. of Comp. Industries Kunc & Morecroft, 2004					
<i>Evolution of</i> <i>Industries</i> Kunc, 2004		Heterogeneous? (Differentiated or Low Cost)			
Dyn. of Innov. Industries Weil & Utterback, 2005					Competition is among firms & technologies. Includes firm entry & exit
Getting Big Too Fast Sterman & Henderson, 2007	Duopoly, large feedbacks	Heterogeneous? (Aggressive or Conservative)	Explicitly / Endogenously	Price & Availability? (pg. 9)	Market dynamic complexity defines successful strategy

G. Interview Participants

The Boeing Company

The Boeing Company served as the most encouraging and supportive learning laboratory that one could hope for. I am indebted to those at *Boeing* with whom I have had the privilege to learn along side with. They are listed below alphabetically, grouped according to their informal networks or formal corporate divisions:

- World Headquarters / Corporate Offices
 - Mike Cave (EVP, Strategy and Business Developent), Paul Gray (Board of Directors), Shephard Hill (EVP, Strategy and Business Development).
- Boeing Commercial Airplanes Leadership Team
 - Mike Bair (VP, Business Strategy and Marketing), Dan Becker (VP, Manufacturing; VP Twin Aisle Programs), Scott Carson (VP, Sales; President & CEO), Mike Cave (VP, Airplane Programs; VP, Business Strategy and Marketing), Ray Conner (VP, Sales), Carolyn Corvi (VP 737 Program; VP, Airplane Programs), Jan Fisher (VP, Boeing International), Karen Freeman (VP), Doug Kight (VP, Human Resources), Jim Jamieson (VP, Airplane Programs; COO), Fred Kiga (VP, Government Relations), Jim Morris (VP, Supplier Management), Rob Pasterick (VP, Finance), Nicole Piasecki (VP, Business Strategy and Marketing), Clay Richmond (VP), Jim Schlueter (VP, Communications), Scott Shearer (VP).
- Commercial Airplane Programs Leadership Team
 - Jerry Allyne (VP, Finance), Dan Becker (VP, Manufacturing; VP Twin Aisle Programs), Ross Bogue (VP, 757 Program; VP, Fabrication; VP 747 Program), Carolyn Brandsema, Mike Cave (VP, Airplane Programs), Wade Cornelius (VP, Global Strategy), Carolyn Corvi (VP 737 Program; VP, Airplane Programs), Kris Fellrath (VP, Program Management Office), Jim Jamieson (VP, Airplane Programs), Paula Janson, (VP, Human Resources), Mark Jenkins (VP, 737 Program), Jacki Konesky, David Leonhardi, Larry Loftis (VP, 777 Program), Pat McKenna (VP, 717 Program; VP Fabrication), David Moore (VP, Information Technology), Mike Olszewski, Laura Peterson, (VP, Global Strategy), Sandy Postel (VP, Propulsion Systems; VP Lean Enterprise Office), Steve Schaffer (VP, Supplier Management) Richard Wynne, Bev Wyse (VP, 767 Program), Russ Young (VP, Comunications).
- Airplane Production
 - Carolyn Corvi, Bill Cogswell, Steve Connelly, Saundra Cope, Wade Cornelius, Rich DeLappe, Lindsey Douglas, Diane Easley, Bruce Florsheim, Debbie Gavin, Jon Geiger, Rick Gross, Mike Hersher, Scott Hoge, Kay Lui, George Maffeo, Craig Martin, Carleton Mason, Dave Moore, Sandy Postel, Jennifer Sumner, Steve Thorson

- o 747/767/777
 - Dan Becker, Ross Bogue, Stephen Connelly, Michael Delaney, Debby Kinsley, Jeff Klemann, George Maffeo, Dwight Miller, Atsuo Miyake, Larry Loftis, Dan Mooney, David Moore, Don Morgan, Paul Nuyen, John Quinlivan, Jeff Piece, Bev Wyse
- 0 737/757
 - Mark Jenkins, Jerry Allyne, Lindsay Anderson, Bill Cogswell, Mike Delaney, Peter Doman, Kris Fellrath, Valerie Jensen, Larry Loftis, Candace Lydston, Scott Peiper, Castel Pittman, Marie Western
- o 717
 - Pat McKenna
- Fabrication Division
 - Ross Bogue, Gary Bomhoff, Tony Carolan, John Cornish, Scott Cruikshank, Doug Dahl, Deborah Dustman, Tim Ferris, Jim Frankland, Jon Geiger, Lew Hustead, Pat McKenna, Andy Moskowitz, Liz Otis, Mick Norris, Dave Pickering, Jenette Ramos, Mark Ross, Owen Sakima, Jim Paige, Rielda Savage, Jon Self, Kim Smith, Drea Stoner
- Propulsion Systems Division
 - o Mo Yahyavi, Sandy Postal, Karyl Bartlett
- Supplier Management
 - o Steve Schaffer, Valery Feliberti, Jeff Luckey, Gary Mesick, Ren Nanstad
- Wichita Division (now Spirit Aerosystems)
 - Jeff Turner, Ron Brunton, Don Blake, Dennis Dietz, Tom Greenwood, Carolyn Harms, Marci Johnson, Randy Kysar, John Pilla, Kip Schmidt, Bob Waner, Dan Wheeler
- Engineering / Manufacturing

 Jim Morris, Dan Mooney, Mark Jenks
- Commercial Aviation Services
 - Tim Copes
- Sales
 - Marty Bentrott, Scott Carson, Ray Connor.
- Human Resources
 - Susan Abbott, Susan Andrews, Curt Brusto, Jeannie Denbo, Joelle Denney, Becky Evans, Mel Fortson, Bill Hartman, Rich Hartnett, Terri Hoge, Bruce Jackson, Paula Janson, Doug Kight, Carey McFarlane, BV McGrue, Duane Shireman, Darlene Thomas, Chris Villiers, Teresa Yoneyama.
- Marketing & Business Strategy

- Fariba Alamdari, Rik Anderson, Tony Arvish, Mike, Bair, Lynda Beaumont, Leyla Beyaz, Jim Billing, Debra Blount, Gretchen Bodine, Silke Boettger, Sherry Carbary, Mike Cave, Nina Clancy, Allison Cook, Larry Coughlin, Deb Dollard, Rasheed El-Moslimany, Blake Emery, Bill Epler, Pradeep Fernandes, Uli Fischer, Kent Fisher, Jennifer Haaginson, Devin Harmala, Ralph Heinze, Joel Hennig, DeAnn Henny, Scott Hilton, Mike Hurd, Andy Hutchison, Janice Imrich, Adam Kohorn, Kay Le, Drew Magill, Mitch Mann, Gregory Mars, Rachel Martin/Portillo, Miko Masters, Tim Meskill, George Metcalf, James Mitchell, Dennis Morden, David Nestvold, Brian Norwood, Daniel O'Neill, Brian Pearson, Chresten Petersen, Nicole Piasecki, Anthony Ponton, Andy Price, Sandy Randles, Lora Rennie, Dustin Robinson, Linsey Rubenstein, Ken Sain, Sean Schwinn, John Shen, Wendy Sowers, David Suguro, Tiim Swanson, Tracey Talbott, Rhodri Thomas, Beth Thompson, Brad Till, Jeff VerWey, Mike Wargel, Dave Wenndt, Gary Wicks, David Williams, David Wirth, Mike Woodward.
- Phantom Works
 - Mark Augustyniewicz
- Lean+ / Lean Enterprise Office
 - o Mike Hersher, Sandy Postal
- The Boeing MIT-Leaders For Manufacturing (LFM) Alumni:
 - Dan Allison, Michelle Bernson, Laura Bogusch, Timothy Copes, Larry Coughlin, Valerie Feliberti, Victoria Gastelum, Tom Greenwood, Steve Herren, Charlie Hix, Keith Jackson, Mark Jenks, Eric Kittleson, Adam Kohorn, Steve Llorente, Rasheed El-Moslimani, Erik Nelson, Dan Park, Linsey Rubenstein, Sharon Rykels, Roland Sargent, Mike VanderWel, Dan Wheeler.
- The *Boeing* Career Foundation Program (BCFP):
 - Kate Beale, Annie Beck, Gretchen Bodine, Kirsten Bowen, Alexa Burns, Michael Cram, Mark Cypher, Leann Decker, Carla Deutsch, Meghan Fiore, Mackenzie Fisher, April Garza, Lauren Henriksen, Rae Kang, Art Livermore, Robert Long, Abbey Louie, Rachel Martin, Josh McDonald, Keely McIlwain, Michelle Mulcahy, Chresten Petersen, Lindsay Petersen, Herb Portillo, Dustin Robinson, Ryan Rubenstein.
- Alteon
 - o Sherry Carbary, President
- Shared Services Group
 - o Tim Copes, President

<u>Spirit Aerosystems</u>

• Board of Directors

Ike Evans, Operating Partner of *Thayer Capital*; Richard Gephardt, former congressman from Missouri; Robert Johnson, Chariman of *Honeywell Aerospace*; Ronald T. Kadish, Lieutenant General, U.S. Department of Defense; Jeff Turner, President & Chief Executive Officer, *Spirit Aerosystems*; Nigel S. Wright, *Onex Corporation*; Paul Fulchino, Prseident and Chief Executive Officer, *Aviall, Inc.*; Charles L. Chadwell, retired Vice President and General Manager, *GE Aircraft Engines*; Francis Raborn, Vice President and Chief Financial Officer, *United Defense*; James L. Welch, President and Chief Executive Officer, *Yellow Transportation*.

• Executive Council

Jeff Turner, President & Chief Executive Officer; Ron Brunton, Executive Vice President & Chief Operating Officer; Rick Schmidt, Executive Vice President & Chief Financial Officer; John Pilla, Senior Vice President & Chief Technology Officer; David Walker, Senior Vice President, Sales & Marketing; Gloria Flentje, Senior Vice President, Corporate Administration and Human Resources; J.A. Greenberg, Senior Vice President, General Counsel and Secretary; Buch Buchannan, Senior Vice President / General Manager, Fuselage Segment; Mike King, Senior Vice President / General Manager, Propulsion Segment; John Lewelling, Senior Vice President / General Manager, Wing Segment; D. Carlisle; Vice President / General Manager, Tulsa; N. McManus, Vice President / Managing Director, *Spirit Europe Ltd.*; Carolyn Harms, Vice President / General Manager, Strategic Initiatives.

BAE Systems

• October 2006:

James Baker, Director of Technology and Engineering Services – Shared Services; Sean Bond, Vice-President Aerospace; Chris Clarkson, Technical Director, Future Systems & FOAS – Air Systems; Geoff Grant, Business Unit Vice-President and Program Manager; Steve Greenbank, Supply Chain and Procurement Director, Air Systems; Jim Imrie, Managing Director, Type 45 Destroyer – Naval Ships; John Jarman, Vice-President and Deputy General Manager; Bob Kearley, Policy Manager; William Lenz, Vice-President Engineering; Tony McCarthy, Business Improvement Director, CS&S; Ian McNeeney, Business Director, Support Programmes; Craig Murray, Human Resources Director – Insyte; Paul Perera, Support Services Director – CS&S; Nigel Philpott, Programmes Director – Insyte; Matthew Riddle, Director Survivability; Jim Schoppenhorst, Program Director DDX; Steve Rowbotham, Managing Director, Munitions; Mike Scrimgeour, Legal Director – Operations; Trevor Spearpoint, Vice-President, Mission Success; Andy Start, Managing Director, IFS Defence – CS&S; Mike Thomas, Commercial Director – *Insyte*; Phil Thomber, Comm. and Proc. Director – CS&S; Alan Tough, Finance Director – *Naval Ships*; Nigel Ward, Operations Director – *Submarines*.

• October 2007:

Matt Anderson, Head of Manufacturing Engineering; Nigel Blenkinsop, Director of Integrated Manufacturing - Samlesbury and Warton; Jayne Bryant, Engineering Director - NA Platform Solutions; Dominic Carr, Head of Commerical - Naval Ships; Michael Christie, Prorgramme Director - Training Solutions; Glyn Cragg, CVF Project Director -Submarine Solutions; Jenny Cridland, Head of HR - Business Improvement; Hamish Davidson, Senior Vice-President; Steve Dowdell, ACA Mission System Director -Insyte: Alan Farnworth, Chief Technical Officer - Insyte; Bob Fewings, Project Director FRES SOSI - Strategic Business Development; Stuart Forsyth, Vice-President Tranche 1/MDC - Air Systems; Ed Gelsthorpe, Senior Legal Advisor; Ronald Herzog, Finance Director - North America; Bradley Jacobs, Vice-President, Finance - North America; Sean McGovern, Operations Director - Regional Aircraft; Walt Mueller, C31 Engineering Director; Graeme Ormiston, Finance Director Type 45 - Surface Fleet Solutions; John Osterholz, Vice-President Global Communications & Advanced Networks - Network Systems; Steve Ripp, General Manager, M/S 01-23LL; Jan Robjohn, Business Development Director - Insyte; Amy Shevlin, Director, HR - North America; Jim Unterscher, Vice-President, Programs - North America; John Wall, Vice-President and General Manager, Flight Systems - Sensor Systems; Gregory White, Vice-President Business Management – North America.

• October 2008:

Richard Ashooh, Vice-President, Government Relations, E&S; Charlie Blakemore, Managing Director - Land Systems; Mark Bowers, Director of Human Resources Insyte; Chris Chambers, Sub Vice-President - Sales & Marketing; Jeremy Charmak, Director of Commercial & Procurement; Sam Cole, Vice-President; Malcom Dare, Director of Supply Chain & IT Services - Submarine Solutions; Jim Garceau, Director, US Fixed Wing Programs; James Geraghty, Senior Director - Programs; Dan Gobel, Vice-President and General Manager - Advanced Platform Electronic Warefare Systems; Neil Graham, Director of Engineering Capability and Performance; Iain Green, Managing Director - IFS Defence; David Herr, Vice-President and General Manager - Commercial Avionics; Brendan Hindle, Head of Machine Shop Operations; Mark Keeler, Vice-President of Operations; John Kesser, Director - Program I; Rusty Kollmorgen, Director - Program II; Martha LaCrosse, Chief of Staff, Chairman's Office; Paul McDonald, Director of Insurable Risk Services; Paul Nash, Head of Supply Chain; Annie O'Connor, Director of Human Resources Integration; Andrew Price, Chief Counsel - Insyte; Mark Ritson, Director of Communications - Insyte; Gary Slack, Chief Financial Officer - Land & Armaments OG; John Steckel, Vice-President of Business Development; Mark Taylor, Director of Strategy & Business Development - Regional Aircraft; Stephen Trichka, Vice-President & Chief Counsel - Platform Solutions; Mark Turner, General Manager -RAF Marham: Candace Vassella, Vice-President, Government Relations; Tony Williams,

Production Director – Govan; Steve Worsnip, Assistant Director – Typhoon Support Programmes; Simon Wright, Head of Engineering.

H. Selected Sample of Qualitative Data for *Discourse & Textual* Analysis

In Table 24 below is a selected sample of qualitative data gathered from publically available sources for firms in both the primary and secondary samples. This data complements the qualitative data collected via interviews and direct observation. The data are arranged chronologically, and are categorized by stakeholder interaction and coded for concepts embodied in the theoretical framework developed herein: fit, form, function, performance. Bold font has been added to highlight the more relevant coding information.

As social "reality" is an enacted phenomena rooted in interactions between entities (i.e. individuals or organizations) which are *behaviorally* complex (i.e. they possess a wide variety of "intentions", including among other complex properties, "deception"), constructing grounded theory systematically and scientifically is an extremely challenging task for a researcher of political organizational phenomena (who also possess their own set of intentions) where power is the central organizational construct.

As has been demonstrated in numerous research studies on organizations since the classic Hawthorne studies (Mayo, 1949), when one measures social phenomena, it can move precisely because it is aware that it is being measured. Capturing "the truth" or high-fidelity data in power-laden levels of complex organizations, requires the building relationships with the actors (individuals and organizations), the establishment of trust through the advancement (and not harm) of their interests, recognizing that these are often in conflict within a firm and between the participants in its extended enterprise.

High fidelity data comes from multiple sources triangulated both within and between stakeholders and longitudinally over time. Such sustained access for the research requires high degrees of emotional intelligence and special skills of empathy and trust-building. It requires the ability to appear to the research participants to "go native" (the bane of ethnographers), while maintaining objective detachment.

The quotations presented in the table below, therefore are not randomly gathered to obtain statistical precision, but to demonstate trends in the qualitative data. The fidelity of any such dataset, whether collected as a random or theoretical sample, will have significant variance, and is a function of the observer and the observed and the quality of their interaction.

						architec ture.
1965	Boeing Annual Report		Firm	α	"On July15, 1966 The Boeing Company will observe its fiftieth anniversary. It is difficult to conceive any other half century in man's history more stimulating, challenging and more rewarding than the span from 1916 to 1966. In those fifty years man's scientific and technological progress has surpassed the total of such advancement in all previous history, and Boeing is proud to have played a leading role in that fantastic acceleration. There is a moment now for a proud glance at the past and a rededication to the next fifty years, and the next, and the next"	On perceive d market niche of a modular enterpri se architec ture.
1978	Toyota Product ion System: Beyond Large Scale Product ion (pp. 2, 9, 114- 115)	Taiichi Ohno, "Fathe r" of the <i>Toyota</i> Produc tion System , <i>Toyota</i> <i>Motors</i>	Firm	ß	"Slow growth is scary." "During a high period of economic growth, any manufacturer can achieve lower costs with higher production. But in today's low growth period, to achieve any form of cost reduction is difficult." "In a high-growth period, productivity can be raised by anyone. But how many can attain it during the more difficult circumstances induced by low-growth rate? This is the deciding factor in the success or failure of an enterprise." "There must be hundreds of people aroud the world who can improve productivity and efficiency by increasing production quantity. We, too, have such foremen at <i>Toyota</i> . But few people in the world can raise productivity when production quantities decrease. With even one such person, the character of a business operation will be that much stronger. People prefer working with large quantities, however. It is easier than having to work hard and learn from producing small quantities. I think it is more worthwhile in a company to work in the area where there are problems due to dwindling sales than in an area where sales are rising." 3 Aug. 2001	Seattle Post- Ingellig encer	Caroly n Corvi, VP/G M, Boeing Comm ercial Airpla nes	Firm	α	"At a time when airplane orders are down and deliveries of new planes are expected to follow, <i>The Boeing Co.</i> is about to do something it has never done beforethe 737 production rate will reach 28 planes a month At first glance, it might seem odd that <i>Boeing</i> is increasing the production rate of its 737 to record levels during a severe downturn in the airline industry, when many analysts predict that orders for single-aisle jets such as the 737 will be down substantially over the next couple of years. Last year, <i>Boeing</i> won 391 orders for the 737. So far this year, customers have placed only 83 firm orders And the more airplanes <i>Boeing</i> can turn out a month, the greater the opportunity to capitalize on the many cost-savings that have been made in the production of the world's most frequently flown jetliner. 'The more airplanes that go outthe factory door, the better the benefits,' Corvi said We always want to avoid jerking rates up or down,' Corvi said. Feb. 7 2002 7 1 1 1 1 1 1 1 1 1 1 1 1	Vew Vork Fines, Finto Chin Air" Roger Lowens ien)	Richar d Ferris, CEO of United Airline s; Stephe n Wolf, CEO of United Airline s; Gerald Green wald, CEO of United Airline s; Jack W. Creigh ton Jr., CEO of United Airline s; Jack W. Creigh ton Jr., CEO of United Airline s; Jack W.	Firm	α	"On the evening of Sept. 10, negotiators for the C.E.O. of <i>United Airlines</i> , James Goodwin, huddled in Washington with union officials representing <i>United's</i> 30,000 baggage handlers, customer-service representatives and reservation agents. They were putting the finishing touches on an agreement for a hefty double-digit wage increase, and Goodwin, a tall, likable West Virginian who had been with the company 34 years, was waiting for a call to give his O.K. It didn't matter that <i>United</i> , which had lost \$605 million in the first half of 2001, was in a financial tailspin: when airline unions are due for a raise, they get one. If you don't understand why, then you don't understand the airline business. As it happened, the talks dragged on, and at 5:30 on the morning of the 11th, the negotiators trudged off to get a few winks. Randy Canale, a union negotiator, returned to his hotel, the Capital Hilton, not far from the Pentagon, figuring they would sign later that day. He awoke earlier than expected, to the sound of sirens. 'Boy, it sounds awful close,' Canale murmured. Someone was banging on his door, and puffs of smoke were visible from the hotel window. Two of <i>United's</i> jets were down, the wage hike was history and so was the 57-year-old Goodwin's career. Seven weeks later, he was dismissed by <i>United's</i> board. It hardly mattered that <i>United's</i> directors would have approved the agreement and were as much to blame as Goodwin. They were letting him go for a way of doing business that has tormented <i>United</i> and the entire industry for decades.	On the disinteg ration and attempt ed reintegr ation of a modular enterpri se architec ture in airline industry

	<i>s</i> ;	failing basic changes it will have helped to perpetuate.
	Rick	Indeed, even as it reels from last year's record \$3.8 billion
	Dubins	operating loss, United is facing the possibility of a strike
	ky,	by its mechanics, pending a vote on a proposed 37 percent
	head	wage hike this past week. If this rings faintly of 'Alice in
	of the	Wonderland,' well, that is because airlines are not like
	AirLin	other businesses, where competition breeds variety and
	e	choice for consumers and profits for business. They are
	Pilots	more like flying utilities. As passengers, we demand
	Associ	quality service on-time takeoffs, edible food, plenty of
	ation	leg room and don't much care who provides it, as long
	at	as they make it cheap. That leaves the airlines with the
	United	dubious honor of competing to be the Ma Bell, the Con
	Airline	<i>Ed</i> , of the sky.
	S	
		One reason the major airlines find themselves in this
		predicament is that they use huge amounts of fixed
		capital wide-body jets go for \$100 million each and
		can't be readily liquidated. They also depend on a
		skilled labor force. The two problems exacerbate each
		other. Since airlines cannot afford to let planes sit idle,
		they can ill suffer strikes. That makes their unions
		unusually powerful. Consider some other businesses for a
		moment: Microsoft has highly skilled programmers but
		little invested capital. Merrill Lynch has both, but its assets
		stocks and bonds mostly could be liquidated
		overnight. Steel has high fixed capital, but it can replace
		its workers more easily. Airline pilots (and mechanics
		too) are not so replaceable. Stringent safety codes
		strengthen the unions further by introducing a stickiness
		into the rules that govern hiring and firing. Any other
		industry would compensate by raising fares, but air travel
		is a commodity, so the temptation is always to cut fares to
		fill seats. None of this was caused by the attack on the
		World Trade Center. But until then, it was possible to
		believe that airlines were turning a corner. Even though
		they were losing money in 2001, they had recently enjoyed
		some good years, thanks to genuine improvements in their
		operations. They had learned to manage their fleets more
		efficiently, they had structured their routes better and they
		had cut overhead. United was emblematic of the
		airlines' ephemeral prosperity. In the late 1990's, it
		reported \$4 billion in profits, and its route map,
		stretching over four continents, was the envy of the
		industry. Most strikingly, it had ventured a daring
		solution to the industry's thorniest problem labor
		by selling a majority of its stock to its employees. But
		despite this groundbreaking arrangement, United was
		never able to fully align the interests of its employees,
		particularly the pilots, with its own. Rick Dubinsky,
		longtime head of the AirLine Pilots Association at
		United, made this clear when he and Goodwin began a
		recent wage negotiation. 'We don't want to kill the
		golden goose,' Dubinsky told Goodwin. 'We just want
		to choke it by the neck until it gives us every last egg.'
		On Sept. 11, the goose ran out of eggs. In five months,
I		en espairi, me geore fuit out et egger in fire montais,

	-	
	United's traffic has shrunk by, on average, a quarter, fares are down and two of its fleets lie mothballed in the middle of the Mojave Desert. Meanwhile, it has been begging senior pilots, who can earn close to \$300,000 a year, to sit home and collect a full 80 percent of their pay for doing nothing; otherwise, they can remain on the premises, though inactive, at full pay. This is why by the end of 2002 United stands to lose every penny it made in the previous five years and why bankruptcy for one of the nation's largest and most venerable airlines looms as a real possibility. United's modern history started in 1985, when Richard Ferris, the C.E.O. at the time, boldly challenged his pilote.	
	pilots. The underlying issue then, and in every subsequent dispute was management's desire to break the contractual stranglehold inherited from regulation. Before 1978, fares were set by the Civil Aeronautics Board, which generally let carriers pass along their costs. Such a cozy set-up naturally bred inefficiency (banks were similarly slothful in the days of managed interest rates), and airlines got used to rubber-stamping union demands. Eventually, they approved a byzantine system of work rules sought by pilots and other employees. Come deregulation, competition intensified, air fares dropped and more people started flying. But the stifling work rules remained and so, of course, did safety constraints and also entitrust concerns proventing memory.	
	constraints and also antitrust concerns preventing mergers. In effect, aviation became deregulated only on one side: free competition for revenue; costs largely immovable. Ferris tried to win points by befriending the pilots. He started flying, got a license and took some union members under his wing. For a while, it worked. Attacking a brazen case of featherbedding, he got the union to agree to cut the number of pilots in the cockpits of Boeing 737's from three to two. But when he tried to impose a lower wage scale for newly hired pilots as Robert Crandall had done at <i>American</i> the pilots went on strike. The head of the union's strike committee, Dubinsky, was nicknamed Mad Dog. The son of a butcher, he was hired by United in 1965 at a measly \$500 a month. He flew the tobacco route:	
	Winston-Salem, Raleigh-Durham, Chattanooga. In the pilot culture of the day, captains were virtual gods and young flight engineers like Dubinsky received barely more respect than the stewardesses. Dubinsky, though, found a vent for his aggressiveness. He started doing small chores for the <i>AirLine Pilots Association</i> and then handling grievances, and the union discovered that he was a badger. By 1985, he was brimming with class-conscious fervor. The pilots, despite their political conservatism and sense of themselves as professional people, heeded him. Pilots make good money but lack the free agency of other professionals. If a <i>United</i> pilot moves to <i>Delta</i> or <i>American</i> , he loses his seniority and most of his pay. That makes him utterly dependent on the union and makes the union a potent force. Ferris hired replacements to keep	

· · · · · · · · · · · · · · · · · · ·		
	United flying, and the pilots returned after 29 days, taking	
	the offer Ferris had on the table. The strike was over, but	
	permanent damage had been done. A certain culture,	
	an implacable Arab-Israeli-like hatred, took hold at the	
	airline, and nobody has been able to dislodge it since.	
	More significant, United's experience helped spread fear	
	through the industry. Airlines began to leapfrog one	
	another, granting successively better terms at each	
	negotiation anything to avoid a strike. Today, thanks to	
	generous vacations, sick-leave provisions and clauses that	
	fix minimums for days worked and trips flown, United	
	pilots get paid for 81 hours a month but actually fly, on	
	average, only 50 hours. Considering that a Boeing 747-400	
	captain gets a top rate of \$302 an hour, you can see what a	
	drain this is. Though pilots spend many nights away from	
	home, a hardship that is worth some extra compensation,	
	they freely admit that flying, on most days, is hardly the	
	risky proposition it was when the first contracts were	
	penned. 'It's not a hard job for a guy that has been around,'	
	says one 40-year-old United pilot I talked to. 'Because of	
	advances in technology, we have great airplanes to fly.'	
	Their flexible schedules allow many pilots to carry on	
	second careers. By 1986, Ferris decided that United	
	couldn't make money just flying planes. So he stitched	
	together a hotel and car-rental conglomerate, aiming to use	
	the airline to feed the travel businesses synergy! He paid	
	a consultant \$7 million to rename United's parent the	
	Allegis Corporation. Wall Street snickered. The pilots did	
	not. They feared that Ferris would divert capital into the	
	other divisions until the airline was a rump operation and	
	then start cutting jobs. The ALPA adviser was the	
	illustrious F. Lee Bailey, and he told them that their jobs	
	would never be safe unless they really took control a	
	message that the pilots, being pilots, were happy to hear.	
	Dubinsky and Bailey flew to Chicago to meet with a	
	leader of the International Association of Machinists and	
	dropped a proposal for an employee buyout into his lap.	
	The machinists didn't like it. Presciently, they saw the plan	
	as leaving workers to bargain with themselves, an obvious	
	conflict. But Dubinsky made his bid public. It was a	
	strange time on Wall Street, in which anybody could	
	seemingly acquire anyone else and companies were said to be worth more dead than alive. Coniston Partners, a	
	hedge fund, bought a chunk of stock and agitated for a	
	breakup. The board, feeling pressured, sacked Ferris and	
	agreed to sell the travel assets. Stephen Wolf, a veteran of	
	two previous airline turnarounds, was named C.E.O. late	
	in 1987. After briefly joining with ALPA to attempt a	
	high-priced buyout (which, when it failed, set off the	
	stock-market crash of October 1989), Wolf embarked on	
	an expansion kick, snatching up international routes and	
	ordering \$22 billion worth of equipment. His competitors	
	followed suit. Since wages rise sharply with experience,	
	airlines were desperate to hire younger crews. 'So how do	
	you get more new pilots?' says Harry C. Pinson, an	
	investment banker who worked with Wolf. 'You grow the	
	investment banker who worked with wolf. Tou grow the	

airline.' The logic was so compelling that airlines bought	
many more planes than they needed. In aviation, such	
capital mistakes don't go away. Equipment is so expensive	
that once a plane is delivered it must be flown. Even	
carriers that file for bankruptcy limp along for years,	
usually operating at lower costs and undercutting the rest. Wolf discovered this in 1990, when conflict in the Mideast	
and a recession at home (sound familiar?) sent the industry	
into a nose dive. Making matters worse, <i>Southwest</i> , then a	
relative upstart, was tormenting the industry and, in	
particular, stealing United's traffic in California. As losses	
mounted, Wolf clamored for union givebacks. He and	
Dubinsky began to shadowbox. When United ordered new	
747's, a dispute with the pilots' union kept them parked on	
a ramp. When United tried to start service to India, the	
pilots delayed it by demanding private restrooms and	
Western food. Dubinsky kept up the pressure, but his time	
was running out. His term at ALPA expired. (He lost an	
effort to rescind a term-limits clause and wrote an acid	
farewell remembered within the union as "the Nixon	
letter.") Wolf, a tall, aloof C.E.O. who arrived at United's	
headquarters near O'Hare Airport at 6 each morning,	
seized the opportunity. He sold off the flight kitchens,	
which made the machinists fear that their jobs would be	
next. Then, with their cooperation, Wolf and the pilots,	
now led by Roger Hall, a less tempestuous chief, cobbled	
together an audacious employee stock-ownership plan . Similar ideas had been tried at <i>Northwest</i> and <i>Eastern</i> , but	
never with workers in control that was what bred such	
hope at United. The pilots, machinists and nonunion	
salaried employees (the flight attendants opted out) got	
three board directors, various control provisions and,	
critically, 55 percent of the stock. The pilots, the biggest	
bloc, got 25 percent, in exchange for an equivalent	
percentage cut in wages and benefits. A new era of	
worker-management cooperation was born. Optimism	
ran high. Robert Reich, the secretary of labor in the	
Clinton administration, gushed that the employee-	
ownership plan 'could change the face of the airline	
industry.' But there was one devastating oversight: yes, you could turn employees into owners, but could you	
get them to act that way? Could you get them to place	
the same value on their stock as on their weekly	
paychecks? The difficulty, as Dubinsky would shrewdly	
observe when he was back battling United management, is	
that 'you can't eat stock' particularly when employees	
were barred from selling their shares until retirement. In	
any case, airlines had never generated value for their	
stockholders. Donald Washburn, a former executive at	
Northwest Airlines, has observed that airlines are merely	
'cash accumulators for other constituencies' the	
various government entities that tax it, the cartel that	
sells it equipment and the industry's bankers. Its	
hungriest constituent is labor, which gobbles up nearly	
40 percent of operating expenses. The employee buyout	
temporarily lowered wages, but it didn't change these	

· · · · · · · · · · · · · · · · · · ·		
	dismal economics. Arguably, it weakened United. The	
	pilots had always sought control; now they could	
	pursue it from inside the boardroom. As owners, the	
	pilots could pick their own C.E.O., and they did: Gerald	
	Greenwald, famed for helping save Chrysler and fresh	
	from running a trucking concern in newly capitalist	
	Czechoslovakia. When Greenwald told his Czech	
	managers that he was leaving to take over the new worker-	
	owned United, one of them stared incredulously. 'We just	
	finished with all that,' he said. Greenwald figured that	
	with workers owning a stake, their interests would have	
	to shift. So he invited pilots and mechanics into	
	strategy sessions and consulted with Fortune to learn how	
	to qualify for the magazine's list of 100 most desirable	
	companies to work for. Many pilots caught the spirit.	
	Absenteeism declined. A captain in Chicago cleaned food	
	trays to shorten turnaround times. And miraculously the	
	good times started to roll. United's stock, \$22 when the	
	ownership plan began, broke \$90 three years later.	
	(Today it is \$12.) Partly, airlines were the beneficiaries of	
	good fortune: fuel prices were low and the economy was	
	strong. But they also had learned to be more efficient,	
	eliminating frills, reducing commissions to travel agents,	
	reaping savings from automatic check-in. Unlike in the	
	previous decade, most avoided the trap of overexpanding.	
	Greenwald strengthened his hubs and eliminated	
	unprofitable, marginal routes. He also enhanced United's	
	unmatched network overseas. These were heady days for	
	the big airlines, as they finally capitalized on the promises	
	of deregulation. Except for one little thing. They still	
	could not keep wages under control. Through the 90's,	
	airline wages rose 43 percent, just slightly above inflation.	
	Not bad until you consider that air fares rose only 6	
	percent. This was, significantly, a time when other	
	industries were holding the line on every conceivable	
	employee benefit. Only the airline industry, shackled by	
	40-year traditions, continued to kneel to its unions. The	
	regional airlines are a perfect illustration. These carriers,	
	like American Eagle or United Express, fly under the	
	majors' flags and serve an essential role connecting	
	smaller cities to hubs. They also pay their pilots, most of	
	whom are represented by ALPA, significantly lower	
	wages. The business has grown smartly, thanks to a new	
	generation of high-performance jets, but the unions don't	
	like these smaller planes and the lower wages that go with	
	them, so they have successfully negotiated 'scope clauses'	
	that limit the size and number of regional jets that a major	
	can hire out. If it were up to the market, a new-generation,	
	50-seat Canadair might fly from New York to Chicago at	
	off hours, when there wasn't demand for a DC-9 or a	
	Boeing 737. Presumably, that would result in more	
	flexibility and choice for customers. But scope clauses, a	
	bit of protectionism that seems wildly out of place in the	
	21st century, make it extremely difficult. With their hands	
	tied on costs, airlines turned their attention to revenues. In	
	the 90's, they perfected the art of 'yield management,'	
	and you, and perfected the art of yield management,	

	exploiting computers to monitor bookings continuously	
	and adjust ticket prices according to availability. Yield	
	management is why you can pay \$1,000 to fly coast to	
	coast and sit next to someone who paid \$200. It is also	
	why so many people hate the airlines. It may seem unfair,	
	but to an airline economist, the passenger say a student	
	heading home for the holidays who books in advance	
	and the executive who sidles up to the counter without a	
	reservation are not buying the same 'product,' even if they	
	are on the same flight. One is buying a surplus seat, akin	
	to last year's sweater on the bargain rack. The other is	
	buying that sweater when it's hot. It is a good business	
	tactic, but the airlines overplayed it. During the late 90's,	
	they jacked up the premium for business fares as never	
	before. I.P.O. money rained on Wall Street, and plenty of	
÷	it got spent on plane tickets. United's San Francisco hub, a	
	gateway to Silicon Valley, became a gold mine. Airline	
	unions exploited the boom to demand higher wages, but	
	the good times for airlines flying utilities, remember?	
	were never good enough. In one recent year, carriers filled	
	72.4 percent of their seats, just a tad more than their break-	
	even level of 70.4 percent. What this means is that on a	
	typical flight, the entire profit was generated by the last	
	three passengers. From 1995 to 1999, the industry's best	
	half-decade ever, airlines earned only 3 1/2 cents on every	
	dollar of sales, whereas American industry typically earns	
	6 cents. And through the full cycle that is, for all of the	
	1990's airlines made less than a pitiable penny for every	
	dollar of sales. If this were another industry, C.E.O.'s	
	would be forced to resign in disgrace, but airline execs	
	were buoyed. At United, Greenwald gave the pilots and	
	machinists consecutive 5 percent wage hikes, the	
	maximum allowed by the terms of the ownership plan.	
	Then the unions demanded a 'snap back' to take effect in	
	2000, restoring them to pre-ownership levels. Greenwald	
	consented and, remarkably, so did <i>United's</i> board. It may	
	be unkind to say the company lived in fear of upsetting	
	its employees, but everyone, especially at United, knew	
	what the unions were capable of doing. Meanwhile,	
	management's relations with the AirLine Pilots	
	Association deteriorated. As Greenwald neared	
	retirement from United in 1999, the union nixed his choice	
	of successor; instead, the pilots tapped Goodwin, a	
	company man that many deemed controllable. As	
	negotiations started for the first post-ownership contract,	
	the drumbeat rose for a more confrontational approach -	
	- rose, that is, for Dubinsky. The rank and file were mostly	
	unaware that while out of office, Dubinsky had been busy	
	suing his own union. He would soon collect a six-figure	
	settlement paid from his pilots' dues. No matter. With a	
	big negotiation looming, the union's 26-member governing	
	body voted him in. United's pilots were counting on a	
	contract by April 2000, when the ownership plan expired.	
	The deadline was unrealistic, and it gave Dubinsky a	
	cudgel to wield against the company. Goodwin	
	compounded his problem when, late in 1999, he and Wolf	
	 compounded ins problem when, late in 1999, he and woll	

who was now running US Airways began to plot a	
merger. The timing was suicidal. Dubinsky, as a board	
member, was informed of the talks but could not disclose	
them to the rank and file. He certainly knew the pilots	
would oppose a merger, because many would lose	
seniority to US Airways pilots. Thus, Dubinsky had every	
reason not to conclude a contract until the merger was	
announced. By early 2000, wage negotiations, predictably,	
had stalled, and <i>United's</i> increasingly impatient pilots were	
getting stickers from the union reading, 'On Top/On	
Time.' They put them on flight bags, in the cockpit,	
everywhere. As the deadline neared, Dubinsky reminded	
his pilots that they weren't obligated to fly overtime, as	
they normally did, and that they should fly '[to the letter of	
our agreement' a euphemism for going slow. Late	
flights began to mount. Passengers went nuts. Goodwin	
was living a nightmare. In May, he announced the merger,	
and the war with the pilots reignited. The nasty labor	
sore, bandaged but never healed, oozed with all the	
ugliness of the past. The pilots refused to fly overtime;	
some of them taxied at 3 knots instead of 15; others flew	
low, to burn more fuel, or opened landing gear	
prematurely, adding to wear and tear. Delays and	
cancellations soared; United, notably, suffered a fourfold	
increase in delays caused by pilots insisting on repairing	
inconsequential items, like a broken coffee maker or a	
burned-out reading light. A pilot in California walked off	
a full 747, claiming nerves. An executive from a	
competing airline tells the story of a United flight from	
Los Angeles to J.F.K. when the captain announced that	
because of 'low clouds' he wanted to recheck his	
instruments. They sat for three hours. The pilots were	
sabotaging their own company. They did have reason to	
be upset. United, having grown more quickly than US	
Airways, had far more newer hires. Pilots feared for	
their careers and were infuriated that their counterparts at a	
weaker airline might supplant them especially since,	
they reckoned, management was paying for the deal with	
the very money it had saved on pilot wages. Their anger	
was, of course, given a significant push from ALPA. Geoff	
Garrett, a <i>United</i> pilot from Seattle, says, 'I never received	
an order to slow down.' However, he admits, there was	
peer pressure. Pilots who flew overtime would see their	
names tacked to a bulletin board, and those who arrived on	
time got flack for 'not flying safe.' Mysteriously, an	
unsigned publication, <i>The Gardener</i> , began to turn up in	
cockpits, often in pilots' sun visors. The Gardener was a	
colored sheet written in country vernacular, reminding	
pilots to 'fly safe' and so forth. Many pilots think it was	
produced by the Industrial Relations Committee, a	
secretive wing of ALPA formed by Dubinsky during the	
strike. I asked Dubinsky about United's dismal summer	
20,000 flights were canceled and on-time	
performance fell to 40 percent, disruptions that cost	
the airline \$700 million. He said: 'The company was	
short on manpower; we told them that. And the	

weather was terrible. Also, our pilots decided to not fly	
overtime.' Does that mean there was no coordinated	
effort? 'That's what I'm telling you. If there had been, they could have taken us to federal court.' In fact,	
United's management had hotly debated whether to do	
that. Many were in favor, but Goodwin, who had the	
longest tenure and remembered the 1985 strike vividly,	
was unwilling to further antagonize the pilots. And so in	
August, Goodwin agreed to an immediate pay raise of 22	
to 28 percent and to additional 4.5 percent raises in each	
successive year through 2004. This pace-setting and lavish	
package stunned United's competitors, who had, of course,	
been guilty of no less in their turn. Then the bottom	
dropped out. By 2001, high tech had gone bust, and big	
corporations like <i>Hewlett-Packard</i> , <i>Cisco</i> and <i>Accenture</i> were taking a hatchet to travel budgets. "'We aren't talking	
about single-digit cuts," notes Jake Brace, United's chief	
financial officer. 'Some of them reduced their flying by 25	
to 50 percent.' These two grim developments were capped	
by a third misfortune when, last spring, the department of	
transportation blocked United's merger with US Airways.	
Thus, in the space of a year, United had suffered punishing	
blows from labor, the government and the economy a	
modest summary of the industry's troubles since	
deregulation. All that was before Sept. 11.	
After the tragedy, Goodwin eliminated 20,000 jobs, but a	
cruel twist of businesses with high fixed capital, like	
aviation, is that cutbacks often worsen the problem.	
Though United saved 23 percent in expenses, it lost a	
whopping 39 percent in revenue. One reason is that union	
rules dictate that each pilot be able to bid for a better	
assignment (the bigger the plane, the higher the pay)	
whenever a vacancy opens. So while <i>United</i> furloughed 591 of its 10,500 pilots, it was also forced to retrain	
hundreds for new assignments, an enormous waste. 'Now	
you have a ton of people being paid and not flying,' notes	
Herb Hunter, an ALPA spokesman. 'When they talk	
about laying off, you get to a point of diminishing	
returns.' This is why airlines cannot cut their way to	
solvency; needing cash to service debt on those \$100	
million jets, they must keep selling assets, a downward	
spiral charted by the dearly departed <i>Pan American</i> . Realizing this, Goodwin warned that without concessions	
from labor, <i>United</i> could 'perish.' The unions demanded	
his head. Over the years, major airlines have improved	
just enough for most to survive to limp from crisis to	
crisis, to turn a small profit occasionally but not to	
build lasting equity. And increasingly they are haunted	
by Southwest, haunted because they can never match it.	
Southwest is in a different business from United, and its	
model is infuriatingly simple: it flies a single aircraft	
type, greatly reducing the cost of training pilots and mechanics, with no frills or first class, mostly on point-to-	
point routes and usually from secondary, less congested	
airports. Its <i>Boeing</i> 737's land and take off in only 20	
anyona. To being 1515 hard and take off in only 20	

minutes -- unthinkable for planes connecting through hubs -- and its pilots usually fly more than 70 hours a month, far more than at American, Delta and United. The traditional carriers, whose systems are built around hubs, can't do this. United's Chicago hub, for instance, draws customers from all over the Midwest, including people in smaller cities connecting to the coasts. Like the old phone company, this fulfills a vital need, but it is much more costly. Jack W. Creighton Jr., United's new C.E.O., has become the latest chief to demand concessions from each employee group. He faces heavy sledding because United's mechanics, as well as its baggage personnel and ticket agents, are still working at pre-ownership-plan (1994) wages. They want a raise, like the pilots got, before they think about concessions. If the mechanics do not accept Creighton's offer and vote to strike, Congress, with the White House's authorization, could impose a settlement. And the White House has been signaling that it will tolerate fewer airline strikes in the future. So is government the answer to shareholders' prayers? Not exactly. Federal arbitration boards tend to resolve disputes by slicing down the middle, generally pleasing nobody. But they do force both sides to talk. And Creighton has held serious discussions with the AirLine Pilots Association. For now, they are talking only wage concessions -- not the work rule amendments that would be needed for United (and Delta, American, et al.) to join the rest of the 21st century. But the talks raise the germ of a possibility. ALPA is demanding something in return for wage cuts. Since the value of the employees' stock from the ownership plan has crashed from \$5 billion to about \$750 million, they certainly won't take more of that. But Creighton and the union have talked about linking wage cuts, in some fashion, to United's profits or revenues. This brings to mind something Dubinsky -- at year-end, when he was retiring -- told me over vodkas in a restaurant near O'Hare. People say the pilots are self-destructive, he acknowledged, 'but we aren't crazy.' Meaning even pilots will ultimately do what is in their interest. That is what's so interesting about Southwest, which has been able to co-opt its workers (who also are unionized) into behaving like owners. For sure, relationships with unions are multifaceted, but one difference at Southwest stands out, which is that workers get much of their annual profit sharing in cash. Maybe you can't eat stock, but you can eat cash. And if wages were to vary with performance, not only would United's labor costs stay tuned to the business cycle but its workers -- just maybe -- would also start to think differently about their employer. Over time, they, and potentially workers at other carriers as well, might be willing to fly more hours, to let the market determine the schedule for regional jets, to let airlines design their

networks with profits as the main consideration. It sounds rather radical -- downright subversive in this industry -

Condit, responded that the disclosure should be delayed. 'My bias is to soften the third-quarter hit with some warning,' he wrote. 'Assuing the scale of the problem remains, use the fourth quarter to prepare the Street to take the real hit then.' On Oct. 22, Condit made the bombshell announcement: The company's massive production problems would force it to write off \$2.6 billion – by far the biggest charge in <i>Boeing</i>'s history. Overnight, shares fell 8%, wiping out abut \$4.3 billion in value. As investors digested the scope of the mess, the company lost years of hard-earned credibility and the stock fell a further 12% by Oct. 27. The tale provides a sobering view of how easily managemut can keep investors in the dark. 'Program Aaccounting', a controversial system that many analysts criticize for its lack of transparency, continues to give <i>Boeing</i> broad leeway to goose earnings – and to make it one of the toughest company did not admit guit. New details supplied by several inside witnesses indicate that <i>Boeing</i> did more than simply fail to tell investors about its production disaster. 'Boeing basically decided in the short-run that [managing earnings] was a lesser evil than losing the merger,' adds Debra A. Smith, a onetime accounting professor. 							
jeopardized. But shareholders never got the full picture unfil well after the merger was completed on Aug. 1, 1997. Top executives "were hoping against hope that none of the problems would bubble up before they got the deal done," says a top Boeing ex-official. On Oct. 8, former <i>McDonnell</i> CEO Harry C. Stonecipher, by then Boeing's president and chief operating officer, shot an e-mail to Condit [Boeing's Chariman and CEO]. 'We do know for certain that there is a big surprise coming, and I thingk we owe the Street a heads-up. We have an unnitigated disaster on our hands and need some very candid damage control.' Condit, responded that the disclosure should be delayed. 'My bias is to soften the third-quarter hit with some warning,' he wrote. huge short-term incentive to prop up its stock price.Taking advantage of an investment community willing to tolerate the company's opaque reporting system, executives managed to conceal fundamental operational problems for nearly a year - which raises the question of how swiftly they would let investors know if a similar problem arose today. As is often the case, none of the outside watchdoge ever barked. The board never forced Condit to come clean about the company's production problems. Stock analysts and business journalists underestimated them. An although the company's auditor Deloite & Touche, raised red flags about Boeing's troubles, it doesn't seem to have put much pressure on its big client to share this information with investors. As a result, Boeing's financial reporting in early 1997 bore little relationship to its business reality. When the company finally disclosed its problems, 11 was stunned, recalls Richard J. Glasebrook II, managing director of Oppenheimer Capital, owner of 5% of McDonnell at the time. '1 thought that Boeing had the building of commercial aircraft down cold.'The [production] problem was compounded in late 1994 when Boeing realized that rival Airbus Industrie, the European Consortium, was undercutting it on price, thanks to lower manufacturing costs, and government subsidies. By that year, Airbus had grabbed 30% of the global jet-plane market – up from less than 3% two decades earlier. It was a potentially devastating development, since lost customers in the airliner industry are hard to win back after they've spent a fortune training pilots and mechanics on rivals' equipment. Boeing was forced to knock down costs across the board. It made early retirement offers to 9,500 workers in 1995, slashing its staff of veteran mechanics and engineers. Execs. Also rolled out a bug-riden new computer system	
1995, slashing its staff of veteran mechanics and engineers. Execs. Also rolled out a bug-ridden new computer system for tracking parts. As a consultant pointed out in a report to factory execs. in the summer of 1997, the proposed doubling of production rates in the face of such change was like attempting a 'four-and-a- half somersault off a 50-foot board into a pail of water.' By early 1997, warning signs were everywhere that <i>Boeing's</i> overheated factories were boiling over. One manager concluded that 'we have a real financial crisis	

virtually impossible to audit,' says Lynn E. Turner,
former chief accountant at the SEC. 'No one really knows
whether the company will produce as many planes as [are]
needed to recover the costs.' To mitigate this problem, the
rules require companies to take an immediate charge as
soon as they have evidence that a line's long-term profit
margin will disappear - or, in industry lingo, that the
program will be in a 'forward-loss' position. And that's
just what appears to have been happening to the 777 line
in early 1997. It had a development budget of \$5 billion
to \$7 billion for initial design, production tooling, and
flight-testing. By 1995, it had quietly overrun this budget by nearly 100%, according to two former high-
ranking <i>Boeing</i> managers. The prospect of a forward
loss in the 777 was galling to <i>Boeing</i> , since it was the
newest model – the plane that boasted the most
advanced technology, that was to drive the company's
performance in the next decade, and that carried
Condit's reputation. Downgrading the 777's forecast
would have been not only an embarrassment but also a
threat to the merger. To avoid this humiliation, the
company allegedly started to shift monetary revenues
from healthier aircraft programs to keep the 777 on
budget, according to the complaint and two former high-
ranking executives. Another method Boeing allegedly
used to stave off a 777 write-off was exaggerating the
effectiveness of some of the cost-savings initiatives it
had launched in the mid-1990s. Under the flexible rules of
program accounting, plane makers are permitted to make
projections about efficiency efforts and start tabulating the
benefits immediately. But this practice can run afoul of
the law. According to the plaintiff's complaint, Boeing
'arbitrarily manipulate[d] cost-savings figures upwards in
order to keep the 777 gross profit estimates from falling
into a [forward-] loss position' during the second quarter
of 1997. The complaint quotes a Deloitte working paper
that says Boeing's managers admitted the second-quarter
cost-reduction figures were 'a plug' to keep the 777
profit margins on target. Boeing's efforts paid off: the
company never declared a forward loss on the 777 in 1997
- and has not done so at any time since. Does that mean that the line met the original profitability targets? Not
necessarily. As a result of this situation, investors need to
be able to place an unusually high degree of faith in the
company's managers.
company o managero.
'You cannot reduce the cost of a wing if you don't know
where you are starting,' Stonecipher complained in an
April, 1999, interview with CFO magazine. 'You can
drive a truck through what's GAAP in aircraft
manufacturing,' says Heidi Wood, an aerospace analyst at
Morgan Stanley Dean Witter & Co. 'I think everybody
has grown weary of program accounting for a while.' At a
time when investors are seeking the maximum in
transparency, Boeing is note even close to that
standard.

28 June 2004	Busines sWeek "Coveru p at Boeing? " (Stanley Holmes & Mike France)	Carol Jensen, Boeing emplo yee filing class- action suit against Boeing	Firm- Emplo yee	α	"Now that <i>Boeing</i> was faced with telling jurors why its own internal documents seemingly contradicted its legal theory, the company suddenly became accommodating. The documents reviewed by <i>BusinessWeek</i> suggest that <i>Boeing's</i> efforts to suppress evidence were far more elaborate. The company's tactics in the pay- discrimination lawsuit, Beck v. <i>Boeing</i> , also raise broader questions about the health of <i>Boeing's</i> corporate culture. Last year, the <i>U.S. Air Force</i> penalized the company for possessing 37,000 pages of sensitive competitive documents some of its employees had stolen from rival <i>Lockheed Martin Corp.</i> Before <i>Boeing</i> eventually acknowledged the theft, it denied any wrongdoing, then misled <i>Lockheed</i> for nearly a year about the amount of material stolen, according to the <i>Air Force.</i> 'We have felt extremely uneasy about the scandals that have plagued <i>Boeing</i> and led to the departure of its CEO,' wrote <i>Lehman</i> <i>Brothers Inc.</i> analyst Joseph Campbell Jr. in a June 7 report. "We have felt there has been a pattern of less than frank communication with the investment community, and more importantly with itself. But the culture started changing after its merger with the more aggressive McDonnell Douglas in 1997. 'These pay disparities were caused by their own practices,' Helgren says. 'None of this was by chance. And they continued for years and years to avoid the problem.' Among [Jensen's] nine children, she currently 'wouldn't let any of them work at <i>Boeing</i> .' The pay gap there may disappear one day. But one thing <i>Boeing</i> will never be able to erase is its long history of underpaying women."	On a modular enterpri se architec ture's lack of trust.

21 Mar. 2005	Busines s Week "Why Boeing' s Culture Breeds Turmoil " (Stanley Holmes)	·	Firm	α	"Boeing's board presented the ouster [of CEO Stonecipher] as evidence of a company so committed to ethical purity that under current circumstances it wouldn't tolerate even a consensual sexual relationship between the CEO and a female exec. Insiders tell another story. They describe an ongoing culture of unrestrained excess. The lack of restraint also led to rampant political infighting among senior managers. The board, meanwhile, seemed oblivious to the turmoil. 'We are committed to strong ethical leadership, and we have fought hard to restore our reputation.' Executive shenanigans and infighting are hardly unknown in Corporate America, but the degree to which they pervade Boeing is rare. In the midst of this turmoil, commercial division head Alan R. Mulally held court at a party in Kirkland, Wash., attended by 100 managers and employees three days before the Stonecipher bombshell. According to several attendees, Mulally talked openly about who would replace Stonecipher, calling it a two-horse race between himself and Jamse McNerney, who is the CEO of 3 <i>M</i> , a Boeing director, and a former top <i>General Electric Co.</i> exec. Those same people quote Mulally as saying: 'It's down to the GE guy or me. It's a fight to the death, and if it's him, I'm outta here.' Mulally wasn't the only exec plotting his ascent in recent years. In fact, one of his most serious rivals may have taken his machinations to such an extreme that they led him to unlawful conduct. Former CFO Michael Sears was sentenced to four months in prison for his role in the illegal job negotiations with Air Force procurement officer Darleen Druyen. Insiders say the controversy was part of his attempt to amass a power base at his rivals' expense. 'It was clear to everybody [that] Sears was anxious to be the successor to Phil to the point that it got pretty disgusting,' said a <i>Boeing</i> board member. 'You got tired of him acting like the heir apparent.' Sears also took control of <i>Boeing</i> 's famed in-house leadership center in St. Louis. Sears's stock rose in	On a modular enterpri se architec ture's low- trust environ ment.
					The back-stabbing was widespread among the top brass. 'It was everybody in the suite gunning for [<i>Boeing</i> CEO] Phil's job,' said a former senior Boeing executive	

					with direct knowledge of the situation. 'It was pretty destructive.' An unhealthy focus on internal politics wasn't <i>Boeing's</i> only culture problem. In March 2004, <i>Boeing</i> agreed to pay \$70 million to settle a sprawling class action alleging widespread sexual discrimination. Sexual misconduct by executives was a frequent topic of conversation among employees. As <i>BusinessWeek</i> reported in December, 2003, Condit settled at least one wrongful termination lawsuit brought by on a female employee with whom he had a relationship.	
					One of Stonecipher's top goals when he was brought out of retirement as CEO was to put ethics front and center. He created an internal governance office that reported to him and required every employee to sign an ethics statement. 'Without integrity you cannot conduct business successfully,' he wrote in June, 2004. 'Firing people who lack integrity is good business.' Words to live by."	
April 2005	Boeing Frontier s	Scott Carson , VP Sales, <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i>			"Our products bring better value to our customers, and our pricing reflects that value. We also have a responsibility to our shareholders, and that means pricing that allows us to make our financial goals. At the same time we have to be competitive in the marketplace. And we have to realize that our customers face great financial pressures, and price is a key factor in their decision- making. But it is only one factor, and it is critically important that we communicate to our customers on those other factors. Do I think that we will ever be the lower- price option? No. Do I think that should keep us from gaining more than 50 percent market share? I answer "no" to that as well. But let me say one more thing that is absolutely essential to our success in the marketplace. We simply must continue to lower the cost of making our products so we can offer the lowest possible prices to our customers. We must improve our productivity every day, every month, every year, forever. It's essential, it's a fact of life, and we all have a role to play."	On a modular enterpri se architct ure's strategy of <i>different</i> <i>iation</i> (as opposed to <i>cost-</i> <i>leaders</i> <i>hip</i>)
18 July 2005	Busines sWeek "I Like a Challen ge – And I've Got One" (Stanley Holmes)	James McNer ney, Chair man & CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	"For McNerney, cleaning up <i>Boeing's</i> toxic culture is Job One. Insiders say a bureaucracy that stifles innovation, resists change, and tolerates rule bending remains largely intact. Adds <i>Lehman Brothers</i> aerospace analyst Joseph F. Campbell Jr.: "this is the <i>Boeing</i> that tolerated behavior that led to sexual harassment suits; debarment, and criminal prosecution." "McNerney says he isn't a big fan of buying for growth, blaming <i>Boeing's</i> recent troubles in part on "banging together a lot of acquisitions."	On a possibly more integral architec t than a modular enterpri se is accusto med.

31 Jan. 2006	The Seattle Times, Transcri pt of Speech by Boeing' s Doug Bain	Doug Bain, Senior Vice Preside nt and Genera I Couns el, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	"Good morning. Jim McNerney asked me to give you kind of a candid assessment of our major scandals and how we got there. As I walked up here, I think I heard [Boeing Chariman and CEO] Jim McNerney mutter, 'Here comes Dr. Death.' My overall message is fairly simple: We as the leaders of <i>The Boeing Company</i> get to choose what kind of culture we are going to have. And we make these choices every day by what we do and frankly what we choose not to do. I want to talk about these scandals not so much from the perspective of how we have tried to argue them or spin them, but from the perspective of the prosecutors and what they have told us. The recurring message we have gotten from the prosecutors and frankly everybody else we deal with is nne of shock and surprise. They say, 'You guys are <i>The Boeing Company</i> . You build things that are larger than life. You do things that are larger than life. You're not a sleazy company. How did this happen?' And the question that they always ask: Where was the leadership? <u>Evolved Expendale Launch Vehicle:</u> We did a poor job of the investigation, did a poor job of disclosing it to the government. Why was there two and a half years of silence? Why didn't somebody say something? Was	On ethics within a modular enterpri se architec ture.

there a culture of win at any cost? Was there a culture of silence? Where was management throughtout this? So what are the consequences? We lost \$1 billion to \$2 billion. And 1'll get to the criminal and civil issue in a minute. And we have a tury burdensome administrative agreement that Bonie [Sodnik, senior vice president of <i>Boeing</i> 's Office of Internal Governance]'s organization is in charge of implementing. Sears/Druyun: On October 17, 2002. Mike Sears [then chief fanancial officer of <i>Boeing</i>] met Darleen Druyun [then chief acquisitions officer for the Air Force] and offered her a job. The next day, Mike sent an e-mail that said 1 had a 'non-meeting' with Darleen Druyun.' So, the cultural questions: How come nobody said is Noold we really be hiring the relatives of our chief procurement officer for the largest customer we have on the defense side.' It also raises the question, Do we have a culture of silence - don't ask the tough questions. We have been trying to resolve these things. We have not been successful yet. But there are some within the prosecutors' offices that believe that <i>Boefing</i> is rotten to the core. They talk to us about prevasive misconduct and they describe it in geographic terms of spanning Cape Canaveral to Huntington Beach, to Orlando, to St. Louis to Chicago. They talk about it in terms of levels within the company that go from non-management engineers to the chief financial officer. The State Department's view of <i>Boeing</i> is that we just don't get it. There are to many violations.			
So what are the consequences? We lost S1 billion of lanches. Lockheed sucd us for anywhere between S1 billion to S2 billion. And P11 get to the criminal and civil issue in a minute. And we have a truly bordensome administrative agreement that Bonnie [Soodhik, senior vice president of <i>Boeing's</i> Office of Internal Governance]'s organization is in charge of implementing. Sears/Druvun: On October 17, 2002, Mike Sears [then chief financial officer of <i>Boeing</i>] met Darleen Druyun [then chief acquisitions officer for the Air Force] and offered her a job. The next day, Mike sent an e-mail that said '1 had a 'non-meeting' with Darleen Druyun.' So, the cultural questions: How owne nobody said to Mike, 'What in the hell do you mean by a non-meeting?' How come in the year 2000 nobody said.', Should we really be hiring the relatives of our chief procurement officer for the largest customer we have on the defense side.' It also raises the question, Do we have a culture of silence – don't ask the tough questions. We have been trying to resolve these things. We have not been successful yet. But there are some within the prosecutors' offices that believe that <i>Boeing</i> is rotten to the core. They talk to us about pervasive misconduct and they describe it in geographic terms of spanning Cape Canaveral to Humingion Beach, to Orlando, to St. Louis to Chicago. They talk about it in terms of levels within the company that go from non-management engineers to the chief financial officer. The State Department's view of <i>Boeing</i> is that we just don't get it. There are too many violations. The numbers at the top [apparently referring to a char1] are the number of formal chies cases of Ethies and Businees Conduct opened in 2004 and 2005. What is astounding to me, of course, is that if you look at 2005,900 of them were found to have substantiation. So is the problem the rank and file? Or is the problem us? We participated in a survey conduced by the Defense Industry Initiatives, and they surveyed our employces. Of the myores surveyed. 26 p			
 Isunches. Lockkeed suid us for anywhere between SI billion to S2 billion. And PII get to the criminal and civil issue in a minute. But there are some within the prosecutors' offices that believe that <i>Boeing</i> is rotten to the core. They talk hout it in terms of levels within the company that go from non-management engineers to the chief fanacial officer. The State Department's view of <i>Boeing</i> is that we just don't get it. There are too many violations. The numbers at the top [apperently referring to a chart] are the number of formal ethics cases of Ethics and Business Conduct opend in 2004 and 2005. What is astounding to me, of course, is that if you look at 2005, 900 of them were found to have substantiation. So is the problem the rank and file? Or is the problem us? We participated in a survey conducted by the Defense Industry Initiatives, and they surveyed our employees. Of the employees surveyed, 20 recent said they had observed abusive or intimidating behavior by management. I also went back and counted the number of vice presidents who have been separated from the company for chics violations over the last few years. The total is 15. I found that to be an astronomicality high number. While		billion to \$2 billion. And I'll get to the criminal and	
administrative agreement that Bonnie [Soodhik, senior vice president of Boeing's Office of Internal Governance]'s organization is in charge of implementing. Sears/Druyun: On October 17, 2002, Mike Sears [then chief financial officer of Boeing] met Darleen Druyun [then chief acquisitions officer for the Air Force] and offered her a job. The next day, Mike sent an e-mail that said '1 had a 'non-meeting' with Darleen Druyun.' So, the cultural questions: How come nobody said to Mike, 'What in the hell do you mean by a non-meeting?' How come in the year 2000 nobody said, 'Should we really be hiring the relatives of our chief procurement officer for the largest customer we have on the defense side.' It also raises the question, Do we have a culture of silence - don't ask the tough questions. We have been trying to resolve these things. We have not been successful yet. But there are some within the prosecutors' offices that believe that Boeing is rotten to the core. They talk to us about prevaise misconduct and they describe it in geographic terms of spanning Cape Canaveral to Huntington Beach, to Orlando, to St. Louis to Chicago. They talk about it in terms of levels within the company that go from non-management engineers to the chief financial officer. The State Department's view of Boeing is that we just don't get it. There are too many violations. The numbers at the top [apparently referring to a chart] are the number of formal ethics cases of Ethics and Business Conduct opened in 2004 and 2005. What is astounding to me, of course, is that if you look at 2005, 900 of them were found to have substantiation. So is the problem the rank and file? Or is the problem us? We participated in a survey conducted by the Defense Industry Initiatives, and they surveyed our employees. Of the employees surveyed, 2 for streep roblem the rank and file? Tor is the problem us? We participated in a survey conducted by the Defense Industry Initiatives, and they surveyed our employees. Of the employees surveyed, 2 for percent said they		civil issue in a minute. And we have a truly burdensome	
 vice president of Boeing's Office of Internal Governance]'s organization is in charge of implementing. Sears/Druyun: On October 17, 2002, Mike Sears [then chief fanacial officer of Boeing] met Darleen Druyun [then chief acquisitions officer for the Air Force] and officer dher a job. The next day, Mike sent an e-mail that said '1 had 'non-meeting' with Darleen Druyun.' So, the cultural questions: How one nobody said to Mike, 'What in the hell do you mean by a non-meeting?' How come in the year 2000 nobody said, 'Should we really be hiring the relatives of our chief procurement officer for the largest customer we have on the defense side.' It also raises the question, Do we have a culture of silence - don't ask the tough questions. We have been trying to resolve these things. We have not been successful yet. But there are some within the prosecutors' offices that believe that Boeing is rotten to the core. I found that to be an astronomically high number. While only two of the 15 were separated for committing crimes, among the other issues we've had are expense-account fraud, travel abuse, violating our procedures for hiring consultants, abusive behavior, surfing the Net for porn, sexual harassment and retaliation. But the question is, if you were not surprised that somebody did something, the next 		of silence - don't ask the tough questions. We have	
offices that believe that <i>Boeing</i> is rotten to the core. They talk to us about pervasive misconduct and they describe it in geographic terms of spanning Cape Canaveral to Huntington Beach, to Orlando, to St. Louis to Chicago. They talk about it in terms of levels within the company that go from non-management engineers to the chief financial officer. The State Department's view of <i>Boeing</i> is that we just don't get it. There are too many violations. The numbers at the top [apparently referring to a chart] are the number of formal ethics cases of Ethics and Business Conduct opened in 2004 and 2005. What is astounding to me, of course, is that if you look at 2005, 900 of them were found to have substantiation. So is the problem the rank and file? Or is the problem us? We participated in a survey conducted by the Defense Industry Initiatives, and they surveyed our employees. Of the employees surveyed, 26 percent said they had observed abusive or intimidating behavior by management. I also went back and counted the number of vice presidents who have been separated from the company for ethics violations over the last few years. The total is 15. I found that to be an astronomically high number. While only two of the 15 were separated for committing crimes, among the other issues we've had are expense-account fraud, travel abuse, violating our procedures for hiring consultants, abusive behavior, surfing the Net for porn, sexual harassment and retaliation. 2006 ce W America BA , Sy "Conver s,	lison Investo food, r 4E estem	tolerate their conduct for this long?" β "Where do you see the values in your businesses; would you agree these are no longer in producing pieces of aircraft but in integration and net-centric solutions? 'For	On the mental
with St Alison ic Wood" D (Phillip pr	roup rateg evelo nent irect	 BAE Systems, we see four value strings The fourth value level is Airbus, where we have a 20% investment. We have the tremendous success of Airbus in the marketplace, with the A380 coming on line and the A350 developments.' Would you agree that in the future it's going to be harder to maintain the transatlantic balance that BAE has been able to achieve, especially when you look at issues such as China— which is both a threat and an opportunity? Which do you think it is? 'One thing to be clear about upfront is that, with the U.S. business having the role it does in the portfolio, we will not be doing defense business in China. Our U.S. business is important to us, and we would not destabilize that. It is very clear that within the U.S., China is seen as a military threat. But the question is valid because China is as much an economic as a military threat and opportunity. For Airbus, China is a tremendous opportunity. But for BAE Systems—with a U.S. portfolio— there is natural question: At what expense do you ignore China?' Are you under any pressure to sell your 20% share in Airbus companies? 'I am sure this is going to be the hot topic for the next 18 months, especially among bankers. Airbus constitutes a very successful business and contributes to our earnings, therefore the group always looks at that as a successful contribution to the portfolio. But probably long term we don't see ourselves as owners of the business. We haven't said we want to be out by any particular date, and it's not an issue of derisking the business; it's a question of choice about where we put the money. The fundamental competitiveness of the wing work in the U.K. is based on competency and capability, and that goes back to earlier points about the competitive environment in the U.K. If the U.K. ceases to be competitive and trails its other European colleagues in areas such as R&D grants and launch aid, then the Airbus management team, putting politics aside, will make a decision about where is best to put	models of a modular owner of an integral enterpri se architec ture.

					Airbus work? 'We don't do it. We have transferred	
					that work to Airbus U.K., to stop that becoming an issue. The only return BAE Systems takes out of Airbus is the dividend we take from the Airbus businesses. By having a return from the Airbus business as a whole you do empower the Airbus management team to run that business in the same way as Boeing. As a U.K. citizen I want to see [the Airbus U.K.] Filton plant remain at its current level of competitiveness. But as an Airbus shareholder I want to see Airbus be competitive, and that means if work has to move out of Munich, filton, or Toulouse, because that's what makes sense in the marketplace, that's the right decision."	
13 Mar. 2006	Busines sWeek, "Cleani ng Up Boeing" (Stanley Holmes)	James McNer ney, Chair man & CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	"McNerney said that 'management had gotten carried away with itself,' that too many executives had become used to 'hiding in the bureaucracy,' that the company had failed to 'develop the best leadership.' 'I think the culture had morphed in dysfunctional ways in some places,' the polished, soft-spoken McNerney said in a recent conversation with BusinessWeek, his first extensive interview since taking the job. 'There are elements of our culture that I think we all would like to change.' McNerney believes that internal rivalry is at the root of the company's ethical scandals. His prescription includes encouraging managers to talk more openly about Boeing's severe ethical lapses. 'I want to try to make it O.K. to have that dialogue,' says McNerney. 'If we can get the values lined up with performance, then this is an absolutely unbeatable company,' says McNerney. Insiders say that McNerney is trying to lead by example. He wins praise from co-workers for not embarrassing underlings in public. 'Jim is more interested in the human side. He is interested in how to create a culture where people speak up and take the risk and stop a production line because something is wrong. McNerney is reform[ing] Boeing's culture, [by] promoting integrity and avoiding abusive behavior." "McNerney introduced General Council, Douglas G. Bain, who really lowered the boom, railing against Boeing's pervasive 'culture of silence.' Bain warned the audience that many prosecutors 'believe that Boeing is	On an architec t re- integrati ng the low- trust environ ment of a modular enterpri se architec ture
26 April 2006	Thomso n Reuters Researc h, excerpt from "The Boeing Compan y, Q1 2006 Earning	James Bell, CFO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm- Investo r	α	 rotten to the core." James Bell (<i>The Boeing Company</i>): "Thank you, Dave, and good morning. As Dave said, I will briefly review our first quarter results and discuss our outlook, then we'll take your questions. Now, beginning this year we have moved to a split of duties between our CEO, Jim McNerney, and myself on our earnings call. Jim will participate in the calls at mid-year and at year-end and other calls on a selected basis. Of course, I will continue to be on all of <i>Boeing</i>'s quarterly earnings calls. Let's begin by turning to the first slide. <i>Boeing</i> is off to a very good start this year. During the first quarter, we grew revenues, net income, earnings per share, and cash flow at strong double-digit rates. Productivity 	On a modular Enterpri se Archite cture's defense of its finanaic al perform ance

s Call	improvements we continue to make across the company	
Transcri	and the significant increase in commercial airplane	
pť"	deliveries generated the strong performance this quarter.	
	Our balanced cash deployment strategy continues to	
	deliver value to customers and shareholders by investing	
	in our growth and returning capital to investors. Boeing's	
	businesses continue to be well positioned in their markets.	
	We expect the Commercial Airplane business will drive	
	strong enterprise growth over the guidance period. Our	
	total backlog grew to a record level of \$213 billion, largely	
	driven by the strong demand for our market-leading commercial airplane products, especially the 787	
	commercial amplante products, especially	
	Dreamliner. Coincidentally, today is the two-year anniversary of the 787 launch. The 787 has been the	
	most successful commercial airplane launch in <i>Boeing</i> 's	
	history. Today, we have 26 customers from around the	
	globe that have placed firm orders for 350	
	Dreamliners. We also continue to make good progress	
	on the development of the 787. As on all new airplane	
	programs at this stage of development, we are working	
	weight and schedule challenges, and we're making steady	
	progress in these areas. We remain confident that we'll	
	meet our customer commitments. We are on track to	
	begin flight testing next year, followed by entry into	
	service in 2008. Last quarter we highlighted the four	
	growth and productivity initiatives we are deploying	
	company wide to help drive us to financial performance	
	that matches the quality of our people and our technology.	
	While we're still early in this process, the implementation	
	of those initiatives is going well. The initiatives are the	
	tools we will use to drive growth and productivity to new	
	levels. They are long term. Combined with our focus on leadership development, they are important keys to	
	Boeing's future performance. Now let's take a look at	
	the numbers. Our operations are running well and	
	gaining momentum. Now let's review the performance of	
	our businesses. Next slide. Our Commercial Airplane	
	business is benefiting from a product strategy that's	
	keenly focused on our customers, and on our	
	commitment to continuous productivity improvement.	
	Clearly Boeing Commercial Airplanes is performing	
	very well in a strong demand environment. Next slide.	
	Connexion by Boeing continues to demonstrate the	
	potential of its satellite-based broadband service.	
	Connexion service is now available on more than 180	
	daily flights. In addition to 500 orders and options	
	from airline customers, we recently completed the first installations of Connexion service in the commercial	
	shipping industry. Also during the quarter, we	
	repurchased 5.5 million <i>Boeing</i> shares, paid a 20%	
	higher dividend, and continue to invest in our growth	
	program, all consistent with our balanced cash deployment	
	strategy."	
	50000 D 1	
	Heidi Wood (<i>Morgan Stanley</i>):	
	"All right. You weren't that active on the share	

repurchase front this quarter. Can you talk a little bit about your cash deployment strategies for the rest of the year? Do you plan on being more aggressive through the balance of the year?"
James Bell: "Well, we plan on continuing to implement our balanced strategy. We will continue to buy back shares. Clearly we have about 18 million or 19 million shares to go under our current authorization. The plan will be to go back to the Board and ask for an additional authorization. We will buy accordingly, as long as the stock is undervalued as it is, we will continue to have a pretty active buyback program."
Steve Binder (Bear Stearns): "All right. Then with respect to pricing in the commercial aircraft market today, and you look at 787, 777, especially the 300ER and the 737 NextGen, if you're looking at deals that you've been doing here in the last three or four months, for the '08 - '09 time period depending on the model type, maybe 787's further out if you isolate the escalator factor, how would you characterize the pricing environment, what you've seen in the last three or four months?"
James Bell: "Well, clearly it's a competitive environment, but we're really pleased with the kinds of deals we're signing. We believe we have embedded in those deals a real opportunity to create real value going forward, Steve, so we're not having fire sales."
Steve Binder (<i>Bear Stearns</i>): "No, I'm actually wondering, are you starting to see better pricing than your normal escalators would show?"
James Bell: "Well, we're seeing good pricing. I think it's stabilizing, and one of the reasons is that we have differentiated products, and we think we're getting good pricing, good value in the market space. That, coupled with what we're doing from a productivity perspective, we think we're going to be able to deliver good value on this order book."
Steve Binder (<i>Bear Stearns</i>): "Lastly, with respect to potential replacements for the 737 NextGen, I know there's been a lot of ideas. Is there any firm sense of whether BCAG down the road would go with a single aisle configuration or a twin aisle configuration to potentially that overall narrow body market?"
James Bell: "Well, no, we're clearly not there yet. We will continually be working with our customers, because that's where a

	product development decision is going to start and end, trying to make sure that we're going to provide to them a product, and invest in that product based on what they believe their needs will be going forward. Right now, Steve, we're just enjoying the success of the 737. As I mentioned earlier, we've delivered the 5,000th aircraft. That model is doing extremely well. It's the most popular airplane in the world. We've got over 6,000 of them on order. We'd just like to deliver on that order book, but obviously we will continue to work closely with our customers so we make the right product development decisions and we make investments according to what we think our customers want, as we've done on the 787. You've seen the benefit of that."	
	Ron Epstein (Merrill Lynch): "Good morning. Just following up on Steve's question about product development. As you guys walk through more of the 787 program , what milestones should we keep an eye out for, so as outsiders looking in, we have a good idea that things are indeed on track ?"	
	James Bell: "Well, I think that clearly the fact that we've gotten through firm configuration, which we did complete, we've been able to manufacture and successfully join some of the composite barrels. We powered up the auxiliary power unit. We've had the engine runs at both GE and Rolls. Now we've started, and our supply chain has started, building their plants, their factories where they can start the fabrication of the other component parts. I think there's been a number of milestones that you can look at now and get a good sense that this development program is on track, and then those others, particularly as our supply chain starts to stand up their factories and start to work on their detail parts, I think that would be something I would watch. Obviously, we're preparing to go into flight testing at the end of next year, or the second quarter of next year excuse me, in the second half, not quarter the second half of next year so that we'll be prepared to have this thing introduced in 2008. We do believe we're on track to make that happen."	
	David Strauss (UBS) "Good morning. James, could you talk about what impact a potential <i>Alcoa</i> strike could have on the business, and what precautions you have taken, as well as maybe what you're seeing out of some of your suppliers?"	
	James Bell: "Well, I think we have tried to be sure that we have multiple sources, and we'll work pretty closely with our supply chain and see what we need to do in order to deal with it, but obviously it's a challenge. We always have contingencies, so I think we'd be able to see our way	

through it."
Joe Nadol (JP Morgan): "Thanks, good morning, James. I was wondering, you've already given us a little bit of color on the supply chain and how things went well in the quarter. Now that you're up to your sort of 100 aircraft per quarter delivery rate, it would seem that you have a pretty good handle on things. I was wondering if you could give a little bit more color on, I guess if there are any necks of the toothpaste tube, where are they, and how you feel about it, relative to maybe three months ago or six months ago?"
James Bell: "Well, clearly that remains a watch item for us and we work it hard every day. We have our teams both from BCA and IDS really working very, very closely with the supply chain to make sure that we're able to get what we need when we need it. So that's why, as we talk about raising production rates, why it's a long-term, well thought through, disciplined process that we have to integrate with our supply chain. So clearly, we're feeling I think relatively more comfortable as we see progress, particularly on the 787, with our supply chain. Clearly that has not been without it's challenges, and we've been able to work closely with our suppliers to offset any of the issues we've seen to date. We will continue doing that going forward. Overall, we're feeling pretty comfortable about it. That's not to say that the supply chain isn't a watch item for us. It's not to say that there are no risks in it, but I think the way we're working together in an integrated fashion is allowing us to have a high degree of confidence that it's not going to cause us an issue as we work our way and harvest this up-cycle."
Robert Toomey (GT Reilly Advisors): "Hi, good morning. Thanks very much. I'm just wondering, James, with respect to the progress you've made on improving your productivity , clearly it's really starting to show through in your margins. Do you believe that based on what you know now, the potential for margins on the 787 could be higher than your other products? In addition to that, there has been some talk about the duration of this cycle being longer. You said earlier this is a different sort of a cycle . Can you just comment on how long you see this commercial cycle extending? Could it go out beyond '08 or '09? Thank you." James Bell: "Well, clearly the way we're building the 787 is different than the way we built the other product, and so we're pretty comfortable with the business case on that product that we're going to deliver good margins. As to whether it will ultimately be higher than the margins on other airplanes, that's yet to be seen. I think the thing that is clear is we're expecting to deliver

	a tremendous amount of value to our shareholders as it	
	relates to the 787 program. What was the second part of	
	that question?"	
	Robert Toomey (GT Reilly Advisors):	
	"Just the duration of the cycle."	
	n in the second s	
	James Bell:	
	"Well, clearly what typically you'd see in the cycle is a	
	peak order year, and then that order for the next	
	several years would drop off pretty dramatically.	
	Although we've seen a moderation of orders this year,	
	particularly given the 176 orders we got in the first	
	quarter, it does look like they will level off and stabilize, is	
	what we're thinking over the next couple of years, at least.	
	So that's somewhat of a different experience than we've	
	had in the past. Then when you couple with that the	
	traditional domestic customers, or domestic carriers, and	
	the European carriers are not back in the market at a	
	significant level yet, gives us some early indication that	
	this cycle really may go longer, and may be a little	
	more protracted and be a little different. Maybe the	
	peak is not as high as it would've been. We peaked at	
	over 1,000 orders last year. We don't anticipate that this	
	year, but we do anticipate getting more orders than	
	deliveries, and we anticipate that over the guidance period,	
	and perhaps it will be a little longer. We'll have to see	
	when the domestic carriers and the European, the	
	traditional carriers there, get back into the marketplace."	
	, , , , , , , , , , , , , , , , , , ,	
	Lynn Lunsford (Wall St. Journal):	
	"Good morning, James. This is just a housekeeping kind	
	of question, but when was the last time commercial	
	airplanes had a 10% profit margin?"	
	James Bell:	
	"You know, we were just trying to figure that out	
	ourselves, and I'm really not sure. I'm not sure that they	
	have, but maybe way back in the early '90's. I don't	
	know, but I'm sure glad they got it now."	
	Stanley Holmes (BusinessWeek):	
	"Good morning, James. Could you be more specific on	
	some of the challenges you see with the 787 in terms of	
	production and putting the plane together? Where do	
	you see the biggest challenges to date? You can just start	
	with that."	
	James Bell:	
	"Well, Stanley, I don't see that we have a whole lot of	
	major issues on this program yet to date, but obviously	
	where the challenges will be is in our supply chain as	
	some of our global partners are trying to do this for the	
	first time. So that's what we're monitoring very, very	
	closely, and making sure we're there. We're having them in	
4	our shop to make sure they know how to do the processes	

	that are necessary to make the material, and to actually perform the operations to develop the major components that they're responsible for. So our team, our technical team in BCA, is working very, very closely with the supply chain to make sure that they can get that done. So I wouldn't necessarily call those challenges, as I would say that we've gone through and looked at this development program. We've identified where the risks would be relative to the way we're building the aircraft, and we are making sure we have the right process in place to work through those and mitigate them so they don't materialize."	
	Stanley Holmes (Business Week): "Okay, what about on the cost side? There seems to be some issues and concerns about costs from suppliers. Where would you assess your suppliers' and Boeing's ability to maintain the entire cost of building a 787 within the parameters that you set out early in the program?"	
	James Bell: "Well, I've got to tell you, as I go through and look at the program, and I've been through a lot of development programs, because I grew up on the government side of the house, so you always are worried about the unexpected things happening that would drive you to over- run your budget. We are well downstream on this development program. We're well within the budget, well within the business case, and it really does look good. Stanley, all I can tell you is that right now, this looks like the best-run development program I've ever seen, but it is a development program. So clearly, we are mindful of that and making sure that we have the right resources embedded in our business case to help if something should happen. So right now, that something hasn't happened, and we'll just have to wait and see."	
	Peter Pae (<i>LA Times</i>): "Good morning. If I was an airline and I ordered a 787 today, when can I expect a delivery?" James Bell: "I think we're sold out in the first few years, so it would be in the 2010, 2011."	
	Peter Pae (<i>LA Times</i>): "A follow-up to that, considering that this is a new way of developing or making the aircraft, how difficult would it be to ramp up production, or what kind of challenges would you have?"	
	James Bell: "Well, a ramp up is complex and difficult, whether it's a new model or an old model, but we're always studying that. We have a global supply chain that has to be taken	

-					and the second	
25	P				into consideration. They're not sitting around just waiting for us to up production. They do have other work and other requirements. So we'd have to work our way through in an integrated fashion. It is a very complex, detailed study that has to take place, and generally, once you get through that, the implementation of it is in the future. It's not something that you can turn on immediately."	On the
27 April 2006	Boeing Confere nce Board, as reported in Uhl- Bien & Carsten, (2007)	James McNer ney, Chair man & CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	 "We thought we'd done all the right things; we had an ethics leader, ethics advisors assigned around the company, and an anonymous ethics-line to report suspected violations. It wasn't enough. So then we had to ask ourselves some really tongh questions: Were these lapses symptomatic of a larger issue with our corporate culture? Were our leaders modeling ethical behavior? Did our people feel confident enough to speak up about ethical concerns without fear of retaliation? Were our people hiding in the bureaucracy; were they 'winking' at wrongdoing or looking the other way? The studies concluded that, certain cultural weaknesses had permitted the people (including leadership) who suspected a problem to, in effect (although they didn't regard it this way) look the other way. In other words: Too many people who thought something 'didn't feel right' failed to raise a red flag for a variety of reasons: They wanted to win a contract, they feared retaliation, they just didn't want to rock the boat, or they lacked the courage to speak up in a command-and-control culture. We also found that just about every part of our organization responsible for guiding, investigating and enforcing ethics and compliance worked prety much in isolation – they didn't necessarily share information with each other. Once we had the facts, Boeing faced a whole new set of challenges: Do we hunker down, fall back on 'process' and make everybody dot every 'i' and cross every 't'? Or do we go for the gold and drive a real shift in how we operate and the culture we operate in? Boeing chose to take the big step. We concluded that we had to make three major changes: 1. Get committed, and get aligned 2. Open up the culture 3. Drive ethics and compliance through our core leadership model, not off to the side of other things we're doing every day. To open up the culture, we are creating an environment that encourages our people to speak up about their concerns and feel safe in doing so. We d	On the chief architec t of a modular enterprise architec ture, exhibiti ng integral behavio r with regards to leadersh ip

					 why, at Boeing, we stress that there can be no tradeoff between values and performance. They go together, and we can't stray from our values or principles as we strive for better performance. Something done unethically will only undermine our ability to perform. I know and you know that one of the absolute prerequisites for success in ethics and compliance is the belief that it is OK for people to question what happens around them. You have to be absolutely honest and candid in talking about those things. Openness and candor have to start at the top. People mustn't be allowed to think that they can hide in the corporate bureaucracy or wink at the misconduct of fellow workers, or even their leaders – especially their leaders. We also realize it all starts with leadership. If an organization's leaders don't model, encourage, expect and reward the right behaviors, why should anyone else in that organization exhibit those behaviors? This must be and must be seen to be a central part of the whole system or training and developing leaders and of the whole process of evaluating and promoting people. This is the key. At the end of the day, the ethos or character of an organization its culture comes down to the behavior of its leaders; leaders get the behavior they exhibit and tolerate. What really makes the difference between one company and another? More than anything else, it's people and how they view themselves and their jobs. Do they feel they can speak their mind freely or do they have to be wheedled and cajoled into giving an opinion? One of the most important aspects of my job is leadership development. This is where I can have the most

5 July 2006	MSN Money, "Boeing Shares Could Fail From The Sky: Optimis tic Investor s are Treating Orders like Revenu es. Given the Comple xities of Produci ng the New Dreamli ner, <i>Boeing</i> May be in for a Hard Landing ." (Jon Markma n)	F	irm α	"Investors admired the ambition, complexity, profitability and market dominance of industry leaders <i>Fannie Mae</i> and <i>Intel</i> all the way up to the point when their earnings forecasts were proven wildly over-optimistic and blew up. Could the same now happen at <i>Boeing</i> ? The parallels are eerie, if not at all perfect. <i>Boeing</i> — the third-best gainer in the <i>Dow Jones industrials</i> over the past year — is priced for perfection, much as the techs and banks were in 2000. And perfection, as we know all too well by now, is rarely attained. Investors in the European consortium behind <i>Airbus</i> found that out all too well last month when executives had to backtrack from laughable assurances that production of their new super-sized A380 commercial aircraft was on track. The bad news sent the consortium's shares down 25% in a week. <i>Boeing</i> investors celebrated the Europeans' bad news, figuring it meant new business from frustrated <i>Airbus</i> customers. But really, they should have taken it as a warning, for it is very hard to believe that the U.S. aircraft maker will manage to escape a similar fate with the construction of its own new plane, the 787 'Dreamliner.' Sky-high optimism <i>Boeing</i> rarely built a new aircraft on time when the planes were built start to finish in the greater Seattle area. But somehow it has managed to persuade investors that this time — when much of the plane is being built overseas from hard-to-get materials and organized with a glitchy new software system — <i>Boeing</i> can not only keep production on schedule but actually build planes at a record clip. A couple of analysts have been sounding the alarm, but have not made much of a dent yet with <i>Boeing</i> bulls. One bearish analyst, David E. Strauss at Swiss-based brokerage UBS, has told clients that the Dreamliner is even more likely to blow deadline than the <i>Airbus</i> A380. 'Risk to the 787 production schedule will continue to increase from here as the program heads toward first flight in late summer 2007,' he wrote. If shares of <i>Boeing</i> do go into a n	On a systemi c understa nding of modular enterpri se architec ture.

a premium for an industrial company's shares when they believe it is halfway through a business up-cycle and recent earnings growth will extend at least three years into the future. They pay absolute top dollar when they think a company whose growth has been cyclical in the past has found a way to smooth out its ups and downs and bring in steadier cash flows through diversification efforts. So what are investors thinking? Forgetting the risk of production delays and the loss of face that would entail, steady cash flows could hardly describe Boeing, which is now, and will forever be, tied to the ups and downs of the worldwide demand for commercial and, to a lesser extent, military airplanes. With energy costs persistently high, global stock markets reeling, worldwide economic growth flattening and the threat of pandemic hanging over travel, the airline business does not look like an ideal place for investment capital at this time -- and that goes double for companies that provide capital equipment, like Boeing. The case for Boeing shares over the past three years has rested on its brilliant campaign to best its only major rival, Airbus, in obtaining orders for nextgeneration commercial aircraft. Airbus made a big bet on offering a gigantic new double-decker, wide-body jet that would transport up to 800 people at a time; Boeing made its own big bet on the 787, a more fuel-efficient aircraft that proposes to save airlines money. So far, Boeing has won the race for new orders by a handsome margin.

A source of concern

But orders are one thing, and producing the darn thing is quite another. And this is where we get deeper into the intersection of ambition, complexity and risk. For if the plane misses its 2008 delivery deadline and fails to perform as Boeing's salesmen-engineers promise, then dreamy investors can kiss many of those orders goodbye before the first plane ever takes off. In its marketing material, the Dreamliner has been sold as a plane that achieves its fuel efficiency and streamlined manufacturing costs through an unprecedented reliance on large quantities of titanium, aluminum and carbon-fiber composites, and on a global supply chain held together by a new software system. Boeing has said that its suppliers and software are performing up to par and that it has not encountered any difficulty in securing enough specialty metals. Yet persistent rumors have surfaced over the past six months, denied by the company, that the 787 schedule has been plagued with technical, production and supply hitches. Fear of the loss of a ready source of titanium was in large part behind the company's stunning pledge to spend \$27 billion over the next three decades on engineering and raw materials in Russia, an economically and politically unstable **country** that happens to house most of the world's supply of the key metal. Two weeks ago, BusinessWeek

reported that the passenger seating section of the 787 fuselage has failed in testing. The company blamed the problem on faulty quality controls, but denied that construction problems at Asian or European airframe contractors would force it to bring more of the work back to the United States.
Cancellations coming? <i>Citigroup</i> aviation analyst George Shapiro notes that historically, <i>Boeing</i> shares have not performed well during development cycles and adds that their recent success 'reflect(s) a lack of concern about problems developing' with the 787 and its outsourced research and development efforts. Shapiro also warns that the 787 production cycle may be shorter than normal as airline profitability has not recovered enough to support the order surge. He expects a wave of order cancellations, even if delivery schedules are met. Why so glum? Shapiro says new planes containing significant technological innovations inevitably encounter manufacturing problems. Already, <i>Boeing</i> has acknowledged that the 787 is overweight, and with a big advance in electronic complexity, my guess is that some variation of the wiring snafus that have tripped <i>Airbus</i> are virtually a lock to appear. It's precisely due to manufacturing crises that <i>Boeing</i> shares have typically underperformed during development cycles and outperformed once planes are finally delivered. The company ultimately fixes the problems, of course, but the solution comes at the price of higher research costs that depress profit margins. Meanwhile, investors are treating orders as if they were booked revenue, even though past cycles have seen up to a third of orders canceled. Although some 787 orders are still coming in, many were made in an environment of much lower oil prices and interest rates, and stronger economic growth.
Tech echoes You may recall that, in early 2000, tech companies boasted that tremendous order backlogs would lead to fantastic earnings growth, only to learn later that buyers had speculatively double and triple ordered. Jets also are ordered by companies that speculate on traffic boosts that never materialize. <i>Citigroup</i> notes that the Indian market is seeing air traffic grow by 20%, while capacity is expected to grow by 30% an imbalance that increases the likelihood that price wars will sap profits and lead to cancelled orders. If cracks appear in <i>Boeing</i> shares' uptrend, the stock could come in for a hard landing. So what are the shares really worth, considering the risk? <i>Boeing</i> has historically traded at anywhere from a 50% discount to a 50% premium to the <i>S&P</i> <i>500</i> aggregate price-earnings multiple. Since the index multiple is around 16 and <i>Boeing's</i> multiple is at 25, it's now trading at a 55% premium. Were the multiple to

24 July 2006	Aviation Week & Space Tech., (Robert Wall)	Thoma s Enders Co- CEO, EADS	Firm- Investo r	β	contract to parity with the broad market and earnings were to come in at consensus 2006 estimates, shares would be worth \$56, or 35% less than the current quote. And if the schedule slips and the company disappoints on earnings, well, sky-high is not the word that would be used for either the multiple or the price. Personally, I'll take an aisle seat in coach." "EADS especially would like to end the recent large fluctuations in its share prices. 'We need more stability,' Enders says, which smoother operations should provide."	On producti on stability causing share price stability
26 July 2006	Thomso n Reuters Researc h, excerpt from "The Boeing Compan y, Q2 2006 Earning s Call Transcri pt"	Jim McNer ney, Chari man and CEO; James Bell, CFO, <i>The Boeing</i> <i>Compa</i> <i>ny</i>	Firm- Investo r	α	W. James McNerney (<i>The Boeing Company</i>): "Boeing has made good progress across most areas of our business during the quarter. We used our cash to invest in our organic growth programs and add capabilities to our services businesses. We also improved our liquidity position, reduced debt and returned capital to our shareholders through our dividend and share-repurchase programs. Our strong cash generation was driven in part by the outstanding sales success we continue to achieve in our commercial airplanes unit, which has expanded our total company backlog to another record level of \$220 billion. Overall, we continue to be well- positioned in healthy markets. Our commercial airplanes business remains our growth catalyst, thanks to an expanding market and airline customers who increasingly prefer Boeing's value-creating products. Business execution is of paramount importance to us. It is our main focus. Before I turn it over to James to provide more detail on our financial results and our updated outlook, I would like to say a few more words about the global settlement we reached with the U.S. government during the quarter and our decision not to seek tax deductibility for any of the charge associated with it. A few years ago, certain Boeing employees did some things that were wrong. We accepted responsibility for their actions and, through the settlement, we sought to put the past behind us and move toward a new era where ethics and compliance would become a competitive advantage for Boeing. We have made substantial changes in our ethics and compliance in everything we do, at all levels in the organization. We have been advised that the bulk of the settlement is in fact tax-deductible and that similar deductions have been allowed in the past. Without question, the short-term financial impact of the taxability issue is significant. However, the long-term value of Boeing's reputation is even more significant. Accordingly, I feel strongly that the right thing for Boeing to do is not to seek tax deductibility for th	On a modular Enterpri se Archite cture's defense of its finanaic al perform ance

settlement charges. This should be a signal to our	
employees, customers, suppliers and our shareholders	
of our willingness to acknowledge responsibility, accept	
accountability and to move forward in a manner	
reflective of the great legacy of our company and its	
employees. Simply speaking, my intent is to focus on	
the future and put this unfortunate part of our past	
behind us. As we move forward, operating with	
integrity will differentiate <i>Boeing</i> just as much as our	
technology, our talented people, and our attention to	
customers."	
customers.	
James A. Bell (The Boeing Company):	
"Commercial airplanes is benefiting from a product	
strategy that is keenly focused on our customers and our	
commitment to continuous productivity improvement.	
Revenues for the quarter rose 10%, and BCA's operating	
margins expanded to 10.1%, driven by a 14% increase in	
deliveries. We are on track to deliver 395 airplanes this	
year, a 36% increase over last year's total. These numbers	
reflect our success in working with our global partner	
network to efficiently increase production rates across	
the entire supply chain, while at the same time manage	
for profitability. We are increasing our R&D	
investment in BCA primarily to reduce risks on 787	
program goals related to weight and schedule. The	
program remains on track to meet its performance	
commitments and entry into service. We captured 311	
airplane orders during the quarter with our industry-	
leading product line. Our success has enabled us to grow	
our very large commercial airplane backlog, which has	
now reached a record \$142 billion. The strong order	
environment and the market demand for Boeing products	
drove our order total for the first six months of 2006 to	
487 airplanes. As of today, we have won net orders for	
510 airplanes. We continue to make progress on the 787.	
We began manufacturing and major assembly during the	
quarter. We also added to the large backlog of 787 orders	
in the period. Since program launch, we have captured 364	
firm orders from 25 customers from around the world. We	
expanded our large service businesses during the quarter	
by completing the <i>Carmen Systems</i> purchase and	
announcing an agreement to acquire Aviall. These focused	
acquisitions, combined with double-digit organic growth	
in our service businesses at both BCA and IDS, will help	
us deliver enhanced capability to our customers and	
additional value to our shareholders. We also achieved	
key milestones during the quarter, including the roll-out of	
our first 737-900 extended range aircraft. Clearly Boeing	
Commercial Airplanes is performing very well in a	
strong market, and we are raising our guidance for BCA	
revenue and earnings in both 2006 and 2007. Next slide,	
please. Turning to our balance sheet on slide 7, we	
continue enjoying outstanding balance sheet strength and	
liquidity. We ended the second quarter with \$10.6 billion	
in cash and liquid investments. Our total debt levels	

decreased about \$500 million in the quarter, as BCC paid down maturing debt consistent with its reduced portfolio size. Financial strength and solid credit quality remains priorities for us, and we are pleased to have the highest credit rating in the industry. Also during the quarter, we repurchased 6.3 million shares, paid a dividend, purchased <i>Carmen Systems</i> with cash, and continued to invest in our growth program such as the 787 and the new 747-8 all of which is consistent with our balanced deployment strategy."
W. James McNerney: "Thank you, James. As James said, our outlook continues to strengthen. Our businesses are strong. Our products are valued. They are building upon our customer relationships and we are focused simultaneously on growth and productivity. Throughout the organization, we are committed to consistent execution, avoiding past mistakes and delivering on our commitments. We are keenly aware that our success depends on providing better value to our customers and on operating our businesses with the highest levels and standards of integrity."
Heidi Wood (Morgan Stanley Dean Witter): "Good morning. Jim, I have a question for you. Now that you have been CEO at Boeing for a year and you said in your comments that business execution is a main focus, can you give us some specifics about how you are addressing the risk mitigation efforts through the company, so the issues come to you earlier and the charges are smaller?"
W. James McNerney: "I think, Heidi, part of the increased focus on risk management and program execution has been to service some issues over the last year. I think that is part of the result of this focus. Having said that, we have had more things to deal with than I would have liked. That is not a perfect answer for you, but maybe by way of explanation that helps a bit."
Douglas Harned (Sanford C. Bernstein & Company, Inc.): "Good morning. I would like to get your reaction to Airbus' wide-body approach coming out of Farnborough. First, there are a lot more details that need to come out on the A350, but the focus of the initial airplane is at the large-end of the 787 and the low-end of the 777. Not surprisingly, they are claiming better performance. In addition, we are seeing Airbus pricing very aggressively to get more A330's in the market at the same time. When you look at all of this, how do you see Airbus' A350 launch and approach to the A330 impacting BCA's performance and product strategy?"

		W. James McNerney:	
		"First of all, we did not expect them to do nothing. They	
		have introduced a product that, on the face of it, and since	
		we really do not have a clear definition of what the	
		product is beyond the concept that has been discussed, it is	
		hard to react to the specifics with regard to performance	
		versus our airplanes. I will say that it seems they are	
		trying to cover two of our airplane families with one	
		airplane, which is a tough putt. You are right, it has some	
		elements of competitiveness with the low-end of the 777	
		line, if they can execute along the lines of the concept they	
		put out. We do not see it as a plane that can compete	
		very well with our 787 line. It is a little big and a little	
		heavy to do the mission the 787 can do. In summary,	
		you have a single airplane trying to cover two of the	
		most successful families of airplanes we have ever had.	
		Knowing a little bit about engine technology associated with these kinds of planes, which is part of the value	
		package as well as the plane itself, it is an ambitious	
		program. Now, will it be a good airplane? Yes. Will it fit	
		some missions well? Yes. Will they try to, while they	
		gear up production which will take them two to three	
		years longer than us getting the 787, we have already	
		had the 777 out for 10-plus years will they aggressively	
		price old technology to bridge some customers? I	
		would be tempted to do that, and that is the A330	
		story. What they are doing makes sense, but will it be	
		enough is the question."	
		Douglas Harned (Sanford C. Bernstein & Company,	
		<u>Inc.):</u>	
		"You are not seeing any real change in the way you are	
		looking at them, at the market based on this?"	
		W. James McNerney:

upward pressure on our current production plans. Alan Mulally and his team are sifting through alternatives, which range from increased productivity in their current facilities, or currently being developed facilities, as well as potentially some additional facilitation. We have not made a call there, but you are right the demand for this airplane, the unprecedented demand for this airplane is forcing us to ask the question. There are worse questions to ask and answer, and over the next year or so, we will come up with a final answer there."
Robert Stallard (<i>Banc of America Securities</i>): "So this plane is essentially sold out until 2010? Is that the current situation?"
W. James McNerney: "Beyond that pretty much through it eats into '11 pretty far too."
Byron Callan (<i>Prudential Equity Group, LLC.</i>): "This is really just a follow-up on Heidi's question how satisfied are you that the focus on execution is such that <i>Boeing</i> has gotten to the bottom of the barrel on some of the issues of that have vexed earnings lately? Are you satisfied that you have the risk reduction disciplines, and even the culture in place that we are not going to see some of these surprises in the future?"
W. James McNerney: "No, I am not totally satisfied none of us are. As I answered Heidi's question, I try to portray a situation where the increased focus itself is surfacing some things. But I think what this company does are things that no other company does and as a result, we can push the envelope a little bit. We have to be more careful, not only in execution, but on things we choose to do. We are spending a lot of time focused on it. We have a lot of our initiatives focused on it. I would see every quarter, every year, an improvement. But I am not satisfied with where we are and I probably never will be totally satisfied, because that is a little bit of the nature of the business, but we are going to improve."
Steve Binder (Bear, Stearns & Co.): "How should we look at the margin guidance for BCAG for '06 and '07? You did not change margin guidance, but you did increase the R&D expense. Should we look at it as just block extensions? Is it lower expected costs on programs? Is it rate changes in the outlook? What are the factors offsetting the R&D build?"
James A. Bell: "Actually, we did have a block extension for the 777 it was off 50 this quarter, and that is why you will see that the deferred production costs went up slightly. But no, it is a combination of things. We are working our

productivity initiatives. We are harvesting the benefit
of that. That is being somewhat offset by raw material
costs, so we are dealing with that. Clearly the R&D that
we have, that we guided you to that is going up, is really
there to make sure that we can get through some of the
issues you normally would encounter at this phase of a
development program, while raising the level of insurance
that we will be able to meet our customers commitment
and our in-service date schedule. That is why you are
seeing the balance in terms of margin guidance, both this year and next at BCA.
year and next at BCA.
<u>Cai von Rumohr (SG Cowen & Co.):</u>
"Thank you. For the second quarter, BCA has done 10%
margin. Could you comment first on some of the color on
that? For example, the difference between program and
unit cost narrowed. What did the impact of the 777 block
extension do? Secondly, while you have increased R&D,
essentially it looks it is going to be relatively flat next
year, and the volume at BCA now is going up. Explain to
us again why those margins do not go up, or in fact, if
there is a chance they could go up, what should we look
for to tell whether they might?"
James A. Belli
James A. Bell: "In '06, as you look at where we are this first part of the
year, in the second-half of the year, we are going to have
less contributions by our supply chain to our R&D. That is
some of the impact. We are having higher R&D costs this
half of the year, and then we have timing on some of our
expenses, primarily our selling expense. That is what you
are looking at and how it would moderate. In fact, if you
took the contribution out of the second quarter, we would
be closer to what the run-rate is that we guided you to. So
we think we are pretty comfortable this year that that is
about the right number. Going to next year, again Cai, it is
clearly we are going to increase the R&D spend rate.
We are also going to be careful with what is going to
happen with raw material costs and our productivity
initiatives. We are doing very, very well on the single [L]. Clearly we are still challenged on how to get that
out of the wide bodies. There are more special features
associated with the 777 and the 4-7 as a custom-built
airplane, but we are optimistic we are going to get it.
Nonetheless, you could say we are being what I would
consider conservative at the right level."
Ronald Epstein (Merrill Lynch):
"Good morning. A question for Jim in the release and
the on the call, you guys mentioned how you are
increasing R&D spend to mitigate risks I guess in
weight on the 787 program. Can you give us any further
color on that? Sort of as outsiders looking in, so we can
feel more comfortable with the development of this new
airplane?"

W. James McNerney: "The weight issues on a program like this are not unusual.	
As a matter of fact, I cannot remember an aircraft program	
that did not have a weight issue of one form or another at	
this stage in the program. I would characterize the	
weight issue we have here as more normal than	
abnormal. Having said that, we have aggressive	
commitments from certification and for entry into service,	
and we want to mitigate any risk associated with not	
meeting those commitments. I think we are attacking the	
weight issues aggressively and the associated schedule	
issues, we still, as we project where we are going to be, we	
still see the plane delivered on time, within the	
performance commitments we have made to our	
customers. These programs are never easy. As you design	
and build the 4 million parts that go into these aircraft,	
there are always going to be issues. We are paranoid	
every day about them and trying to attack them and	
leave no stone unturned at this stage. I would rather be	
paranoid now than deeply disappointed later."	
burning non-runn and har and her	
Ronald Epstein (<i>Merrill Lynch</i>):	
"So we are still looking at first flight at the end of next	
year?"	
W. James McNerney	
"Yes, first flight '07 and next year. It is third quarter	
and then similar timing '08 for EIS, entry into service."	
David Strauss (UBS):	
"Good morning, thank you. Jim, could you just give us	
your current view on the status of the overall supply	
chain? Incrementally, have you seen any improvement or	
has your confidence increased over the course of the last	
three to six months? If any problem areas, if you could just	
give us some examples."	
W. James McNerney:	
"We knew at the beginning that there would be issues that	
cropped up in the supply chain, particularly as we relied	
on people for higher level components, and we tried to	
anticipate this by our use of IT, common engineering	
tools, real-time visibility across the globe in our labs	
and their labs simultaneously. We try to anticipate it by	
the way we manned and worked together our site and their	
site all toward the end of seeing problems early, dealing	
with them aggressively. We have had a couple of	
instances where we have moved work, but that was all part	
of the contingency plan, where we had built extra	
engineering capacity in the event that someone ran into an	
issue on completing work and we had engineering	
capability and facilities ready, and that has happened once	
or twice. Again, anticipated, planned for, and we are	
dealing with it, but I would not characterize any of it as	
unanticipated or earth-shaking. We are right at the stage	
now where the transition from engineering to development	

is happening and we are monitoring it every day."	
Joseph Nadol (JPMorgan Chase & Co.): "Thank you, good morning. I have one more on the 787 R&D. Over the two years, your R&D guidance has gone up \$0.5 billion. It sounds like it is more than that for Commercial, and I guess specifically for the 787. I am just wondering if you could be a little more specific as to where that money is going. Are you hiring more engineers? Are you paying overtime? Any more color on that, and then, as an adjunct to that, are your suppliers	
also seeing increased costs across the board or anywhere particularly?"	
W. James McNerney: "I think the backdrop to my answer, and the quick answer is more engineers and more overtime to execute these risk mitigation programs. But the perspective you have to have here is that this will be the most efficiently developed airplane that we have ever done. The strategy of working together with our partners and our suppliers where they are shouldering some of the development work in concert with us is producing a cash model for this airplane, even with some risk mitigation activities, that promises to be superior to anything we have ever done. Having said that, yes, more engineers and overtime, and not all unanticipated."	
Joseph Nadol (JPMorgan Chase & Co.): "Are your suppliers participating in the higher costs, or are you picking up most of the slack?"	
W. James McNerney: "They have skin in this game to, so the extent to which we [achieve] together, that they are falling behind in some area or where the weight is an issue in another, yes, it is their resources that they are applying. That is part of our agreement with them."	
Myles Walton (<i>CIBC World Markets</i>): "Thank you. A question on pension. For '06, you have lowered that number by \$200 million, left '07 intact. Given current year adjustments tend to be a little stickier, can you just give us background on how that '06 number changed? Also, given the rising interest rates, it looks like maybe 75 basis points higher next year, why you left your '07 \$1 billion intact? Then, as an adjunct, is most of that pension expense still flowing through BCAG?"	
James A. Bell "Well, that was about six questions, Myles, but let me see if I can remember them all and answer them. First of all, the overall pension cost for the year is the same. It is about \$1 billion. What you are seeing is what actually flows through earnings for this year, and that is the differential between what goes to inventory and what	

actually flows to expense. In our model, we had to modify the method for making that determination, and it turned out that it gave us [inaudible] for this year, because the way the thing works is that which is inventoried last year gets expensed this year, and then a portion of this year's cost gets expensed this year. That is what you are seeing in '06. In '07, the pension cost as you know is determined well in advance of what you would see in changes in interest rates. The change in this year does not have a significant effect on '07. Nonetheless, that method, what you see, what we think will happen in '07 stays about the same based on what we have just done. It is a one-time adjustment in '06."

Myles Walton (CIBC World Markets)

"Most of that is flowing through BCAG?"

James A. Bell:

"The pension cost is allocated -- the cash piece is probably going through, **most of it is going through BCA**, but then what you are looking at a lot of too is the adjustment that flows from it stays on the corporate books, the fast-cash adjustment."

Joseph San Pietro (Wachovia Securities):

"Good morning. Circling back to the Connexion issue, the company has stated in the past it has justified its investment in the program not necessarily from the revenues that can be derived from the back of the plan but more importantly from what is going on up-front. My understanding is that part of the lower operating cost of future programs, specifically the 787, are tied to the efficiencies that can be gained from using the Connexion system. If you guys keep it or sell it to someone, I get that, but if you decide to shut it down, exactly how does that affect the operating costs for the outlook for new aircraft programs?"

W. James McNerney:

"Not significantly is the quick answer, but you are right. The program is largely justified by the back of the plane -so I differ with you a little bit there -- but also in part justified by facilitating operations of the airplane and some service elements. The facts are that our business model is not being met. We are taking a good swing at this business and we are falling short of where we want to be, which is why we are asking a series of fundamental questions now on a going-forward basis -- restructure, terminate, affiliate being the obvious options, but continuing to operate as we are now is not an option. We are taking the fundamental look. All elements of the business model are falling short of the projections and impact on a major restructure or terminate would not significantly impact the economics. There are other ways to do what you are describing."

 Joseph San Pietro (<i>Wachoid Securities</i>): "What has been the response from your customers, specifically? The system seems to be working. I mean, <i>Lufthanuss</i> acress to be relatively pleased. It is a drag that you gays had the U.S. carriers back out due to your financial situation, but at some point they come back. You gays were not the only ones that invested in this, so what are your partners saying?" W. James McNerney:		
 specifically? The system scems to be working. I mean, Lythwaras scems to be relatively pleased. It is a drag that you guys had the U.S. carriers back out due to your financial situation, but at some point they come back. You guys were not the only ones that invested in this, so what are your partners saying?" W. James McNerney: "We are talking to them right now, including Lufthansa, as you point out. We are trying to sort through the issues. Eventually, if the business model does not work at all for us, it is not going to work at all for them either. We are trying to find out, through discussions and sharing with them the reality of our situation, and you are right – the technology is performing reasonably well. The airlines as a group have not aggressively adopted this service to anywhere near the extent that we had hoped." David Gremmels (Thomas Heisel Partners):		
 Lipthance is consistent of the U.S. carriers back out due to your financial situation, but at some point they come back. You guys were not the only ones that invested in this, so what are your partners saying?" W. James McNerney: "We are talking to them right now, including Lipthansa, as you point out. We are trying to sort through the issues. Eventually, if the business model does not work at all for us, it is not going to work at all for them either. We are trying to find out, through discussions and sharing with them the reality of our situation, and you are right the technology is performing reasonably well. The airflues as a group have not aggressively adopted this service to anywhere near the extent that we had hoped." David Greennels (<i>Thomas Weisel Partnersit</i>:		
 you guys had the U.S. carriers back out due to your financial situation, but at some point they come back. You guys were not the only ones that invested in this, so what are your partners saying?" W.James McNerney: "We are talking to them right now, including Lufthansa, as you point out. We are trying to sort through the issues. Eventually, if the business model does not work at all for us, it is not going to work at all for them either. We are trying to find out, through discussions and sharing with them the reality of our situation, and you are right – the technology is performing reasonably well. The airlines as a group have not aggressively adopted this service to anywhere near the extent that we had hoped." David Gremmels (Thomas Weisel Partners): "Good morning. I just wanted to ask, maybe you could provide some additional color on the BCA environment? Given your competitor's issues lately, it is possible to imagine them being more aggressive with pricing to try to hold on to market share, so are you seeing any changes in that environment?" W.James McNerney: "The answer is yes, we have seen very aggressive pricing from our competition, in part because old technology is fighting met technology. As a matter of fact, now that they have some new technology, at least planned. I do not want to any the pricing is going to abate because as a question surfaced earlier, the A330 could be kind of a fighter transition model. But you know, I think pricing has been pretty aggressive in both the twin area and in the A340 versus 777 area. I would not see it getting worse, necessarily. It has been pretty add, and now Atrhus promises, hopefully by the end of the year, to have a new defined, and when they do, they may want to value for that, so we will have to see." Dominic Gates (The Seatule Tinnes). "Hello, a question for Jim McNemery. Jim, at Farnborough, you in an interview brought up some issues on the ta		
 financial situation, but at some point they come back. You guys were not the only ones that invested in this, so what are your partners saying?" W. James McNernev: "We are talking to them right now, including Lufthansa, as you point out. We are trying to sort through the issues. Eventually, if the business model does not work at all for them either. We are trying to find out, through discussions and sharing with them the reality of our situation, and you are right – the technology is performing reasonably well. The airlines as a group have not aggressively adopted this service to anywhere near the extent that we had hoped." David Gremmels (<i>Thomas Weisel Partners</i>): "Good morning.  provide some additional color on the BCA environment? Given your competitor's issues lately, it is possible to imagine them being more aggressive with pricing to try to hold on to market share, so are you seeing any changes in that environment?" <u>W. James McNerney:</u> "The answer is yes, we have seen very aggressive pricing from our competition, in part because old technology is fighting new technology. As a matter of fact, now that they have some new technology, at least planned, I do not want to say the pricing is going to abate because as a question surfaced earlier, the A330 could be kind of a fighter transition model. But you know, I think pricing has been pretty aggressive in both the twin area and in the A340 versus 777 area. I would not see it getting worse, necessarily. It has been pretty bad, and now Airbus promises, hopefully by the end of the year, to have a new defined, and when they do, they may want to value for that, so we will have to see." <u>Dominic Gates (The Seattle Times):</u> "Hello, a question for Jim McNerney. Jim, at Farnborough, you in an interview brought up some issues on the tanker program and the unfairness of the regulatory environment for Boeing versus EADS. You brought up specifically the ITAR and Foreign Practices Act and how those apply to you versus them. I note that afterwards, Northrop Grumman, which is the lead contractor in the rival tanker proposal, reacted quite sharply to that and issued a statement saying you have your facts wrong. I am wondering, is Boeing going to pursue either of those questions, either of those specific

acts on the tanker thing? I think in Farnhorough one of		
acts on the tanker tring: 1 think in Fathoorough, one of	acts on the tanker thing? I think in Farnborough, one of	

the IDS people mentioned that they wanted the ITAR out of the tanker proposal, they wanted to insert that back in there. Will <i>Boeing</i> pursue these and what is your reaction to the <i>Northrop Grumman</i> statement?"
W. James McNerney: "As I pointed out, Dominic, we are just seeking a level playing field here, equally applied regulatory environment for both. This issue was raised as we discussed in Farnborough really by the legislature in terms of discussions they have had and resolutions that have been put forward to ensure this level playing field. I think our customer and the legislature behind it are probably the ones that should push for this rather than us. We are a self- interested party. We are a competitor here. We just want to make sure it is a level playing field. I saw your interview with Mr. Crosby. You know, for all I know, they are taking steps to respond to these things that I am unaware of. That is where we stand."
<u>Molly McMillen (<i>The Wichita Eagle</i>):</u> "Good morning. My question is for Mr. McNerney. I saw comments from Alan Mulally out of Farnborough about a plan for the 737 replacement, that that plane would be more composite. My question is, what kind of impact do you anticipate that could have on <i>Spirit</i> <i>AeroSystems</i> here, which certainly has a huge portion of the current 737? What do they need to be doing in the meantime?"
W. James McNerney: "Listen, first of all, I do not think Alan meant to say, and I do not think he did say that there was a clearly defined next-next generation 737. You probably did not imply that in your question. We are studying where to go and obviously composites are one of the technologies that could flow from the 787 down into the narrow body. The value of the composites, obviously strength, maintainability and weight. I think Spirit is doing a good job on the composite side. They are a very valued partner, so I think whatever plane we define for the future aero body which will not be for a number of years, keep in mind we would hope that Spirit would remain a very important partner for The Boeing Company going forward. Based on the capabilities I see there, I think that is going to happen."
Molly McMillen (<i>The Wichita Eagle</i>): "So you would anticipate them getting a bigger chunk than they have of the current 787?"
W. James McNerney: "No, that is not what I said. That is not what I said. What I said is that they will remain a very important partner. It is hard to have a work statement until you have an airplane defined. I see the capabilities that have

		9	Pierre		developed there, the quality of the people developed there, I see them holding on to a big chunk of it, and we want them to hold on to a big chunk of it, consistent with competing for the business. I think they are going to be very competitive." <u>Amik Sacheet (Chicago Tribune):</u> "Good morning. I wanted to ask you, with Airbus likely to seek new launch aid for the A350, how that might affect any potential settlement of the trade disputes?" <u>W. James McNerney:</u> "Well, I do not think it would be helpful. I think if they seek launch aid on the same terms that they have had it historically, I think our government would view that as a step backwards, a significant step backwards in the negotiating process. As I said before, I hope we can find a way to negotiate something, our government and the European governments, but that specific step, would not be helpful, in my opinion."	On a
Sept. <i>H</i> 2006 (<i>y</i>	The Boeing Compan website	Scott Carson , Preside nt, <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i>	Firm	α	"Boeing Chairman, President and CEO Jim McNerney today announced the appointment of Scott E. Carson as president and CEO, Boeing Commercial Airplanes. Carson, 60, a 34-year Boeing veteran, moves to the leadership position from vice president, Sales, for Commercial Airplanes. He replaces Alan Mulally, who has been named chief executive of Ford Motor Company. 'Scott Carson is a seasoned and well-respected leader who knows our customers, our business strategies, and our products and services inside and out,' said McNerney. 'He is uniquely qualified to step in and lead our commercial airplanes team and continue to advance our performance and growth plans.' Boeing also named James M. Jamieson, 58, to the new position of chief operating officer, Boeing Commercial Airplanes. Jamieson currently serves as senior vice president, Engineering, Operations & Technology, at Boeing's corporate offices in Chicago. Jamieson will report to Carson and oversee airplane operations and product development. 'Adding the strength of Jim's background and experience in engineering, operations and product development will make our already strong Commercial Airplanes team even stronger,' said McNerney. Carson has a long record of accomplishment across Boeing. In his most recent position he reinvigorated sales of Boeing commercial airplanes and related services to airline customers and leasing companies around the world. He has also served as executive vice president and chief financial officer of Boeing Commercial Airplanes, where he led the finance and business strategy organizations, as well as information systems and services. He also held leadership positions in the company's defense business and was the first president of Connexion by Boeing. 'I am excited and energized by the prospect of leading the people of this great business,' Carson said. 'We will remain steadfast and focused on executing our growth and	On a modular enterpri se architec ture's creation of a COO position to shore up its new CEO (having little operatin g experie nces in light of the coming 787 challeng es).

Oct. 7-13, 2006 Oct. 12, 2006	The Econom ist Financi al Times (Paul Betts)		Firm	β	strengthen engineering and operations functions across the company, and provided leadership to the <i>Boeing</i> technology and information technology organizations. He served previously as senior vice president of airplane programs for Commercial Airplanes, where he was responsible for the design and production of all <i>Boeing</i> commercial airplanes. Other roles he has held include head of <i>Boeing's</i> single-aisle commercial airplane programs, chief project engineer for the 757, and chief of customer engineering for the 747 and 767 programs." The increase in total company R&D reflected in our new guidance is expected to be offset by performance improvements at our other businesses. We continue to expect that the 787 and the 747-A will be delivered on time and in accordance with our contractual obligations. We expect BCA margins to moderate in the fourth quarter due to the timing of costs and the absence of supplier participation payments to offset R&D expense. Despite lower margins in Q4, we expect BCA's full year margin to exceed 9%, which is consistent with our current guidance. And we also expect BCA margins next year to exceed 10%. Clearly, our commercial airplane business is performing very well in a strong demand environment. During the quarter, we announced that we would discontinue our Connexion service by year end and take charges totaling approximately \$320 million in the second half of 2006. Now, turning to our balance sheet strength and liquidity. We ended the third quarter with over \$8 billion in cash and liquid investments. So moving on to cash flow on slide 8. Our cash flow generation remains very strong. Also during the quarter, we repurchased 8 million <i>Boeing</i> shares." 							
 partner network to efficiently increase production rates across the entire value chain, while at the same time managing for profitability. The 787 program continues to experience pressure with respect to weights and supplier implementation. We are raising our R&D forecast to reflect these increasing pressures. changed since last july (changed since last July?"	

Jim McNerney: "I think I would characterize what we're doing here as pretty aggressive contingency planning. We are at that point in the development program where weight remains a dogged issue. We know what we have to do. Suppliers occasionally need help, and what I am trying to do along with the BCA team is put a contingency plan in place. Just to give you some context, we have got eight contingency plans that we're looking at. We've funded one right now. We're trying to get out ahead of it just in case. This program has been characterized from the very beginning as a program that cuts across all boundaries within our company and across our company and to other companies that are our partners. We have one database, common tools and processes. We see everything, and what we're trying to do is as we go through this, just be as conservative as we can be; and there is a fair amount of conservatism built into this. We know how to build this airplane. This plane will be done on time and will be done within contractual commitments."Heidi Wood (Morgan Stanley): "Good morning, gentlemen. I am wondering if you can provide us a bandwidth of kind of the high, low range where as you see now R&D's possible variance could go versus the '07 guidance you're giving us of the 3.2 to 3.4? I mean, obviously, that's a single-figure number, but how	
 much risk do you see to that being up over the next couple of quarters? I mean \$100 million to \$200 million a quarter through '07?" Jim McNerney: "As we see it now, that's a pretty conservative number, Heidi, as was consistent with the answer I gave Byron. We are trying to witch-hunt the issues in this program right now, and we do have some weight issues as I have said. We do have some supplier implementation issues. We are addressing all of them with aggressive recovery plans, and we've planned on more, should additional issues crop up. So I would characterize this from where we sit today against the delivery commitments and the contractual commitments we've made, a pretty conservative number." James Bell: "And let me add to that. What you're seeing as the spending profile is still well within the business case, well, actually well under the business case for the current spending that had us to launch this program. As you can see by the number of orders today, it is obviously a lot more successful than we ever envisioned at this point in the program." 	*
Heidi Wood (Morgan Stanley): "This is sort of a question for both of you, because it's both	

a strategic as well as a financial question. But your current market outlook pegs the 787 market niche size at around 3,600 aircraft and assuming a 50% share, that's 1,800 planes. But at the 432 bookings, you're at 25% there before the first delivery. So the business case you guys talked about presumed an <i>Airbus</i> response, but now it's looking like the A350 XWB isn't going to deliver until the 2014 or 2015 timeframe, which gives you sole positioning in the mid-size wide-body niche for a good seven or eight years. Does the A350 looks like it's more positioning itself to more than fully take on the 787? I am wondering if you guys can talk to us about how you think about the trade-off in production rates and pricing, given that it appears either your market share or the size of your market assumptions have been conservative?"
Jim McNerney: "No. I'd say the 50% looks pretty good, and there is upward pressure in our planning on production rates." <u>Heidi Wood (Morgan Stanley):</u> "Would you need to spend additional capital, Jim, to get there, though?"
there, though?" <u>Jim McNerney:</u> "Not anywhere near the size of the opportunity" <u>Cai van Rumohr (Cowen):</u> "Thank you, gentlemen. Could you give us more color on
the supply issue and the weight issues on the 787 and perhaps answer the more important question: you have increased the R&D here in '06 and '07, but do you still feel as comfortable about the potential for this program to be solidly profitable as we get out to the 2008 and 2010 timeframe?"
Jim McNerney: "Cai, this program's projected economics are significantly better than any airplane program I have been involved with and that's because of the structure of the supply chain, both in its participation and recurring and nonrecurring costs. I think you know the business model. So the structure of it combined with unprecedented market acceptance leads you to a pretty good conclusion about the concept and the strategy. As James pointed out a few minutes ago, even notwithstanding some upward pressure on research and development here in the short and medium term, we are well within the business case. Our internal targets are significantly within the business. This
pressure hasn't really changed that outlook, so I don't see a fundamental change in an outstanding business case because of what we're talking about here today, at all."

Column Deverator (Counce)
<u>Cai van Rumohr (Cowen):</u>
"And to the issue of supplier issues and weight issues?"
Jim McNerney:
"Just more color you mentioned. Yes, I would say that we
have a significant amount of engineering resources. Now
that we've largely completed the engineering release
process, there are some places we're going back to get
weight out. So the good news is that we completed the
majority of the engineering releases within the timeframe
we hoped to and we have time to go back with a team. We
have a weight reduction team that is going back both on
parts that we designed and parts that others have designed.
Remember, we're all on the same system. So we
understand the design parameters and design specifics
on a real-time basis as well with our partners as we do
in our own engineering shops. So we are very agile and
very quick in terms of being able to go back and put
resources on some of that. Other things we're doing, there
has been some production process help we've given a
couple of suppliers as they're setting up new facilities and
needed some boundary-less kind of collaboration
between our production people and theirs to move it along
a little faster. It's all the kinds of thing we anticipated. It's
all the kinds of things that you do when you share a
supply chain with people who have a lot of skin in the
game with you. But the good news about a lot of skin
in the game is we are both incented to get it done. It is
not us pointing at them and them pointing at us. It's us
getting together and so it's a mix of weight reduction and
production process facilitation, I would say."
Joe Campbell (Lehman Brothers):
"Hi, guys. Good morning, all. I would like to go back to
the second part of Heidi's question, which is when looking
at the stock, it is a bit upset because it looks like people
are assuming over runs in R&D are for sure, and
estimates that it will do better in the future on the
operating performance are maybe. I am wondering
whether or not implicit in the numbers that are the 2007
guidance, or if that will do even better? It looks to me like
what you've got is a forecast of the second half of 2006
performance forecast into 2007. And if it is true that the
R&D is really only contingency, it would seem that we
might not be so heavy on the R&D, but we could be better
on the operating side while the market seems to be
worried that the R&D is for sure, and we might not
make the operating profit gains they're going to offset
the R&D. So I wondered if you could talk with what
you've assumed, in terms of getting better versus I know
your hopes are that you will do better.
Jim McNerney:
"We feel good about the underlying operating plan.
You know the ramp up, which will continue next year
in a number of our airplane programs, has gone well. I

think we have confidence that the underlying operating marging for R&D will be delivered. The R&D I would
margins for R&D will be delivered. The R&D I would characterize as a conservative number, one that
anticipates contingency actions that could happen.
We'll be ready for them if they happen. Could there be
an upside? Perhaps, but I think planning on an upside
is not the way to run a business. James, do you have any
other comments here?"
James Bell:
Yes. And I think the other thing, Joe, if you look at what
we're projecting and normalize our earnings this year that
we're projecting to potential charges, I think we're still
going to have 30% earnings growth year-over-year.
Although we have the ability to see the way the program is
being managed, see the risk early and make a decision to
make available resources to have contingency plans to offset those risks, should the risks hit the beach; I don't
want us to lose sight that we've had a significant
number of recent accomplishments on this program
that are hitting right on schedule. For instance, we have
begun major assembly of the center wing section. We
started fabrication of the landing gear, the APU integration
facility is up and running, we completed the first test of the
engine pylon. We've unveiled the wing test box. We're
opening the new production propulsion integration center.
We've had the first major partner-to-partner delivery, and
that was the keel assembly and the pressure deck. We
completed the 787 integration test vehicle, and we're now
testing the large cargo freighter. I mean those things
have been hitting right on point. The fact of the matter
is, Jim and I are going to run this business from a
conservative perspective, and we're going to make sure that we have in place plans early enough that we can
implement, so that we can hold to schedule and meet
our customer obligations, and I think that's what
you're seeing in this increase in R&D."
V
Doug Harned (Sanford Bernstein):
"Good morning. Over the last two quarters as you've
taken up your estimates for R&D, you've kept your
guidance the same in commercial. I am interested in
understanding, I mean that's better than a 1.5 points in
margin. I am interested in understanding where that
benefit is coming from? I know you have had a number of initiatives on the operations side also on the
of initiatives on the operations side, also on the corporate side. Could you talk about what you see that
you've captured, where it has come from and how you
get comfortable about those savings?"
Jim McNerney:
"Well, I think the two places we've had pressure are R&D
and some sourcing pricing inflation on some key raw
materials. I think that's well known in the industry and
well known as discussed by us. Where we are offsetting
that is in conversion productivity. There is a lot of

innovative work going on in the PCA factories, whether it is moving lines in Renton, the beginning of moving lines in Everett which is a revolution in the way airplanes are converted; whether it is volume-related leverage as we take up our rates a bit; whether it is labor productivity. There is a lot of great work being done on conversion productivity, which is by in large, along with volume, offsetting these pressures. That's the business model we run under. I mean when we talk about growth in productivity simultaneously, we mean it. The reason we drive productivity so hard in the Company is to make sure we have resources available to properly fund these huge opportunities we've got. When you look a t the 787 which we've talked a fair amount about here this morning. This is one of the most competitive airplanes when both measured against the planes it is replacing and against the planes that the marketplace is offering as an alternative as you will ever see. We don't want to you lose sight of that as we have these candid discussions about how we're managing R&D and managing risk as we develop the airplanes. We want to be up front with you. We want to be up front with ourselves as we march through this program." Doug Harned (Sanford Bernstein): "That's good. I am trying to understand, though, on the cost side, what's allowing you to get the better margin? If you put R&D aside, is it also the overhead type initiatives that you have let out of corporate?" Jim McNerney: "There is some of that. The answer is yes. I mean, we have reduced some of what you would call corporate and SG&A costs as a percentage of sales. But I think the hard work has been on conversion productivity in our factories and with the way we're working with our suppliers. I think that is leaving aside price inflation on some commodities as a separate issue, as a pressure. I think that is a bigger part of it, and there is more to go on both by the way. There is more to go on conversion productivity, and there is more to go on G&A and corporate costs. We do have, as you point out initiatives in place to address both. A lean plus initiative, our corporate services reduction initiatives as well as our development process excellence initiative which gets at some costs. So we are going to be relentlessly focused on these things." Steve Binder (Bear Stearns): "And the same question was about pricing. You know, we have no clue what you're assuming not just for escalators, but for pricing on your model types, especially since you have a compromised competitor. That's why I was wondering have you seen any revision in those estimates, variables." **James Bell:**

	"Well, our pricing has stabilized, we think. Clearly, we are expecting more growth going out, we will give you more guidance on that obviously in the fourth quarter as it relates to '08. But we are assuming we're going to get the productivity as we go forward And in fact we've demonstrated it. We've demonstrated we've been able to move up in rate in all the current models and do that effectively and do that profitably. We anticipate to do that going forward, and also to get additional leverage."	
	Robert Spingarn (Credit Suisse): "Good morning. You know, Jim, as a follow-up to what Steve just mentioned on the 747-8I , could you give us a little bit more color on where you are on that program? Clearly, you have the R&D ramp. It looks like from macro perspective, you may have more opportunity here lately to capture some share just based on some instability perhaps in the marketplace right now, vis-à-vis a competitor. If you could give us more color there."	
	Jim McNerney: "Yeah. I mean I think you have to back off a little bit and get some altitude on it. First of all, this is a derivative program, and the amount of money we're spending on this reflects that. I mean this is taking an airplane we know how to make, we've made for years, one of the world's most successful airplanes and we're modifying it. So as we adjust and tweak to meet specific market requirements, we have to keep the context that it is not a huge development program for us. Now, having said that, I think the requirements have settled down on that airplane now. We've had a lot of dialogue with not only the legacy carriers in Europe that Steve referred to, but a lot of other people. We've made some modifications. We know what we have to do. We understand the engineering of the airplane, and we know how to do it and we have time to do it. So I think we're in pretty good shape, with the requirements having settled down."	
	George Shapiro (Citigroup): "I wanted to pursue the R&D a little bit more. I mean effectively, you've raised R&D pretty substantially now two quarters in a row. When do you think the period of greatest risk in this program is? Or you can't say until we get to say the initial flight test program?"	
	James Bell: "Well, I think we're in it. We're in a period of considerable risk, and I think we've identified them early. Obviously, we want to get the contingency plan in place in time and have them resourced in case we need to call on them, George. Obviously, you'll have a different set of risks once you get into the flight test. But I guess the real point I want to make on this is that we think we understand how to build this airplane. I mean we think	

	we've gone through it. We understand the systems we need to go deal with and how to do them. We don't have the complexity on our airplane that the A380 is, we have a fifth of the electrical wiring in it. So I think if some of the concern is being driven by what you see out there in other places, then I think you have to	
	understand there's some distinct differences in what we're doing here. What you're seeing here is early risk mitigation. I think we're there in terms of our ability to go look forward and see where those risks might hit the beach and where we can put contingency plans in place and hopefully mitigate it."	
	George Shapiro (<i>Citigroup</i>): "But if something incrementally worse didn't happen in the third quarter, why wouldn't you have raised the R&D by a bigger amount in the second quarter? I guess I am looking for what did you incrementally see in the third quarter that you didn't in the second quarter?"	
	James Bell: "Well, again, if you remember in the third quarter half of this increase is associated with the 747-A. The other piece that's associated with the 787 is to look at those other contingency plans that we had on the table and we understood in the second quarter, but we now have another quarter of history or time has passed and so we wanted to make sure we had the resources available. So, quite frankly if we were going to focus on something big happening, it would be something that would be totally unexpected like somebody dropping a big piece of hardware or a big piece of tooling or something having a major failure. But right now in terms of the technical things that need to be done, we think we understand them pretty well and we just want to get the weight out of it and then make sure we hold the schedule."	
	"There has been no dramatic or qualitative change in the risks we're managing one quarter to the next. I think it's a matter of as James said, being at that point in the program where, as the risks exist, you want to get out ahead of them and more than get out ahead of them. I think that's what you're seeing here."	
	Ronald Epstein: And then a product placement or product development question for you. Lately I think the BCA guys have been out talking in industry conferences and have been a little bit more vocal about <i>Boeing</i> being involved with a small plane, something maybe around 100 seats . Jim, I was wondering if you can speak to that, how seriously <i>Boeing</i> is considering that and any color you can add on a smaller narrow bodied jet."	

		T' BE BI	
		Jim McNerney: "I don't think, Ron, that we have a crystal clear view yet of what the narrow body market of the future is	
		going to look like . Certainly there is a lot of discussion around the 100 packs, and there is a lot of discussion	
		around a bigger version of a narrow body, you know, the	
		200-plus size as well as the core of the market, the 150 to	
		180. A lot of discussion, a lot of debate, different camps	
		within our company. Meanwhile, we're just focused on	
		maturing the technologies that we know will fit into	
		any of those versions as that clarifies. But I hesitate to tell you I know exactly what that market is going to	
		look like eight, nine years from now. Over the next year	
		it's going to get a lot clearer."	
		Joe Nadol (JP Morgan):	
		"Thanks. Good morning. I was wondering if you could	
		comment just a little bit more on your current production	
		at BCA. You've been running the past couple quarters with unit costs accounting, profits higher than program	
		and this quarter that slipped around. So I was	
		wondering what caused that."	
		James Bell:	
		"Joe on the unit margins it's just we've had the impact of	
		the increased material costs they had a more dramatic impact on unit margins early, and it doesn't have the	
		ability to have the production improvement that we have	
		over time in programs. So again, with the problem with	
		unit margins, I know you all like them, but they're	
		volatile, because they can be affected by near-term things and doesn't take a program picture into effect.	
		But it's a data point."	
		Joe Nadol (JP Morgan):	
		"So you characterize the issues you're facing more as just	
		raw material inflation rather than getting the stuff in the door."	
		James Bell:	
		"Exactly. And for the quarter there was a big difference in	
		terms of delivered units which have a pricing impact."	
		Peter Jacobs (Wells Fargo):	
		"Good morning, gentlemen. James, could you just highlight again specifically where you're seeing some of	
		the weight issues on the 787-A program and any kind of	
		additional color you can give there?"	
		Jim McNerney:	
		"No, I don't want to name names. But in general what we	
		have is the airplane is pretty much designed and as you start laying out the components, there are weight	
		opportunities, and obviously the bigger the component,	•
		the more generally the opportunity is. So we're trying to	
		attack those that have the highest payback and that we	

-
could do within the timeframe necessary to meet our delivery dates and still meet all of our contractual obligations, and so that's the focus."
Gary Liebowitz (Wachovia Securities): "I am going to kick the R&D dead horse one more time. Jim, in the beginning of the conference call you were speaking that there were eight contingency plans, one of which you had funded. Are you saying that there is potentially seven more contingency plans to be funded?"
Jim McNerney: "What I meant by that was that we have around eight, last time I reviewed it, contingency plans in place if we need them. The R&D level that we are talking to you about assumes we fund all of them and more. We've only triggered funding, we've only needed to trigger funding on one of them. I was trying to point out a specific with regard to the conservative posture we have with our R&D. So is that clear? In other words, if we fund them all, we still won't be pressuring the number I gave you."
Lynn Lunsford (<i>The Wall Street Journal</i>): "Good morning. Just one little question and I think it's more looking at nuance than anything else. Up until now you have pretty well said that you expected entry into service for the 787 to be mid-2008. I noticed in your press release that in the graph where you talk about that you just say during 2008. Does that mean you're slipping that or is that just a word?"
Jim McNerney: "Not at all. I mean that's wording. I believe it's August '08. It has always been late August, early September has always been the timing and still is the timing. That was advertent, Lynn."
James Wallace (Seattle Newspaper): "Yeah. Good morning, Jim. I had a question and in previous interviews that Mike Bair has done with me and others, he has mentioned 2% has been the overweight issue, plus or minus something. Has the weight increased recently or are you just trying to tackle the same weight that he's been talking about?"
Jim McNerney: "I think it's within the range of what he is talking about. I don't know when you last talked to him, but I would say the weight pressures have increased slightly, but also the opportunities to reduce them have increased. So we're working it, but it's within that range sort of low single- digits."
Dominic Gates (The Seattle Times):

1 Jan. 2007	Aviation Week & Space Technol ogy (Michae I Mecha m & Anthon y Velocci)	Alan Mulall y, Former Pres. & CEO of <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i> . Curren t Pres. & CEO of	Firm	α	 "Good morning a couple of things. I wondered, Jim, if you could give us any idea of what the one contingency plan that you have had to fund, what that was exactly?" Jim McNerney: "There will be some work that is going to be brought to Seattle. That was going to be done by a couple of our suppliers that is more efficiently done in Seattle, and so we've made an adjustment there, and that's the one we have triggered." Dominic Gates (<i>The Seattle Times</i>): "Is it major work?" Jim McNerney: "Well, I don't know what you would categorize as major work. I mean it is systems installation work, that is systems that are going to be installed in the airplane." Dominic Gates (<i>The Seattle Times</i>): "Thanks for letting me back in. I just wanted to go back to one answer that Jim McNerney gave earlier. I was a little surprised when you told Lynn Lunsford that the first deliveries of the 87 would be in late August of '08, because I certainly understood it was going to be earlier that summer. One of the reasons for that was ordered the 87 wanted it for the Olympics. Isn't that going to be too late if you're delivering it in late August? The first one goes to Japan, not China. Jim McNerney: "Dominic, you're right. I may be confusing when we're shipping an airplane to somebody versus when they are implementing it. Our date for delivery to the Japanese and Chinese airlines have changed. If I have confused the date, I apologize. We'll reaffirm that with you. I am not trying to signal any change at all." "I don't think one bit about whether it can be done or not, I'm focusing on how to do it, to turn it around, to find a way to do it. And if it can't be done, then the assets will go to somebody else. And they should, it's business."	On a modular enterpri se architec t's views of competi tion and capital.

areas represent the bulk of our R&D spending at this po	
and we're making progress on all fronts. On weight	
have identified a number of areas where we are tak	
weight out of the airplane. We've redesigned numero	
parts and changed some materials. And we f	
confident we'll get where we need to be. To mitig	
schedule risk, we've continued to provide engineering a	d
manufacturing support to our partners, many of whor	
have personally visited over the last twelve months.	
continue to make good strides there as well. We contin	
our process of robust contingency planning wh	
keeps us looking forward at risks we may encoun	
and mitigation actions we may need to implement.	
have committed resources for these plans as we not	
to, and retired plans no longer required. To help	bu
track our progress on the 787, we plan to update you	at
least twice a quarter, once during our earnings call	nd
once by Mike Bair, our 787 program head during	
quarterly call with media and investors. So, while mino	
of the inherent challenges and risks that lie ahead o	
program like this, we are pleased nonetheless with	
progress we are making on the 787 and with	1e
airplane's performance, which we expect will exc	
the overall performance levels we committed	
customers when we launched. We continued to inves	
developmental programs like 787 and the 747-8, both	
which will be major growth programs for the	15
Company for a long time to come. While we impr	
the value and performance of our business, we further the value and performance of our business.	
enhance the value we provide to shareholders	
increasing our dividend 17% and authorizing a new	
billion share repurchase program. We see more poten	a1

	to return capital to owners through share repurchase and dividends as our financial performance improves. You have heard me say that we are committed to delivering financial results that match the quality of our people and our technology with our momentum and continued focus on growth and productivity we have a great opportunity to do just that."	
	James Bell (<i>The Boeing Company</i>): "Now turning to our segment guidance. BCA airplane deliveries are forecast to grow to between 440 and 445 airplanes in 2007. Deliveries in 2008 are expected to be approximately 515 to 520 airplanes, driven by higher production rates and the introduction of the 787 Dreamliners. Looking further out, we expect airplane deliveries in 2009 to be higher than those in 2008. Commercial Airplane revenue guidance for 2007 is between \$32.5 and \$33 billion. And it's expected to grow to between \$39 and \$40 billion in 2008. We expect 2007 operating margins for Commercial Airplanes to be above 10%, reflecting higher deliveries and continued productivity. For 2008 we expect BCA margins will continue to expand to approximately 11%. Now, in terms of airplane orders, we expect the strong demand for our products will keep our book-to-bill ratio above 1 for 2007, resulting in a further increase in our backlog."	
	Jim McNerney: "Thank you, James. Well, this is the second time I have addressed you to discuss our year-end performance and the road ahead. Last year I told you we had embarked on a new course based on a new management model, dedicated to the simultaneous pursuit, growth and productivity and founded on the principles of leadership development. Our results show we are making very good progress on this new course. I also told you last year we moved to put some of the ethics and business problems from our past, put them behind us, and we have succeeded there as well. I personally believe that we will look back on 2006 and see it as a pivotal year in the history of <i>the Boeing Company</i> . We will heighten our focus on growth in productivity. We will expand our leadership development, and we will redouble our efforts to meet commitments while living the <i>Boeing</i> values. We want to remain the world's strongest, best integrated aerospace company, and we want to make sure our stakeholders see us that way, too."	
	Doug Harned (Sanford Bernstein): "On the 787, there have obviously have been a lot of rumors out there particularly related to suppliers, and when we were back in the last quarter you talked about the eight contingency plans , and that you were working on one of them at that time. Could you describe where you are today? Are you exercising more of those contingency	

plans, and are you still on track for the 112 deliveries that you have described for '08 and '09?"	
Jim McNerney:	
"This is Jim. I will answer the question, Doug. The answer	
is the specific answer on the contingency plans is we had	
outlined eight, I think we had said that we had activated	
one, and we were prepared to activate the rest as we	
needed them. The facts are, we sort of activated a	
couple other ones, and they had to do with work generally	
being done in different places or preparing for the	
contingency of that happening, I guess is a better way of	
saying it, and hiring some people and having them hot	
ready to go in the event that that happens. It doesn't	
involve much money, it doesn't involve that many people,	
but it does anticipate worst case kind of scenarios for some	
traveled work. We retired one of the contingency plans,	
the interface control data, because we made better progress	
on getting that systems level work done, and so we're about where we thought we'd be. We sort of activated	
half of them, and ready to go, and I think your second	
question on the deliveries in '08 and '09 as we look at it	
today, we feel comfortable with that anticipation."	
today, we teel comfortable with that anticipation.	
Doug Harned -(Sanford Bernstein):	
"And when you talk about the contingency plans and some	
of the challenges here, do you see them more in the	
structures area, the systems or are they more general	
weight reduction type issues?"	
Jim McNerney:	
"The weight reduction program is a major program that we	
kicked off in the second half of last year. We're making	
very good progress on that. That is a core engineering	
activity, and that we turned the gain up on as the plane,	
like all planes, started to come in a little heavy. I am	
feeling pretty comfortable about the progress on that	
weight reduction program and getting the plane down to	
where we need to be to meet the commitments to our	
customers, so I feel good there. I think the kinds of things	
I am talking about with contingency plans are having	
stand-by capability to make some tubes, clips and brackets	
in the state of Washington in case they don't show up in	
some of the components that have been stuffed before they	
get there. I mean, it is things like that that I am talking	
about. The weight reduction thing is a major effort, and I	
am feeling good about the progress there."	
Cai von Rumohr (Cowen and Company):	
"Thank you. Like to follow up on Heidi's question. Even	
if the 787 were at 0 profit given you're going to be down	
150 to 200 bips in R&D, and also you're going to get a	
positive swing in pension, it looks like your margin	
before R&D is down, is that pricing? Is it	
conservatism? What is it, because basically the	
numbers don't add up."	

James Bell: "We're conservative, Cai." Cai von Rumohr (Cowen and Company): "Okay. Thank you." James Bell: "You got me." Howard Rubel (Jefferies & Company): "The dilemma that you sort of talked about, Jim, is that things are so good, how do you make them better, might very well be characterized with one of your challenges, and one of them is that your backlog stretches so far that, how do you keep your sales force motivated to continue to sell airplanes? And are have we if we look at what we see in the way of rate schedules, there have to be at least one or maybe two more rate increases planned beyond what you've announced. Is that fair?" Jim McNerney: "I think we have to get a little more visibility longer term before we consider we just raised we are just getting	
before we consider we just raised we are just getting there now, and listen. I don't want to argue with you, because your big point is right which is that with this kind of demand we are always looking at rate increases, but we always want to do them prudently, so because as you know, companies like ours get in trouble when they chase rate without the proper supply chain management. And so you're going to see us raise rates prudently, and I think the I think our sales force, by the way, they have a lot to do out there as they work with airlines and work with other customers and the infrastructure that supports them to make sure we get the current technology that's moving out installed properly and supported properly, and they're not taking Wednesdays off."	
Joseph Campbell (Lehman Brothers): "Good morning. I wanted to ask again about production rates. You were careful in 2006 to make sure that you raised the production rates. I can't remember your exact phrase, but it had to do with profitably ramping up rather than just ramping up, and you had a strike and gave us rather conservative numbers about the time it would take to you get whole, and you've now raised the production rates in '03 for the existing products. You've given us a range, something like 3 a month '08 over '07, and I wondered whether we should look at the '08 rates which you've talked about as being limited still by your ability to ramp up as they were in '06, and I presume in '07 as well, or whether you now have got your production rates as what you think are prudent given the level of demand that you see out there. Thanks very much."	

	Jim McNerney: "Yes. I think the short answer to your question is that we see a good fit between demand and our rates in '08. Could we sell another airplane or two if we scrambled to ramp up another few airplanes in the year? Maybe. Is it worth the risk? Absolutely not. I think we've got clear visibility on how to raise the rates to the level that we're talking about in '08. By the way, to do that we had to start working with many of our suppliers a year ago. I mean this is a long- cycle activity, and as a result, to chase speculative demand with rate is not the way to run this business. We got a good match in '08. We're in good shape."	
	Lynn Lunsford (<i>Wall Street Journal</i>): "I am trying to this is sort of a larger philosophical kind of question, but over the last several weeks the <i>Boeing</i> stock has been pretty volatile, and it seems like several days ago whenever one of the analysts came out and declared the top of the order peak that is started going down. I guess the question is, is by focusing on book-to-bill and the order peak, are people keeping their eye on the wrong ball? Is there something else that investors should look at when watching how <i>Boeing</i> performs?"	
	Jim McNerney: "Well, I think, obviously, book-to-bill is a factor to consider when you're looking at any company, but I think when you're looking at a backlog the size and the diversity and the balance that we've got across the Company, the backlog is many, many multiples of the yearly revenue of our Company. I think looking at the backlog and our progress on executing against it, when it is as big as it is, is probably a better measure of in terms of visibility that you want to project, particularly when you've got a the biggest part of the backlog, Commercial Airplanes, with a cycle that doesn't look like it is slowing down right now. We talked about the legacy carriers in '07 and '08 getting back into the game, and so I think you add it all up, and I think I would pay a little more attention to the backlog right now than book-to-bill. If the backlog were a lot smaller, I think book-to-bill would be a more relevant something you would worry about a little bit more."	
	Lynn Lunsford (<i>Wall Street Journal</i>): "You said also that one of the key things with this ramp-up is, can you raise your rates and maintain increasing profitability. Are you pleased with where that's going so far?" <u>Jim McNerney:</u> "Yes. The short answer is yes, I am pleased with where that's going so far. We have had a number of rate increases, and there is some here in the planning period	
		 see a good fit between demand and our rates in '08. Could we sell another airplane or two if we scrambled to ramp up another few airplanes in the year? Maybe. Is it worth the risk? Absolutely not. I think we've got clear visibility on how to raise the rates to the level that we're talking about in '08. By the way, to do that we had to start working with many of our suppliers a year ago. I mean this is a long-cycle activity, and as a result, to chase speculative demand with rate is not the way to run this business. We got a good match in '08. We're in good shape." Lynn Lansford (<i>Wall Street Journal</i>): "I am trying to - this is sort of a larger philosophical kind of question, but over the last several weeks the <i>Boeing</i> stock has been pretty volatile, and it seems likeseveral days ago whenever one of the analysts came out and declared the top of the order peak, that is started going down. I guess the question is, is by focusing on book-to-bill and the order peak, are people keeping their eye on the wrong ball? Is there something else that investors should look at when watching how <i>Boeing</i> performs?" Jim McNerney:

Jamison and the team there are bound and determined to do this in a disciplined way, and I am certainly philosophically aligned with that. And so the steady increase in margin expansion that you're seeing combined with the on-time delivery of our planned rate increases with suppliers who are committed to working with us, is working so far, and we're just going to keep	
doing it that way."Dominic Gates (Seattle Weekly): "I would like to go back to the 787 supply chain and the various glitches there. Two parts. You said three or four partners are having some difficulties. Are those all structures people or are the systems partners working and are you having to help any of them out as well. And then second part, with regard to the structures work that traveled from Japan to South Carolina, could you talk about how that, the new business model for the 787 may, perhaps, be creating a much more complicated situation than in the past. Where if work had traveled Boeing would just have done it in Everett. Now you've got global aeronatica having to cope with work traveling to them, and so are they asking for more money as a result, and are you in effect having to renegotiate contracts with the Japanese and global aeronatica as a result of work traveling that way?"Jim McNerney: "Your first question, Dominique, the three or four partners we've been working with over the last few months have 	
it has centered on the structures side of the business as we're trying to share learning across all of them and us to make sure we get it right, and there has been a lot of cooperation going there. As to the traveled work question, I see it a little differently. I think because the fundamental work is spread out a little bit, because there is an interim step in South Carolina on the way to Seattle, there is a little more flex in the system to	
where everything showed up in Washington and there was a huge geographically centered "Oh my God" that where the number of people and the amount of work all came together at one time, and there is a little more opportunity the way we're doing it now to handle it within a more flexible environment. As to the last part of your question, as you know, many of the contracts	
most of the contracts with our supplier partners do leave room for accommodation when more or less work happens than was anticipated, and there are often times robust discussions with our and this has happened in every airplane program we've ever had, robust discussions with these partners as to price and the amount of the end result of the financial accommodation, and, yes, we're having those discussions, and occasionally they last more than a	
minute." 19 Busines Suppli α "For union workers, a new corporate owner usually means"	On a

	,			House Minority Leader Richard A. Gephardt of	
				Missouri. 'It is what we are going to have to do in a lot	
				of our industries to be globally competitive,' says	
				Gephardt, who is a consultant with Goldman, Sachs & Co.	
				'It aligns [workers] with the company and gives them a	
				fair reward for their contribution.' This improbable	
				story began several years ago, when Boeing, in a bid to	
				shed weak assets and outsource more of its	
				manufacturing work, decided to sell its uncompetitive	
				Wichita plant. Although it was Boeing's biggest internal	
				supplier, cranking out fuselages and nose cones, it suffered	
				from inflexible work rules, high wages, and testy labor	
				relations. Enter Mersky and fellow Onex Managing	
			2	Director Nigel S. Wright. Where Boeing executives saw	
				lemons, the two turnaround specialists saw lemonade.	
				They reasoned that if they could cut costs, make the plant	
				more productive, and start working for Airbus, defense	
				contractors, and regional jetmakers, the Wichita plant	
				could become profitable. But first Onex had to get costs	
				under control. The firm saved \$40 million annually by	
				slashing corporate overhead costs inherited from	
				Boeing. It negotiated price reductions from Spirit's	
				suppliers and simplified the procurement process. It	
				managed to reduce the complexity of work rules,	
				reducing 160 job classifications to 13. Finally, it asked	
				the unions for a 10% wage cut to better reflect the	
				prevailing wages in the area and told them it would reduce	
				the workforce by 15%.	
				SHARING THE PAIN	
				Onex, which sought the union's support, lost the first vote	
				with the Machinists. Many workers came from third- and	
				fourth-generation Boeing families and wanted to stay with	
		I	1	the giant. 'It was tough on people,' said Ron Eldridge, the	1

Feb. 21, 2007	Bloomb erg.com (Andrea s Cremer)	Manfre dBisch off, Co- Chair man, <i>EADS</i>	Shareh olders	β	Machinists' aerospace coordinator for Wichita. 'It was like an ugly divorce.' The managing directors approached R. Thomas Buffenbarger, international president of the union. 'They asked: 'What's it going to take?'' Buffenbarger recalls. 'I said, 'If you want to share some of the pain, then give us a stake in the enterprise.' They warmed to it quickly.' A new deal was negotiated: For the wage and job cuts, <i>Onex</i> offered union members a 10% equity stake in an eventual IPO. The new owners sketched out a scenario where workers could earn some \$30,000 in stock and cash over five years as long as the IPO was successful. Now, 18 months later, the bargain has exceeded everyone's wildest dreams. An IPO on Nov. 21 raised \$1.4 billion. Each Machinist is about to receive \$61,440 in cash and stock. Given <i>Boeing's</i> backlog of orders, plus a surge of defense-related spending, analysts figure <i>Spirit's</i> stock will do well in the next few years. That should buy the company goodwill for when the industry hits the skids.'' "The board members of <i>EADS</i> nominated by <i>DaimlerChrysler</i> are solely geared to the success of <i>EADS</i> and <i>Airbus</i> . Thus, the allegation that they might act in national or political intent is absolutely wrong. At the same time, the inevitable impacts in the countries involved must be made acceptable and enforceable by means of a fair distribution of future opportunities.'' 	2007	Boeing		our major development programs, including the 787	ance
	Earning	Compa		Dreamliner. Scott Carson and Mike Bair gave you a	
	s Call	ny		detailed 787 update last month, and as you've seen as soon	
	Transcri	ŕ		as yesterday with the Virgin and Air Canada	
	pť"			announcements, demand for the Dreamliner continues	
				unabated. We are also making progress toward our	
				development milestones for this year and next. Let's	
				review just a few of those. During the first quarter, we	
1				surpassed 500 orders for the Dreamliner, which is an	
				unprecedented achievement by the BCA team. We now	
1				have 544 firm orders from 44 customers, which is the	
				highest tally ever achieved by a commercial jet program	
				within three years of its launch. We are now in the process	
				of bringing the 787 to life. Major structural elements of the	
				first airplane are being assembled, and in some areas we	
				are already working parts and assemblies for airplane	
				#5. Fuselage sections from Japan, Italy, South	
				Carolina, and Wichita, are coming along well, as is the	
				wing box from NHI. Second special 747 Freighter or	
				Dreamlifter has taken its first flight and delivered its first components. And we have a third Dreamlifter at the Mod	
				Center and a fourth one heading there. Our engine	
				partners are making good progress on their flying test	
				beds. And work on the systems side is moving ahead as we	
				enter integration testing of these major elements. In	
				Everett, the upgrade of the final assembly day is going	
				well and we have started receiving components there. The	
				horizontal stabilizer arrived just very recently and other	
				major components will be arriving in the next few weeks.	
				We will rollout the first 787 out of our Everett factory	
				on July 8th, an event we will webcast so all of you can	
1				see the airplane. As you know, we are targeting a first	
1				flight in late August, which will kick off our flight test	
1				program. We will remain on-track for first delivery to	
1				ANA in May of 2008. As we have said before, we are	
1				working late, scheduled, and supplier challenges, as we	
1				strive to meet our milestones. These areas represent the	
1				bulk of our R&D spending at this point and we are making	
1				strides in each area. We are moving into the very critical	
1				final assembly and systems integration phases of our	
1				program, and as you can imagine the entire 787 team is	
1				working very hard to achieve our milestones. So, mindful	
1				of the inherent challenges and risks that lie ahead, particularly in the latter stages of major airplane	
				development programs, we are nonetheless pleased with	
1				the progress we are making on the 787. We are also	
			1	the progress we are making on the 787. we are also	

 -	1		
		pleased with the airplane's performance, which we expect will exceed the overall performance levels we committed to customers when we launched this program. We will continue to update you on the 787 as we move through our key milestones.	
		So, let me wrap up my opening comments by saying that we have reaffirmed our financial guidance for 2007 and 2008. Our record backlog, increasing productivity and the progress of our development programs have us on track to achieve our growth and productivity objectives."	
		James Bell (Boeing): "R&D spending for the quarter was on track at \$788 million. We expect BCA's R&D to begin declining in the second half of this year which along with productivity improvements will drive margin expansion consistent with our guidance. Program margins exceeded unit margins this quarter due to new customer introduction costs and pricing mix that reflects airplanes sold two to three years ago in a tougher pricing environment. We captured 109 gross orders in the first quarter which lifted BCA's backlog to another record of \$188 billion which is 6 times current BCA revenues. Now Jim has already talked about the tremendous success of the 787 as enjoyed in the market and the progress we are making in its development.	
		We continued our balance cash deployment strategy as we invested in organic growth programs, repurchased 4 million shares for \$360 million, and contribute to our pension plans, as well as, paying a 17% higher dividend to shareholders."	
		Jim McNerney: Thank you, James. You can see from the outlook James just discussed, that we have some ambitious goals for this year and next. We are confident we can meet those goals. Our businesses are executing well, and all of us are focused on executing even better. We are in healthy markets pursuing prudent growth strategies and seeking to boost productivity in each of our factories and our offices. Meeting the financial commitments we make to you is as important as meeting the performance commitments we make to our customers. We are determined to deliver on both. We want to remain the world's strongest, best integrated aerospace company."	
		Byron Callan (<i>Prudential Equity Group</i>): "Jim, you have been at the helm for almost two years. I am just curious where do you think you have made the most progress with things you want to change at <i>Boeing</i> . What are you most keenly focused on today? And are there areas you are <i>disappointed with or frustrated with</i> that you think the company can do better at? Thanks."	

		Jim McNerney: "Yeah, sure. Listen this was certainly not a broken company when I took the helm a couple of years ago. It was a company that was doing a lot of things right and had some good strategies in both its businesses. I think though we are emerging from era of management turmoil, some uncertainty with regard to priorities and I thought, just to use a term, some of the software the company needed addressing in terms of leadership development, management needed to be infused with a little more accountability in some cases. So, it was more around the leadership. A refocus helped the company regain its confidence in itself, because the strategies were good and the products were by and large good, also focused a lot more on international I would say and some of that effort is beginning to bear fruit."	
		Byron Callan (<i>Prudential Equity Group</i>): "Okay. And areas that you think you could still do better out here?"	
		Jim McNerney: "Well, I don't want to give the bullish answer which is there is nothing we can do better, because there is a lot of things we can do better. But I think with \$260 billion plus backlog, the issue is obviously around execution, because the markets and our customers are accepting our technology, and the backlog represents to all of us at <i>Boeing</i> , both a huge opportunity and a big burden to get it done properly. And so we are focused on a lot of things that you don't see, which have to do with new ounces of making sure priorities are right, making sure people are aligned and accountable, making sure that we have balanced work across the enterprise and make sure that people feel like they are growing and are excited about what they are doing. Those are the kinds of things we are focused on now."	
		<u>Howard Rubel (Jefferies & Company):</u> "Thank you very much. I want to kind of go from the broad to a little bit more narrow, two things are sort of notable, one is that if you exclude the Research and Development spending from your operating profits, it looks like you are about 19.8% versus 17.5% year ago Jim. And that would sort of indicate to me that there is some real change in the way you are addressing productivity and profitability, where do you take up from here, and as we look out this could imply maybe as much as 15% operating margins in commercial, is that a fair way to think about it?"	
		James Bell: "Well, first of all Howard your math is impeccable. Yes, it's not bad at all. And I think you are seeing the fact that we really are starting to harvest a lot of benefit not only from lean but our other productivity initiatives	

that we implemented a year ago, and we would expect there is more opportunity as we get the volume from our higher production rates and the lower order traffic. And as Jim mentioned earlier, as we have the opportunity to convert this record level backlog and convert that to value. So, we will continue to be working that to see how we get these pre-R&D margins up."	
Jim McNerney: "And I think you said it James, I think we are going to continue to face into a competitive environment though, every dollar of improvement that we get may not flow to the bottom line because we have customers that need to be productive, and we have competitors that aren't going to sit still and let us take easily as much of the market forever as we are taking now. So, how that exactly gets expressed in terms of progress towards a 15% operating margin or whatever target will sort of unfold, but we are determined to be ready to make any necessary competitive responses, any kinds of investments we need to making customers and grow our margins as we move along."	
Steve Binder (Bear Stearns): "Just wanted to follow-up on Howard's question, because James you touched on a difference between unit and program in your introductory comments and you did touch on pricing on the unit costs so I bet it's reflecting deliveries at a less favorable pricing and you changing your program method. So, I am just wondering the reason for that increase in the pre-R&D margin to 19.8 from the low 18% range in the fourth quarter of '06. is that really just cost system or visions or is it also reflecting a better pricing environment that's built in to your blocks?"	
James Bell: "It's both I would tell you its productivity and better pricing going forward. The planes which you are seeing in the unit margins and the impact of that is two or three years ago we really were faced with a much more competitive pricing environment and also a phase we are trying to have pricing that bridge us to new market particularly for the 747-8 and then also we saw a more robust market in this time period for the 777 two or three years ago and we needed to make sure we got there along with the single arm. So, I think you are seeing a combination of both the better pricing as it stabilizes today and then also our productivity efforts."	
Heidi Wood (Morgan Stanley): "James and Jim, I want to also hark on the margin outlook for commercial and make sure I have got through the right puzzle pieces as we think this is true. If you look at our guidance in '07 versus '08, you are talking about 20% uptick in volume and over 13% decline in overall R&D, which means that commercial R&D is going down more, and yet only a 10% increase in BCA margins year-over-	

		-
	year. So, again just what are some of the key assumptions that would help offset that mix of productivity and mix in R&D tailwind?"	
	James Bell: "Are you talking going forward, Heidi?"	
	<u>Heidi Wood (Morgan Stanley):</u> "Yeah, I am just trying to think what keeps us from thinking about 15% margins by 2010."	
	James Bell: "Well, principally, what's going to keep us from that by 2010 is the fact that we are going to have dilution from the 787 margins. Obviously, it's the beginning of a new program, and although it will start out more probable than any new program, any new product introduced at least in our history. It will still dilute the margins that we experienced on our mature programs. And so clearly to the 2010 timeframe that's going to have an impact particularly since we expect to deliver over 100 airplanes in the first two years and then that will grow in the third year."	
	Heidi Wood (Morgan Stanley): "And that more than overpowers the increase in volume and decrease in R&D?"	
	James Bell: "I won't say that it more than overpower. I am just saying to you that we are going to have that dilutive impact and we will have to wait and see as we get closer if we are able to get more productivity as we ramp up on the 87 because that dilution is real. And remember just what we have been talking about 18% or 19% in these years for our pre-R&D margins on our mature program. Obviously, it's going to take us some time to get to that same level on the 787."	
	<u>Cai von Rumohr (Cowen & Company):</u> "Yes, thanks a lot. If I go back to the commercial margin issue, your R&D commercial was 10.4% of sales. Even if you come in at the absolute tippy-top of your R&D estimate \$3.4 billion, I mean it's got to be down at least \$200 million to \$250 million and unless a program accounting margin pre-R&D go down from that 19.8%, it's kind of hard for me to see how the margins for the year won't be above 11%?"	
	Jim McNerney: "Well, I think I got your question there Cai. Look, I think is there opportunity to expand our margins? Yes. Are there other things we are wrestling with to make sure they are put in the box before we revise anything? Yes. But the opportunity to continue to improve our margins in BCA certainly lies in front of us and the head set of Scott	

 -		
	Carson and his team supported by me and James is to do just that."	
	James Bell: "And Cai we do feel comfortable. We will hit our	
	guidance at greater than 10."	
	Robert Stallard (Banc of America Securities): "But these are very distance dates, is that leaving to airlines encouraging you to raise rates how aggressively than you would like?"	
	Jim McNerney: "Yes. We have been encouraged to raise rates. But I have a fundamental belief, which is that the best customer service is to deliver on your promises. And so to raise rates and then later not be able to deliver because the supply chain was not with you and the planning was not done properly is a lesson that this industry teaches itself every decade or so, and I am bound and determined not to learn that lesson that way while in this job. So, we want to raise rates because our	
	customers do need the airplane, and we as you noticed were raising rates and we are doing it prudently and we are going to keep looking at raising rates because we do want to satisfy these customers. But it will be done when we can do them."	
	Robert Toomey (E.K. Riley Investments): "There has been a lot of news lately about China entering the commercial jet market, and I am wondering if you could make some comment on your observations on what China maybe doing here in the near-term, I guess, in your industry in the next five years? And then also if you could make a comment on your assessment of the airline, on behalf of your major customer, the airline industry? Thank you."	
	Jim McNerney: "Yes, I think there is no doubt that the Chinese will be someday in the commercial airplane business. There is lots of speculation on how long it will take them. It will probably take them a considerable period of time to get there, but they have a large internal market. They have technical capability, and they have the resources to do it. So, I think whether its 10-years or 20-years, I think, we will see somebody probably in the narrow-body segment from China competing there. Listen, it is a huge market for us, we have many partnerships over there. I am one of	
	us, we have many partnerships over there. I am one of these people who believes that partnering with people who are potentially competitors is not necessarily a bad thing. So I think we will have a headset of both competing with them and partnering locally because we benefit from it as a company, it strengthens our company. And they will find us the top competitors and they would expect to. It's close to what's probably a 10% to 12% of our sales	

over the last few years had been in China that will moderate a bit as other parts of the world get back in the game, but they will continue to be major customers, and they have shown preference for our products, and we continue to think they will, for a pretty long period of time."	
Stanley Homes (Business Week): "Hey, I wanted to just ask you, or actually follow-up on the contingency funds that you set aside for the 787? Could you just wanted you to let us know how many again you have triggered and have you triggered anymore since the last time you talked about those funds and using them, setting aside those funds for some of the production issue?"	
Jim McNerney: "I think we are at roughly the same place we were the last time we chatted with you. I mean we have got contingency efforts in place for wiring, for tubes, for traveled work, other forms of traveled work. These break down into three teams, that we hope won't have a lot of work to do. But if they need to, they are ready to go. And we are training them and standing them up, and as we re-planned some work as pieces come into Charleston and then to Seattle and these guys will be ready to go. And I am always asking the question, so as Scott, are these teams ready? Are there enough of them in our worst case scenario? And we feel very comfortable with where we are. So, the specific answer to your question is, there is three teams ready to go. We have retired one team actually, that was whether we got in place to make sure we had any extra composite work that needed to move around. But it turn out, we didn't need that. All the partners did their composite work that they promised they could do. So, that team is sort of gone mute."	
<u>Stanley Homes (Business Week):</u> "Okay. So, you have retired a composite team and then you have three teams that are for wiring, tubes and traveled work. Those are the ones that are still sort of setup, ready to go if you need them?"	
Jim McNerney: "Yeah, wiring and then the tubes, clips, brackets, those kinds of thing."	
Stanley Homes (BusinessWeek): "Alright, okay, yeah."	
Jim McNerney: "And then some other traveled work that we would have to plan and that, as you know, when these kinds of things, Stanley, those teams would need to be in place for their first, usually 20 airplanes or so, just as it winds down	

				and all the work settles in and where it's going to be."	
				Stanley Homes (Business Week): "And then finally how are the Italians doing? And why were they little slower than some of the others? What were their issues? And I am assuming that they're pretty much on track, is that correct?"	
				Jim McNerney: "Yeah, I think in a word they're doing better. I think the transition from prototype to production was not easy for any of our partners, and it may have taken them a little longer, but they are now flowing with the work, and so we are feeling better about it. Still challenges in front of us, still <i>Boeing</i> people working with them, but I would say we are feeling incrementally better there."	
				Lynn Lunsford (Wall Street Journal): "This is kind of a follow-up on that, is looking at the 787 program clearly there is a whole bunch of folks who are sitting on the sideline and waiting for Boeing to stand up and say oops! and so far you keep reiterating that you are on track and on schedule. What is probably the single biggest challenge that you still have to meet? Is it making sure that all of the systems come together, and where if you just have to kind of handicap your biggest hurdle yet, what would it be?"	
				Jim McNerney: "Well, I think, obviously the system's integration at this stage in a program becomes very important and things can happen that require re-work, re-looping work, and that represents in our norm. So far that's going well, but it represents a risk. I think when you add it all up Lynn, whether the airplane flies at or around the time that our milestone says it should, will be the time when everything comes together. And if we hit that milestone on or within a reasonable time around our target there and EIS is now threatened, then I think you could look at that and say we are in good shape. Now, the next risk is what you would find out in flight test, and there could be some unknowns there as well. But as we sit here today we think it's going to come together, and we think we will be flying."

For many people,</i>	On the chief architec t of a modular enterpri se architec ture, using integral rhetoric with regards to leadersh ip

					- part of the job of being a leader. If you rate the majority of employees as 'above average,' you under-	
					value the work of those who ought to be recognized for	
1					truly superior performance.	
					An open culture cannot work without reality-based	
					communication - honest and respectful conversation.	
					That is why the candid, constructive, one-on-one	
					discussion between a manager and his or her direct	
					reports is an essential element in developing people and achieving strong performance within an open culture.	
					Done well, it is that interaction, more than anything else	
					that engages people's hearts and minds, that excites them	
					and moves them forward.	
1						
					As we're thinking of it here, leadership might seem to	
-					consist of a series of paradoxes. To be a leader, you have	
					to be:	
1					• Both tough and inspirational	
					 Far-seeing and results-oriented 	
					• Unsparingly honest and strongly supportive	
					Well, that's a little daunting, isn't it? Just how do you do	
					it all? You don't want to go to work every morning,	
					desperately thinking to yourself 'What do I need to do	
					today to be seen to be both tough and inspirational?' In	
					my view, that is the wrong mindset. You will wind up being both tough and inspirational if you give yourself a	
					chance to grow into leadership thinking of it less as a	
					form of play-acting during dramatic, life-and-death	
					moments, and more as an organic, continuing part of	
					what must be done to help an organization or team	
					proceed toward a shared goal. As we all intuitively know,	
					it is when you are working for the larger good of others	
					that the courage to lead decisively can be found within	
					yourself. Nonetheless, pushing someone hard, even in	
					their own eventual self-interest, is not easy.	
					That brings me back to leadership development, which I	
					regard as the single most important part of my job. We	
					have metrics for assessing every one of our managers and	
					executives on how well they perform against the six	
					leadership attributes. It is well understood within Boeing	
					that a leader's job consists – in large part – in helping	
					others to discover their own capacity for improvement.	
					As my own father – and mentor – would have said: Aim	
					high. And don't overestimate the competition. If you	
					have the will and courage to lead, you will gain valuable	
					support along the way. I wish you well in your future

Speech"	Comm	fuselage sections of the new jet? I put that question to	
(James	ercial	Boeing on Thursday. 'The suppliers you name and some	supplier
Wallace	Airpla	of their subtiers,' a <i>Boeing</i> spokewoman said when asked	S
)	nes	to clarify Bair's comments. Was Bair's speech reviewed	
		and approved ahead of time by his immediate boss, Scott	
		Carson, or by anyone else at <i>Boeing</i> ? Bair did not have a	
		prepared speech, the spokeswoman told me. One industry	
		analyst called Bair's speech 'remarkable.' 'It's	
		remarkable that <i>Boeing</i> is saying publicly that some of	
		their world partners are falling down on the job and	
		that Boeing made a mistake and that they will do it	
		differently the next time,' said Scott Hamilton of	
		Leeham.net. For Boeing's next all-new jet program	
		after the 787, Bair said, it would be better to have a	
		central manufacturing site rather than the global	
		assembly method that is being used for the 787. He said	
		Boeing would put pressure on its suppliers the next	
		time to locate in the same area. On the 787 program,	
		Boeing gave some of the design work to suppliers, in	
		addition to manufacturing responsibilities. Bair said some	
		of that design work had to be done by Boeing when	
		suppliers could not. 'Some of them proved incapable of	
		doing it,' he said"	
		Posted by unregistered user at 11/2/07 3:29 a.m.	
		"Hmm, Mike Bair and rest of the top management at	
		Boeing must have felt, that after the Sonic Cruiser	
		boondoggle, the 7E7 would have to constitute a	
		technological leap forward, if they were to remain an	
		equal contender at the forefront in the civilian airliner	
		business. I would guess that the mandrel molding	
		production method must have looked like a simple and	
		elegant method to them, and not the least; a 'hi-tech'	
		way in which to leapfrog <i>Airbus</i> ; however rushed their	
		design might be. Currently, <i>Boeing</i> does carry a lot of	
		weight as an Original Equipment Manufacturer, and based	
		on its past performance credentials, the company	
		obviously has a lot of clout with their customers.	
		However, past performance is not necessarily indicative on	
		how a future program will perform; and especially not	
		when the OEM does not follow industrial best-practice	
		recommendations that suggest new products should use	
		existing processes and tools, the existing organization and	
		demonstrated technologies. Well, guess what, Boeing	
		didn't follow any of the industrial best-practice	
		recommendations. It appears that they threw a Hail	
		Mary pass to try to "win" the fierce fight for market	
		share in the LCA business in the second decade of the	
		millenium."

		"Ok, talking Barrel Mismatch From the 'unofficial	

photos' One barrel was clearly overflush by approx 0.25" at one point, at no other point on the diameter was it underflush, therefore the diameter of one barrel was approx 0.25" greater than the other. The real problem is that the circumference is therefore 0.75" longeron one barrel when it should be much closer, so when you start bolting up you either need a lot of spacers to distribute the gap around the fuselage (prohibitively expensive and work intensive), you make 'proper' matching barrels, or you do what <i>Boeing</i> have done, make up some special joining pieces down one side and whack in a load of filler. There is no easy fix to this problem! Commentators such as Leelaw were correct pillory the rollout, it was a complete joke! This was a <i>Boeing</i> interface slip up!"
Posted by unregistered user at 11/2/07 2:20 p.m. "It is important that these companies do take risks. That is the point, if they played it safe they would have an updated 767, what good would that have done. Risk and failure is how companies grow provided two things - The failure is not so immense it takes them down, and two they learn from it. If the 787 turns into a 2 year delay boondoggle then it may approach that immense failure. If Boeing actually manages their way out the maze and actually deliver 100+ planes by 2009 then all will be well and the risk and failure will permanently move the bar to a higher level. If they deliver 6 airplanes by April of 2009 then they will be in serious serious trouble. So it is to early to call the risk an abject failure. We will now get to see how well Boeing Executives can really manage. It will be interesting to see how they do compared to EADS when they ran into trouble."
Posted by unregistered user at 11/2/07 8:58 p.m. "Bair used to say we 'hired them for their ability to the job'. What an incredible screening process. Bair said, it would be better to have a central manufacturing site rather than the global assembly method that is being used for the 787. No kiddin, I don't believe it. That is radical. Real engineers can look at the 787 and see that it is an aluminum plane made out of graphite. Revolutionary? he, he. Boeing Senior Managers, take a good look in the mirror and you'll see who's at fault."
Posted by unregistered user at 11/3/07 10:29 a.m. "When are <i>Bloeing</i> due to give the next 787 program update? I'm looking forward to hearing about misaligned barrels, phantom fasteners, software code issues, overweight aircraft, underperforming <i>GE</i> engines, etc"
Posted by unregistered user at 11/4/07 1:06 a.m. "When the photos of the mismatch were leaked <i>Boeing</i> were livid. For such photos to get out showed serious breaches in security not to mention confidentiality

issues from employees. Boeing have now clamped
dowm as they were mortally embarrassed by both the
photos and by the leak itself. You will not see a 0.25"
gap from 120 feet. The mismatch problem still exists. I
reckon they will now have spacer panels moulded up that
go 360 degrees around the joint. What this will do for
fatigue on the bolts is anyones guess, and it will have
added much weight and cost. This is one relatively minor
issue, I'd love to see what else is going on. The program
is an utter mess."

and <i>EADS</i> is below 25 and headed down?"
Posted by TriplePac at 11/5/07 12:34 p.m.
"Seriously though, as one who grew up in the culture of
one of the suppliers AND customers, he should should be
shot for such a public flogging of them regardless of the
problems. Maybe that's a little insight into his day to
day management style. Counterproductive American
arrogance in a global economy; period. For Boeing's
case, they need to get rid of him. Boeing seems to be
exhibiting an alarming level of leadership. Keep it up
& they'll be worrying about Mitsubishi instead of
Airbus."

"Counterproductive American arrogance: Apparently
creating the greatest economic engine the world has ever
known is counter productive. 'The transformation of
EADS requires substantial efforts across the group.
Dirbo requires substantial choits across the group.

	7					
					Airbus in particular, requires an overhaul of the	
					original industrial set-up, a behavioural evolution and	
					more modesty ' This little gem came from <i>EADS</i> own	
					website, so who is the arrogant ones?"	
					Posted by Leelaw at 11/5/07 10:33 p.m.	
					"However, I find the 'Great Satan' Aboulafia's assessment	
					of Mr. Bair's recents remarks in his November Newsletter	
					far more interesting:	
					Boeing has done extremely well with global sourcing so	
					far. The 767 and 777 were hugely successful with exactly	
					this kind of global supply chain. The top-tier 787	
					suppliers that Bair criticized, by the way, are valued	
					partners or suppliers on these aircraft. And the 787 looks	
					set to be the successful culmination of these global	
					trends. Geography has never been a problem for Boeing.	
					Outsourcing (in the US and abroad) works great for the	
					company. The real problem is that this time they trusted,	
					but didn't verify. In their zeal to maximize profit and	
					spread much of the financial risk, they offloaded most of	
					the airframe responsibilities without the due diligence	
					needed to ensure that their partners could do the design	
					and integration work. Boeing's unrealistic 787 program	
					schedule didn't help either. Even if it was the partners	
					that screwed up, it was ultimately Boeing's mistake-the	
					buck stops at the prime contractor. The supersite idea,	
					by contrast, sounds completely dysfunctional. Imagine the	
					labor consequences. In good times, you'd see hellish wage	
					inflation for engineers and manufacturing workers, with	
					Boeing and its contractors all poaching employees from	
					each other. In bad times, you'd have a regional	
					employment slowdown that would create armies of	
					workers scrambling to Mexico for maquiladora jobs. A	
					jetliner "bust" cycle would cripple an entire region.	
					Requiring foreign partners to relocate work and jobs to	
					the US would eliminate Japanese, Italian or other	
					government financial support for new programs (to his	
					credit, Bair made this last point in his speech). You'd see	
					fewer bidders vying to work with Boeing on the next plane.	
					Of course, the prospect of a supersite does serve as a ploy	
					to attract the mother of all incentive packages from state	
					and local governments"	
					Posted by unregistered user at 11/6/07 9:35 a.m.	
					"Bair should just shut up and be thankful he still has a job.	
					Stop threatning the State of Washington to provide more	
					tax incentive for <i>Boeing</i> to stay. How is this difference	
					from <i>Airbus</i> subsidy. <i>Boeing</i> executives have known for	
					a very long time that there be delay. No one was honest	
					enough to share that so innocent shareholders	
					purchased <i>Boeing</i> stocks thinking of rosie future is now suffering. Could a class action law suit be far away?"

16 Nov. 2007	Seattle Post- Intellige ncer, "Boeing Bosses Spy on Worker s" (Andrea James)		Firm- Emplo yee	α	"Within its bowels, <i>The Boeing Company</i> holds volumes of proprietary information deemed so valuable that the company has entire teams dedicated to making sure that private information stay private. One such team, dubbed "enterprise" investigators, has permission to read the private e-mails of employees, follow them and collect video footage or photos of them. Investigators can also secretly watch employee computer screens in real time and reproduce every keystroke a worker makes. One company source said some employees have raised internal inquiries about whether their rights were violated. Sometimes, instead of going to court over a grievance on an investigation, <i>Boeing</i> and the employee reach a financial settlement. The settlement almost always requires people involved to sign non-disclosure agreements, the source said. <i>Boeing</i> desires to keep investigation details under wraps. Recently, a <i>Boeing</i> investigator told a Puget Sound-area employee that he was followed off company property to a lunch spot, that investigators had footage of min 'coming and going' and that investigators had accessed his personal Gmail account. The primary reason for the 2007 investigation, the employee said, was <i>Boeing's</i> suspicion that he had spoken with a member of the media. He has since been fired. 'I wasn't surprised, but more just disappointed in them, that instead of looking at the problems, instead of investigating that, they investigated the people that were complaining and got rid of them,' said the employee, who had been an auditor in the company's Office of Internal Governance and asked that he no be named. The problem, Ed Mierzwinski [consumer program director at the federation of Public Interest Research Groups] said, is when companies use the surveillance tactics available to them to root out whistle-blowers. Dec. 20, 2007	Seattle Post- Intellige ncer	Group Scott Carson , CEO, Boeing Comm ercial Airpla nes		α	"Boeing picked world-class partners, but then failed to provide adequate insight about what was happening with those partners. 'We looked into them, but it was more from the outside in,' Carson said. 'When I talk about insight , its about having enough knowledge, enough sense of what's going on in their factory on a daily basis to identify issues that may bite them so you can help clarify and resolve those kinds of challenges. I think we came too late to realizing we needed that insight . When I look back at this thing, the lesson I carry away is you have to manage the production process as viorously when it is distributed as you do when it is centralized . And	On Boeing' s "Large- scale Systems Integrati on" strategy on the 787.
Jan. 26, 2008	The Econom ist	Christi an Streiff, Former CEO of <i>Airbus</i>		β	frankly, shame on me for not recognizing that sooner."" "What has characterized most of Mr. Streiff's career is boldness and a bullish impatience to get things done. Mr. Streiff should have known that running <i>Airbus</i> would require political skills of a high order. Describing his first few days as 'vertical take-off' at 'full thrust', he threw himself into the job of saving <i>Airbus</i> , as he saw it, from itself. The <i>EADS</i> board told him that his behaviour was not acceptable. He claimed that his plan had been undermined by the dysfunctional corporate governance at <i>Airbus</i> . But the more emollient Louis Gallois who succeeded him showed what could be done even in less than ideal circumstances, and Mr. Steiff now admits he could have been more diplomatic. There is certainly no doubting Mr. Streiff's effectiveness when it comes to managing down."	On the manage ment qualities of a failed modular leader in an integral enterpri se.
Jan. 29, 2008	<i>Reuters,</i> James Regan	Louis Gallois , CEO of <i>EADS</i>	Firm	β	"[Gallois] sees no sign of a downturn in the aviation industry, despite global financial turbulence and does not expect more major swings in demand after a record year for orders in 2007. While in the past, planemakers had suffered from a 'very brutal cycle with peaks and canyons', the emergence of an autonomous second market in the Middle East and Asia made the industry less susceptible to the current credit crisis and threat of a U.S. recession. 'We do not see that the second market is suffering from the downturn for the time being. It's two different markets, two different cycles. We could expect not to have peaks and canyons, but more hills and valleys."	On characte rizing the dampen ing of the business cycle.
30 Jan. 2008	Thomso n Reuters Researc	Jim McNer ney, Chari	Firm- Investo r	α	" <u>Steve Binder (<i>Bear Stearns</i>):</u> Can you maybe just touch on the 08 BCA guidance as far as margins obviously is not, productivity is one of the drivers of the margin improvement , is it coming at all	On a modular Enterpri se

	1		 from block shanger on is that armine simply from	Archite
	h,	man	from block changes or is that coming simply from productivity improvement and maybe you can address	cture's
	excerpt	and	which lines it pertains to.	defense
	from "The	CEO;	which lines it pertains to.	of its
	Boeing	James Bell,	James Bell (Boeing):	finanaic
	Compan	CFO,	It really is coming from productivity improvement	al
	<i>y</i> , Q4	The	across the in-production airplane programs. We clearly are	perform
	2007	Boeing	continuing to focus on driving our productivity initiatives	ance
	Earning	Compa	in the BCA and we are starting to bear those fruit and it is	
	s Call	ny	primarily what we are seeing of the 777 moving line as we	
	Transcri		get into its implementation and we continue to harvest the	
	pť"		kind of productivity we have seen in the past going	
			forward on the 737.	
			Steve Binder:	
			And if I can just follow up, you addressed the cycle to	
			some degree that growth and demand across the globe,	
			maybe if you can address, how do you believe the so-	
			called credit crunch we are seeing today both in rate	
			increases and availability of credit in the aviation industry	
			granted that is mainly tied to the US carriers, but certainly	
			it is affecting the ability of some leasing companies and	
			some lower grade airlines around the world to get	
			financing, how does that affect your decision on what the	
			rates, the 373 rates further number one, and two, how does	
			that affect you achieving your rates that you plan to get to	
			by the 2010 timeframe.	
			<u>Jim McNerney:</u> I do not think the credit situation, while it has had an	
			impact in parts of the capital markets, I do not think it	
			has changed our thinking on the near-term, medium-	
			term opportunity in front of us. Most of our planes are	
			financed by non-capital market institutions that have	
			remained in pretty good shape throughout all of this	
			whether it is sovereign credits. The leasing companies	
			themselves have been doing reasonably well. I think the	
			capital markets, you have seen a risk premium built-in in	
			some of the faultier deals are not getting done, but we are	
			actually seeing a little bit of loosening up there as some paper that was not being sold, maybe four or five months	
			ago is now being sold again in the capital markets albeit at	
			a higher premium, but I would characterize that as	
			marginal and not yet impacting nor do we see it	
			impacting, quite frankly our prospects for growth.	
			Doug Harned (Sanford Bernstein):	
			On the 787, now, we are looking at a delay of at least	
			nine months in delivery off of the original schedule and I	
			am just wondering if you could give a perspective on when	
			you look at the areas that we might see higher cost and	
			financial impact and I classify those as customer	
			penalties, supplier costs, for your own operational costs	
			as time stretches out, where do you see the greatest risk	
			financially?	

				Jim McNerney (Boeing):	
				The business case remains sound. Obviously, we are	
				very disappointed with the delay in terms of its impact on	
				our customers, but the backlog remains in place. The	
				profitability of the airplane could be marginally	
				impacted and will be marginally impacted by the delay	
,				in terms of some increased cost in the supply chain and	
				some possible penalties on the customer side, but we do	
				not see those kinds of cost having a significant impact	
				over the huge volume base that we are fortunate to	
				have on this airplane, so this is a case where I think the	
				value of the plane to our customers as borne out by the	
				record order book is helping mitigate what are bound	
				to be some cost. In the meantime, James, do you have any	
				further comments there.	
				James Bell:	
				I think the other side of that equation is that the schedule	
				stretch out that we have experienced is going to allow us	
				to work harder on finding opportunities for productivity	
				that would also offset some of the cost we would	
				experience as a result of the delay, so we have not gotten	
				through the assessment yet to really know where things are	
				going to fall out, but I think, along with the risk, there will	
				be other opportunities that we have not foresaw	
				previously.	
				proviously.	
				Doug Harned:	
				So I would assume particularly from your guidance at least	
				in the near term and even as you go out a couple of years,	
				I am looking at margin, it sounds like you are not	
	1 ×			seeing anything that really changes your economic case	
				for the airplane even over the next couple of years	
				other than a push back.	
				Jim McNerney:	
				Absolutely not.	
				Howard Rubel (Jefferies & Co.):	
				I want to talk for a second on DFA certification process	
				that you are going through on the 78, I know you cannot	
				fly the airplane, but there is a whole bunch of things that	
				you can do in the process to get there. Could you sort of	
				touch on that and then again, Jim maybe talk about how	
				this delay has been able to have been insulated from	
				the core business which really showed terrific results.	
				lim McNomey (Peaing)	
				Jim McNerney (<i>Boeing</i>): Wall you are right about your observation on the part	
				Well, you are right about your observation on the cert	
				process. About 70% of the certification effort	
				documentation does not have to come from the flight test	
				program. It can come from things we are doing today and	
				we have got about half of that done, and we have got a	
				clear plan with the FAA so we are feeling pretty good	
				about that. Obviously, the flight test program has its own	
		1	ı	set of risks, but we are feeling pretty good about it and we	

	are certainly working as well with the FAA on this program as we have on any that I can remember.
	Now, one of my jobs, I think is to work with Scott Carson to make sure that when you have a program that is struggling and in terms of schedule that you get as much focused effort on that program as you can. You get the best leadership and we have done a lot of that over the last months and we have got our best of Boeing team working on that program now on the 87 and a lot of folks from BCA obviously and with some help from IDS depending on the task at hand, and at the same time, we have got to make sure that that effort does not impinge on the fundamental running of the business. I mean, the 87 while a critically important program for us is one of 300 programs we manage here at <i>Boeing</i> and we have got to make sure that the leadership understands that struggles are one part of our company do not mean distraction, rather it means, intense focus to make sure that we keep delivering the results that the total corporation is aiming for. So that is a leadership challenge and it is all about how we work together and help lead and manage each other and that is
	one of my tasks and I am very sensitive to it. <u>Robert Spingarn (Credit Suisse):</u> Just to follow up on your answer to that last question on leadership and particularly on communication within <i>Boeing</i> between Seattle and Chicago, between suppliers in Seattle. How has your oversight and your involvement in 787, recognizing it is one of many programs, how has that evolved over the past six months or so?
	Jim McNerney (Boeing): As is typical in big corporations like what we are part of here, there are days when Scott and his team probably feel I am too involved and then there are days I wake up and say to myself, 'why are you not more involved?' But the fact is I think, we have a pretty good balance. I mean there is a very good team out there. I am probably more involved now, as you can imagine. I mean I think part of my job is to get involved when help is needed. And that has been the case on the 87 over the last few months as we have all tried to understand together the issues. I try to understand the right way forward and I think it is done in the spirit of less of oversight and administration, more in the spirit of all getting in the boat together, trying to figure it out. So, yes, I am a little more deeply involved now than I was, but that could be said about some other programs that we are trying to manage to the success we know they can have.
	<u>Robert Spingarn:</u> Would you say that you are involved to the point that you are very comfortable that your R&D guidance of 3.2 to

3.4 in '08 will not go up?	
Jim McNerney: Well look, I am comfortable with that guidance and that is why we are giving it. But, are there some risks inherent in research and development? The answer is yes, but I feel comfortable with that guidance and we have been through it pretty thoroughly and Scott and his team are committed and I am in the boat with them.	
Ronald Epstein (Merrill Lynch): Just kind of going back to the 787 for a minute, when we think about the compressed flight test schedule , Jim, how do we get comfortable with that ? You know, if you compare it to previous aircraft, all the new stuff on this airplane, it seems like getting the airplane out on this new schedule is really contingent upon that Flight Test schedule. You mentioned in the past, we are going to run it like an airline. It is not so much as flying the plane but it is crunching the data in dealing with the issues when they arise.	
Jim McNernev (Boeing): Yes well I think, it is a non-aggressive Flight Test program. It is a little less aggressive than the Flight Test program schedule we had earlier, but still aggressive and I think one of the silver linings of the delay is we have had more time to test systems, which are critical elements to the Flight Test program, ensure software compatibility and have a little more time with static and fatigue, which I think all are giving us reassurance that some of the more mundane things that can happen during a Flight Test program would not happen, which still leaves us some of the fundamental risks. But we think the program is eminently doable, the head start we have got with the FAA is helping us here and so, I think it is one airplane type, it is not multiple airplane types, one-engine type, or engine configuration I should say. So, I think there is less complexity in this Flight Test program than there is in our usual set of Flight Test programs. So, we are confident we can do it.	
Ronald Epstein:And then one follow up, if I may, you have got roughly\$12 billion of cash on the balance sheet and you are deploying it for share buybacks. What else are you thinking about?James Bell: Well clearly, what you see is our fundamental basic deployment strategy and obviously other things that we are looking at, we could not talk about in any detail, but we are always looking at better ways to provide value to our share holders with that cash and that can include some things like you have seen in the past, particularly with the	

in our support business and how we could look at our strategy in terms of being horizontally versus vertically integrated. We look at that as we always do and see if there is opportunity there to create better value than current cash deployment strategy will provide, but we are looking at a lot of things.
Joe Campbell (Lehman Brothers): Good morning, our aircrafts seems like firmly on the weight of 40 narrow-body a month and with somewhere between 250 and 300 on the FWB [XWB?] pushing forward on that aircraft, targeted against the 777, I guess with delivery in 2013 but <i>Boeing</i> thus far has narrow-body only to 31 a month, apparently constrained by factory production issues, your judgment for that, what would be prudent in the ramp up and perhaps some apprehension about the cycle and the sustainability . But it seems to me that most of these concerns on the narrow-body have been delayed but thus far, we have not seen any comments from you on plans to at least put in place the option of going higher with the 737 nor anything about the response to the A-350. So I was just wondering, whether that difference above, almost a hundred airplanes a year on the narrow-body and the stretch from the 787 were seen as serious and we will be seeing response in 08.
Jim McNerney (Boeing): I will take that one. First the A-350, I think that the model that will compete for the long-range 777's if the plane has the performance that <i>Airbus</i> thinks it can have is the 1000 and I think that that is not a 2013 airplane, I think it is more 2015 or 2016, I am not sure. It is certainly later, it could be seven or eight years from now. So, I think we have time to assess that plane and we have time to assess what we might need to do if anything with the long-range 777s. So that is one.
Joe Campbell: Nothing in '08?
Jim McNerney: In terms of what our R&D on the 777?
<u>Joe Campbell:</u> With this response from you, in order to get ready for whenever they are going to have their plane ready.
Jim McNerney: Well I think my point is that we do not have to do anything in 08, if I am getting the sense of your question.
<u>Joe Campbell:</u> Yes that is right, I was thinking, so you are going to wait until 09 or 10 to do something.
Jim McNerney:

Well yes. I think we need to see what the performance of the A-350 might be. We are not just sure. I know they have designed goals, but I think they have, just like anybody would, us included, seven or eight years ahead of an introduction. There are a lot of unanswered questions about the performance of the airplane and I do not think we want to put too many wheels in motion although we are obviously thinking through some contingencies and we are doing some preliminary work in the normal course of events, but I would not see a major program emerging until after this year. Heidi Wood (Morgan Stanley): I am curious about your comment about another good order year for BCA, can you define that for us a little bit better. Kind of talk about where you are seeing incremental demand coming from geographically and perhaps where you are seeing demand may be exhausting	
perhaps where you are seeing demand may be exhausting and what you are thinking also about 09 and 2010 in terms of units and book to bill. James Bell (Boeing): Well, we think the traffic that we have seen in prior years remain and so we think that is where we will continue to get it. We also believe that it is going to pick up domestically as Jim has mentioned and we have talked about before that although the US carriers really have it engaged heavily in the cycle that with the higher oil prices and their needs at least we understand them. They will have to get engaged soon. That is kind of where we would expect to see the order traffic come from this years and then going forward. I mean there is a lot of aging	
year and then going forward. I mean, there is a lot of aging aircraft in the US that cannot be operated economically and clearly can be competitive and allow them to create value for their shareholders if they continue to operate them in this current environment. And then that coupled with all that is going on with green and the environment, I just think that there is going to be a lot of pressure to replace old airplanes and that is what we see. <u>Heidi Wood:</u> But do you see demand exhausting in the Middle East and Asia Pacific where it has been inordinately robust in the last couple of years. I mean, does that slow down?	
James Bell: At some point, I think it will. We have not seen it yet, but obviously at some point we are not sure exactly all that drives their needs, we know a lot of it. An issue had been the infrastructure, but we will see. <u>Troy Lahr (<i>Stifel Nicolaus & Company, Inc.</i>):</u> James, I thought you talked about aircraft service work and how it increased this year at a double digit rate, can you maybe talk a little bit about what was driving that	

		and do you expect that growth rate to continue at a double digit pace next year end of 2008?	
		Jim McNerney (Boeing):	
		We do have good momentum. The base business there is	
		obviously sparse and some routine work, but more and	
		more we are getting our technology into play. The	
		drivers are convergence. There is a lot of passenger to	
		freighter convergence. That business is continuing to grow	
		and also some modification kind of work and then, supply	
		chain work where increasingly, our customers are looking	
		for folks like us to manage their supply chain for them more productively on an outsourced basis, so those tend to	
		be drivers and we see it going and I would say on the	
		productivity side, we are beginning to share infrastructure	
		across the two sides of our services businesses, the defense	
		and commercial side that can give us a little more	
		productivity and best practices and things like that. We are	
		beginning to leverage all of <i>Boeing</i> to improve that overall	
		business.	
		Troy Lahr:	
		But the double digit growth rate, that should continue?	
		Jim McNerney:	
		Yes, low double digits is the plan.	
		Joseph Nadol (J.P. Morgan):	
		My question is on the 747-8 passenger variant. Just wondering what your outlook is perhaps for this year for	
		demand. You have the one order from Lufthansa so far	
		and also the development program. How do you	
		characterize that as progressing and then stepping back	
		after that, what is your commitment to the aircraft if	
		your order outlook does not meet expectations?	
		Jim McNerney (<i>Boeing</i>):	
		I do not have the numbers right here in front of me,	
		somewhere between a hundred and hundred fifteen orders	
		for the two airplanes. We have got about 27 or 28 on the	
		PAX side. DLH with 20 as you pointed out and then we	
		have some other small orders, so the majority remains	
		freighters which are an extremely well received in the	
		marketplace. We have got about ten discussions going on	
		right now with folks for the PAX version. So we anticipate	
		success here. We do not anticipate failure. And so none	
		of our plans include an offer up here. All of our plans	
		include making this a success and it would not surprise me	
		in 08 if you saw a few of those customers shake loose and	
		we all felt a little differently about it a year from now.	
		Joseph Nadol:	
		Can you characterize the difference or the incremental and	
		definite requirement to do, the passenger in addition to the	
		freighter very qualitatively and maybe the commonality	
		between the two aircraft.	

Jim McNerney: As you can imagine, there is a lot of commonality in the structure in the systems, without divulging the details of it, I mean, there is enough unique investment on both sides of the model so that you pay attention, but I think the overall characterization would be tremendous energy that affords you the opportunity to do both. David Strauss (UBS): Looking at your BCAG revenue forecast for 08, you are forecasting about 40 additional deliveries, yet you are only forecasting about a billion, a billion and a half additional revenues. You have already talked about double digit growth in services, so it just seems that that revenue forecast would be a little bit light given what I assume is better pricing coming through in 08.
James Bell (Boeing): I think it is about right the way we have done it and you are going to see the bulk of the better pricing come through at 09 and then there are some product mix in there that would differentiate what we did relative to revenue.
David Strauss: And then, on 777 [787/?] can you just comment on the status where you are with supplier negotiations, I guess, where you were before the announcement of the latest delay and are we back to square one here. How progress is going there?
Jim McNerney: Well, we are going through a process right now of adjusting the schedule and as we mentioned at the end of the first quarter, we will talk about the new schedule. It obviously needs the cooperation and commitment of our supply base who are cooperating and who are committed given the tremendous market success of this airplane, but there are discussions going on because there is a new schedule and there are shifts in cash flows and pain that has to be borne, but I would characterize those discussions as constructive and heading toward a conclusion which we will report on at the end of the quarter.
Myles Walton (Oppenheimer and Company): I guess this is kind of a follow up to that last question, what kind of guidance are you giving in the interim three months to the supply chain such that you will hopefully dissuade them from making some independent decisions that could potentially exacerbate the delay as far as their procurement of raw material goes? Jim McNerney (Boeing): Which guidance are you talking about there?

<u>Myles Walton:</u> Production on the 787, obviously with the next three months, you are establishing a new production plan. They are making their own production decisions. How are you communicating with them in an effort to make sure that the line of communication is open.
Jim McNerney: In all of our supplier partners, we have got between 50 and 130 Boeing employees working hand in hand, minute by minute, hour by hour 24/7, so transparency on each other's issues is not our problem here. It is getting resolution. We are working very closely with our suppliers and they have their people in our facilities and so, it is a pretty seamless operation right now as we all work hard to resolve the issues.
James Gonzales (<i>Bloomberg News</i>): You mentioned that the amount of <i>Boeing</i> employees are out in the facilities and working overtime , I was wondering if you guys have got any feedback from STIA or the machine expedient, I am inquiring further on what the status of the program is and any kind of feedback from them on the working conditions and what the overtime hours that they are having to put in ?
Jim McNerney (Boeing): Our union partnerships have been extremely supportive here. We are all trying to focus on the success of this airplane and the success with the company. So I would characterize it as, overall, very supportive in general.
<u>James Gonzales:</u> And just one other question for you, with the deliveries being revised for this year, this is for James because I remember that you taught that 08 would be the year to surpass <i>Airbus</i> on deliveries. Do you think that is still the case?
James Bell: I do not think I ever said that. That it would be the year we would and I would know that until we get through the year and deliver them. We are giving you our guidance and I am not sure what their delivery guidance is for 08.
Jim McNerney: I think there had been some analyst projections that said that 08 would be the crossover year but quite frankly, I do not think we ever characterize it one way or the other.
<u>Julie Johnson (Chicago Tribune):</u> Okay on the 787 supply chain, could you just give us a little bit of color on how you plan to drive greater efficiency through the production process and could

	
	that potentially mean dropping under performing
	partners?
	Jim McNerney:
	Well, I think obviously the whole concept here, when
	we get through the startup is to have an extremely
	efficient production process where multiple
	organizations are each focusing on their piece and
	through the repetition become very good at a drive
	down their own learning curves and when you add
	them all up, it is better that we were all doing it, that is
	the concept. What was the second part of your question
	there?
	Julie Johnson:
	I was just wondering if potentially you—
	i was just wondering it potentially you
	Jim McNerney:
	By enlarge, we have absolutely no plans to drop any
	suppliers. When we qualified our partners early on, we
	did it with our eyes wide open and they did it with their
	eyes wide open. We have each put a lot of investment
	into it, now I think from time to time, we shift work
	around. We restructure relationships the way the work flows in order to capitalize on things that emerge as
	strengths, or things that emerge as weaknesses, but I
	would characterize it more as fit and finish and that way
	than ever thinking about dropping the supplier except
	in some extreme circumstance, but we do not see that
	here.
	Sebastian Svanki (Book Review):
	I would like to ask another question on the 787 production partners, please. Has <i>Boeing</i> any intention to maybe
	invest financially or organizationally in your
	production partners in order to strengthen them and
	maybe help them through the dire times when they do
	not get the money back in time, and if you would today
	have to decide about like a 737 follow on, would you do
	the very same production set up or would there be
	something different given the experience you have made
	until today?
	Jim McNerney (<i>Boeing</i>):
	Two very good questions. I mean, I think the form of
	financial support that we might contemplate in
	extreme circumstances would be more jointly carrying
	inventory or material together if we put an undue
	hardship on somebody, rather than investing in their
	own facilities, but we have a good feeling about the way
	we are approaching this airplane despite the startup
	difficulties, would we do it exactly the same? We might do it a little bit differently, but the overall strategy
	would be the same. I think we now have learning about
	the relative strengths between ourselves and our
	partners and I think we might draw some lines in

				different places but we would not change the concent	
				different places, but we would not change the concept. Lyn Munsford (Wall Street Journal): This is kind of just a high level question here, but in the last several months, it seems that your issues with having to push off the schedule on the 787 have been kind of the result of this voyage of discovery you have been on, how do you feel right now, are you at a point now where you can see to the bottom of the barrel to know that you do not have any more surprises coming up or when do you expect to be at that point? Jim McNerney (Boeing): I think it is true that the projections we made earlier when we did not have much experience with all the work that traveled to our facilities unanticipated where we did not have robust enough contingency plans when you look backwards. It is true that we missed some projections. Now, we are a lot closer today to completing the first airplane now that we have properly staffed the effort, we now more fully understand the requirements as they came in from our partners and work that we thought they were going to do. And just by virtue of being closer to the end than to the beginning and having had experience with working with the engineering drawings of our partners, having now rounded up the supply chain, a lot of the original supply chain issues have gone away as we have gotten our arms around inventory that was going to travel to other places and things like that, so I think just by virtue of having the experience of getting deep into the	
				complicated than that. Lyn Munsford: Okay, thanks and just one other thing is, do you anticipate as a result of some of the things you are seeing here that you might ramp up a little more slowly than you initially expected so that, when you do actually start getting into the production of airplanes, it would not be at a super aggressive rate and it will be more gradual?	
				Jim McNerney: Well, that question has to be answered over the next couple of months Lyn. We are very mindful of committing to a ramp that we can execute. We are also very mindful that we have already disappointed some of our customers in terms of when we are getting them the technology that they have faith in us to deliver. So, that tension, I think will produce a realistic but aggressive ramp."

3 Mar. 2008	Reuters	Custo mer	α	"'This was not a close outcome in any sense of the term,' the analyst, Loren Thompson of the Lexington Institute, told Reuters. 'Northrop won decisively and completely, and Boeing simply was not competitive in the major measures.' Air Force reviewers pressed Boeing to stretch out its aggressive development schedule for a new version of its 767 jet, which in turn added cost. In fact, the Boeing proposal was initially rated as 'high-risk' because the reviewers were concerned that Boeing's proposal to build a new version of the 767, using parts from other versions, would cost more than expected. "Although some observers expected that the Northrop team would offer a better price, nobody expected that they would be better in every significant regard,' Thompson told Reuters. Buying the Boeing tanker would have resulted in a much slower tanker replacement rate. 'The reviewers concluded that if they funded the Northrop Grumman proposal, they could have 49 superior tankers	p/EADS On losing the bid to provide the US Air Force with a tanker replace ment to Northro p/EADS

11	The	Louis	Investo	β	operating by 2013, whereas if they funded the <i>Boeing</i> proposal, they would have only 19 considerably less capable planes in the year,' Thompson said. Air Force reviewers also had less confidence in <i>Boeing's</i> past performance due to 'poor execution' in three relevant programs, including long-delayed tanker deliveries to Japan and Italy, Thompson said. <i>Northrop</i> got higher ratings due to 'satisfactory' execution on six programs deemed relevant to the tanker competition. <i>Boeing</i> had expected to face tough competition from <i>Northrop</i> on cost, but it compounded its problems by failing to adequately explain its assumptions in calculating the cost of developing a tanker, Thompson said. 'The resulting low confidence in <i>Boeing</i> cost projections undercut its claims of lower life-cycle costs,' he said."	On

17 Mar. 2008	The Tacoma News Tribune	Ray Gofort h, SPEEA Execut ive Direct or	Labor Union	α	"Before I took this job, I'd been told that relations with SPEEA and Boeing were pretty darned strained, and I had hoped that could be fixed, but I learned that isn't going to happen easily. Mr. Carson explained that he wanted to get rid of all unions at Boeing and that he intended to continue to support the efforts to bust the bargaining units where they could. It was disappointing. I appreciated the candor. It did supply some clarity on these problems. I went into this hoping that we could partner to solve these problems, but the answer was 'no'. They shared their plans to eliminate the pension plan for all new hires and to make negative changes to the medical plan that will drastically shift costs onto the employees. They seemed to be setting us up for what could be a cataclysmic conflict this fall. Their stance on the pension plan came after the news that Boeing's pension plan is overfunded by \$5 billion, and they are enjoying healthy profits so this is not like the auto industry where they're facing some tough problems that call for some creative solutions. These aren't things they need to keep the business healthy. These are things that they simply want. If I wanted to synthesize it, I'd have to say it is bewilderment that the people who run the company are intent on running it into a ditch and won't listen to the people that really do the work. My members are telling me we're going to have even more delays. Within Boeing	On pending strike negotiat ions (particul arly on the adverse relation s between labor and capital - i.e. "Corpor ate" - not between labor and the firm).
