19 Mar. 2008	The Financi al Times	Steven Udvar- Hazy, Chair man, Interna tional Lease Financ e Corpor ation	Custo mer	α	management there's an almost religious belief right now that this offshoring is good, and when you point out the problems, it's seen almost as a challenge to the fundamental belief tenant rather than a discrete problem to be fixed. Hopefully we will find solutions to these problems that are peaceful and quiet and professional. Thus far, <i>Boeing</i> corporate has found no interest in finding solutions, so we've begun to prepare our membership for very tough negotiations and possible adverse labor actions." "Boeing admitted on Wednesday that it would have to redesign parts of its troubled 787 Dreamliner, raising the prospect of a third delay in recent months to delivery of the new aircraft. Mr. Hazy told a <i>JPMorgan Chase</i> conference that the state of the Dreamliner programme was 'not pretty'. He said first deliveries would be delayed for at least another six months because its centre wing box – which holds the wings in place – needed to be redesigned. <i>Boeing</i> refused to comment on the specifics of the redesign work but said Mr. Hazy was not painting an accurate picture of the overall programme. 'We are doing some redesign work but things are more complex than what we said,' said Yvonne Leach, for <i>Boeing</i> . Mr. Hazy said he expected delivery of the jet to be delayed until the end of the third quarter of next year. <i>Boeing</i> 's most recent guidance was that the Dreamliner would be ready in 'early' 2009. <i>Boeing</i> said it was sticking to its most recent guidelines. A further delay would be hugely embarrassing for the company. Last month <i>ILFC</i> said it would seek compensation 'on a large scale' from <i>Boeing</i> for the 787 delays. The 787 is <i>Boeing</i> 's most successful new aircraft, with 857 orders in place, worth about \$140 billion. But analysts are asking difficult questions about how profitable the whole programme could be if penalty payents are added to other cost concerns. 'The large number of 787s sold at low prices, combined with rising recurring costs, are steadily eating away at programme margins and long-term progr	On a modular enterpri se architec ture's overpro msing and underde livering.

	,				disturbing that Boeing considered polygraph test of its	Archite
					leadership team. 'Initially, we thought the source of	cture.
					the leaks had to be one of the 10 or 12 people on the	
					leadership team, or two or three support people in	
					meetings during conversations,' Bair said. But	
					management scrapped the polygraph idea when it	
					'decided that would look bad when that leaked out,'	
					Comparison of the second of the second	
					Bair said.	
					Boeing investigators questioned those privy to the	
					information, and checked phone and e-mail records.	
					Among the files confiscated from Eastman's home	
					computer, the biggest 'heart-stopper' concerned	
					airplane concessions, Bair said.	
					n en	
					Concessions are the closely guarded difference between	
					the list price of an airplane and what <i>Boeing</i> actually	
					charges customers. 'This is as close to the jewels you	
					can get in terms of sensitive information,' Bair told the	
					jury. If an airline buys a jet and then finds out that its	
					competitor paid millions less for the same plane, 'We'd	
					have a social problem with that customer,' Bair said.	
					On cross-examination, Bair admitted that the concession	
					data never appeared in any media reports.	
					'Everyone knows we live in a duopoly with a	
					competitor that is heavily subsidized by the French,	
					German and U.K. governments,' Bair told the jury.	
					'And every day is intensely competitive with Airbus.'	
					One of the jurors upon seein Bair remembered that he used	
					to work for him. Bair still works at Boeing, but is no	
					longer 787 program chief. The juror works on the 787	
					program, and has worked as a finance estimator who	
					helped prepare the type of long-range business	
					planning documents that Eastman is accused of	
					leaking. Judge Monica Benton excused the juror and sent	
					him home, leaving 13 jurors including one alternate.

7 April 2008	Flightgl obal.co m	Ross Bogue, Boeing Comm ercial Airpla nes VP & GM of 747- 8	Firm	α	"Boeing now acknowledges that sticking to the 747-8 Freighter programme's original schedule could mean that the aircraft is delivered slightly above nominal weight targets. Part of the weight problem is caused by <i>Boeing's</i> decision to keep deliveries for the 747-8 on schedule, Bogue says. If deliveries were delayed, <i>Boeing's</i> engineers would gain more time to optimize the design of the aircraft to reduce weight. The 747-8 has faced schedule pressure [due to a delay on] the 787 programme , [which] meant that engineers from that programme could not be transferred to work on the next- generation 747. <i>Boeing</i> solved the problem by outsourcing engineering work to a variety of aerospace firms abroad. The engineering workforce at <i>Boeing</i> IDS also were loanded to the programme. Although this strategy has helped to overcome the workforce shortfall for the 747-8F, <i>Boeing</i> has also learned that the work was distributed too broadly , Bogue says. "I would tell you we spread the work too far on the Freighter,' he says.	On how to make architec tural tradeoff s between time and product perform ance, modular izing an integral product.

	nt	hires, 'it ended in a strikeThis is unacceptable. I'm	
		sure our members will walk again.'	
		"We're going to have disagreements," Kight said. "The	
		key, as leaders, is how you respond.' The Machinists'	
		2008 negotiations slogan is 'It's our time this time!' Said	
		Kight, 'I wish we were half as good as the IAM at	
		crafting great slogans.'	
		'Past, present, future, it doesn't matter. We fight for	
		all our members. You're fighting for the unborn,'	
		Wroblewski said. 'Our members didn't fall for it in	
		2005. They won't fall for it this time.' The Machinists	
		have struck Boeing six times since 1948, including a 69-	
		day walkout in 1995 and a one-month strike in 2005.	
		That fighting stance followed an initial meeting with Kight	
		and Boeing Commercial Airplanes Chief Executive Scott	
		Carson. Goforth and the two other union officials present	
		insist that Carson told them candidly he'd prefer 'to get	
		rid of all the unions at <i>Boeing</i> ' and intended to continue	
		to support efforts to do so. Kight, who was also at the meeting, flatly denied that. 'He didn't say that,' Kight	
		said. 'He knows it would be a fool's errand to make a	
		statement like that.' Late last month, Carson himself	
		defended his remarks in the February meeting in a letter to	
		an employee. His version of what he said was: 'I wish	
		Boeing didn't have to work through a third party to	
		have discussions with employees. To say these comments indicate that Boeing is anti-union is, in my	
		opinion, a mischaracterization.'	
		'I'm responding to a campaign of aggression against the union. The company is assentially trying to put us	
		the union. The company is essentially trying to put us out of business,' Goforth said. 'If they attack us in one	
		place, they attack us all.' Kight said the efforts to unseat	
		the union in each place were employee-driven, and the	
		outcomes were determined by employee wishes. 'It's up	
		to the employees,' Kight said. 'We respect the choice.'	
		Clearly, well-paid white-collar workers do not strike	
		lightly. SPEEA has only had one strike that lasted more than a day in 2000.	
		more than a day in 2000.	
		Goforth cited a survey of his members, the results of which	
		are still coming in. Of the almost 4,000 people who have	
		responded so far, three-quarters registered 'low	

18 April 2008	Seattle Post- Intellige ncer, "Boeing to ask Unions to Drop Pension Plans for New Hires."	Ray Gofort h and Tom Wroble wski, SPEEA Execut ive Direct or, and IAM district Preside nt	Union	α	 confidence' or 'no confidence' in Boeing corporate management. 'This is setting us up for some pretty tough negotiations,' Goforth said. 'My fear is that we might find ourselves stumbling into a strike.' At this point in the 787 program, that could be disastrous for Boeing. 'All of us must continue to keep focused on what we've got to do to meet customer commitments,' Kight said. 'The last thing we can afford to do is slip up on our promises to customers." "The change is 'about attracting a new generation of employees that may not have the same appreciation for the value of the traditional pension,' [Boeing spokesman Tim] Healy said. 'The new generation may not be willing or have a desire to stay at the same company for 30 years,' and would instead favor a more portable retirement plan. While Boeing said it has broached the subject with both unions, comments made by top labor negotiator Doug Kight and published in Seattle-area newspapers Friday seem to have taken both by surprise. 'They have never come out and said, it is our goal,' Tom Wroblewski, president of Machinists Union Local 751, in an interview. 'I'm pretty upset about it.' Wrobleswski said the company's plans would shrink new employees' retirement savings and leave them more vulnerable to market swings. 'If the employer wanted to restructure the retirement package in a way that didn't take money away from the employees and put it in their pockets,' Goforth said." 5			company in the first quarter. The difference between the program accounting and the unit accounting was some \$330 million, which is the largest number we have ever seen I think in a single quarter and 71 million of it, which is pretty much consistent with what we have been seeing is related to the 777-300ER. I wondered if you could sort of tell us what was going on because the actual is so different from the assumed program performance?	
			James Bell (Boeing): Yeah, some of it was again we are still experiencing the impact of the more aggressively priced airplanes several years ago that we are delivering, which has a more profound impact on unit margins than program. Then coupling that with the mix that was delivered in the quarter had the increase the gap a bit based on what's in the accounting quantity relative to that mix and the pricing associated with it, Joe.	
			Joe Campbell: James, what was the mix difference. I didn't notice anything especially different?	
			James Bell: Well, there were more 777 in it today in the	
			Joe Campbell: 777 wasn't the issue, it was only 71 million of the 330? So the big number	
2			James Bell: You are only talking about the difference in pricing on 777, there is a mix difference also that would be associated with better priced airplanes out in the outyears, Joe.	
			Joe Campbell: But, I mean, you are showing us the difference between actual and program assumptions on the 777 to be only \$71 million. So is it not correct to assume that 330 minus 71 is related to some airplanes other than the 777 ?	
			James Bell: Well, there is. Yes, there is.	
			Joe Campbell: So, I am asking what that 200 million is, which is	
			James Bell: It's mostly the 777, but there would be some mix relative to the 777s as well that's in the cost base that's beyond which you are seeing in deferred production and it would be quite frankly the mix between freighter and passenger.	
			Heidi Wood (Morgan Stanley): Jim when you, James I guess, when you go through and	

analyze the range of possible additional costs on these customer penalties and supplier support. In totality what's the highest negative cost outcome that's realistic. I mean does that number ever exceed 4 billion. We are really struggling on the outside to conceptualize this. I mean if we can't think of it is 2 to 4 billion is that a reasonable bandwidth? James Bell (Bocing): Well Heidi, you know, the fact of the matter is we go through and struggle with that same thing ourselves and with the information we have to date, its hard to set a number. And that's why we obviously have taken the position that we are going to start off booking the program at a zero margin to make sure we have adequate reserve in order to deal with that. I can't predict what the number will be. I just know that our past history would suggest that we do a pretty good job of mitigating that and not having and roll through to be a significant impact to your financial performance. Heidi Wood: A tright. You gave us color on when you are going to make the decision on the program block, but maybe can you give us more transparency on the process of how will you make the determination for the accounting block size for earnings recequition. And when you look at all of this backlog that you have, obviously the implications of these higher non-recurring is very different if you use a 400 block. Can you walk us through the process of that? James Bell: I can Heidi. Let me start with history. Typically when we got to a point of delivering the first airphane we sell it about a 100, this in raw numbers on our new aliphane models. And as you mentioned typically the block turned out to be - the initial block is on the marker potential is for the airphane range. So what that is beyond the long orders you look at a time period over which you can estimate your cost and estimate you reveal and then may to puscle with the accounting quantity is and then what's your booking margin ought to be on these airphane as yo			
what's the highest negative cost outcome that's realistic. Theme does that number ever exceed 4 billion. We are really struggling on the outside to conceptualize this. I mean if we can't think of it is 2 to 4 billion is that are assonable bandwidth? James Bell (Bocing): Well Heidi, you know, the fact of the matter is we go through and struggle with that same thing ourselves and with the information we have to date, its hard to set a number. And that's why we obviously have taken the position that we are going to start off booking the program at a zero margin to make sure we have adequate reserve in order to deal with that. I can't predict what the number will be. I just know that our past history would suggest that we do a pretty good job of mitigating that and not having and roll through to be a significant impact to your financial performance. Heidi Wood: Aright. You gave us color on when you are going to make the decision on the program block, but maybe can you give us more transparency on the process of how will you make the determination for the accounting block size for earnings recognition. And when you look at all of this backlog that you have, obviously the implications of these higher non-recurring is very different if you use a 400 block. The area not 800 block. Can you walk us through the process of that? James Bell? Jame			
realistic. I mean does that number ever exceed 4 billion. We are really struggling on the outside to conceptualize this. I mean if we can't think of it is 2 to 4 billion is that a reasonable bandwidth? James Bell (Bacinz): Well Heidi, you know, the fact of the matter is we go through and struggle with that same thing ourselves and with the information we have to date, its hard to set a number. And that's why we obviously have taken the position that we are going to start off booking the program at a zero margin to make sure we have adequate reserve in order to deal with that. I can't predict what the number will be. I just know that our past history would suggest that we do a pretty good job of mitigating that and not having and roll through to be a significant impact to your financial performance. Heidi Wood: Alright. You gave us color on when you are going to make the decision on the program block, but maybe can you give us more transparency on the process of how will you make the determination for the accounting block size for earnings recognition. And when you look at all of this backlog that you have, obviously the implications of these higher non-recurring is very different if you use a 400 block or an 800 block. Can you walk us through the process of that? James Bell: I can Heidi. Let me start with history. Typically when we got to a point of delivering the first airplane we sell it about a 100, this in raw numbers on our new airplane models. And as you mentioned typically the block turned out to be - the initial block turnes out to be and about 400 airplane range. So what that is beyond the long orders you look at a time period over which you can estimate your cost and estimate you revenue. And so you take those things in consideration and then you sette on what the accounting quantity is and then what's your booking amrgin ought to be on these ariphane as you deliver them. Well in the case of the 787 we are going to have probably a 1000, so by the time we deliver it. So we are g			
 billion. We are really strugging on the outside to conceptualize this. I mean if we cart think of it is 2 to 4 billion is that a reasonable bandwidh? James Bell (Boeing): Well Heidi, you know, the fact of the matter is we go through and struggle with that same thing ourselves and with the information we have to date, its hard to set a number. And that's why we obviously have taken the position that we are going to start off booking the program at a zero margin to make sure we have adequate reserve in order to deal with that . I can't predict what the number will be. I just know that our past history would suggest that we do a pretty good job of mitigating that and not having and roll through to be a significant impact to your financial performance. Heidi Wood: Atright. You gave us color on when you are going to make the decision on the program block, but maybe can you give us more transparency on the process of how will you make the determination for the accounting block size for earnings recognition. And when you look at all of this backlog that you have, obviously the implications of these higher non-recarring is very different if you use a 400 block or an 800 block. Can you wak us through the process of that? James Bell: James Bell:			
 conceptualize this. I mean if we can't think of it is 2 to 4 billion is that a reasonable bandwidth? James Bell (Bacing): Well Heidi, you know, the fact of the matter is we go through and struggle with that same thing ourselves and with the information we have to date, its hard to set a number. And that's why we obviously have taken the position that we are going to start off booking the program at a zero margin to make sure we have adequate reserve in order to deal with that 1 can't predict What the number will be. I just know that our past history would suggest that we do a pretty good job of mitigating that and not having and roll through to be a significant impact to your financial performance. Heidi Wood: Alright. You gave us color on when you are going to make the decision on the program block, but maybe can you give us more transparency on the process of how will you make the determination for the accounting block size for earnings recognition. And when you look at all of this backlog that you have, obviously the implications of these higher non-recurring is very different if you use a 400 block or an 800 block. Can you walk us through the process of that? James Bell: I can Heidi. Let me start with history. Typically when we got to a point of delivering the first airplane we sel it about a 100, this in raw numbers on our new airplane models. And as you mentioned typically the block turned out to be - the initial block turned out to be and about 400 airplane range. So what that is beyond the long orders you look at what the market potential is for the airplane you look at a time period to you wake to be on thes a you deliver them. Well in the case of the 787 we are going to have probably a 1000, so by the time we deliver it. So we are going to be more constrained by which obviously, gives us great opportunity over a time period to produce indue than well be able to reduce in that ime 			
billion is that a reasonable bandwidth? And as you mentioned typically the block turned out to be the initial block turnes out to be and about 400 airplane range. So what that is beyond the long orders you look at what the market potential is for the airplane you look at a time period over which you can estimate your cost and estimate you reveue. And so you take those things in consideration and then you settle on what the accounting quantity is and then what's your booking margin ought to be on these airplane as you deliver them. Well in the case of the 787 we are going to have probably a 1000, so by the time we deliver it. So we are going to be more constrained by which obviously, gives us great opportunity over a time period to product good earnings and value for both us and our customers and it also gives you great capacity to deal with unknowns that you don't understand you will experience as you look back to today. But we will be more constrained about the period and what we'll be able to estimate over a time period and what we'll be able to estimate over a time period and what we'll be able to estimate over a time period and what we'll be able to estimate over a time period and what we'll be able to estimate over a time period and what we'll be able to estimate over a time period and what we'll be able to estimate over a t			
the decision on the program block, but maybe can you give us more transparency on the process of how will you make the determination for the accounting block size for earnings recognition. And when you look at all of this backlog that you have, obviously the implications of these higher non-recurring is very different if you use a 400 block or an 800 block. Can you walk us through the process of that? James Bell: I can Heidi. Let me start with history. Typically when we got to a point of delivering the first airplane we sell it about a 100, this in raw numbers on our new airplane models. And as you mentioned typically the block turned out to be the initial block turns out to be and about 400 airplane range. So what that is beyond the long orders you look at a time period over which you can estimate your cost and estimate you revenue. And so you take those things in consideration and then what's your booking margin ought to be on these airplane as you deliver them. Well in the case of the 78 we are going to have probably a 1000, so by the time we deliver it. So we are going to be more constrained by which obviously, gives us great opportunity over a time period to product good earnings and value for both us and our customers and it also gives you great capacity to deal with unknowns that you don't understand you will experience as you look back to today. But we will be more constrained about is what we'll be able to estimate over a time period and what we'll be able to estimate over a time period and what we'll be able to produce in that time

		period. So you can get the significant opportunity we are	

wha our ver to o do bas sig <u>He</u> We init	ng to have on the initial opening quantity here. But at we see today and what we understand based on what contracts have in them, based on N-SAR, our very y preliminary discussion with our customers, it is hard estimate what the customer settlements will be but we believe that whatever the opening quantity will be ed on the price theory I just described, there will be nificant profitability in the program today to cover . idi Wood: It that's interesting so basically in the scenarios on this tial program block, you're saying that in every nario the costs are still less than the revenues?	
	mes Bell: at's correct.	
Ok aga had 289 the Yo sta des und kno cos this get	idi Wood: ay, thank you. And then one last one, if you don't mind, in a bit of a doubles [divagate] question for you. You d one 747 order in Q1 and a great booking quarter of P planes. You had 25 747s in '07, yet you are raising e R&D and raising the non-recurring on the 747. u've gone from some 280 changes on the wings that rted of mildly to what looks like to a whole new wing sign which is kind of \$3 billion to \$4 billion. Help us derstand why is that the right answer? I mean, we ew there is backing out the door to buy 787s and your its are rising on the plane, we can understand it but in s situation your costs are rising and we're not ting confirmation for higher customer demand. Can a walk us through your rationale there?	
We the tall tha yea res int tall	a McNerney: ell hi this is Jim. I think we've about 110 orders for both freighter and the passenger. And I think James just keed historically about models we've introduced at about t rate and so we're already aware and we're still over a ar late from introduction. Now having said that, I will be t in Canada, if I didn't tell you I wish we had more ercontinental orders which is I think what you were king about, the passenger version.	
Ye	ah. mes Bell:	
We	idi Wood:	
An	d only one major customer	
Ye	n McNerney: ah and one major customer, although the minor stomer would not appreciate your characterization there the way, but we're in discussions with about 8 to 10,	

serious discussions with 8 to 10 major carriers. It is impossible for me to predict how many of those will order but typically when we're at this stage, a large number of them would. So, I think we are still basing our spending on what we perceive to be the market and by the way we are up to a pretty good start with a 110 orders worth over a year to go before we have to set accounting quantities and the like. But I also wish we had another couple major intercontinental orders right now and the guys are really working hard at it and I think there is a good chance we'll have some soon.
Howard Rubel (Jefferies): Thank you very much. I want to go back to the R&D. You kind of I mean we all live in glass houses in form or another and you've sort of had to go through this a couple time and raise that. Is there any change in process that Jim that you need to look at in terms of helping you think about estimates for programs?
Jim McNerney (Boeing): Well, we can be better. I think if you're looking for a root cause, it would probably center on the 87 development. As we've struggled with getting the supply chain in place and the costs associated with recovering from that. We've been forced to keep an experienced set of engineers on that program that had been planned to go on off to other programs. The 47-8 that increased costs as we scrambled to find the engineering capacity we need the trading, we need outside help supplementation from time to time, little more costly, so. I think part of what you are seeing is the scramble but having said that I'm not happy and Scott Carson is not happy with our inability to get our arms around predicting the development cost. The business case for both airplanes remains good but we need to do a better job there and we are working hard to do that. And we do not a have shortage of business reviews around the subject.
Ron Epstein (Merrill Lynch): A boarder strategic question for you Jim. If the tanker stays with <i>EADS</i> and <i>Airbus</i> ends up setting up a wide- body production in North America. I mean how will that change the strategic outlook for the industry. I mean how do you have to consider them now if you get your competitor here in a dollar cost structure putting together wide-bodies?
Jim McNerney (Boeing): Yeah, I mean I think it wouldn't change the nature of their business and it wouldn't introduce another competitor. But would change where they produce or have the capacity to produce some things. So it ultimately gets down to a dollar based production site. If they end up wining this thing believe me that site will be pre- occupied with modifying freighters made in France for

a long time. So I'm not sure they'd immediately convert hat into something else. So it's more of a geographic deployment. They've announced similar things in China, US. They've got lots of dispersed production in Europe. It will not be an in complicated supply chain for them to manage by the way as you look at from managing manufacturing operations it will tough.	
Ron Epstein: Okay and then just one follow on if I may, I think everybody else did. When you look at your suppliers everything from raw material down to your Tier-I's, Tier- II's, on the legacy programs . I mean how's the supply chain doing?	
James Bell: On through legacy programs, its doing fine. Not that it doesn't labor from time to time. I think the team quite frankly is doing an excellent job on the legacy programs. We've go through periods where certain raw materials are scarce, other periods where quality funds are found. But I would categorize them as being well managed and less difficult than you probably imagine. Most of our supply chain issues have been centered over and found the 787 development and those are well chronicled. So I am trying to paint a picture, when I managing at everyday we are but we have had no major disruptions in our production and with our fingers crossed we think we can keep that record going.	
Robert Spingarn (Credit Suisse): Jim you've already noted earlier in the call the prevailing weakness in broad economy and <i>Boeing's</i> very impressive backlog here, and you said many times and you alluded to this earlier that you resist the temptation to over ramp at BCA . So with that said, what kind of backlog erosion could Boeing tolerate before 2009 and lets say 2010 production plans would be impacted?	
Jim McNerney (Boeing): Let me answer your question by a array of siding another stressful time and that would be the recession 2000 and then closely followed by 9/11. I think when you looked what happened there roughly 6 or 7% of our orders ended up being cancelled and that was a very tough situation. There where a number of reschedules, a push outs, and number that the majority didn't change. But we managed to work through with our customers we are facing difficult headwinds to say the least of that time. And a lot of those orders were US based carriers then. And as you heard me earlier describe that's in contrast where we are today, we are the vast majority of orders 80% plus are with international carriers backed by Ex-Im financing. So we	
are in a stronger backlog position, today all you can use is data here, because you can't predict future. So if you had exactly the same situation happened to you as happened to	

	you in 2001 same kind of pressures although differently constructed you can end up with something like that. And I think that given that we have constraints on most of our product lines right now, we can get people airplanes right now. And as you say we are sort of a biased to be cautious on the rate increases even though we are increasing, but you add that all up, the strong ability to managing the past when we got lacked. We are in pretty conservative position to go again and return we have more order than we have production. And so could there be some impact? Yes. Would it be a major thing? Probable not.
	Robert Spingarn: Let me also understand because I think you just said that if you had a 6 to 7% cancellation to fuel environment which is the similar trend that we saw following 9/11 is that what you said?
	Jim McNerney: No I am just saying no. Because there were other factors that impacted our financial performance. I was only dealing with the question of volume and I was simply pointing out that at that time we had more than 6% deferrals okay 6% cancellations is what I said.
	Robert Spingarn: Okay.
	Jim McNerney: We tend to assume that kind of cancellation rate as we put together our business plans and our financial promises.
	<u>Robert Spingarn:</u> Okay. Because people are going to look to the ramp down from the '01 production rate of over 500 to 240 or so two years later and I want to clarify that's that not what you are talking about?
	Jim McNerney: No, you are right. I mean that's not what I am trying to portray and I can see, why I confused you. What I am trying to say is that 6% orders loss were in much more and a lot of that ramp down was a result to push outs. But we are in a much stronger position today in that or insulated from economic conditions with most of our orders outside the United States Ex-Im Bank financing. So you would see a lot less deferrals in my opinion this time around.
	Lynn Lunsford (<i>Wall Street Journal</i>): This has to do a little bit more with the deliveries on 787 kind of in the out years; some of your customers that have airplanes that are way at the end of the delivery line here, are kind of expressing a little bit of concern that the delays will cascade down through the chain. Do you

have any sense of how far down the airplanes maybe delayed by the slower ramp up? Is there a scenario that all 900 of them could be delivered later than people had thought?	
Jim McNerney (Boeing): Lynn, this is Jim. We don't believe that the slide will impact all 900. Having said that we're still working through exactly what the impact will be. As you know, I think we've told you what's going to happen in '09 that the ramp-up will be slower after that and full rate production in 2012. We're seeing if that could be pulled in. We don't know and we're seeing what we can do to ramp-up beyond that, after that, that both of those could significantly improve the situation and when we've thought through that, we'll be able to be more precise with everybody. But we don't see a scenario where all 900 would be delivered late.	
Hal Weitzman (Financial Times): You said earlier Jim that EADS, if they were to end up wining the tanker contract would face a complicated supply chain and I just wanted, given your own experiences with the 787, what have you learned in terms of supply-chain issues?	
Jim McNerney (Boeing): Well, we have learned a lot and have the scars to prove it; I guess would be my summary on the 87. I think having real time visibility of your partner's inventory as well as their rep as they as they are assembling things so a global understanding of how things are coming together all the way down to Tier 3 and 4 would have helped us a lot. So, IT visibility, like we had on the engineering side and so there is some learning there for us. We are already doing it differently. And whether Airbus chooses to learn from that or not is something that, then at last they will be confronted with similar challenges and I think they know it will not be easy.	
Hal Weitzman: The next time around, you're going to do things differently?	
Jim McNerney: No, our strategy will be the same. We believe that global leverage is important both from a cost and risk mitigation standpoint. We might draw some lines at different places, now that we understand our own capabilities; better understand the capabilities of our partners. I think we all learned and I think it will be more of an adjustment to the strategy than a change in strategy.	
Dominic Gates (Seattle Times): I just wanted to clarify if something Heidi Wood has asked about. She characterized a change to the 747-8 program.	

	The wing the change to the wing was effectively a new wing and put a price tag on it, total price tag I think of 747-8 development of somewhere between 3 and \$4 billion. So, is the characterization of more or less the whole new wing accurate and what about that price tag?	
	Jim McNerney (Boeing): The wing was an issue we had to wrestle through. There was some redesign that had to happen there, it took us longer than we thought, but I think we are largely through it. We feel comfortable with it and it did explain a lot of the non-recurring pressure that we had particularly last year.	
	Dominic Gates: And is that increasing the cost to about the levels Heidi cited of 3 to \$4 billion?	
	Jim McNerney: Yeah, I don't think we talk about that publicly. It obviously cost more than we thought it was going in, but we remain very comfortable that this will be a profitable program and the business case remains strong.	
	Mike Mecham (Aviation Week): Hi. A couple of weeks ago, Steve talked about some weight issues in the 787 continue to had in the -10 as you know isn't a particular program yet, but those implications there as to how you might set the company up to compete with the A350, the larger A350s that would creep into your 777 programs as competitors? Is there any thinking about a development effort on 777 to position against the A350 or are you confident that what you have got definitive 300-ER?	
	Jim McNerney (Boeing): That's a good question. Obviously, the A350-1000 as it comes together, it comes together as Airbus has characterized it will in terms of its performance would put some pressure on our longer range 777 fleet and we would have to answer the question what we would do about it. So it's very much of a wide issue. I think the driver is what were the real performance of the A350-1000 be and since that probably won't be introduced until 16ish, I am guessing here, but I think that's right, it's introduced after the 800 and 900, we have plenty of time to make the decision on what kind of modification might be needed if the performance does threaten the bottom of our long range part of our 777 fleet. But given the order rates that we continue to have on 777s, I don't think the marketplace is all really worried about it yet, but it will be an issue we have to address.	
	Suzanne O'Halloran (<i>Bloomberg</i>):	

23 April 2008	The Wall Street Journal, "Ford Eyes More Cuts As Recover y Advanc es"	Alan Mulall y, CEO, Ford Motor Compa ny	Firm	α	You mentioned company-wide part gains in your release and I am just wondering if you could give some examples. And then also since your plane deliveries, I guess they will be flat next year if you strip out the 787, does that means you have already achieved all the productivity gains that helps you with this deliveries last quarter? Jim McNerney (Boeing): The productivity gains are pretty much across the board in our productions programs. If you looked at both on IDS and on commercial airplanes, you look at the 737 the 777 and you look at F-18, F-15, C-17 you would see good year-over-year productivity on all of our major product lines. It is an article to face [*of faith?"] each year that we will make progress there. So I think its in across the board story. And your other question I couldn't quite hear you. Suzanne O'Halloran: I just was wondering it looks like your commercial plane deliveries will be flat next year, if you strip out the 787, and so I am wondering that that means you have already achieved all the productivity gains with this delivery last quarter? Jim McNerney: Absolutely, not. And I think the example I would cite there is our largest facility, our Edward [Everett?] facility, James mentioned it earlier, there are productivity efforts that are just gaining maturity up there on the 777 in particular and on the 747 that will produce significant productivity for us even at rate. And there is still productivity approvals year-over-year planned for renting [Renton?] as well. So like I said it's an article of fake [faith?], we never get there." "The firm isn't done cost-cutting. According to people close to Mr. Mulally, he is looking at selling Volvo. Similarly, he hopes to shutter the ailing Mercury brand. More job cuts may be coming. In Ford's most recent buyout offer, only about 4,000 workers signed on, about half the desired total. Mr. Mulally will likely offer one more round, then could resort to layoffs. 'Clearly, we have lots of mechanisms to keep taking the fixed costs out,' Mr. Mulally says.	On a modular Enterpri se Archite ct's approac h.
	1 Sec. 19				'This is a classic example of how one can shrink to grow,' says Peter Nesvold, an analyst at <i>Bear Stearns</i> . Mr. Mulally 'is making many difficult decisions during a down cycle, which should benefit the company as they enter the next upturn.' Mr. Mulally came to <i>Ford</i> from <i>Boeing</i> , the aircraft maker, where he had spent his entire career. <i>Boeing</i> twice passed him up for the CEO's job despite his work rehabilitating <i>Boeing's</i> once struggling commercial airplane division	

					by borrowing efficiency ideas from Toyota.	
					by borrowing efficiency ideas from <i>Toyota</i> .	
					Mr. Mulally wanted Ford's market share to reach its 'natural level' – the volume where cars sell without big discounts. 'I don't care what market-share level you are,' Mr. Mulally says, the goal is to 'get back to profitability.'"	
24 April 2008	Reuters, "Four- hour strike hits Airbus France Producti on." (Nicolas Fichot, Jessica Mead)	Jacque s Rocca, Direct or of Comm unicati on, <i>Airbus</i> France	Firm	β	"Striking workers disrupted production at <i>Airbus</i> factories in France for four hours on Thursday in a dispute over restructuring. The strike was called afer <i>Airbus</i> dropped plans to sell some of its factories in Germany to an outside investor but pressed ahead with plans to sell two of its three factories in France. French Unions say French and German plants should be treated equally . <i>Airbus</i> declined to comment. 'We will let the strike speak for itself,' said Jacques Rocca, director of communication at <i>Airbus</i> France." 25 April 2008	Bloomb erg, "Ford Chief Mulally May Do for Automa ker What He Did at Boeing" (Bill Koenig)	Alan Mulall y, CEO, Ford Motor Compa ny	Firm	α	 "The confidence in our plan is really increasing,' said Mulally, 62 in a <i>Bloomberg Television</i> interview yesterday. 'We said we had to aggressively restructure to meet real demand.' At <i>Boeing</i>, Mulally slashed employment as head of the commercial airplane division by more than half, to about 50,000 in eight years. He sped production of a more fuel-efficient jetliner, the 787, and helped lay the groundwork for record orders. In his current post, Mulally has eliminated 46,300 jobs in North America over the past two years as <i>Ford</i> has closed or scheduled to close nine plants to match its shrinking manufacturing footprint. The system is patterned after <i>Toyota</i>, the automaker Media. 	On a modular Enterpri se Archite ct's approac h.
28 April 2008	Seattle Post- Intellige ncer, "Boeing Won't back Down, but Civility is Key In Tanker Dispute " (James Wallace)	Jim McNer ney, Chair man & CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	Mulally studied when he was at <i>Boeing</i> ." "Boeing Chairman and Chief Executive Jim McNerney knows a thing to two about rough play 'Our view is the (tanker selection) process chose the wrong tanker ,' McNerney said. 'Which is why we are protesting. And everything we learn as we move thorough the protest makes us feel better about having protested that process.' In a report issued Monday, Loren Thompson, a noted defense expert at the <i>Lexington Institute</i> , wrote, 'If you want to understand hower former allies end up going to war – or former lovers end up getting divorced – take a look at how <i>Boeing</i> and the <i>Air Force</i> are treating each other in their angry confrontation over the award of a next generation tanker program to <i>Northrop Grumman</i> .' Thompson said that <i>Air Force</i> leaders believe <i>Boeing</i> 'is willfully misstating the facts in a bid to obscure the	On how a modular enterpri se architec t solves disputes with its custome r

					the state of the s	
29 April 2008	The Seattle Times "Boeing Won't Throw 'Elbows ' in Dispute " (Susann a Ray)	Jim McNer ney, Chair man & CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	inferion performance of the plane it proposed. A marathon session of <i>Air Force</i> acquisition experts two weeks ago concluded that none of the 200 issues raised by <i>Boeing</i> in its complaint to the GAO was likely to be upheld, and that whatever minor problems the accountability office might uncover would be far from sufficient to overturn a competitive outcome that service says was not close.' Beyond the merits of <i>Boeing's</i> case, Thompson wrote, ' <i>Air Force</i> officials are insulted by the tone of the company's public statements,' which have used phrases such as 'deeply flawed' and 'severely prejudiced' to describe the tanker selection process. 'There is nothing I'd like better than to get that work back into our company,' McNerney told shareholders at the company's annual meeting. " <i>Boeing</i> , chided by the <i>Air Force</i> along with <i>Northorp</i> <i>Grumman</i> for the tone of its military-contract dispute, will avoid throwing 'sharp elbows' without backing down from the protest, Chief Ecceutive Officer Jim McNerney said Monday. <i>Boeing</i> lost its first chance at the contract in 2003 after an ethical scandal sent a company executive and a former <i>Air</i> <i>Force</i> official to jail. 'There is a certain amount of shamelessness about <i>Boeing's</i> current campaign to overturn the awarding of the tanker contract to a different company,' shareholder Peter Flaherty, president of the <i>National Legal and Policy Center</i> , said at Monday's meeting. 8 May 2008	Bloomb erg, "Boeing Unions May Use 787 Delay for Contrac t Leverag e" (Susann a Ray)	Tom Wrobl ewski, <i>IAM</i> Preside nt; Ray Gofort h, <i>SPEEA</i> executi ve directo r; James Bell, <i>Boeing</i> CFO	Firm- Labor	α	"Boeing Co.s' delayed 787 Dreamliner may give its two main unions extra leverage in contract talks. 'Unions have the upper hand now,' said Richard Aboulafia, an analyst with Teal Group, an aviation consulting firm. 'They're determined to get their share of the good times.' 'The last two negotiations, we were at the mercy of the company,' said Thomas Wroblewski, president of the International Association of Machinists' Seattle-based District 751. Boeing's Puget Sound-area machinists have gone on strike six times since the union was founded in 1935. With profit and demand rising, the union is in 'the best position we've been in a long time,' Wroblewski said. 'Its our time this time.' The Society of Professional Engineering Employees in Aerospace has staged work stoppages twice, most recently for 40 days in 2000. 'We seem to be on a repeat pattern this year with the same kinds of issues that provoked our members the last time,' said Ray Goforth, who took over as executive director. 'There could be some serious conflict this fall. I'm hoping not, but it's looking	On a modular enterpri se architec ture's increasi ngly short- term relation ship with labor,

—					pretty bad.'	
	5	Prov	Pinn		'Outsourcing is obviously a concern for us,' Goforth said in his Seattle office, where a poster with a picture of the 787 says, 'Bring back the work so it's done right.' <i>Boeing</i> Chief Financial Officer James Bell said that the company may do more production itself and have back-up capacity at its own facory if a supplier gets into trouble. 'In some cases we drew the line too far and we ought to pull back a bit and retain some of the work,' Bell said. 'But it wold only be a moderate bit.' 'We absolutely believe in this model,' Bell said. 'It is the model you will see us using going forward.'"	On a
8 May 2008	Seattle Post- Intellige ncer, "Boeing , Machini sts Union Open Contrac t Negotia tions" (Jessica Mintz)	Doug Kight, VP HR, <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i>	Firm- Labor	α	"Doug Kight, head of human resources and labor relations for <i>Boeing's</i> commercial airplanes unit, outlined some of the company's thinking. One of <i>Boeing's</i> key worries is that its growing obligation to fund its employee pension plan could undercut its ability to maintain booming orders and a massive backlog. 'In a long-term business like <i>Boeing</i> , where you have long-term capital investment requirements to invest in your new products and the design of your next generation of airplanes, a market downturn that all of a sudden obligates you to spend billions and billions to fund your pension is a real challenge,' Kight said. 'We've got to have more stability and predictability so that we can have some assurance that we've got the resources there to invest in the product line.' The proposal, which the union opposes, is also designed to make <i>Boeing</i> more attractive with a younger generation of workers who may not stay at the plane maker for five years and want a retirement plan that's portable and vests immediately, Kight said. Citing a 7 percent annual increase in health care costs, Kight said <i>Boeing</i> is asking the <i>Machinists</i> to accept a modest increase in what workers pay for coverage and elimination of early retiree medical benefits for new hires who retire before age 65. The union has threatened to strike ove the company's pension demands. 'They're posturing to take away benefits that we've fought hard for,' said Tom Wroblewski, president of Machinists Union Local 751 in Seattle, adding a jab about <i>Boeing's</i> much-delayed new jetliner: 'That strategy is as flawed as their 787 production system.' Wroblewski said <i>Boeing's</i> blockbuster earnings, most recently a 38 percent jump in profit to \$1.2 billion in the first three months of 2008, should support more benefits for workers, not the cuts and higher costs <i>Boeing</i> proposes. The union struck for 30 days over company demands to cut retiree medical benefits, Wroblewski noted. 'I can't believe they would come back again and want to talk about that again,' he s	On a modular enterpri se architec ture's increasi ngly short- term relation ship with labor, (as well as its slightly inconsis tent logic and focus on exogeno us events)

					The Machinists will also try to regain control over jobs lost to outsourcing , Wroblewski said. He would not give any details about the union's proposals in that area. <i>Boeing</i> spokesman Tim Healy said <i>Boeing's</i> outsourcing of jobs and deals with suppliers around the world is in response to customer demands and rapid growth .

23 May 2008	Bloomb erg, "Airbus at 'Less Than Zero' Value Still Loses Altitude " (Andrea Rothma n)	Louis Gallois , <i>EADS</i> CEO	Firm- Investo r	β	 "Airbus SAS, the world's largest commercial aircraft maker, is valued at 'less than zero' after this year's 32% drip in the shares of parent EADS according to Lehman Brothers Holdings Inc. analyst Joe Campbell. 'The market is viewing Airbus as a liability, rather than an asset,' said Campbell, 62, who is based in New York and has ranked among the top five aerospace analysts for six consecutive years in an Institutional Investor magazine poll. EADS, on May 13 reported an additional three-month delay in deliveries of the A380 superjumbo jetliner, which was already two years behind schedule. Airbus is also six months to a year late on the A400M military transport. The planemaker sought in part to shift investment for new planes to subcontractors who would buy Airbus plants. It chose local companies in France and Germany that lacked the capital to shoulder the risk and the plan fell apart. Investors' low valuation of Airbus is 'a bizarre outcome for a large company,' Campbell, whose firm is an investment bank for EADS, said in an interview. 'It reflects both the industrial challenges of engineering and making big airplane programs, and particularly and primarily, the euro trading at \$1.50 or \$1.60.' He rates the shares 'equal weight.' EADS's non-Airbus assets are worth 15 or 16 euros a share, or about where the stock is trading, estimates Campbell. Non-Airbus businesses contribute a third of the company's sales, which totaled 39.1 billion euros in 2007. Scott Babka and Rupinder Vig at Morgan Stanley in London say EADS without Airbus is worth 13.5 euros a share. Getting an aircraft maker for free might provide a floor for the stock, according to Vig. In an interview, [EADS CEO] Gallois agreed with Lehman's Campbell about EADS's valuation. 'He's right,' Gallois 	On an integral enterpri se architec ture's overinv estment (as a mixed uopolist) and subsequ ent valuatio n

					said. 'Either you're getting Airbus free or the other activities are free. In any case, the shares don't represent the company's value. Our shares are very linked to the dollar – I'd say too much [linked to the dollar].'" When EADS was founded in 2000, management promised 10 percent margins on earnings before interest and taxes by 2003. The best so far was 7.3 percent in 2005. CEO Louis Gallois in March 2008 forecast margins on earnings before interest and tax at Airbus 'in the mid-single digits' through about 2011. 'As long as Gallois and Enders and people at the top of the company can't give guidance that EBIT margins will go above 5 percent, there's not a lot of incentive to buy the shares,' said Klaus Breil of Cominvest Asset Management in Frankfurt.

1 June 2008	Seattel Post- Intellige ncer, "Boeing Says It can Handle Airline Fuel Crisis – For Now" (James Wallace	Scott Carson , Preside nt & CEO, <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i>	Firm	α	Do you have any regrets about the way you handled it? Some people say: 'Look, he's a high-profile manager and highly regarded. How come he was so low-profile during such an important time for the company?' 'I don't think the guys in Seattle would characterize me as low-profile regarding my involvement with the 787. Having said that, you can always look back on these situations and say if I'd moved two months earlier here or a month and a half earlier there we probably could be in slightly better shape I can learn from that.' What kind of confidence do you have that the targets you've got for the 787 will be met? 'We have a high level of confidence. It's still the most successful introduction in aviation history.' I was talking with a money manager who has a position in <i>Boeing</i> stock, and he said: 'The dollar has put enormous pressure on <i>Airbus</i> , and yet they're outselling <i>Boeing</i> in the smaller end of the market.' How is that possible? Why haven't you been more successful there? 'The fact is our sales levels are about the same in the narrow-body segment so I wouldn't characterie us as losing out in the narrow-body side. But our competitor has been doing a good job there.' You've got roughly \$12 billion in cash right now. A lot of people might say: 'That's about \$16 a share. We would like a high dividend or more acquisitions.' Are there any plans to use that case differently? 'We are mindful of the employees first – in terms of pension plans and health-care plans – and our investors. But you have to remember, aerospace is a lumpy industry. I'm a pretty conservative manager who likes to keep probably more than enough cash around.''' "Although sky-high aviation fuel prices have thown a scare into the airline industry not since the horrendous 9/11 downturn that resulted in massive layoffs at <i>The Boeing</i> <i>Company</i> , the leader of the compnay's jetliner business said that the aerospace giant will be able to manage its way through the current crisis without much impact at least for now. 11 June 2008	The Seattle Times "Vough t Chief Elmer Doty Explain s Why Compan y Pulled Out of Part of <i>Boeing</i> ' s 787 Progra m," (Domini c Gates)	Airpla nes Elmer Doty, CEO, Vought	Suppli er	α	 "Vought Chief Executive Elmer Doty said today that his company pulled out of one part of Boeing's 787 Dreamliner program because it didn't have direct management control over other suppliers. Doty compared the complicated supply chain that must deliver parts for a new jet to a relay race where each member of the team must run in sequence. 'A year ago ago, definitely we were at the back of the pack,' Doty said. 'We've moved to the middle of the pack, and we're moving up. The thing about this race is, it only counts when everyone gets across the finish line.' Boeing did not disclose what it paid Vought for the ownership stake, which leaves Boeing and Alenia of Italy as 50-50 partners in the joint venture. Tuesday in Charleston, Bob Noble, vice president in charge of Boeing's 787 supply chain, insisted to skeptical journalists that Boeing hadn't bought Vought out Global Aeronautica (GA) wasn't working well. 'It was not performance-related,' said Noble. Enzo Caiazzo, GA's chairman and also chief operating officer of Alenia North America, went further and insisted that Vought's four-year participation in GA could not be considered a failure because it had created a state-of-the-art airplane manufacturing plant on a previously empty site. Speaking in a phone interview vrom Vought headquarters in Dallas, Texas, Doty gave his take on why it happened. Doty said Vought's role in the GA venture became problematic when the supply chain broke down and work supposed to have been completed at other major suppliers traveled to Charleston for GA to finish. GA takes large sections from Alenia as well as from Fuji and Kawasaki in Japan and integrates them with a lot of Boeing-furnished parts. The problem was that Vought had no control over the procurement of those large pieces, Doty said. Boeing, as the prime contractor, was responsible for managing those major partners. To manage the traveled work efficiently, you need that 	Iver. On a modular enterpri se architec ture's dis- integrati on.
					accounted for less than 10 percent of <i>Vought's</i> 787 program revenue, he said, 'It was a huge distraction and difficult to execute' because <i>GA</i> lacked that partner oversight role. 'That is best done by the prime,' Doty said. After discussions with the 787 leadership team,	

				Boeing agreed.	
12TheJuneSeattle2008Times, "Boeing 'sDilemma: IfCompany LosesTankerAppeal,Appeal,ShoulditThrowTowel? ""(Domini		Firm	α	 Boeing agreed. Initial customer payments won't begin to flow until at least 14 months later than originally planned and after that more slowly than anticipated as <i>Boeing</i> holds down the new jet's delivery rate. <i>Boeing</i> paid <i>Vought</i> a cash advance of \$122 million in March as partial restitution for that loss of cash flow. Further payments are being discussed. A person familiar with the negotiations said Doty played hardball with <i>Boeing</i>, insisting that the company wouldn't continue to build parts – grindin the whole 787 supply chain relay race to a halt – unless <i>Vought</i> got paid. In the interview today, Doty would say only: 'It's a negotiation. <i>Boeing</i> is my biggest customer.' With sales of the Dreamliner sky high, the program will likely deliver big profits in time. But with revenue flow pushed out, for now all the suppliers are hurting as they continue to spend big. Struggling financially, <i>Vought</i> secured \$200 million in loans in the first quarter. 'Of course, it's a good idea to be on the program,' Doty said. 'You're talking to someone who just arranged to take out additional debt and worked hard to find ways to finance this program.' The money from the <i>GA</i> sale will help, too. Longer term, private equity firm the <i>Carlyle Group</i>, which owns <i>Vought</i>, is looking to sell the company. Possible buyers include <i>Spirit Aerosystems</i> of Wichita, Kan., or conceivably <i>Boeing</i> itself. Doty said he couldn't comment on prospective buyers. 'We were for sale the day 1 walked in,' said Doty, who became CEO in February 2006. 'My job is to continue to build.'''' 18 June 2008	Chicago Tribune, "Boeing , airbus Jet Orders Tailing Off", (Julie Johnsso n)	George Shapir o, analyst , <i>Citi</i> <i>Invest</i> <i>ment</i> <i>Resear</i> <i>ch;</i> Randy Tinset h, VP Market ing, <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes;</i> John Leahy, COO, <i>Airbus</i>	Firm- Custo mer	α & β	"Orders are starting to slow for planemakers <i>Boeing Co.</i> and <i>Airbus SAS</i> after three straight years of record- shattering sales. What's unclear is whether airlines are taking a breather after splurging on more than 7,300 new aircraft, or whether they are headed for a global shakeout that will force them to cancel or defer plane orders on a large scale. Analyst George Shapiro of <i>Citi Investment Research</i> sees early signs that a sharp downturn looms for the planemakers and the companies that supply them. The aerospace sector to date has been largely unaffected by the twin forces squeezing airlines: an oil shock and slowing economy. Shapiro predicted in a research note Tuesday that 'over the next several months, orders will fall off sharply, cancellations and deferrals will increase.' He thinks the next downturn could be the steepest since the 1989 market correction, when about one-third of Chicago-based <i>Boeing</i> 's order backlog was canceled. <i>Boeing</i> and <i>Airbus</i> say they are closely monitoring oil's impact on global travel but believe they are protected by a record backlog of orders that will keep production lines at both companies humming for the next seven years. 'This is going to create great strain on the airlines,' Randy Tinseth, vice president for marketing with <i>Boeing's</i> commercial airplane division, told the <i>Tribune</i> last week. 'We're watching it very closely.' Other analysts downplay the risk to <i>Airbus</i> and <i>Boeing</i> . 'With such deep backlogs, whether a particular customer receives delivery of an aircraft next year or in three years is of little consequence to the [manufacturers],' said Brian Studioso, aerospace analyst with <i>CreditSights Inc.</i> , in a report Tuesday. Shapiro believes fore ign carriers will widely adopt the survival tactics that have taken hold in the U.S.: price hikes, parked aircraft and cash preserved at all costs. 'Usually, airline profitability takes two years to go from peak to a loss, but it will likely be only one year this time, increasing the tisk of a sharp downturn,' Shap	On the modular nature of the global airline industry in creating the boom and bust order and delivery cycle; as well as the modular nature of <i>Boeing</i> .

					Dut Design ion't taking the surrent situation lightly. Its	
					But Boeing isn't taking the current situation lightly. Its managers meet weekly to match current and future sales with production schedules, a practice it started during the airline collapse following the Sept. 11 attacks. 'The important thing is that we actively manage our production system,' Tinseth said. Airbus, too actively manages its order book, Chief Operating Officer John Leahy told the Tribune last week via e-mail. 'So far, [Airbus] is handling the airline crisis well, but if the fuel price bubble were to soar to \$200 per barrel, then all bets would be off,' he wrote.	
19 June 2008	Busines s Week, "How Big is Boeing' s Big Win?" (Keith Epstein)		Gover nment	α	"We're going to the mat,' vows Representative Norm Dicks (D-Wash.). 20 June 2008	Aviation Week "Boeing Reconsi ders Plan for 787-10" (Robert Wall)	Scott Carson , Preside nt & CEO, Boeing Comm ercial Airpla nes	Firm	α	"The 787-10, although not formally launched, would be a double-stretch of the basic 787-8 and the top end of that aircraft family, But <i>Boeing Commercial Airplanes</i> President Scott Carson says the paramount consideration now is whether the double-stretch concept makes sense . Carson, however, says the company is 'not threatened' by <i>Airbus</i> activities. One of the challenges for the Seattle manufacturer will be finding the industrial resources to birth the twin- widebody in the same timeframe as the 737 replacement."	On a modular enterpri se architec ture's inability to perform long- term product strategy.
20 June 2008	Aviation Week "Analys t: 25% of Aircraft Ordersa t Risk" (Joseph C. Anselm o)	Robert Stallar d, directo r, <i>Macqu</i> <i>arie</i> <i>Capita</i> <i>l</i>	Investo rs	α	"A new analysis finds that a quarter or more of the commercial aircraft backlog at <i>Boeing Co.</i> and <i>Airbus</i> could be at risk as high oil prices continue to batter airlines. The two aircraft builders have taken comfort that the hardest-hit segment of the industry – U.S. airlines – accounts for just 12% of their backlogs. But Robert Stallard, a director at <i>Macquarie Capital</i> , warns that orders from undercapitalized startups in Asia and Europe and carriers with overly aggressive growth plans also are at risk. He believes 25-30% of the backlog of commercial aircraft orders could be deferred or canceled. 'The question that has yet to be	On a modular enterpri se architec ture's inability to see long- term trends due to

					answered is not whether there will be a downturn, but how bad it will be,' says Stallard.	its myopia.
					There are two schools of thought on how to answer. Optimists believe that with backlogs equal to seven years worth of production, <i>Boeing</i> and <i>Airbus</i> can afford to lose orders and still make it to the industry's next up-cycle with minimal pain. They argue that demand for air travel should continue to grow in places like China and India, making up for declines in other regions. Indeed, <i>Boeing</i> refuses to lower its 20-year demand outlook, even though the forecase is based on oil selling at a fairy tale price of \$70-80 per barrel when in reality it's closed ro \$140. The second, more negative answer is that a step change in global energy demand has created a permanent era of high prices and sent the airline industry into unchartered territory. While many of the challenges of the last downturn - overcapacity, inefficiency, labor costs – were within management's span of control, this time there is no obvious remedy. As cash reserves rapidly dwindle, all choices will have to be draconian."

23 June 2008	Busines s Week "A Granco- German Civil War at Airbus? " (Carol Matlack)	Tom Enders , CEO, <i>Airbus</i>	Firm	β	"The French also say they are bearing the brunt of the so- called Power 8 restructuring plan to slash \$7.5 billion in operating costs bu 2010. As of March 31, <i>Airbus's</i> German operations have achieved only 23% of the cost reduction target, while the French operations had achieved 39%. 'The social climate is not good,' <i>Airbus</i> boss Tom Enders acknowledged in an interview published June 23 in the French business newspaper <i>La Tribune</i> . 'It's impossible to change everything at the same time and at the same speed. To have a total, permanent equilibrium, as some of our unions want, is absolutely unrealistic,' Enders said. Enders told <i>La Tribune</i> that he understood the concerns in Toulouse about the large number of Germans working in the factory. 'I asked the same thing when I arrived last year,' he said. 'But the sad reality is, the lack of integration in <i>Airbus</i> , caused by an organization of work along national lines as well as different kinds of training and language problems, forced us to bring a large number of Germans' to complete the work that had been started in Germany. As for moving some aircraft cabin work to Toulouse, Enders said, 'It was a decision that went against the traditional division of labor, and it proves that the management is reacy to make pragmatic decisions if necessary.'"	On the difficult y of maintai ning integrali ty.
24 June 2008	<i>Boeing</i> website	Rick Stephe ns, Senior VP, Human Resour ces and Admin istratio n, <i>The</i> <i>Boeing</i> <i>Compa</i>	Firm - Emplo yee	α	"The Boeing Company is introducing a new retirement benefit program for nonunion employees hired or rehired on or after Jan. 1, 2009. 'We are changing our retirement program for nonunion new hires for several reasons,' said Rick Stephens, senior vice president, <i>Boeing</i> Human Resources and Administration. 'This new approach addresses new employee preferences for retirement programs that offer flexibility and portability and responds to market trends and practices of peer companies. At the same time, it allows us to better manage our retirement plan expenses and reduce financial risk.'"	On a modular enterpri se architec ture's continu ed disinteg ration of the firm- labor link.
25 June 2008	Reuters, "Boeing Shares Plumme t After Goldma n Cut" (Esha Dey)	ny Richar d Safran, analyst , <i>Goldm</i> <i>an</i> <i>Sachs</i>	Investo r- Firm	α	"Boeing Co. shares fell to a two-year low on Wednesday after Goldman Sachs cut its rating on the airplane maker and defense company to 'sell' from 'neutral', reflecting falling orders, problems facing airlines and high fuel prices. The stock fell 5.5 percent – its biggest one-day drop in more than five years – to \$70.68 on the New York Stock Exchange, its lowest point since February 2006. The stock is down 34 percent from its all-time high of \$107.80 last July, hurt by the delays on its 787 Dreamliner program and general concern about high oil prices. 'We expect the weak macroeconomic backdrop and record fuel prices to hurt airlines and translate to a significant slowing in the order book,' said Goldman analyst, Richard Safran in a research note published on Wednesday. He put a \$60 price target on the stock for the next 12 months, but said there was substantial risk the stock could go lower. Safran, who downgraded the	On a modular enterpri se architec ture's non- systemi c, short- term view on valuatio n

25 June 2008	Wall Street Journal, "Boeing, Gone" (David Gaffen)	Richar d Safran, analyst , <i>Goldm</i> <i>an</i> <i>Sachs</i>	Investo r- Firm	α	whole commercial aerospace sector to 'cautious' from 'neutral,' expects orders for the sector to drop 50 percent in 2008 and another 50 percent in 2009 as airlines focus on restoring profitability through aggressive capacity cuts and price increases. 'Aerospace stocks are off nearly 30 percent from October highs, but history indicates the stocks could fall another 20 percent or more as we think the market is not factoring in that the combined effect of accelerated crude prices, a weak economy and rapidly deteriorating airline fundamentals could pose a worse problem for the aerospace group than 9/11 and SARS,' wrote Safran. He said there is more risk to the 787 program than is priced in as the program has yet to even enter flight test, where historically most issues on development aircraft are found. Other aerospace suppliers also fell sharply on Wednesday, including <i>Spirit Aerosystems Holdings Inc.</i> " "Shares of aerospace giant <i>Boeing Co</i> . have been weak in the last few months, and they're getting weaker in early trading Wednesday, down 5% after <i>Goldman Sachs</i> put the company on its 'conviction sell' list, a move that's hard to misconstrue. The stock is down 34% since a 52-week high of \$107.83 and <i>Goldman</i> says the economic environment is none-too-friendly for a maker of large aircraft. 'We expect the weak macroeconomic backdrop and record fuel prices to hurt airlines and translate to a significant slowing in the order book, driving further multiple compression,' writes analyst Richard Safran. He adds that delivery rates and margin expansion will suffer, and added that the Dreamliner 787 program contains more risk than 'is currently priced in as the program	On a modular enterpri se architec ture's non- systemi c, short- term view on valuatio n
25 June 2008	Wall Street Journal, "Boeing, Gone" (David Gaffen)	Market beat@ wsj.co m (blog)	Investo rs- Firm- Emplo yees	α	 has yet to even enter flight test."" "I am highly suspect of the motives of Goldman Sachs report by Richard Safran." [Comment by John Hannahs]. "this is bs, just 3-days before boeing employies will get there share value, they analyst and boeing ceo give the ok to trash this stock. Ther is a big payoff going on ! but again not for co employies" [Comment by dave]. "I would like to thank Mr. Safran @ Goldman Sachs for his most timely downgrading of Boeing. Now my Boeing Shared Value Trust award will be less. We had a June 30 stock price that would set the amount of the award. Perhaps a little boeing birdy told him hummmmm??????" [Comment by satman]. "Watch for another BA stock buy-back announcement around the time 2nd quarter earnings are released. BA seems to drop in value before Share Value Trust payout and then the company announces a major buyback." [Comment by Former BA Analyst]. "Boeing had a record last quarter, record boeing sales/backlog, dreamliner on track/power on, and GAO vindication. Goldman Sachs downgrade is pathetic like 	On a modular enterpri se architec ture's potentia l zero- sum game, due to allegati ons from unconfir med employ ees.

June S 2008 7 "" S P S D B M B D (() C C S S S S S S S S S S S S S S S S S	he Geattle Fimes, Boeing Stock Price Slumps Days Before Magic Bonus Day" Domini Gates) CNN, Gates)	Tom Libby, analyst with Power Inform ation	Investo rs- Firm- Emplo yees	α	30-month low – and even employees who don't buy company stock may have lost some money as a result. After a <i>Goldman Sachs</i> analyst reduced his rating on the stock from 'neutral' to 'sell,' <i>Boeing</i> shares closed down \$5.15, or 6.9 percent, to \$69.64. The downgrade came as 80,000 <i>Boeing</i> current and former workers in Washington state await word on a company incentive program that hinges on what the average share price will be on Monday. This time around, the trigger price is \$54 . If the average share price on Monday is \$70, the average payout would be about \$1,493 in company stock , a <i>Boeing</i> spokesman said. <i>Boeing's</i> Share Value Trust pays nonexecutive employees once every two years , assuming the stock prices is above a predetermined threshold. Employees wha worked the entire four years beginning July 1, 2004, qualify for the full amount. Those who worked less receive a pro-rated amount. Companywide, about 196,000 people are eligible for incentive payments under the Share Value Trust. Collectively they would receive about \$309 million in Boeing stock , based on a \$70-a-share price. The trust payout in 2006 yielded <i>Boeing</i> workers an average \$5,231 before taxes. That was the result of a much larger spread between the threshold share price of \$47 and the stock price on the final day of the period , \$82.29 ." <i>"General Motors</i> stock price fell almost 11% Thursday, to the lowest level in more than 33 years , as analysts reacted to a <i>Goldman Sachs</i> downgrade and continued concerns about the automaker's competitiveness . That was the lowest price for <i>GM</i> shares since Dec. 24, 1974, when shares traded at \$11.16. The price has been adjusted for splits and other price-affecting distributions. The selloff followed a report issued Thursday by <i>Goldman</i>	On a modular enterpri se architec ture's potentia l zero- sum game, due to allegati ons from unconfir med employ ees.
26 7			Investo	α	 the way they look after their own finances." [Comment by Richard]. "Wall Street Gerbils and Goldman Sucks just put their hands on the scales they must want to load up at \$65 and sell at \$100 this fall." [Comment by Richard]. "Two years ago our last Share Value award was tanked by a huge write down by <i>Boeing</i> the day before the award. Now this? Maybe Mulder and Scully should come to investigate this conspiracy theory." [Comment by I Believe]. "Look out Ba at the next contrack." [Comment by nu know]. "Boeing shares slumped nearly 7 percent Wednesday to a 	On a

		ny; David Cole, chairm an of the <i>Center</i> for Autom otive Resear ch			 next is likely to lead it to look to raise capital, which we believe could lead to significant shareholder dilution and/or a cut to the company's dividend.' Tom Libby, an analyst with Power Information Network, an automotive research company said the automaker faced increasing material and high labor costs, representing an additional hurdle when competing with Asian manufacturers on price. "Their market share is under pressure now, and it will be for the rest of the year,' Libby added. It will take over a year for GM to realize the cost savings of the recently negotiated contract with the United Auto Workers Union, said David Cole, chairman of the Center for Automotive Research. 'The big question sis whether they have enough cash to make it from here to there,' Cole said. 'It is going to be tough, and it depends on the economy. Once they start to realize the we 	ent, non- conserv ative balance sheet), as well as potentia l zero- sum game between factors of producti on.
8 July 2008	Flight Internat ional, As Airbus A350 Takes Shape, Can it Avoid the A380's Trouble s?" (Max Kingsle y-Jones)	Gordo n McCo nnell, <i>Airbus</i> A350 chief engine er	Firm	β	have never seen from GM."" "After a turbulent couple of years for the A350 XWB programme, Airbus finally finds itself in a relatively calm state. There are now more than 4,000 engineers working on the A350, which McConnell [A350 chief engineer] says is a lot more than on previous aircraft for this stage of the programme. 'We've front-loaded the programme deliberately because we want to have a very mature aircraft when we go to flight test so we don't have many changes,' he says. This should reduce the number of changes required after certification to enable a faster ramp-up during the flight-test programme when production of customer aircraft will be under way. 'We've also selected our suppliers earlier than on previous programmes.' The earlier supplier selection is part of Airbus's strategy to follow the industry trend to involve companies in the design process sooner. 'Once we've selected the supplers, we immediately put in place a joint development phase and there are currently 21 JDPs running with system suppliers,' says Francois Caudron, vice-president A350 customer and business development. Significantly, all contracts for the outsourced aerostructures work are dollar rather than euro-based, despite much of it staying in Europe. Much of the fuselage work has in fact been allocated to existing Airbus plants in France and Germany that will eventually be divested, which are dubbed French and German 'newcos' for the time being. 'The two 'newcos' will be created in France and Germany and owned by EADS,' says Caudron. 'The next step will be to open the capital of the shareholding to the public to meet the divestment target of Power8.'"	On an integral Enterpri se Archite cture's de- risked approac h to new product develop ment.
14 July 2008	Aviation Week & Space Technol	Jim McNer ney, Chair	Firm	α	"There's been a lot of speculation about how the 787 program got off track. What's your take? 17 July 2008	The Econom ist, "Marath on Man: Can Tom Enders, the Chief Executi ve of Airbus, Turn the Planem aker into a 'Normal, Compan y?"	Tom Enders , <i>Airbus</i> CEO	Firm	β	"'I knew this was not going to be a sprint, but a marathon,' says Thomas Enders as he looks back on his first years as chief executive of Airbus - the firm that, with Boeing, holds a duopoly in the market for large civil aircraft. The emphasis Mr. Enders puts on the long haul is calculated. This week, at the biennial Farnborough Air Show, the aviation industry had the chance to judge whether Mr. Enders has the right stuff to give the planemaker the stability and strategic clarity it desperately needs. But Mr. Enders admits that much more must be done if he is to turn the technologically brilliant but politically dysfunctional firm into what he calls a 'normal company'. Plagued by power struggles within the core group of <i>EADS</i> shareholders as well as it s bizarre governance, <i>Airbus</i> suffered when it admitted that deliveries of its new superjumbo, the A380, would be seriously delayed. Shares in <i>EADS</i> tanked. The immediate cause was problems wiring up the huge aircraft, brought on by the use of incompatible software in the firm's French and German factories. But the underlying reason for the mess was a hopeless lack of integration within the company. A month later, at the 2006 Famborough Air Show, a new chief executive, Christian Streiff lasted a hundred days, quitting after he concluded that the politicized <i>EADS</i> board would interfere with his own radical cost-cutting programme, known as Power8. After Mr. Streiff's stormy exit, the sophisticated and emollient Mr. Gallois held the fort for several months before Mr. Enders was finally appointed. The Power 8 restructuring plan, which included selling some factories in Europe to suppliers, was proceeding slowly, but with less union resistance than had been feared. Mr. Enders and and as fast as possible in the direction of being a normal company. Aerospace is a political and strategic industry, but we need to make as much room as possible for business thinking and entrepreneurial decisions.' In practice, he says, that means both fixing the integration woes that be	On the leadersh ip qualities of an integral enterpri se architec ture.

23 July 2008	Thomso n Reuters Researc h excerpt from, "The Boeing Compan y, Q2 2008 Earning s Call Transcri	Jim McNer ney, Chari man and CEO; James Bell, CFO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm- Investo r	α	"Ron Epstein (Merrill Lynch): Yes, good morning. I just want to just talk a little bit about the commercial revenue. I think I was a bit surprised, and probably some other investors, with the weakness in the quarter in those revenues. When you kind of look at the aircraft that you delivered and the customers that you delivered to, I think you delivered ten 737s to Continental, nine to ILFC, nine to Southwest. I mean the weakness we saw in the quarter, I mean is that an indication of a trend or was it truly just a weak customer mix in terms of pricing in the quarter?	On a modular Enterpri se Archite cture's defense of its finanaic al perform ance

pt"	we expect to see in the second half, Ron, where we think the pricing will be a little better on those delivered airplanes. And then also we had a difference in the mix in terms of we had more single aisle and fewer wide-body delivered for this quarter, which also impacted the revenue. Again, that's timing.
	Ron Epstein: Okay. Great and then one follow-up if I may, <i>Continental</i> changed their outlook with regard to refunds in pre-delivery deposits . They were expecting 8 million this year. Now they're expecting 71 million, that would be 66 million additional dollars they're getting back from you guys in pre-delivery deposits. Are we going to see that from other airlines that have ordered the 787?
	Jim McNerney: I don't think you're going to see it from us, so I don't know what you'll see from a, you know, I—that's news to me.
	James Bell: Yes, we're going to be refunding any deposits to Continental.
	Howard Rubel (Jefferies): Mr. McNerney, you talk about, you know sustained focus on productivity and an improvement and execution and yet these results fall short of that. Could you reconcile kind of the two? And then just related to that, a lot of the, you know, initiatives that you talk about or at least you hint at that you can do in the short term to help you make the numbers seem hard to understand, given the long-term nature of the business and just the way in which the accounting system works and recognizes a lot of your costs?
	Jim McNerney: Let me try it this way. The two, actually three major headwinds we faced this quarter, two of which were development programs, 87 push out and the AW&C, I think the way we're trying to run the company is to have an ongoing productivity program that assumes that when we have stumbles in innovation, which those two represent, that we can largely cover it with a strong productivity program, which we do have here—and were it not for a strong productivity program we would not be able to reaffirm guidance this year. So I think that is the philosophy behind it. Both IBS and BCA have got well- funded, well-resourced programs, for example the productivity program and Everett, the moving line, a number of similar programs in St. Louis and Southern California and Philadelphia—so when we have these disappointments on the development side, we are ready to
	cover them. Now, obviously we are very disappointed with the development program issues that we are facing, and we are working very hard to minimize

those. And I would say we are closer to the end than to the beginning of working through a number of those legacy development programs that have caused us some pain.
Howard Rubel: I mean, Jim, just to follow up, it is a 200 basis point slip in commercial and some of that should have been recognized at the time you moved the 787 schedule. And so I'm struggling a little bit to understand how we are going to get such strong performance in the back-half of the year. Can you be a little bit more specific either in terms of quantifying it, or lay out some of the initiatives?
Jim McNerney: Yes, well let me just say one thing, and then James you can talk about the booking. I mean, roughly half of the running-rate issue that I think you are alluding to here is timing, maybe a little more than half is related to timing of revenues and costs, but there are significant productivity program efforts that are underway now—that we are not just dreaming up now, that are underway now that we are counting on as we have counted on before. So James, you want to talk about the booking?
James A. Bell: Yes, Howard, I just wanted to also say that you are talking about approximately \$200 million short in earnings overall. About half of that is related to the timing and some of the product mix we experience, so we'll pick that up when we deliver those airplanes during the second half. The other part, though, partially is also timing of expenses. We'd expect the expenses and cash to be lower in the second half than they were in the first in terms of those expenses incurred to provide infrastructure to support their future growth requirement, and then we will start seeing—as we gain more experience—more benefit out of some of the productivity initiatives that have been in place like the 777 moving line as we get more clarity around the benefit of that and it continues to smooth out, we expect to see more benefit there. And we have asked the BCA team and they have accepted the challenge and they're committed to going out to see what we can do to reduce some of the other cost in the infrastructure to moderate those as the base has diminished somewhat with the flying of the 787. So we believe it's doable.
David Strauss (UBS): Jim and James, can you give us some color with where you are with 787 supplier and customer negotiations, how much progress you made in the quarter, and on the customer side, are you seeing airline customers opt for cash, in terms of the damages, or are they looking for additional lift to make up the GAAP [gap]? Jim McNerney (Boeing):

Well first of all, every customer is different in terms of both the contractual obligations we may have with them or they may have with us, and every customer situation is different relative to the things that can be brought to bear to resolve the discussion. So it is very hard to generalize. We have gone through customer-by-customer. We do have a view of the cost in cash that it will take to resolve it. It is in our guidance. The majority of it is resolved within the 87 program, but there are some resolutions that impact current numbers, and that's all taken into account in our guidance.	
Also, with the suppliers , our supplier partners, as I said, I went out and visited all of them last month and I have a great deal of confidence in their business progress and while every financial discussion is not yet complete, most are well along. And again—they're the typical issues around scope, timing, execution that we have on every program, and we're getting those resolved. And the supplier discussions are probably ahead of the customer discussions in terms of resolutions, but again, we tried to capture all of the projected resolutions which we can quantify in total, roughly, in a conservative way.	
David Strauss: Okay, and as a follow-up on the 787: What's left until the plane is completely assembled at this point, and when do you actually expect the plane to be completely assembled?	
Jim McNerney: Well, the plane will be flying in the fourth quarter, as you know. We are on or slightly ahead of both the assembly and the testing. The structural assembly of the plane is largely complete. There are some systems installations that have yet to be done, but the electronic infrastructure and backbone, the structures itself, as evidenced by the Power On test going very well and the hydraulics and control surfaces tests going very well. You need a largely assembled airplane to accomplish all those things. So it's a matter of getting the final systems in and then doing some ground testing and then flight testing, and we're on schedule.	
Joseph Nadol (J.P. Morgan): James, just on the program accounting versus unit accounting margins in the quarter, I guess big picture, trying to understand if there are any changes to your either pricing or volume assumptions in the out-years that might have impacted what you recognize this quarter? Because program accounting earnings came down sequentially a lot more than unit accounting did.	
James A. Bell (<i>Boeing</i>): There is, there was only an addition of 200 to the 737 accounting quantity and 25 to the 747. That was what impacted it. I think what you are seeing is the GAAP	

		[gap?] is closing. The impact is really what we talked about earlier, and that again is the mix of customer and product that were delivered in the quarter that would affect that difference. That's all it is .	
		Joseph Nadol:	
		At what point would we expect to see the lines cross?	
		Because program, in theory, is a smoothed version of	
		earnings and it should be more volatile. In good times	
		earnings should be higher than program, but how do we	
		think about –	
		James A. Bell:	
		I got you, but what you will see over the course of this	
		year is that GAAP [gap] is going to narrow and, we	
		think, narrow pretty significantly. It's hard to say	
		when it will really cross, because if we get new customer	
		introductions and we get new things that add to the cost that we would inventory because the subsequent delivered	
		units would benefit from it. That could extend it, Joe, but	
		what I would say to look for is that, as we go through the	
		course of this year, the GAAP [gap] will definitely narrow.	
		Joseph Nadalı	
		Joseph Nadol: And there are no changes in terms of your narrow-body	
		pricing assumptions?	
		James A. Bell:	
		No.	
		Robert Spingarn (Credit Suisse):	
		James, your guidance implies that BCA margins in the	
		back-end of the year, the second half has to be in the	
		low 12s, maybe 12.5% in order to hit that 11.5 for the full	
		year. And you talked a bit about reimbursed R&D et cetera, but you're guiding to 11.5% for next year. So do	
		we have a decline in margin from the back-end of '08 into	
		'09? Is that attributable to some 787 next year? How	
		should we think about that, and the carry of this	
		infrastructure absorption for the next several quarters until	
		those aircraft are actually delivered?	
		James A. Bell (<i>Boeing</i>):	
		Well, you're right. We are expecting that they are going to	
		deliver higher margins in second quarter-and it's in the	
		range of the second half, in the range that you	
		mentioned—and that is going to be driven by the lower R&D cost, including subcontractor contributions. But it's	
		also going to be the timing of some of the expenses will be	
		down again. The annual what we thought from a cost	
		standpoint will hold for the year. Now as we go into '09,	
		we will be better prepared and we would expect to see	
		good performance, but that good performance will be	
		impacted by the dilution of delivering the 787 that we	
		will start delivering in 789 [ph 00:43:10], in 2009. So that	
		will dilute the margin picture, and that's why we are	

saying we're going to hold 11.5 year-over-year.		
Robert Spingarn: Okay, and then James or Jim, how do you think about that R&D profile as we get into the out-years, when we have to consider potentially a 777 refresh or the next-gen platform , obviously at Farnborough Gene [ph 00:43:35] talked about a new engine ready for 2016, and that sort of thing. And you're spending, on the commercial, around 2.9 billion. We expect that to trend down over time. Where do you think you'll trough on R&D and when?		
Jim McNerney: Well, this is Jim. Obviously we are projecting some of the R&D coming down off the current program of spends on the 87 and the Dash 8 that's going to begin to come down significantly in the second half of this year. We see it continuing into next year although we are going to sustain some level of investment in R&D against the two things you mentioned. And the 777—either a refresh or a renovation, based on what we see with our customers and what we see that the A350-1000 is or isn't, and we'll have plenty of time to look at that. I think its delivery is in the 15, 16 timeframe. And then obviously, stay positioned to mature the technologies associated with the narrow-body. And those are the two things that we have to do, so when the actual program ramp-up of those happens is to be determined. but we don't see the big ramp-up happening within our guidance right now.		
<u>Robert Spingarn:</u> It sounds like it might not even be by 2010, and so what is the 9% R&D against commercial revenues can have by then?		
Jim McNerney: Well, listen, the marketplace has changed. Competitive environment's changed. Customer requirement's changed. And when we get the 10 guidance, we'll discuss that the best way we know how.		
Doug Harned (Sanford Bernstein): I wanted to go back to the BCA margins and just understand. You talked about, in Q2 you had some period expenses and then you had overhead absorption. Can you mention how much is each, give an idea where the real impact was? And then when you look at going forward the next two quarters, there's the overhead absorption issue. This added cost, does that stay with you at the same levels it did in Q2?		
James A. Bell (<i>Boeing</i>): So, it's about half-and-half if you look at the timing versus the increased spending. And some of the increased spending, remember, is also timing-based in that we expect lower spending particularly in cash in next guarter.		

Now the infrastructure absorption issue, the BCA team is committed to go and look at what they can do to reduce that during the second half of the year without doing something that would reduce capability needed again in 2009 as we get this 787 program on track from a production-support perspective. That's how I would look at it. It's about half-and-half and we absolutely believe we have great plans in place with opportunities to correct the cost growth that we experienced in the first half, in the second half.
Doug Harned: If I went back to Q1 and your guidance at that time— and as you looked ahead at that point in time, did you expect to have this level of overhead absorption to deal with?
James A. Bell: No, we did not. We did have an estimate in there, which we obviously underestimated the disruption that would be caused relative to these costs being allocated to programs, and so we trued it up in second quarter.
Doug Harned: So you're saying that the productivity-improvement effort that you are doing now has to step up a little more than you had expected back then to get to the same margin level?
James A. Bell: Well I think—we think—we have to continue to drive good productivity and if it stepped up a little more than the current levels, I wouldn't be disappointed, let's put it that way.
<u>Myles Walton (Oppenheimer):</u> Just a quick question for you on R&D into '09. Your guidance reflecting a \$500 to 600 million tech decline, James is that entirely within commercial , or is there also some anticipated decline on defense as maybe the international tanker winds down?
James A. Bell (<i>Boeing</i>): It's primarily in commercial and it's primarily representing, as we complete and finalize the design effort on the747-8 freighter. The R&D is already starting to come down on the 787 from prior year levels.
Myles Walton: Yes, I guess I was referring to when you raised the guidance from 2.8 to 3.2 to 3.4, you said 50% of the change was—
James A. Bell: Yes, there was a little piece in there associated with international tankers, and that's behind us. But the bulk of

3		
	it was driven by 747 and increased spending on the A7 [87?].	
	Joe Campbell (Lehman Brothers):	
	Let me go back to our favorite margin target on DPA	
	[BCA?]. I'm still struggling a little bit to understand—	
	I'm trying to understand what was going on still, I know	
	you've told us three or four times on BCA, what these	
	margins were. So I'm trying to understand why the	
	disruptions of the 787 aren't just allocated to the 787,	
	and why they're spilling over to the production	
	programs. Or is it simply a difference that you assumed	
	you would be able to charge stuff to 87, because you	
	thought that you would deliver the planes that are not now	
	happening? And I wondered if you could also say	
	something about the after-market? Many of the suppliers	
	are saying that the after-market is weak, and I	
	wondered whether you could say something about how	
	Aviall and the rest of the affiliated BCA companies'	
	outlook has changed, or not—	
	James A. Bell (Boeing):	
	Okay, Joe, I'll take your first question and Jim will take	
	your second.	
	But essentially on the 787 issue, we planned on the old	
	schedule to have more 787 work in-house this year than	
	now the actuality, with the slide of the schedule, is actually	
	showing up. And so the cost that we're talking about here,	
	the heart of the very infrastructure costs are constant. And it only can be allocated for the work that's in-house, and	
	so that's why we're seeing a shift of the 787 program onto	
	the other production programs because that's the work	
	that's currently in-house. Is that clear?	
	Joe Campbell:	
	Yes, so I guess it means that the overhead went up and	
	you were expecting it to be covered by 787. So why's	
	the overhead up?	
	James A. Balli	
	James A. Bell: The infrastructure cost remained constant. What we	
	assumed is we'd have more 787 work in-house than we	
	did after the schedule slide, so less of that constant cost	
	was allocated to 787 and more of it was allocated to the	
	production program-at 787's program was then allocated	
	to 787 program accounting and inventory. The remaining,	
	since the 787 work did not show up, that differential went	
	to the production programs and flowed through the	
	earnings.	
	Joe Campbell:	
	Okay, got it.	
	Jim McNerney:	

And then on the services, you know it is true Joe, we are seeing a moderation in the spares rates and that makes sense. As people are taking out older inefficient aircraft, which tend to have slightly higher maintenance rates, and some of the mod work is slowing a bit too as planes are staying in service, not being modified to freighter configuration—for example, because of A380, 87 delays. Having said that, the other parts of our business are doing well and the guys are achieving their business plan although they're breathing a little harder than they were a quarter ago.

Joe Campbell:

So but then you're still expecting to make their business plans that you have in the '08 and '09 guidance? A lot of other people are moderating their '09 business plans and you haven't changed anything.

Jim McNerney:

Listen, we're not changing our overall guidance which obviously has puts and takes in it, Joe, okay? And obviously the services, the BCA business is a watch-item for us and despite some softening, they're doing well. But I think as we put together the specific plan for that specific piece of the business, we'll have to see what the environment and the competitive situation looks like. So there are other places where we have less pressure and other places we have upside, and that's what gives us the confidence to give you the guidance. But to your earlier point, we have seen a softening in spares and conversions. We're dealing with it and we'll just have to monitor the situation.

Cai von Rumohr (Cowen And Company):

Yes, to maybe understand a little bit better the [inaudible 00:54:31] costs, if infrastructure costs were shifted from the 87 to other programs, does that mean that the other programs profit-accrual rates have gone down and if not, why not? And secondly, you mentioned period costs in the second quarter, those presumably costs are expense as incurred. How big were they in the second quarter and how big are they likely to be for the entire year?

James A. Bell (Boeing):

On your first question on the infrastructure costs: The infrastructure costs, as I said earlier, were constant and then they're just allocated on the basis in-house, and what was the second half of that question? [Interposing] What it is is that the profit rates on the production program, before allocation of those costs, would remain constant. Then it would have taken up a bigger absorption of those costs through the allocation process, if the work was there.

Cai von Rumohr:

True, but if that happens, their accrual-rate goes down and the profit margin stays the same, how come?

	*	 r		
			James A. Bell: Exactly, their accrual rate was impacted this quarter as a result of the allocation of those costs.	
			<u>Cai von Rumohr:</u> Right, but I mean, presumably program is through the end of the program, so if you have lower program accrual-rates in this quarter, presumably you're looking forward and that continues. And if so, given the guidance hasn't really gone down that much, why not?	
			James A. Bell: Because we plan on dealing with the increased cost we experienced in the second quarter in the second half of the year.	
			<u>Cai von Rumohr:</u> Okay, and then the period cost that you mentioned that are expensed as incurred, how big approximately were they in the second quarter and how big would they be for the year?	
			James A. Bell: So if you're just talking to <i>Delta</i> , it would be about half of the \$200 million difference we saw, in what we anticipated the earning rates to be versus what they were.	
			George Shapiro (<i>Citigroup</i>): Good morning. James, is part of the issue with the allocation happening this quarter because this was the quarter that the 787 was supposed to be initially delivered?	
			James A. Bell (Boeing): It's because, George, we expected to have more 787 work in our shop this quarter than it turns out we did because of the schedule slide. It wasn't just because of deliveries. It's more about the amount of work on the 787 program that we originally anticipated having in the shop.	
			George Shapiro: Okay, and then if you could go forward, James, why wouldn't I assume that you'll probably wind up being short of your margin in commercial aircraft but you'll be better on unallocated, because you only have 130 million through six months and you're saying it will be \$1 billion for the year?	
			James A. Bell: Well, we think we're going to make our plan in commercial airplanes, but if we don't, we'll still make our earnings per share expectations and the guidance we provided you.	
			Troy Lahr (Stifel Nicolaus): When you guys talk about 2010 deliveries up due to 787,	

27 July 2008	The Wichita Eagle "Boeing Wichita Head Prepare s for Change " (Molly McMilli n)	Scott Strode, former ly in charge of develo pment and produc tion of <i>Boeing</i> 's 787 Dream liner progra	Firm	α	does that mean legacy programs are going to be flat and all the growth is coming from 787? And really, how are you thinking about the supply-and-demand balance and what your supply chain can keep up with versus airline demand for new aircraft, specifically 737 line? Jim McNerney (Boeing): Yes, I mean I think since we don't offer specific guidance on rates, it depends until the beginning of '09, we were just isolating the 87 as a known factor that will for sure be an upper based on our current schedule, and isolating that as something that would drive it higher. And I guess the assumption behind it is that everything else would stay the same, but that's something we'll work through before we give our final guidance. Troy Lahr: And then how are you balancing supply chain with what the supply chain can kind of keep up with versus demand? Like if you look at the 737, how many do you have in backlog? Where do you stand on that? Are you more concerned with the supply chain or more concerned with the supply chain or more concerned with the supply chain or more concerned with the supply chain do no the 37, and we also have got a well-established supply chain through a program that has been in place for many, many years. So while there are certainly challenges day- to-day on the supply chain." "Before coming to Wichita, Strode was in charge of development and production of Boeing's 787 Dreamliner program. The issues Boeing has run into on the 787 are not unusual, he said. In hindsight, the right plan was in place. 'it's just a matter of executing it,' he said. So what could have been done differently? 'Some of the issues we could have recognized earlier,' he said. But 'we were busy inventing an airplane, too.'"	On a modular enterpri se architec ture's non- systemi c view of separati on of design from executio n.
30 July 2008	The Seattle Times, "Machi nists Say Contrac	m Mark Blondi n, lead negotia tor for the Interna	Firm- Labor	α	"The lead negotiator for the Machinists union said Tuesday that contract talks with <i>Boeing</i> are 'in deep trouble' and implied a strike in September is likely if the company's offer doesn't improve. The tough talk from Mark Blondin, lead negotiator for the International Association of Machinists (IAM), came during a joint teleconference with representatives of the white-collar	On a modular enterpri se architec ture's adversar

	t Talks with Boeing "In Deep Trouble" (Domini c Gates)	tional Associ ation of Machi nists (IAM); Doug Kight, <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i> , VP HR			engineering union at <i>Boeing</i> . The two unions also delivered a scathing critique of the state of the 787 Dreamliner program and of the company's strategy of global outsourcing. The outsourcing of 787 work and the prospect of <i>Boeing</i> sending out more work on future jets add tension to this year's labor negotiations, which climax next month ahead of the new plane's expected first flight in October. 'So far, all they are talking about is take- aways,' Blondin said. 'If that continues over the next couple of weeks, they are in deep trouble.' Blondin said <i>Boeing</i> is 'acting right now like it is ni bankruptcy court, rather than where they are with a record backlog of orders and record profits.' 'There's enough orders right now to sustain two or three bargaining cycles, and we know it,' he said. 'We're going to get our share of those profits.' <i>Boeing</i> 's top labor negotiator, Doug Kight told employees this month that the company will release full details of its final offer by Labor Day weekend. Kight's message gave no hint of an impasse in the talks. 'We're about three weeks away from moving to the hotel for the final phase of negotiations,' Kight wrote. 'I am pleased with our progress.' "I am very surprised <i>Boeing</i> has come out with the same tactics in 2008,' said Blondin, who headed the District 751 Machinists when they went on strike three years ago. 'Our members didn't stand for those divisie tactics last time. I don't see it happening this time.'" Stan Sorscher, director of research for SPEEA, said the union has argued for a long time that outsourcing airplane design cannot work as it may for simpler products, say sneakers. Building something as complex as a plane requires a tight community of experienced engineers and mechanics working together to overcome the inevitable challenges, he said. 'We thought the 787 would be a test case for this,' Sorscher said. 'The results are in.' One rank-and-file member who requested anonymity said only a strike will demonstrate to workers that they got the very best deal. '	ial relation ship with labor
					best bargain they could, so a strike is almost a given,' he said. 'The real debate is on its duration.'"

(Chris	blow to San Antonio residents, who nevertheless are	ns.
Woodya	grateful the company has kept so many workers on the	
rd)	payroll. The San Antonio plant's month-long closure is	
	testing how Toyota, one of the world's most respected and	
	savvy companies, handles a miscalculation.	
	The decision to jump into making full-size pickups now	
	is eating into the Japanese automaker's bottom line and raising questions about why it, too, was suckered by the	
	same siren call of profitable big trucks that's now	
	sapping Detroit's Big Three. It's humbling for an	
	automaker noted in the past for being able to grab	
	market share when its American counterparts	
	stumbled. Toyota got into full-size trucks with 'a little	
	bit of hubris and pride, thinking, 'We conquered all	
	these other segments, and here is an opportunity to put	
	the Marlboro Man out of a Ford and into a Toyota,'	
	says James Womack, chairman of the Lean Entreprise	
	Institute, and educational group that fosters steamlined	
	productions systems such as <i>Toyota's</i> . The lesson:	
	'Toyota's crystal ball doesn't work any better than	
	anyone else's.' 'The lure was money,' Womack says.	
	'It would have taken a lot of discipline to stay out of	
	this thing.'	
	"We're a full-line manufacturer,' Bob Carter, U.S. sales	
	chief for <i>Toyota's</i> cars and trucks, said in a recent	
	conference call. 'Certainly the market has been	
	surprised in the truck area, but we have full confidence	
	it's going to return in the future.'	
	Truck first with each Gran have shown have	
	Toyota, flush with cash, 'is a long-term player,' says	
	Michael Robinet, vice president of auto market forecaster CSM Worldwide. 'The Asian culture thinks in years	
	CSM Worldwide. 'The Asian culture thinks in years and decades, not months and quarters.'	
	and decades, not months and quarters.	
	Toyota archival Honda, by contrast resisted the	
	temptation of full-size trucks and has been rewareded.	
	'They were smart,' Robinet says of Honda. 'This is a	
	company that said, 'We're not going into the truck	
	market. We're going to stick to out knitting.'	
	Mostly non-union Toyota is continuing the Japanese	
	tradition of lifetime employment policies for	
	permanent hires. Breaking with that practice could	
	lead to consequences at other global <i>Toyota</i> facilities.	
	'If they laid off San Antonio workers for three months,	
	that would be the shot heard 'round the world,' says	
	Jeffrey Liker, a University of Michigan professor whose	
	The Toyota Way and other books on Toyota's production	

					system hasve become business best sellers.	
					system hasve become business best seriers.	
					If the training program for the San Antonio plant stoppage works, the result could be workers with higher skills and more loyalty, lowering the plant's costs in the future. It is also building a reservoir of local good will. 'If I were in Texas, I think any sane person would say, 'the market is awful, and this crazy company is actually keeping people employed,' Liker says.	
					Texans express gratitude toward Toyota for continuing paychecks, and say they believe Toyota will continue to invest in the plant. 'Toyota is still the top,' says Judge Nelson Wolff, the Bexar County executive who took a leading role in trying to lure Toyota here. 'They are there for the long term.' Former Texas state legislator John Longoria said the Japanese 'plan 10, 30, 40 years ahead of time, and they didn't forsee this.' As Wolff, the city's former mayor, points out in his book Transforming San Antonio, if Toyota hadn't taken extra steps to protect workers during the shutdown, 'It could force closer scrutiny of Toyota's agreement that led to creation of the plant.'	
					Stephen Carter, a physician in the <i>Toyota Family Health</i> <i>Center</i> outside the complex's south perimeter, says workers are confident they'll get through this rough	
29	The		Firm-	α	patch." "'I'm as against it as I possibly can be,' said Joe	On a

29 Aug. 2008	Bloomb erg, "Boeing Union Urges Worker s to Reject Offer and Strike" (Susann a Ray)	Richar d Aboula fia, an industr y analyst with the <i>Teal</i> <i>Group</i>	Firm- Labor	α	"The IAM also filed unfair-labor practice charges against Boeing with the National Labor Relationsh Board for 'direct dealing with our members,' spokeswoman Connie Kelliher said today near Seattle, the company's manufacturing hub. Managers met one-on-one with workers 'to enhance their own bargaining position, undermine the union and intimidate our members.' The union's members in Washington state, Oregon and Kansas have followed leaders' voting recommendation in three of the last four negotiations, stopping work over two of them to gain contract improvements. The plan would preserve the way Boeing uses contractors, rejecting changes the IAM sought and had warned it would be willing to strike over. 'Boeing is gambling that their concessions are appealing to enough of the workforce to keep a strike from happening, but job security is a sticking point for a lot of them,' Richard Aboulafia, an analyst with Teal Group in Fairfax, Virginia, said today. 'There is no question that union management feels as though the company is working around them.' Lead company negotiator, Doug Kight said, 'As leaders it is not only our right but our obligation to talk to	On a modular enterpri se architec ture's zero- sum competi tion between labor and the firm.
29 Aug. 2008	Busines sWeek, "The Dreamli ner's Cost to Boeing" (Joseph Weber)		Firm- Labor	α	employees, owners of the company, about our business." "By the time <i>Boeing</i> puts its first new 787 into the air this fall, after delaying the so-called Dreamliner for more than a year, the company will have racked up extra costs that may top \$2 billion. That hit comes with deferred sales worth at least \$3.5 billion, and a roughly 40% slide in its stock market value. Such dismal numbers—and the possibility of even further delay—pressured <i>Boeing</i> at the contract bargaining table since it can ill afford a work disruption. Fears of rising costs spurred by additional Dreamliner delays make <i>Boeing</i> executives especially wary of a strike. The \$2 billion-plus estimate, toted up by <i>American Technology Research</i> analyst Peter Arment, is twice the figure analysts broached last fall when <i>Boeing</i> announced its first six-month delay. The company followed that delay in January with a three- month holdup and another six-month delay last April. 'It's been a strain financially and from a credibility standpoint,' says Arment. The tab includes penalties <i>Boeing</i> owes customers for delayed orders and	On a modular enterpri se architec ture's non- systemi c labor policies impacti ng producti on schedul es and product launche s.

					1.122 and the shares are the state of the st	
					additional research charges, as well as payments to suppliers. 'This is an enormously complex program and that comes with a lot of risks,' says Arment. 'They've spent more than four years modeling and testing and developing the systems for this aircraft, but this is still an all-new composite frame and all-new electronic system architecture. There are many different systems.'"	
30 Aug. 2008	Market Watch, "Boeing Risks 787 by Refusin g to Deal with Outsour cing Problem s, Says SPEEA "	Ray Gofort h, executi ve directo r of SPEEA	Firm- Labor	α	"The Boeing Company's public acknowledgement that outsourcing is causing problems with the 787 program is lip service until action is taken to correct problems created by a global network of suppliers and inexperienced workers, according to the Society of Professional Engineering Employees in Aerospace (SPEEA), IFPTE Local 2001. Officials at SPEEA and other unions, including the Internationtal Aerospace Machinists (IAM), repeatedly warned the aerospace giant that it was a mistake to part out highly complex aerospace products to inexperienced workers around the world. More than one year after a ceremonial 'roll out' of a 787 shell, the same aircraft remains in the factory incomplete and missing parts from suppliers. 'Continued statements that everything is fine with the 787 global supply network just doesn't fly,' said Ray Goforth, executive director of SPEEA. Last week, the company announced plans to place full-time Boeing inspectors at key suppliers to reduce flaws and maintain quality. The announcement, reported by the Puget Sound Business Journal, said Boeing will first target about one dozen problem companies. SPEEA's Goforth said more inspectors at suppliers to scatates cost and avoid the real problem – Boeing's great experiment to outsource large parts of the engineering and manufacturing of the next major leap in air travel failed. 'It's time for Boeing to stop the lip service and take real action,' Goforth said. 'Face the fact that the global network is a failure and bring back the critical work back so the experienced employees can get the 787 back on track.' Boeing needs more than paid advertising and internal campaigns to regain the trust of customers and employees. The most recent Ritenhouse Ranking Survey of corporate candor ranked Boeing 98 th , six spots below Excon Mobil. The annual survey evaluated 100 Fortune 500 companies and CEOs for fair, open and sincere communications. 'Instead of thanking and rewarding employees for correcting the errors of suppliers and management, Boeing is banking pro	On a modular enterpri se architec ture's disinteg ration of its supply and labor modules , and its inability to reveal the true status of progress

1 Sept. 2008	Financi al Times, "Boeing 787 Dreamli ner Threate ned by Strike" (Hal Weitzm an)		Firm- Labor	α	"Boeing aims to fly the 787 for the first time by December and to start making deliveries to customers by the third quarter of 2009, at least 14 months behind schedule. Another delay to that timetable would be a headache for the company, which is facing demands from customers for compensation. Boeing has already said it is assuming all 787 deliveries it expects to make next year will not generate profit because of compensation payments. During the union negotiations, Boeing opted for a strategy of appealing directly to workers over the heads of union leaders. The aircraft-maker posted its offer on the internet, rather than allowing union leaders to present the details to their members first. It stopped bargaining last week in order to give workers time to study the final offer before voting. As the company attempted to secure the support of one-third of union members it needs to avoid a strike, Boeing also held one- on-one meetings with machinists. The company says the meetings were merely intended to get feedback on the negotiations. However, the union filed an unfair labour practice complaint with the National Labor Relations Board, alleging that Boeing violated US laws prohibiting such 'direct dealing'. 'The disrespect they have shown for the negotiation process is exactly the same way our members have felt and why they have been marching in the factories at lunchtime for the past weeks,' said Tom Wroblewski, president of the union's district 751 in Seattle."	On a modular enterpri se architec ture's continu ed lack of trust between firm and labor.
1 Sept. 2008	Puget Sound, "Boeing		Firm- Labor	α	"It seems clear from the decision of the Machinists Union leadership to support a strike against <i>Boeing</i> that they have learned nothing of the lessons of how the modern	Percepti ons on the
	Machini				economy has evolved in the last quarter century. In the	inevitab

	sts: Penny Wise and Pound Foolish " (Eric Earling)			 next quarter century they'll likely have the declining jobs for their members to prove it. <i>Boeing</i> gave in on initial proposals to phase out retiree health care and traditional pensions - though those issues remain serious concerns for a company trying to avoid crippling legacy costs. Clearly, <i>Boeing</i> doesn't want to see a strike given the volume of cash being thrown at the Machinists and the number of other concessions the company has made. Nevertheless, the union says the deal isn't rich enough, including ongoing rank-and-file complaints about a lack of "job security." Sadly, no one seems to have told the union and its members that the era of a single job with one corporation for life is well nigh over. More importantly, it is obvious the lessons of the domestic auto, airline, and steel industries have been utterly missed by these guys." 	le logic of a modular enterpri se architec ture.
2 Sept. 2008	The Financi al Times, "Boeing Could Make Europea n Acquisit ions to Respon d to Toughe ning Domesti c Conditi ons" (Charles Rice & Berange r Guille)	Firm	α	"Boeing (NYSE: BA), the listed, Chicago, Illinois-based aerospace systems integrator, could be seeking defense acquisitions abroad, several sources told mergermarket. Possible reasons for acquisitions abroad include a target- poor environment in the US. [An] analyst said that Boeing has strength in the commercial side with its 787 project. However, the company could look to acquire some of its smaller suppliers, like its March stake purchase in Global Aeronautica, on that project to help shape things up." Aug. Wa 2008 "E Un In en Pla for Pla in	ans r ants erman	Firm- Suppli er	β	"After the failed sale of its three plants in the German cities of Augsburg, Nordenheim and Varel, <i>Airbus</i> parent <i>European Aeronautical Defense and Space NV (EADS)</i> is whipping the sites into shape. According to a company spokesman, some 360 million euros (\$518 million) will be invested in the Augsburg and Nordenham plants. A new 180 million-euro plant will be built in the southern German city of Augsburg. According to the Augsburg plant manager Hans Lonsinger, it will be the most modern of its type, producing fuselages for <i>Airbus</i> A350 long-distance aircraft. Another 180 million euros will be invested in Nordenham, on the North Sea. Originally <i>EADS</i> wanted to get rid of the plants in order to minimize the A350 development risks. The planned sale fell through at the end of March, however, due to the falling dollar and the turbulence in the international financial market. Despite the failed sale, <i>EADS</i> still wants to form a new subsidiary called <i>Premium Aerotec</i> that will group together the two plants in Augsburg, along with the plants in Nordenham and Varel, said the spokesman. "We can't just lay our hands in our laps and wait and see what happens," he said. One of the main goals of the factory will be changing the material used in the fuselages	On an integral enterpri se architec tur's "reversa l" of its prior outsour cing decision
Sept. erg 2008 "E Be a of M sts Av Stt (S	Boeing ets on Third achini	Firm- Labor	α	from aluminum to carbon fiber." "Boeing's refusal to go along with changes the union sought on using outside vendors was enough to convince 23- year machinist Art Schilling to vote to strike. 'We're not asking for the moon; what we're asking for is a fair shake,' Schilling said today after casting his ballot at the union hall outside Boeing's Renton, Washington, factory, where 737s are built. Hundreds of machinists marched together from Boeing's factories to vote at union halls on their breaks, some carrying signs saying, 'Out the gate 2008' and 'Go fly this, Kight,' referring to Doug Kight, Boeing's lead negotiator. One wildcard is a change in the union's demographics since the last contract in 2005, when more than 18,000 workers walked out. Back then, 37 machinists were under age 30. Now there are 2,300 about 10 percent of the IAM membership in Boeing's main Seattle manufacturing hub because Boeing has recalled laid-off workers and hired new employees. 'The determining factor is going to be the new hires,' Tim Limestall, who's also worked for Boeing for 23 years, said after voting to strike at the Renton union hall. 'They're younger and a lot of them come from non-union shops.' Boeing's hiring spree since the last contract has cut the average age of machinists to 46 from 49. The average wage fell in the past year by \$1 an hour to \$26. 'This is to a certain extent a test for the machinists to see how good a job they've done socializing the younger workers into the IAM,' said John Budd, a professor of industrial relations at the University of Minnesota in Minneapolis.	On a modular enterpri se architec ture's approac h to labor.

				The question is whether they 'are willing to fight for pension benefits and retiree medical coverage and those types of issues, or whether they're more focused on salary and job- security issues.'	
				Tom Wroblewski, president of the IAM's District 751 in Seattle, said the younger workers seem to be united with older machinists and 'more resolved than we'd anticipated' to strike."	
3 Sept. 2008	Seattle Post Intellige ncer, "Boeing Waits on Machini sts Vote" (James Wallace)	Firm- Labor	α	"When we go out on strike, the price goes up,' Tom Wroblewski, president of local District lodge 751 of the International Association of Machinists and Aerospace Workers, said as he stood on a side walk down the street from the plant gate and slapped hands with many of the Machinists as they marched by toward the union hall and the all-important vote. 'They miscalculated,' Wroblewski said of <i>Boeing</i> . As the Machinists marched, they chanted, 'Union power! Union power!' 'It would surprise me if we came back before the first of November,'' said one longtime <i>Boeing</i> machinists who did not want to be quoted by name. 'The company is dug in and so are we.'''	On a modulat enterpri se architec ture's approac h to labor.
3 Sept. 2008	The Seattle Times, "Machi nists Turn Out to Vote on Boeing Contrac t" (Domini c Gates)	Firm- Labor	α	"We can't afford to go on strike, but we can't afford this contract,' said Lindsey Good, who has been an interior mechanic for six months. 'They want to stuff money in this pocket while taking money out of this one,' said Good. Philip Conklin, another Machinist of six months, voted against the contract even though it offers a raise that would give him better pay than some people who have worked there longer. 'My uncle has been here more than 20 years,' Conklin said. 'If I sat down at the dinner table with him on Sunday and said, 'Yeah, that's a great contract for me,' we wouldn't see eye-to- eye.' For Jimmy Le, who has worked at the company since 1986, it will be unusual if there is no strike. 'Only one time was there no strike,' he recalled. An electronic technician on airplane interiors, Le said that as long as <i>Boeing's</i> top executives receive big pay increases, so should the Machinists. 'They make good money, and the last two contracts they didn't give up anything,' Le said. Alicia Winkler, 24, who distributes and inventories tools for mechanics, sported pierced lips and eyebrows. She said she feels threatened by <i>Boeing's</i> lack of movement on the issue of subcontracting parts and tools delivery work. 'Mostly I'm concerned about outsourcing. I don't want to lose my job to someone else," said Winkler. "We need to stick together as Americans." The older generation of Machinists was for the most part equally supportive of the union leadership. 'I've been through three strikes,' said Patrick Ferguson, 48. 'I'm well-prepared.' Some Machinists indicated their willingness not only to strike but to stay out for a long time by wearing a black T-shirt with the slogan 'Walk the Line till '09.' The marchers from the factory carried signs leaving no doubt how most of them will vote. 'The best	On the zero- sum relation ship between the firm and labor in a modula enterpri se architeo ture.

3 Sept. 2008	Bloomb erg, "Bomba rdier Beats Boeing Returns in Turbopr op Revival " (Hugo Miller)	Bomba rdier	Firm	α	'Look out, Ford. Here comes McNerney," read another, referring to Boeing Chief Executive Jim McNerney and the fact that former commercial airplanes boss Alan Mulally left Boeing since the last strike in 2005 to become CEO at Ford. 'There's a few things in the medical plan I don't like, but the way times are, it's a fair contract,' said Tom Yardy, 40, who assembles doors on the 767 and has been with Boeing 20 years. 'I really don't want to go on strike.' Yardy seemed to be in a minority, but he pointed out that some who plan to vote yes will not advertise it but do so quietly." "Bombardier Inc., the world's third- largest commercial- aircraft maker, may widen its share performance gap over Boeing Co. with turboprop planes. The higher fuel prices that hurt sales of Boeing's biggest jetliners are spurring orders for Bombardier's 74-seat passenger planes and commuter-rail equipment, sending the two companies' shares in opposite directions. Bombardier has gained 41 percent in Toronto trading this year as Boeing has dropped 24 percent in New York. 'The higher the fuel price gets, the more attractive a turboprop market," Drew Hall, Bombardier's director of commercial aircraft product planning, said in an interview. Turboprops were fading into commercial-aviation history a few years ago. They owe their revival to a doubling of fuel prices since January 2007 and 30 percent greater efficiency than jets. The shares are valued at 15 times this year's estimated profit, higher than Embraer's 14 and Chicago- based Boeing's 11, according to Bloomberg data."	On contradi ctory claims between competi ng modular enterpri se architec tures about how high fuel prices increase demand for their product
4 Sept. 2008	Washin gton Post, "Boeing Waits on Count of Strike Vote" (Michae I Fletcher)		Firm- Labor	α	 'People feel that in a time of record profits, the company should not come with any takeaways,' said Connie Kelliher, a union spokeswoman. 'When times were bad, workers went for years without a salary increase. But now things are good.' Boeing officials have said that to offer more than it has already would hamstring the company with unsustainable labor costs. 'Our best and final offer rewards employees for the company's success and allows us to remain competitive,' Boeing said in a statement. 'Without a question, the company has drawn a line in the sand,' said Harley Shaiken, a professor at the University of California at Berkeley who specializes in labor issues. 'But it is a risky gamble given the stakes. High labor and benefit costs can be a burden, but if there is a strike, the company could be doing more damage to itself if it disrupts production and progress on the 787 Dreamliner.' 'Any further delay will have 	s. On the zero- sum game between the firm and labor in a modular enterpri se architec ture.

	N	D		both a tangible and intangible effect,' said Howard Rubel, an aerospace analyst at <i>Jefferies & Co.</i> 'The tangible will be that the planes are even later. The intangible is, 'When do we regain the trust of this company?''	On the
4 Sept. 2008	Bloomb erg, "Boeing Union Rejects Contrac t; Leaders Delay Strike (Susann a Ray)	Firm- Labor	α	 "Eighty percent of the voters opposed the three-year contract and 87 percent supported a walkout, the International Association of Machinists and Aerospace Workers said tonight in Seattle. Union leaders Mark Blondin and Tom Wroblewski were shouted off the stage by workers, many already holding 'On Strike' signs, who wanted to walk off the job tonight. 'It was our job to negotiate a contract that's acceptable to you, not to negotiate a strike,' Wroblewski told the crowd. Chicago-based <i>Boeing's</i> lead negotiator, Doug Kight, said he was 'disappointed' by the vote. 'Our job at this point is to listen to the union; we put the last contract offer on the table,' he said a press conference. 'We will seek to understand and then make an assessment to see if there is a path forward.' 	On the zero- sum game between the firm and labor in a modular enterpri se architec ture.
4 Sept. 2008	Washin gton Post, "Boeing Machini sts Vote to Strike (Michae 1 Fletcher)	Firm- Labor	α	hear out the union on the 'critical-few issues.'" "The disrespect they have shown for the negotiation process is exactly the same way our members have felt and why they have been marching in the factories at lunchtime for the past weeks,' the union said in a statement posted on its Web site early this morning." 4 Sept. 2008	The Seattle Times, "Machi nists at Boeing Reject Contrac t; Strike on Hold for 48 Hours as Mediato r Steps In" (Domini	Firm- Labor	α	"One thing that must worry <i>Boeing</i> management now is that a new generation of workers is learning about union power and joining older employees in the long history of bad blood between the IAM and the company. Brett Baehm, 20, is one of the thousands of younger workers hired since 2004. He was hired in June to work on the 777. The <i>Boeing</i> offer would have given Baehm an immediate wage increase that looks good to him. Yet he said he still voted to strike. At an Everett factory march on Wednesday morning, he reveled in the brotherly solidarity. 'For me, it's a decent contract. But if it's bad for everybody in general, I won't accept it,' Baehm said. 'Everybody is looking out for each other right now.'	On the zero- sum game between the firm and labor in a modular enterpri se architec ture.

		r			
c Ga	tes)			use their leverage when the company is flush with profits and has a seven-year production backlog. Before the vote, <i>Boeing</i> was firm that its offer was final. 'If we go out one day, it'll be at least 30,' said Robert Fullerton, a lead mechanic on the 777 and 30-year <i>Boeing</i> veteran. 'This is the best time for our union to get what we need.'	
				One big stumbling block is outsourcing. For future airplanes, the union wanted to stop the subcontracting of parts-delivery work forced upon it in the 2002 contract and now a reality on the 787. But <i>Boeing</i> has always refused union demands to give up its ability to outsource. 'Our jobs in parts receiving and kitting are jeopardized,' said Judy Simpson, 66, a Machinist for nine years whose son and daughter also work at <i>Boeing</i> . 'They can bring anybody in there and lay us off.'	
				Boeing also appears to have miscalculated the appeal of the economic aspects of its contract offer to both the younger, newer hires and the more senior machinists at the top of the pay scale. One older Machinist, who asked for anonymity so as to avoid company retaliation, outlined the perspective of longtime workers in an e-mail message. "I have to foremost think of myself and my wife's future," he wrote. "We do get paid well, but we are more concerned with our health and retirement plans." Boeing's offer increased the basic monthly retirement pension from \$70 to \$80 per year of service. Machinists wanted the company to do better, given \$13 billion in net profits over the last five years, half of those profits from the commercial airplane unit. Soon after the initial offer from Boeing last week, Machinists started forwarding around e- mails from a 2006 Boeing filing with the Securities Exchange Commission showing that at that time low-level executives got monthly pensions of \$400 per year of service and top executives got \$4,000 for each year of service.	
				Jayleen Roman, who was hired 18 months ago as an electrician on the 787 line, was incensed that new hires will earn the same rate as her. 'We've been working one- a-half years for what?' she asked. Roman said her family has a long <i>Boeing</i> tradition. Her dad has been there 28 years and her brother 11 years. She knew to save for a strike. 'When you apply to <i>Boeing</i> , you learn to expect this,' she said."

	(Carol			boost in company payments into their pension plan. So,	zero-
	Matlack			guess which company's employees are out on strike? OK,	sum
)			so the headline gave it away: Airbus is Company A, and	competi
				Boeing Co. is B. On Sept. 6, members of Boeing's biggest	tion vs.
				union walked off the job, halting production and throwing	positive
				the timetable for the already late-to-market 787	-sum
				Dreamliner into confusion. Contrast that with Airbus,	coopera
				based in Toulouse, France. It has suffered only minor	tion.
				labor protests as it moves to eliminate 5,000 jobs over	
				the next two years as part of its so-called Power 8	
				restructuring plan. Union leaders also agreed to that 1.5%	
				pay raise, well below France's 2.5% inflation rate in 2007.	
				What happened to those famously militant French labor	
				unions? At Airbus, most of the rank-and-file is	
				represented by the Force Ouvrière, or Worker Power	
				union, one of the country's most hardcore labor groups.	
				Sounds ominousbut the truth is, private-sector strikes	
				in France are exceedingly rare. Transit workers,	
				teachers, even doctors, frequently walk off the job, but	
				factory workers almost never do. At Airbus, union	
				leaders may realize that a strike could aggravate an	
				already precarious situation. The company has posted	
				operating losses for the past two years as production delays on the A380 mega jet knocked billions off the	
				bottom line. The euro's rise against the dollar has seriously	
				dented its competitive edge against <i>Boeing</i> . And, it must	
				be said, <i>Airbus</i> is still a pretty good place to work.	
				Starting pay for the least-skilled production workers is	
				about \$15 an hour, and experienced machinists make \$26	
				or \$27 an hourroughly the same as the average machinist	
				salary at Boeing, though it's difficult to make direct	
				comparisons because French workers get more-	
				generous benefits than Americans. Among other things,	
				they pay practically nothing out-of-pocket for health care,	
				and under French labor law, most can expect nice	
				severance packages if they're laid off. Moreoever, Airbus	
				isn't laying anyone off: The job cuts are being made	
				through attrition and early-retirement buyouts. To the	
				unions' relief, Airbus also has scrapped plans to sell some	
				of its French and German factories, a move that had	0
				sparked fears that the new owners would shift jobs to	
				lower-cost countries. Airbus abandoned the idea after it	

÷					 was unable to find buyers. 'We were afraid of outsourcing, but things have calmed down,' says Matthieu de Georges, a Force Ouvrière representative. For the moment, he says union members have no major complaints about Airbus. 'Of course if they say they aren't happy, we'll act.' Asked if Force Ouvrière would care to comment on the Boeing strike, de Georges politely demurs. But it's hard to avoid the conclusion that Airbus stands to benefit if Boeing's unions stage a long and crippling strike, or if they win concessions from management that significantly drive up production costs. NEWS FLASH: Those Airbus union members now have a new reason to protest. Louis Gallois, the CEO of parent company European Aeronautics Defence & Space, tells French newspaper Le Monde in an interview September 9 that Airbus will begin producing some aircraft components in Tunisia to cut costs and reduce its exposure to the strong euro. Stay tuned!"

12 Sept. 2008	"Respec t and the Strike at <i>Boeing</i> "	Gary Chaiso n, Profess or of Industr ial Relatio ns, Clark	Firm- Labor	α	On September 3, when the 27,000 production workers at <i>Boeing</i> walked off their jobs in a strike, most observers began the usual searching for the underlying cause . After all, the parties were fairly close in their offers and demands (the unionthe International Association of Machinistsasked for a 13 percent wage increase over three years and the company offered 11 percent as well as a signing bonus of \$2500). Substantial wage increases are not common in manufacturing. The conventional wisdom seemed to be that the strike was over <i>Boeing's</i>	On a modular enterpri se architec ture's adversar ial <i>style</i> , as opposed

		I I a income			indictance on its night to sutsounce would done by the	to the
		Univer			insistence on its right to outsource work done by the union members. While this is certainly one of the	substan
		sity			contributing factors, I feel that primary reason for the	ce of its
					strike can be found in bargaining style , not bargaining	poor
					issues. Quite simply, <i>Boeing</i> was disrespectful. It didn't	offer, as
					treat the Machinists as the rightful bargaining agent.	the
					When the Machinists announced the results of the strike	reason
					vote (87 percent of the workers for it) and the rejection of	for a
					Boeing's proposed contract (80 percent against it), the	strike.
					union emphasized how the company had behaved	
					disrespectfully. There is ample evidence of this. First,	
					Boeing attempted an 'end run' around the union	
					bargaining committee by appealing directly to the	
					workerssomething that is never done in mature	
					bargaining. Boeing widely advertised that its contract	
			4		proposal was available on the company web page. Second,	
					it offered the workers a signing bonus if they approved	
					the contract. I see this as a bribe for going against the	
					union's recommendation that the contract be rejected.	
					Finally, Boeing told the workers know that the proposal	
					was its 'best and final offer'. When they used this phrase,	
					the company was declaring that as far as it was	
					concerned, bargaining was over. Boeing was mistaken	
					in it's belief that it could sell a collective bargaining	
					agreement to its workers. It confused public relations	
					with collective bargaining, assuming that it could be so	
					persuasive that the workers would vote against a strike, against their union, and for the contract. But it forgot that	
					the role of the union is to act as a bargaining agent by	
					standing between the workers and the company. The	
					workers knew that if they accepted <i>Boeing's</i> proposal and	
					rejected a strike it would be a vote of 'no confidence' in	
					their union and they weren't about to do this. Boeing	
					doesn't have to like the Machinists and it doesn't have	
					to like the process of collective bargaining, but it has to	
					respect the Machinist's role as an equal at the	
					bargaining table. The strike will be over when, and	
					only when, the company understands that if must first	
					persuade the union's bargaining team to accept the	
					terms of the new contract, and then let them to	
				0.000	recommend that the members' accept it."

Though skeptical, union chief negotiator Mark Blondin went along with the early start to talks. Now, he says, 'I sensed a PR thing coming, and sure enough that's what happened.' Just how much listening really took place is far from clear. By July, the union leaders didn't think they were making much headway. The proposed "givebacks" on medical and pension benefits, which the union leaders had warned were sure strik-starters, remained on the table. So the leaders told their members to start saving for another strike, which would be the seventh launched by the LAM against <i>Boeing</i> since World War II. Sure that a walkout was inevitable, some longtime workers canceled summer vacations and set aside enough cash so they could get by on the \$150 a week in strike benefits. Despite the early start, no real movement took place until the end of August. With a Sept. 3 strike vote looming, management caved in on the plan to end medical benefits for some retirees. They decided to stick with traditional pensions even hiking the amounts the company would contribute. Kight and his team made a best-and-final offer on the Thursday before Labor Day, offering raises of 5% in the first year of a new contract and 3% each for the two years afterward. To pry any doubters loose, they sweetened the pot by offering more than \$6,000 in bonuses, some \$2,500 of which	on what contract terms might fly and what would be dead	
 Doug Kight said. The company, he argued, wanted to share its success with the workers even while making sure it could stay competitive. In a May memo, Kight said the early talks were a chance 'to have open and respectful conversations.' For the union leaders, however, the early start did little more than raise suspicions. Boeing, they figured, just wanted more time to sell its least platable plans to the workers. Among them: proposals to eliminate medical benefits for some retirees and to kill off a traditional pension program for new hires while giving them a 401(k)-like retirement plan instead. Though skeptical, union chief negotiator Mark Bloander. Just how much listening really took place is far from clear. By July, the union leaders didn't think they were making much headway. So the leaders told their members to start saving for another strike, which would be the seventh launched by the IAM against <i>Boeing</i> since World War II. Sure that a walkout was inevitable, some longtime workers canceled summer vacations and set aside enough cash so they could get by on the \$150 a week in strike benefits. Despite the early start, no real movement took place until the end of August. With a Sept. 3 strike vote looming, management caved in on the plan to end medical benefits for some retirees. They decided to stick with traditional pensions even hiking the amounts the company would contribute. Kight and his team made a best-and-final offer on the Thursday before Labor Day, offering raises of 5% in the first year of a new contract and 3% each for the two years afterward. To pry any doubters loose, they sweetened the pot by offering nore than \$6,000 in bonuses, some \$2,500 of which depended on getting a fast majority vote for the deal. The offer was, CEO McNerney told employees in a memo, 'the best contract in the aerospace industry.' But the take-it-or-leave-it tack, which barred further talks before the vote, proved to be a dud. <i>Boeing</i> blitzed the Seattle radio waves with ads making the case for the deal and urged workers to read the details about its offer on the company Web site. But such tactics, union leaders to fast of the union bargainers. The 		
 pension benefits, which the union leaders had warned were sure strike-starters, remained on the table. bid to bargain directly with workers—an approach that seemed quickly to backfire as the leaders condemned "givebacks" that offended them. The workers, meanwhile, were furious. Angered by proposals the company was floating, they had been staging marches around the factories. The distractions made it impossible to get work done, some workers say.
The union pored over the offer and pounced on terms it found objectionable. Trims in health-care benefits loomed large, even though <i>Boeing</i> officials insist the changes on balance would be neutral, with higher co-pays offset, for instance, by cuts in premiums. Even more problematic, however, is the company's power to subcontract work, to let suppliers from around the U.S. and in other countries provide parts and have nonunion outsiders deliver such goods to the assembly lines in Washington. The union fears that such outsourcing, which it says has been on the upswing, will ultimately kill off jobs. Management contends that globalization requires it be able to have work done around the world—especially in countries where that might help it sell more planes. McNerney 'wants the flexibility to do what's right for the business,' says Noel Tichy , a management professor at the University of Michigan who has known McNerney since he was a rising star at General Electric (GE) in the 1980s. It's an issue, Tichy says, on which the CEO can't compromise.
'Can you together work out a reasonable compromise? Yes,' says the professor. 'But I think it's [McNerney's] position that there are some things that he does consider non-negotiable, and the other side is saying the same thing.' Part of the problem is union officials have long memories. Some are still troubled that the outsourcing power was put in place in a nettlesome contract in 2002. That contract went into force only because the union fell short of getting a two-thirds vote for a strike, even though most members opposed the contract. Then the union was unable to get the language pulled in 2005. "It puts our members' jobs at risk," says negotiator Blondin.
By Sept. 3, when 87% of the workers backed a walkout, it was clear the union had long been spoiling for a fight. Sporting T-shirts emblazoned with the slogan 'It's Our Time This Time,' the workers paraded to the union polls led by motorcycle-riding colleagues. Many were angry when the union leaders agreed to delay the strike for 48 hours, until late Sept. 5, to see if any common ground could be found.
Some machinists argue that <i>Boeing</i> , which has been blessed with record profits and its biggest backlog of plane orders ever, can well afford to scrap all "givebacks" and to "bargain up," as a union spokeswoman said. Gutting the outsourcing language is a

		[key part of what the union hopes to gain. Its leaders figure	
					that concerns about further delays for the new 787 Dreamliner on Wall Street and in the Boeing executive suite, give workers leverage. It's really anyone's guess just how drawn out and costly this fight will ultimately be. Analyst Cai von Rumohr of Cowen & Co. figures a strike could last between 29 and 65 days, pushing a conclusion into mid-November at the latest. He figures the end of health-care coverage, at the opening of October, will put the first bit of serious pressure on workers, while in November the approach of the holidays steps it up. The union went on strike at Boeing for 69 days in 1995.	
					Von Rumohr estimates <i>Boeing</i> could lose as much as \$2.3 billion in revenues this quarter. Some of that, of course, could include deferred rather than lost sales, but company officials do fret that demand for planes could slip over time, especially as the global economy slows. Some workers say they'd love to see a change in the contentious relationship between the company and the union that flares anew with every contract round. 'My family and I are completely exhausted with going through a financial disaster or potential disaster every three years,' says one 21-year veteran worker. On the other hand, he looks on the IAM as one of the last strong unions able to hold the line on hard-fought gains, while other industrial labor groups have folded.	
					For the company's part, when Kight began the talks with the union back in May, he seemed to do so with the best intentions. 'Boeing's goal is to create an open and honest environment by communicating frequently and having robust discussions,' he told managers back then in an e- mail message. But when the differences—and distrust— are deep, honesty may do little to bridge the gap. Instead, it boils down to which side can stand the pain of a strike long enough to claim victory."	
12 Sept. 2008	The Wall Street Journal, "Boeing Strike		Firm – Suppli er - Labor	α & β	"Triumph Composite Systems Inc., which produces air ducts and composite floors for <i>Boeing</i> , said it would lay off at least 220 of the 550 workers at is Spokane, Wash., plant. 					new way of working and is calculating that the long-	integral
					term benefits of outsourcing will outweigh the bad will,	enterpri
					cost and delay caused by a strike. A week into the	se
					stoppage, he still has the support of Wall Street. The	architec
					company's share price is holding steady around its 12-	ture.)
					month low, but most analysts expect a jump when the	
					strike ends. 'Things could turn around here after the strike has been resolved,' said Paul Nisbet at aerospace	
					equity specialists JSA Research, based in Newport, Rhode	
					Island. 'I would expect things to start moving pretty	
					favorably in the company's direction.'	
					The International Association of Machinists and	
					Aerospace Workers (IAM), sensing the upper hand as	
					Boeing reaps record profits, is holding out for a hefty	
					pay rise and removal of contract wording giving Boeing	
					almost unfettered power to use outside suppliers. The	
					company came close to meeting pay demands, but is	
					refusing to budge on outsourcing with no further talks	
					planned. Resolving the strike, which is costing <i>Boeing</i>	
					\$100 million a day in revenue, looks to be the biggest	
					challenge in the CEO's career. Walter James McNerney	
					Jr., who prefers to be called Jim, worked his way quietly into one of the most important positions in U.S. business.	
					He came to <i>Boeing</i> after four and a half years at the helm	
					of manufacturer 3M Co. and a 19-year career at General	
					<i>Electric Co.</i> where he lost out to Jeff Immelt in the race to	
					take over from Jack Welch. His time in charge at <i>Boeing</i>	
					has been relatively calm, after the company lost two	
					CEOs in dubious circumstances . Philip M. Condit	
					resigned in December 2003 after it emerged that <i>Boeing</i>	
					had improperly offered a high-paying job to the U.S. Air	
					had improperty offered a high paying job to the 0.5. All	

					Force's No. 2 acquisition official. The successor, Harry C. Stonecipher, resigned in March 2005 when it was revealed he was having an affair with a <i>Boeing</i> executive. After taking over in July 2005, McNerney moved quickly to clean up <i>Boeing's</i> legal and ethical problems, settling long- running federal investigations into its procurement practices and illegal appropriation of <i>Lockheed Martin Corp.</i> rocket program documents. His leadership has coincided with a three-year boom in commercial plane sales and steady growth in U.S. defense spending. Last year, <i>Boeing</i> had a banner year, crushing rival <i>Airbus</i> with an industry record 1,413 plane orders and its highest-ever annual profit of \$4.1 billion. Despite those successes, <i>Boeing's</i> shares have plunged about 36 percent in the past 12 months, compared with a 15 percent drop in the <i>Standard & Poor's</i> 500 index, hit by the credit crisis sell-off, spiking oil prices, and worrisome delays on the 787. 'He's not coming out smelling too much like a rose at this point, with problems on the 787 and not being able to reach an agreement with the workers,' said Nisbet. 'But they (<i>Boeing</i>) are definitely right. They could be leading the aerospace industry down the same path of the airline industry and the auto industry if they didn't take a stand.'"	
15 Sept. 2008	Financi al Times, "GKN Pays £136m for Airbus Plant" (Kevin Done)		Firm- Investo r- Suppli er	β	"Around 1,500 employees, 25 per cent of the workforce at Filton, will transfer from <i>Airbus</i> to <i>GKN</i> . Tom Enders, <i>Airbus</i> chief executive, said the group's remaining wing, landing gear and fuel systems design and engineering business at Filton was core to its role of being an aircraft 'architect and integrator.' It would retain a workforce of around 5,000 at Filton including for the assembly and equipping of the composite wings for the A400M military transport aircraft." 18 Sept. 2008	Bloomb erg, "Boeing Enginee rs' Union Says Talks Many End in 'Train Wreck' " (Susana Ray)	Ray Gofort h, Execut ive Direct or, SPEEA	Firm - Labor	α	"'Things are looking worse,' Ray Goforth, executive director of the Society of Professional Engineering Employees in Aerospace, said in an interview after a meeting with <i>Boeing's</i> negotiating team yesterday. 'These negotiations will end up in the same train wreck as they did with the machinists if they don't change how they're approaching us.' The engineers are demanding the return of some work the company gave suppliers to help control costs while developing and building planes like the new 787 Dreamliner. In its first response to the union, Chicago- based <i>Boeing</i> said yesterday it's sticking to its outsourcing strategy. The current contract expires Dec. 1. 'We won't give up the flexibility that we have, but we're willing to talk about other ways to increase productivity or other initiatives like that,' Karen Fincutter, a <i>Boeing</i> spokeswoman in Seattle, said in an interview. <i>Boeing</i> says its business plan counts on external suppliers and it needs to make sure it keeps costs low enough to stay competitive. <i>Boeing</i> proposed a contract longer than the current three years. 'What they proposed today was full of take-aways, so even if we	On a modular enterpri se architec ture's method to compete in "Cost Leaders hip"
					were to accept such a terrible contract, why would we lock that in for longer?' Goforth said. 'They were completely unsympathetic to our concerns' about outsourcing."	
19 Sept. 2008	Financi al Times, "Airbus Sticks with Producti on Increase Goal" (Kevin Done)	John Leahy, <i>Airbus</i> COO, Custo mers	Firm	β	"Airbus is sticking with plans to raise commercial aircraft production by almost a third in the four years to 2010, in spite of the rapid deterioration in the financial state of the airline industry. John Leahy, Airbus commercial director, said the European aircraft maker had reviewed its production plans this week and remained "on track" to raise output of its single-aisle A320 short-haul jets from a current level of between 34 and 36 a month to 40 a month by early 2010. Output of its wide-body, long- haul jets, chiefly the A330, was being raised from eight to between 10 and 11 a month by 2010, he said. 'We are still seeing demand and we still have some overbooking [in the production schedule] for 2009 to 2011' for the A320 aircraft. 'You know someone will not turn up, but you don't know who.' The level of overbooking had fallen from a year ago, however, and the higher production schedule was being maintained 'with fingers crossed'. Mr Leahy said Airbus was 'increasing somewhat' the amount of 'back-stop' financing it was providing to airline customers facing difficulties in securing finance for new aircraft deliveries."	On an integral enterpri se architec ture's producti on at sustaina ble rates.

	Kay)					Manage ment- rights and responsi bilities: "Manag ement- rights" do not seem to be associat ed with manage ment taking responsi bility for employ

					ee strikes.
Sept.ionalI2008HeraldATribune,C"AirbssC	John Leahy, <i>Airbus</i> COO, Custo mers	Firm- Labor	β	"Ten thousand job cuts are expected. Entire plants are being sold or split off. Union members are getting a pay rise of only 1.5 percent for this year, and managers are working to send more jobs abroad. Yet European workers at <i>Airbus</i> are not out on the picket lines. They are working round the clock to rewire at least 6 A380 superjumbos by hand to meet a target for completing 12 of them this year. Meanwhile, in developments that turn national stereotypes on their head, American workers at <i>Boeing</i> , worried about job security, have been on strike for almost three weeks, despite an offer of an 11 percent pay increase over three years. The strike is further delaying production and costing the company \$100 million a day in lost revenue. There is little rejoicing over <i>Boeing's</i> problems at <i>Airbus</i> , which has been through plenty troubles of its own over the past two years. But managers at the <i>Airbus</i> headquarters in Toulouse say their work force seems to agree on the urgency for change, at least for now. 'We have pretty good working relations with the unions, which are not nearly as adversarial as in Seattle,' John Leahy, the top salesman at <i>Airbus</i> , said Friday during an interview in Toulouse as <i>Qantas</i> received its first A380 here. 'We have more of a partnership here, and whether you are on the assembly line or an engineer you can understand the euro-dollar problem, and see the foreign exchange rate going in the wrong direction.'' <i>Airbus</i> has not been without labor problems as it tries to recover from its own stumbles, mostly related to A380 production, while adapting to tough market conditions. Work on <i>Airbus</i> assembly lines was disrupted three times in as many weeks in February and March of 2007 as more than 33,000 demonstrators protested thousands of planned job cuts. Smaller job actions continue sporadically. On Friday, as many as 300 workers from one small union walked off the job for two hours in Toulouse to protest the restructuring. But the hand-over ceremony to <i>Qantas</i> was not disrupted. Analysts	Compar ing modular and integral approac hes to labor.

•

companies are battling to cut costs, and both are	
outsourcing supplies and parts of the assembly process.	1
Airbus is especially feeling pressure to shift production out	
of the euro zone and into lower-cost regions, including the	
United States. That is mostly because aircraft are priced in	
dollars, and Airbus has the disadvantage of bearing the	
bulk of its costs - labor and supplies - in euros. The strong	
euro also means that the discounts manufacturers usually	
5	
give to win big orders cut deeper into Airbus revenue.	
'Airbus has less margin to maneuver,' said Howard	
Wheeldon, senior strategist BGC Partners, a brokerage	
firm in London. 'It gives discounts that it can ill afford to	
give.' Thus, most of the recent expansion has been outside	
the euro zone and toward growth markets. Airbus is about	1
to start assembling some A320 planes in China, a fast-	() () () () () () () () () () () () () (
growing market. The company gets half of the doors for	
the A320 from Hindustan Aeronautics, an Indian	
company. Airbus also had big plans to start building the	
cargo version of its A330 in Mobile, Alabama, until its	
U.S. Air Force contract to produce refueling tankers, based	
on the A330, was thrown into jeopardy this year. Still, the	
company is moving ahead with plans to ship some of its	
production in France to Tunisia. Thomas Enders, the	
Airbus chief executive, said last Friday that 30 percent of	
the airframe of the <i>Qantas</i> A380 had been outsourced, half	
from suppliers in the United States. The level of airframe	
outsourcing on the wide-body A350 will be 50 percent ,	
Enders said. Though <i>Airbus</i> employees have not walked	
off the job en masse, that does not mean they are	
unconcerned about greater amounts of production	
being done outside the company and outside Europe.	
Workers fear that Airbus will make itself more	
vulnerable to delays if it loses control of core	
competencies, especially on new technologies like the	
lighter composite materials that will replace the aluminum	
and alloy fuselage on the new A350. This plane is the	
intended competitor to the Dreamliner 787, which has	
slipped behind Boeing's original production plan and may	
have been further delayed by the strike. Airbus said in	
May that Spirit AeroSystems, a former Boeing subsidiary	
based in Wichita, Kansas, would design and produce part	
of the central fuselage of the A350 at a new factory in	
North Carolina. An Airbus union official who had taken	
part in recent talks with managers expressed concerns	
about working with outsiders. 'With the A380, we didn't	
master all the production inside the group, and we are	
even more anxious with partners we don't know and	
who don't know our processes,' he said, speaking on the	
condition of anonymity because of the sensitive nature of	
relations with management. 'Airbus was solid enough to	2
support the cost of the A380, but we are not sure it can	
support the A350 if it is delayed.' Enders said Friday	
that the fear of losing control of its critical operations	
was a legitimate concern. 'That would be a danger if	
we didn't know what our core competencies were,' he	
said. 'But we've done studies into what should be core

28 Sept. 2008	Bloggin g Stocks, "Airbus Gets a Leg Up on Boeing" (Dougla s A. McIntyr e)	Firm- Investo rs- Labor	α & β	"It is hard to do business, make sales, and drive profits when your company is shut down by a strike. It also aids the competition. <i>Boeing Co.</i> is finding that out the hard way. According to <i>Bloomberg</i> , ' <i>Airbus SAS</i> , starting its first aircraft assembly today outside Europe, said it may buy up to \$1 billion of components from China by 2020, as the world's most populous nation may need 3,000 planes in the next 20 years.' By putting a plant inside China and offering to put money into the economy, <i>Airbus</i> is making best friends with the central government, a move that is almost certain to garner significant orders from the nation's commercial airlines. <i>Boeing</i> management made a huge mistake by allowing its machinists to go out on strike instead of improving their compensation packages enough to keep the	the past. Contrast ing modular and integral approac hes to labor & investor s.
29 Sept. 2008	The Seattle Times, "Simme ring Boeing Strike	Firm- Labor	α	company operating. Boeing said that its margins could be hurt by the size of the deal the union wanted. The machinists knew better. They could see the size of the Boeing back-orders for products like the new Dreamliner going out for years and year driving higher and higher sales. Each day that the strike goes on, Boeing risks losing more customers to Airbus. Management has not done the shareholders any favors." "With the aviation business teetering on the edge of a major downturn, however, Boeing management remains adamant the company must rein in long-term costs and cannot offer concessions on job security. Boeing also knows that making big concessions increases the chance of another strike in 2011. And sooner than that, any job-guarantee commitment to the IAM invites	Manage ment of Modlua r Enterpri se Archite
	Scorchi ng Both Sides" (Domini c Gates)			 matching demands from the Society of Professional Engineering Employees in Aerospace, the engineering union that has just begun contract negotiations. Most Machinists display a firm resolve to stay out, while handling the strike in individual ways. On Thursday, Jayleen Roman, a younger machinist on the 787 program, began a 10-day Hawaiian vacation with her parents. Her dad is a 28-year veteran machinist. They had long planned and saved for both the vacation and the strike. 'We're ready to stay out as long as it takes,' said Roman. Stephen Watkins, an electrician on the 777 program, has been building a fence for his brother-in-law while on strike, and will move on to do some work for his father-in-law. Like many veterans, Michael Spears, a team leader on the 777 jet program in Everett, has borrowed from his 401(k) retirement funds and set aside money for his mortgage payments through January. If the strike lasts a month or two, he expects to repay the loan from a signing bonus typically part of any IAM strike settlement. If it's more drawn out, he said he'll plan to work until 57 instead of retiring at 55. For now, Spears is enjoying the break from the heavy noise and vibration of his workplace. 	cures views job- security as a long- term cost, without seeing it a a source of long- term producti vity increase s, and therefor e a route towards reining-

			'For the past 18 months I've been working 10-hour days, seven days a week, sometimes a month straight. My body is appreciating the downtime.' Blondin says the possibility of a downturn in aviation — with the potential for layoffs at <i>Boeing</i> — makes the union demand for an end to outsourcing 'that much more important to fight for now. 'We need to get that job-security stuff solved first and the rest is doable,' he said. Kight counters that the option to outsource work or slow production in a downturn is key. <i>Boeing</i> , he said, must be able to 'react nimbly to what can be very sudden and dramatic changes in our marketplace.'	in long- term costs.
29 Sept. 2008	The Seattle Times, "Simme ring Boeing Strike Scorchi ng Both Sides" (Domini c Gates)	Firm	"A Seattle Times analysis using the company's online wage and benefit calculator shows that the current offer over three years gives the average Machinist approximately an extra \$22,000 over the 2008 compensation level. (The company has said the contract adds \$34,000 but it acknowledges that figure ignores substantial extras included in 2008 pay, including a lump-sum bonus.) Average pay with overtime and bonuses, all totaling \$68,000 in 2008, will rise to \$80,000 in 2011, said <i>Boeing</i> spokesman Tim Healy. Based on those averages, the company offer would increase <i>Boeing's</i> total annual cost for its IAM work force by some \$550 million, from \$2.43 billion this year to about \$3 billion in 2011. <i>Boeing</i> must weigh its goal of capping those future costs against the reality of profits drained away in the present. After the 2005 Machinists strike, which lasted 28 days, <i>Boeing's</i> regulatory filings pegged the hit to its profits at up to \$300 million for that year. However, those filings do not reflect the full financial impact because Boeing spreads its program costs over hundreds of airplanes and about four years of production. ' <i>Boeing's</i> accounting disclosures don't reveal the true cost of the strike,' said an analyst at a Wall Street firm that doesn't allow him to be quoted. A solid estimate for the real cost of the 2005 strike is revealed in an internal <i>Boeing</i> document obtained by <i>The Seattle Times.</i> It was prepared for then-Chief Executive Alan Mulally and his senior management team in October 2005, soon after the Machinists went back to work. The document projected that over a four-year period through the end of 2009, the net loss of profits due to the 2005 strike would be just over \$700 million. That figure included profits deferred from the planes not delivered during those four years, as well as more than \$200 million in "abnormal costs" including penalties paid to suppliers. The implication of the projection is that three years after the 2005 strike — and in the first month of a new IAM strike — <i>Boe</i>	On the non- systemi c hidden costs behind a strike in a modular enterpri se architec ture.

29 Sept. 2008	Washin gton Post, "Clearer Skies May Be Ahead for Boeing" (Klana Polyak)	Firm- Investo r	α	through to today. Extrapolating from the 2005 projection, based on today's much higher production rates and profit margins, the Wall Street analyst estimated that the total hit to profits for a one-month strike now would be at least \$1.3 billion. Balancing that, <i>Boeing</i> has plenty of money in reserve: more than \$10 billion at last report, compared with \$8 billion three years ago. 'The company is in a strong financial position should this situation get extended,' said Kight." "Then there's the 15-month delay of introducing <i>Boeing's</i> much touted fuel-efficient jet, the 787 Dreamliner. The program has been delayed four times. Should the strike continue for more than a few weeks, delivery of the Dreamliner could be pushed to 2010. Delays notwithstanding, the Dreamliner's potential is huge. 'Long-term,' says Fletcher Perkins, an analyst with <i>Hillman Capital Management</i> , 'it will turn into a very good profit source for <i>Boeing</i> .'	On a modular enterpri se architec ture's understa nding of comple xity.
8 Oct. 2008	Bloomb erg "Boeing , Union Say Crisis Won't Break Stike Resolve " (Susann a Ray)	Firm- Labor	α	"Boeing Chief Executive Officer Jim McNerney told employees in an Oct. 6 memo that the 'ongoing turmoil in the financial markets' shows why it's important for the company to be able to react quickly and not restrict its competitive moves through job promises. "Decisions on where to place work, to whom, when, must be owned by the company; that is a boundary that we're not going to cross," Kight said in an interview yesterday at <i>Boeing's</i> commercial-plane headquarters near Seattle. 'We are also not in a position, nor is any other employer, particularly when you look at what's going on in the world today, to guarantee employment."" 9 Oct. 2008	Forbes "The Upside of Downsi de for Boeing" (Carl	Firm	α	"Paul Nisbet of JSA Research beleives the recent global financial turmoil has brought added pressure on union members to start working again. 'I'm sure many of them have lost money in the market and in pension plans, Nisbet said, 'and as the situation has changed there are quite a few minds that have changed as well.' Although Nisbet believes <i>Boeing</i> will give in to some extent on higher wages, better provisions for health care and pensions, he	On commo nality between modular enterpri se architec

	Gutierre			expects the company to be steadfast in its stance on its	ture's
	z)			ability to outsource. 'I think Boeing's view on outsourcing is if it does give in it will lead the aerospace industry down the same path as the auto and airline industries have seen,' Nisbet said."	views across the aerospa ce, airline and automot ive industri es (the three industri es of the theoreti cal sample in this research).
9 Oct. 2008	Seattle Post Intellige ncer "Strikin g Machin sts Rally Around Union Leaders Before Talks Resume " (James Wallace)	Firm- Labor	α	"'We don't want subcontractors in our workplace setting up parts distribution centers. That's our work," [IAM Preseident] Blondin said. 'We will work with the company on lean activities and process improvements, but the IAM has to be a partner in that,' he added. 'But we are not going to have suppliers come in while our members are being laid off. That's really what it is all about. That's part of job security.' Boeing knows the union's position, so the fact the company is willing to start talking again is an encouraging sign it may be willing "to move" on this issue, Blondin said. 'I hope they are not wasting our time.' The other big issue that could prove difficult to reach agreement on involves outsourcing. The union wants more opportunity to compete for work that <i>Boeing</i> is contracting out. 'We are not looking to shut them (<i>Boeing</i>) down globally,' Blondin said. But what the union will insist on in any new offer, he said, is the right to bid on future work that <i>Boeing</i> wants to outsource. 'We don't get a look at the work that goes out the door day to day throughout the country, much less the overseas stuff,' Blondin said. 'We get a very narrow slice to look at. If the company determines that it is emergent or temporary, we don't get to look at it. What we are saying is that 'emergent' is not work that goes out for a year. If you are going to call it emergent or temporary it better be short term.' He said the union wants language in the contract that allows it to bid on that work. 'We want to be able to compete with all things considered, including material costs, labor costs, delivery costs and rework costs. The whole works,' Blondin said.	On a union's more integral approac h in working with a modular enterpri se architec ture.

					support for the <i>Boeing</i> strikers."	
10 Oct. 2008	Forbes "Boeing Shares Sink As Analyst Cuts Projecti ons"		Firm	α	"Goldman Sachs analyst Richard Safran lowered delivery forecasts for the Chicago-based airplane maker to 462 aircraft in 2009, down from an earlier estimate of 489, and 392 in 2010, down from 524. 'We believe that the inability to obtain financing will cause customers to defer or cancel orders,' he wrote in an investor note. 'As a result, we believe (<i>Boeing</i>) will lower production rates.'"	On a modular enterpri se architec ture's use of "exogen ous" events to drive growth/ contract ion plans.
10 Oct. 2008	Seattle Post Intellige ncer, "Analys t: 787 Won't Deliver Until 2010" (James Wallace)	Kataua	Firm- Labor	a	"Here is part of what David Strauss of UBS Investment Research said in his report Friday: "Watching flights into Paine Field in Everett: We are tracking movements of Boeing's modified 747 "Dreamlifter" fleet to gauge the progress of 787 production. Specifically, we are monitoring Dreamlifter flights into Snohomish County Paine Field Airport (KPAE) in Everett WA, adjacent to 787 production, to gauge the pace of shipments from the major structural suppliers. Major structural components are delivered via the Dreamlifter fleet to Boeing in Everett and include the wings from Japan, aft fuselage from Charleston SC, center fuselage from Italy (via Charleston), and forward fuselage from Wichita KS. Strike halts already slow-paced structural deliveries: We did not track any Dreamlifter flights into Everett in September as Boeing has apparently halted all 787 deliveries from its suppliers given the ongoing Machinists strike. We continued to track some center fuselage deliveries to Charleston. Flight test program now unlikely to complete prior to early 2010: Even prior to the Machinists strike that began in September, the slow pace of structural deliveries had led us to believe that Boeing was highly unlikely to hit its revised 787 flight test schedule. Boeing has now missed the scheduled assembly complete dates for the first three flight test aircraft and we believe the flight test program is unlikely to complete prior to early 2010.""	On the true effect of a strike on the delay of the 787.
20 Oct. 2008	Busines s Week "How Toyota Plans to Beat the Downtu rn" (Ian Rowley)	Katsua ki Watan abe, Preside nt of <i>Toyota</i> <i>Motors</i>	Firm	β	"After taking over as <i>Toyota</i> (TM) president in June 2005, Katsuaki Watanabe regularly warned of the dangers of complacency creeping in at the Japanese automaker (<i>BusinessWeek</i> , 3/5/07). But until recently, it was a tough message to get across. The company was doing too well: In the year through March 2008, <i>Toyota</i> sold 8.9 million vehicles, an increase of 32% over five years, while its net profits rose 53%, to \$17 billion. This year it will likely overtake <i>GM</i> (GM) to become the world's largest carmaker. These days, though, Watanabe need only point to <i>Toyota's</i> stock price to keep employees' feet on the	On how an integral enterpri se architec ture manage s in a low- growth

					ground. Since the beginning of the year, Toyota's shares	environ
					have fallen 37%. While roughly in line with Japan's	ment.
					benchmark stock index, the performance isn't much	
					better than troubled GM, whose stock is down 39%.	
					And Toyota's recent sales, though not nearly as bad the	
				6	Big Three's, hardly instill confidence. Some analysts are	
					sounding the alarm. In an Oct. 10 note to investors,	
					NikkoCitigroup auto analyst Noriyuki Matsushima	
				1, 1	predicted 'a sudden and substantial earnings decline' for	
					Toyota. 'We believe Toyota needs to draft a new	
				1	strategy that changes its existing course and includes	
					initiatives to secure appropriate sales volumes,' he	
					wrote. Lowering his projections for the current fiscal year,	
					Matsushima expects Toyota to post operating earnings of	
				0	\$11 billion, a 50% decline compared with the year that	
					ended Mar. 31, and \$5 billion less than the company's	
					projection. Time for investors to bail out? Not exactly.	
					Even if Toyota's earnings drop by half this year, the	
					company's operating profits are still likely to exceed	
					\$10 billion. And with a solid balance sheet, more than	
					\$20 billion in cash, and a slew of new car initiatives,	
					Toyota is better placed than most automakers to	
					weather economic uncertainty. 'Once [Toyota	
					executives] have made the decision to do something,	
					they can get on and do it without having to arrange	
					financing,' says Andrew Phillips, an analyst at KBC	
					Securities in Tokyo. For now Toyota's problems seem	
					minor compared with the Big Three's	
					(BusinessWeek.com, 10/7/08)—and it's moving to keep	
					it that way. <i>Toyota's</i> bulging coffers will help it most in	
I					the U.S. There, it's using the cash—\$3 billion at its U.S.	
					financing unit, as of the end of June—to plug falling sales.	
					Facing an increasingly severe slowdown and growing	
					inventory, <i>Toyota</i> on Oct. 3 began offering for one month	
					interest-free financing on 11 models, including the	
					Corolla, Camry, and Tundra full-size pickup. The risk, say	
					critics, is that 0% financing could undermine car-resale	
					values and hurt the brand if the company decides to extend	
					the offer. <i>Toyota</i> is also taking radical steps at its North	
					American factories. After opening a plant for big Tundra	
					pickup trucks in San Antonio in 2006, the company has	
					since curtailed production. It also has suspended	
					production at three U.S. plants for three months in August	
					to retool them so there's more emphasis on smaller, fuel-	
					efficient models. (It's not letting go of the 4,500	
					workers, though; they're keeping busy by doing	
					everything from training programs to filling in at	
					assembly lines elsewhere or volunteering in local	
					communities.) And for the first time, its hot-selling Prius	
					gas-electric hybrid will be built in the U.S., at a plant in	
					Mississippi—a move that will help it meet a target of	
					selling 1 million hybrids a year early in the next decade."

cing"	ional	787 outsourcing has produced program delays	ment
(Domini	Engine	unprecedented in <i>Boeing</i> history and has fueled	and
c Gates)	ering	'disdain for corporate management.' 'We want to	labor.
e Gates)	Emplo	make sure they never make this disastrous decision	
	yees in	again,' said Goforth, 'We would like the professional and	
	Aerosp	technical community to have a serious say in how future	
	ace	production systems are set up.' Across from Goforth	
	(SPEE	when main-table talks begin next week at the SeaTac	
	A);	Doubletree Hotel will be Mike Denton, vice president of	
	Mike	engineering for Boeing Commercial Airplanes. Denton	
	Denton	won't promise the union a say in organizing future	
	, vice	programs but says Boeing will address the errors it's	
	preside	made in the Dreamliner's design and production. On	
	nt of	its next plane after the 787, Denton said, Boeing plans	
	engine	to keep in-house some of the major work. Ahead of the	
	ering	talks, the two negotiators have opposite perceptions of	
	for	the mood of the technical work force. The Machinist	
	Boeing	union has been on strike against Boeing for more than six	
	Comm	weeks. And the looming recession must give pause to	
	ercial	anyone who contemplates forgoing a paycheck. Yet	
	Airpla	Goforth puts the chance of avoiding a white-collar strike	
	nes	at no better than 50-50. He says preliminary talks in	
		the past few months have gone badly. Goforth	
		complains <i>Boeing</i> officials have not engaged in genuine	
		discussion, instead rejecting union proposals out of hand, which he said will infuriate his members. 'If	
		[management] don't understand that, they are fools.	
		They know nothing about collective bargaining,' said	
		Goforth. 'And they will lead this membership to a	
		strike that is absolutely unnecessary.' But Denton sees	
		an engineering work force with restored morale and a	
		renewed faith in the company. He says that in 2000 —	
		when the union had its first and only extended strike —	
		many employees feared <i>Boeing</i> was on its way out of	
		the commercial-jet business. 'Today, people don't	
		doubt that we have a future,' said Denton. Denton said	
		that in meetings with his engineers he doesn't detect the	
		heightened anxiety he hears from Goforth and other	
		SPEEA officials. 'I truly hope they are wrong.' Boeing	
		engineers earn on average almost \$89,000 a year in base	
		salary, and technical staff average about \$67,000,	
		according to SPEEA. Overtime and incentive pay increase	
		those averages to \$108,000 and \$82,000, respectively,	
		according to Boeing.	
		Goforth, 40, has a youthful vigor and charisma. With a	
		rakish twinkle in his eye, he rattles off energetic threats	
		to Boeing with machine-gun delivery. The first in his	
		family to go to college, Goforth grew up 'working poor' in	
		Los Angeles, built an early career in social services, then	

went to law school. He worked his way up to a job in Seattle as strategic adviser with a local government employees union. Goforth took the top staff job at SPEEA at the start of this year. A month later, he signaled a startling new SPEEA militancy when he warned union members they should begin to save for a possible strike. At that stage, preliminary talks had barely begun. He says technical workers' frustration with Boeing's executive leadership is 'the culmination of years of being ignored, of having their experience discounted and of having to clean up the messes.' The design work done by Boeing's partners on the 787 or by Russian engineers at Boeing's design center in Moscow often 'comes back all screwed up,' he said, and his members must work constant overtime to fix the problems. And he says Boeing's use of a few thousand nonunion contractors to do in-house engineering work will leave the company ill-equipped to recover on future jet projects. 'What happens when the next program runs into development problems? They won't have the internal capacity to dip into to fix it,' said Goforth. SPEEA is proposing restrictions on Boeing's use of contractors to do engineering work. And Goforth will push the broader demand for more say in how future airplanes are designed and built, even though it's unclear how exactly that might be incorporated into the contract.

Denton, 53, a 31-year technical veteran of Boeing Commercial Airplanes, was a SPEEA member before joining the management ranks in 1988. Now Boeing's chief liaison between the executive leadership and the technical staff, he says, 'I think of the engineers as my team.' His father flew Air Force bombers in World War II and the Korean War, and was briefly a pilot for United, says Denton, so 'aviation is sort of in my blood.' Denton said Boeing has hired so many contract engineers to avoid pitching union members into a roller-coaster 'hire-and-fire cycle.' When the 787, the 747-8 and the 777 freighter all finally start production, there'll likely be a lag of some years when fewer design engineers are needed. Boeing can let the contractors go and keep its core technical team, he said. And he believes work-force morale is far better than at the time of the SPEEA strike in 2000. Denton recalled the 'depressing environment' at Boeing then: Executives had halted several new airplane developent programs, and then-company President Harry Stonecipher hit a nerve when he pushed for a profit-driven approach to replace what he called Boeing's 'family' culture. Today, Denton said, 'a lot of those wounds are healed,' because Boeing has combined 'the good of Harry's message with the good of the traditional Boeing culture.' 'I'm not shy of talking about family,' he says, but 'you have to recognize, too, that you are in business.' He concedes the outsourcing of the detailed design of major parts of the 787 -Mitsubishi of Japan does the wing, for example - has

					become a major issue for the technical work force as the	
					program has faced major delays. 'Some would have preferred doing that design work,' said Denton. 'The fact that they are having to fix it later is doubly irritating.' But Denton said that as a result of the lessons learned on	
					the 787, <i>Boeing</i> is likely to keep in-house 'some part of major production' on the next airplane. 'We want to	
					be on the leading edge of technology,' he said. 'Whether it's all of a wing, or all of the fuselage, or some [other] part of production — all of that is to be figured out.	
					But that's the general direction we will go."	
21 Oct. 2008	Busines s Week, "Pressur e Builds for Boeing and Machin sts to Settle" (Joseph		Firm- Labor	α	"Indeed, the union contends it has been willing to compromise, particularly around the sensitive issue of outsourcing. In the recent talks, for instance, the IAM suggested it would let suppliers enter factories and deliver parts to receiving areas near assembly lines, where the parts would then be transported further by IAM members. The arrangement could protect some 2,000 jobs, the union says. But the company argues it needs more flexibility than that, including the ability to cut jobs if needed. 'They want to put a bubble around these 2,000 jobs,' says <i>Boeing</i> spokesman Tim Healy. 'There's no way,	On a modular enterpri se architec ture's mis- aligned objectiv es between
	Weber)				especially in this economy, we can agree to preserve the jobs in perpetuity.'"	manage ment and labor.
Fall 2008	MIT Sloan Manage ment Review, "The Manage ment Lessons of a Beleagu ered Industry " (Michae I S. Hopkins)	MIT Sloan Prof. Thoma s A. Kocha n	Firms	β	"Southwest's model is a difficult model [to copy] because in some respects it's a bit anti-American." "The two most financially successful airlines in the world are Ryanair Holdings plc, in Europe, and Southwest, headquartered in Texas. Both emphasize low unit costs. That is, providing a service at low cost. The fundamental difference is that Ryanair get there by minimizing labor costs, by squeezing employees, by adopting very harsh working donditions, by high levels of turnover so that costs don't build over time. Whereas Southwest gets to low cost by emphasizing improved productivity [and] loyalty on the part of employees so they stay a long time and use their skills and knowledge to build a successful airline that meets customer service needs [and] that is designed with a work system that miximizes employee ideas and discretion for solving problems and achieving their financial objectives. So you have two highly successful airlines in financial terms but, on the one hand, Southwest does it by engaging employees, and Ryanair does it by squeezing employees are among the highest paid. They've moved to that position as the legacy carriers have either gone into bankruptcy and lowered their wages or cut wages through concessions outside of bankruptcy. Ryanair has taken some of those same attributes from	labor. On the differen ces in how modular and intergral enterpri se architec tures pursue "cost leadersh ip" in the airline industry – i.e. via <i>flexibilit</i> y and commit ment respecti vely.

22 Oct. 2008	Thomso n Reuters Researc h, excerpt from "The Boeing Compan y, Q3 2008 Earning s Call Transcri	Jim McNer ney, Chari man and CEO; James Bell, CFO, <i>The</i> Boeing Compa ny	Firm- Investo r	α	Southwest, but said, 'All right, we're going to do this but we're going to do it bare bones and make sure we don't get unions.' Ryanair has certainly been successful in keeping their costs down, just in a very different way from Southwest. Southwest said, 'Look, we're in the airline industry, just about everyone is unionized, we need to get off the ground, we need political support, we don't want to have theses battles.' Southwest is a low-fare competitor, and they've had high-quality jobs. They make sure they hold their employees accountable for providing the productivity that warrants a higher wage. If you look at evidence across industries, we see productivity differences between 20% and 35% among companies that have high-quality employee- management relationships and those that have standard labor-management relationships. That's an enormous number." (Note: [ph] means "problems hearing" for the transcript). "Joe Campbell (Barclays Capital): Yes good morning. My one part question is for James and it's about the Boeing commercial margins in the quarter. In the last quarter, we saw some issues related to overhead absorption related to the 787, and I suppose there is some extra block [ph] pressures from the strike that will be recorded in the margins going forward. And I wondered what was going on with the margin before R&D, at the program level not the unit level where we will see the strike, and whether these margins reflect their estimate of the impact of the strike, the ongoing strike, the recovery, the extra cost, as well as whatever is left over from that absorption issue?	On a modular Enterpri se Archite cture's defense of its finanaic al perform ance
	s Call				ongoing strike, the recovery, the extra cost, as well as	

		full block for the production airplanes. So I'm struck by how much the margins went down. So apparently, I mean I know you're not giving '09 guidance but unless something changes, your current estimate to complete the blocks is significantly lower than it used to be.	
		James Bell: No, I think the available margins – the margins that are on the airplanes, particularly those that slid out both due to the strike and the galleys, these issues are pretty, and so the impact on earnings this quarter is more significant as a result of that. In terms of the difference between what we would expect versus what we recorded, because as you know on the galleys, it is mostly the white [wide?] bodies that moved out, Joe.	
		Joe Campbell: But I'm still confused James with that, and we can do it offline if you want, but I mean if the program is coming, it would reflect the difference between unit and program, it would cause that thing to be really big and talk about the program margins [ph].	
		James Bell: Yes, the difference between unit and programs are large.	
		<u>Joe Campbell:</u> Yes, I know. That's what I say, but I don't understand why that would affect the program margins, unless you had made some big adjustments about what the future costs would be.	
		James Bell: Well, we did not make, we actually put the strike impact in there as well but if we excluded the strike impact and if we excluded the slide out, the program margins would have been 11%, about 11.1% in the operating. So and the pre-R&D margin would have been in the range we've always talked about around 30%.	
		<u>Robert Spingarn (Credit Suisse)</u>: Jim, you referenced two cancellations and 80 deferrals this year and talked about offsetting demand for those slots, but a little more color please. Are these generally front-ended in the backlog and has the pace of these types of discussions changed recently, and how should we think about strike deferred airplane supporting rates next year and in 2010?	
		Jim McNerney (<i>Boeing</i>): Well, first of all, the cancellations and deferrals are pretty much in line with what we've experienced over the last three or four years, and we still have a – I would say, a significant overhang of demand, people who'd like to move their positions forward if other want to move them	

out. Now, I would say the discussion slightly more, but I would not say step function more discussion along those line. So we're monitoring it very closely. But I think it does speak to the fact that a lot of our backlog is in economically strong parts of the world. I think that speak – and that our airplanes are relatively productive compared to their fleets that things were hanging in, but we're monitoring it very closely. In terms of the impact on production rates, again, the – we have steadily increased production rates in a measured way over the last few years, as you know. We have tried hard to meet demand without getting beyond our headlights, so to speak and I think that's serving us well now, because I – we'll provide guidance going forward once we understand exactly where we are post strike. But we're feeling good about our production rates over the next couple of years. But we want to make sure we understand the impact of – any impact of the strike before we give you a definitive answer to that question.	
Howard Rubel (Jefferies): I want to go back to an operational question and sort of use the 747-8 as the paradigm. I mean, you have again that looks like a charge or additional costs associated with that program. And if we kind of look, there's been – whether it's been the AWACS or the airborne early warning control or even the 787, you had just a series of what I call development misses relative to what normally Boeing is able to do. So, what are you doing to go back and look at program management or operational management to not have these misses?	
Jim McNerney (Boeing): On the BCA side, I think the 87, we're trying to learn from that. I think, in retrospect, we bit off more than we could chew. New composites, new design tools, new production process, global responsibility for design as well as production. I think there is a lot to learn from how we did that. There's a lot of good and there's some bad, obviously, that we are committed to learn from and hopefully, you'll see that reflected in some of our newer programs. On the -8, we're not particularly proud of how that is sorting out but we'll get that program done. And it's one that – it's suffered from a few mis-assumptions that we've caught up on now, and we're going to get fixed.	
Howard Rubel: And so when we look at some of this, there's – I mean, I don't think it's systemic. I mean, it just – I mean, what you've done to solve the problem, I mean, it's just not costing. I mean, it's process as well and I mean, could you just elaborate for one more moment on what sort of process changes you've done to help me feel more comfortable looking forward?	

		David Strauss: Yes, I guess what I was getting at was are you approaching a position where you think you might have to take a forward loss?	
		<u>James Bell:</u> No, that's why we're saying that there is none.	
		Lynn Lunsford (Wall Street Journal): Thanks. I wanted to ask a question regarding the strike and the situation where both sides of this dispute seemed to be pretty well dug in on the issue of – well for the union, it's job security and I think you and Jim had said it was management rights. But, I guess the thing that I'm trying to get a sense of this do you think there is a compromise in that area that would be possible without one side or the other completely capitulating?	
		Jim McNerney (Boeing): Yes. I think there's a way forward, Lynn, to be honest with you. I think the management rights issue is one that leaves us with the ability to manage our business. I think having said that, I think there's a way to work with the union to meet some of their goals and in fact I think discussions that are starting up again tomorrow – the federal mediated discussions that are starting up again tomorrow, although it is impossible to predict success or lack of success, I think both sides are approaching it with a constructive headset. So maybe we can find a way forward here.	
		<u>Lynn Lunsford:</u> Do you plan to get involved in these at some point?	
		Jim McNerney: I'm involved in the strike on a day-to-day basis and so I think Scott will be the lead – Scott and Doug Kite will be the lead negotiator as they always have been but I'll be involved 24/7.	
		Tim Klass (Associated Press): The last three Boeing strikes, both of the machinists and with the engineers' union have been settled only with the Boeing CEO and the President of each parent union getting together to reach a final agreement. Do you plan to be at the table or are you ready to be at the table directly in these talks that are resuming tomorrow?	
		Jim McNerney (Boeing): Well, like I say, your first statement wasn't true. I mean we've resolved strikes with a variety of people at the table, usually led by the commercial airplanes business leader who runs a \$37 billion business for whom the striking employees work. So like I say, I'm involved deeply. I've had a number of conversations with the union leadership, and I am open to be a constructive force in	

	this thing any way I can be, while also leading the company in a way that I think is best.	
	<u>Tim Klass:</u> Can you elaborate on the conversations you've had with the union leadership?	
	Jim McNerney: Not particular. I mean, I think the nature of these things are private constructive discussions and I think both of us would just assume they stay that way.	
	<u>Susanna Ray (Bloomberg News):</u> You mentioned the possibility of having to send some workers home. Was that the engineers or who were you talking about? You mentioned the possibility of having to send some workers home, and I'm wondering if you're referring to the engineers or to whom?	
	James Bell (Boeing): Listen, what I was talking about that as the strike goes on, if it goes longer, we would have to looking at more significant action to manage the ongoing costs that would, if in fact it went longer enough, could include sending people home. Right now, there are no plans to do that.	
	James Wallace (Seattle P-I Newspaper): Yes, Jim, in a couple of your messages to your employees since the strike began, you've commented about how disruptive this continual labor problems are. When it comes time to find a site for your next all-new airplane after the 787, how much consideration or how much of a factor will these strikes and labor unrest be in deciding where to build that new airplane?	
	Jim McNerney (Boeing): Well, it's far too early to figure out where we're going to build a plane that we haven't designed yet. But listen, the workers, not withstanding the strike and not withstanding the frustration on behalf of our customers that I have about interrupting their lives on a pretty regular basis, I think we're – I'm a human being, I think we're all human beings who are frustrated by that. Not withstanding all that, the workers on Puget Sound, represented by the IAM, are very fine workers. And they do a good job and I'm anxious to get them back to doing a good job, and they can compete for any work that we've got.	
	James Wallace: If I could follow up, Jim, when Alan Mulally and Mike Bear came to Chicago to make the presentation for the 787 to be built in Everett, you were on the board. Were you considering at that time that a possible labor strike like this one was going to disrupt production of the 787 just as you got started?	

		Jim McNerney: I don't think that that was a front and center consideration, to be honest with you, back then. I mean, I think we were trying to find the best production structure. Alan, at that time, was trying to find the best production structure and the best place to build the airplane. And I think that issue gets front and center during a time like this when you're making an investment decision. It probably wasn't a huge factor.	
		Andrea Rothman (<i>Bloomberg News</i>): Yes, hello. A question for Mr. McNerney. Can you tell me, do you have a threshold for order members on the 747 AC before actually committing to build that plane? I know you have (inaudible). I'm not even sure if Eric has actually signed firm for the four that they announced in (inaudible).	
		Jim McNerney (<i>Boeing</i>): Now, we have committed to build the plane.	
		<u>Andrea Rothman:</u> Okay. So even if you only had 30 or so orders, you will still move forward with it?	
		Jim McNerney: Yes. I mean we have – I think the combined orders are somewhere in the neighborhood of about 100 and 110 or so which is, I would say, about average in terms of this stage in a program development. So we – while we're frustrated by the incremental cost we're seeing, that doesn't change our mind about getting this done for our customers. There is good demand for this plane.	
		<u>Andrea Rothman:</u> Okay, can I just follow up to get a clarification from Mr. Bell? There's a question about who you would send home if you – if you had to send workers home, you said we might have to send people home. Who would those people be? I mean is it engineers or?	
		James Bell: We don't know. We'd have to get to there and see.	
		<u>Andrea Rothman:</u> So you don't? Okay.	
		James Bell: No, we're not planning on sending anyone and we have no plan yet. I'm just saying it was a hypothetical discussion around if the strike continued longer, would you have to make different decisions and the answer to that is, yes, including what we would do to manage and conserve our resources both here and with our supply team and collectively we will figure out what's the right thing to do. In order to that including –	

r						
					Jim McNerney: Cost reduction.	
					James Bell: - and that would drive cost down until we got them back to work."	
23 Oct. 2008	The Seattle Times, "Boeing Profits Dive; Execs Admit Strike Isn't the Only Producti on Problem " (Domini c Gates)		Firm	α	 to work." "The quarterly results Boeing announced Wednesday revealed big problems with jet production beyond the Machinists strike. Boeing profit dropped 38 percent in the third quarter, hit not only by the strike that began Sept. 6 but also by a major supply-chain glitch: German supplier Sell was unable to deliver onboard galleys so that five to 10 wide-bodies couldn't have been delivered from Everett anyhow. And on a teleconference to discuss the earnings, Chief Executive Jim McNerney also revealed that another major airplane program besides the 787 Dreamliner is in trouble: the 747-8 update to Boeing's iconic jumbo jet is costing more than expected and the delivery schedule is under pressure. The results also show Boeing's cash and liquid assets slashed by \$3 billion for the quarter, due to the strike, 787 costs related to delays before the strike, and spending on several defense acquisitions. Company spokesman Todd Blecher said the hit to Boeing's cash position that can be directly attributed to the strike's impact during September is slightly less than \$1 billion. Boeing ended the quarter with \$7.2 billion in cash. The galley glitch was responsible for 25 cents a share or about \$185 million in net corporate profits and reduced the commercial unit's pre-tax reduction operating profits by about \$250 million. Boeing said that its supplier Sell is now "making good progress" and the galley problem should be under control after the strike ends. Had the galley problem not existed, those wide-body jets would not have been delivered anyway due to the strike. So arguably the full strike impact on profit would have been \$445 million in net earnings (or \$600 million to pre-tax operating earnings). On the 747-8, McNerney said 'We're not particularly proud of how that is sorting out, but we'll get that program done It suffered from a few 	On a modular enterpri se architec ture's systema tic problem s.
					program done It suffered from a few misassumptions that we've caught up on now and we're going to get fixed.'	
					In July, <i>Boeing</i> said it would conduct test flights of the plane in the fourth quarter. But Wednesday it said it would offer no further details on the plane's schedule until the strike ends."	
23 Oct. 2008	The Seattle Post Intellige	Jim McNer ney, Chair	Firm- Labor	α	"As <i>The Boeing Co.</i> and its striking Machinists union renew talks Thursday aimed at settling the 47-day strike, Chairman and Chief Executive Jim McNerney said there is room for compromise. te"	Tom			
(James	Buffen		McNerney sounded somewhat optimistic that the strike,	
Wallace	barger,		which began Sept. 6, could be resolved during the	
)	nationa		upcoming talks in Washington, D.C., with a federal	
	1		mediator. But Tom Buffenbarger, national president of the	
	preside		International Association of Machinists and Aerospace	
	nt of		Workers, told The Associated Press after the Boeing	
	the		earnings call that he had not spoken with McNerney and	
	Interna		he was 'not optimistic' about a quick settlement, in	
	tional		part because he was told McNerney would not be part	
	Associ		of the talks. McNerney said there have been	
	ation		'constructive' discussions behind the scenes since the	
	of		last face-to-face talks abruptly broke off after only two	
	Machi		days on Oct. 13. Since then, both sides have continued to	
	nists		talk with the federal mediator. He decided earlier this	
	and		week to call the parties back to try to end the strike by	
	Aerosp		about 27,000 Machinists in three states. The major issue	
	ace		has been job security and the company's use of outside	
	Worke		vendors to deliver parts directly to planes in its plants	
	rs		work traditionally done by Machinists. The union has said	
			it must protect those jobs. McNerney was asked if there	
			were room for compromise. 'Yes,' he said, adding,	
			'There is a way to work with the union to meet some of	
			their goals.' He said both sides are approaching	
			Thursday's talks 'with a constructive (mind set), so	
			maybe we can find a way forward.' Although McNerney	
			is not expected at the talks, Scott Carson, chief executive	
			of Boeing Commercial Airplanes, will likely be there.	
			Buffenbarger of the Machinists may also join the talks at	
			some point. His office is in Washington, D.C. Boeing	
			believes there is a better chance of resolving the strike	
			with Buffenbarger part of the talks, sources said. But	
			Buffenbarger, who indicated he thought McNerney	
			should be at the talks, was quoted as saying, 'I'm not	
			going to make a deal until McNerney signs off on that.'	
			'I'm involved, deeply,' McNerney said. 'I've had a	
			number of conversations with union leadership and	
			I'm open to be a constructive force in this thing any	
			way I can be.' But, he said, Carson and the company's	
			labor chief, Doug Kight, are leading the negotiations	
			for Boeing. The strike will be in its 48th day Thursday,	
			which will match the third-longest strike by the union	
			against Boeing, in 1989. James Bell, Boeing chief	
			financial officer, said it might have to lay off workers	
			who are not on strike, if the work stoppage lasts a lot	
			longer, and some suppliers might have to shut down.	
			'Right now,' he said, 'there are no plans to do that.'	
			The consequences of the strike have been significant.	

23 Oct. 2008 29 Oct. 2008	Flight Internat ional, "Cost Jump for 747 Frustrat es Boeing" (Stephe n Trimble)) Seattle Post Intellige	Jim McNer ney, Chair man and CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i> Ray Gofort h,	Firm- Labor	α	McNerney said the galley problem has been pretty much resolved and should not be an issue after the strike. <i>Airbus</i> recently said that because of the financial crisis, it will not boost production rates as expected. But McNerney said <i>Boeing</i> production rates in place before the strike 'look good' for the near term." "Higher costs reported by the 747-8 development program in the third quarter are causing frustration with <i>Boeing's</i> corporate executives, but the widebody is continuing to make design progress despite the strike. <i>Boeing's</i> third quarter earnings statement released yesterday contains two references to 'additional 747 program costs', but does not elaborate. Jim McNerney, <i>Boeing</i> chairman, president and CEO, noted executives are 'frustrated by the incremental cost we're seeing' on the 747-8 during a conference call with reporters. <i>Boeing</i> spokesmen declined to detail neither the amount of nor the causes for the cost increases. 'We don't provide specific details on the issues the program is having from a cost perspective,' a spokesman tells <i>ATI</i> . <i>Boeing Commercial Airplanes</i> reported overall research and development costs at \$2.1 billion for the first nine months of 2008. The third quarter outlay amounted to \$705 million, or about 7% higher than the same period a year ago. As a derivative aimed at a 'niche' long-haul market, the 747-8 may be more sensitive to cost pressure than <i>Boeing's</i> new-build development programmes." "Some 14 months late and still not flying, <i>The Boeing</i> <i>Co.'s</i> 787 Dreamliner will serve as a symbolic backdrop at the bargaining table starting Wednesday when the	On a Modula r Enterpri se Archite cture's systema tic "conspir acy of optimis m"
					Boeing lost about \$250 million in profits during September because of the strike, or 35 cents a share, Bell said, while supplier issues were responsible for another hit of about 25 cents a share. Until the strike ends, Boeing said, it will not provide financial guidance or outlooks. The strike has also delayed Boeing's 787 Dreamliner, which was about 14 months late even before the strike. Each day the strike lasts results in at least a day's delay in all Boeing airplane programs, including the 787, McNerney said. But even when the strike is over, it will take some time to get the company's production system and its supply chain back up to speed, McNerney said. That will add to the delays caused by the strike. The longer the strike goes, the longer it will take to get the production system back to where it was before the strike, McNerney said. Boeing will update the status of the 787 program and its other airplane programs and delivery schedules once the strike is over. The biggest supplier issue involves a German company, Sell, whose galleys for Boeing widebody jets have been late. According to a striking Machinist on the Everett

Unhapp	Mike	on strike for 53 days as of Tuesday, will vote on a new	ship
У	Denton	contract Saturday. If a majority approve Boeing's latest	with its
Union"	, vice	offer, which was announced Monday, the strike will be	unions.
(James	preside	over and 27,000 Machinists could be back to building	
Wallace	nt of	airplanes starting Sunday night. Regardless of what	
)	engine	happens with that vote, Boeing now must try to make	
	ering	peace with its white-collar union known as SPEEA, which	
	for	represents about 21,000 workers, mostly in the Puget	
	Boeing	Sound area. The union, which has had only one walkout	
	Comm	of any length in its history, has not been shy in recent	
	ercial	weeks about throwing around the 'strike' word. Its	
	Airpla	contract with Boeing ends Dec. 1. Talks with Boeing	
	nes	during various committee meetings since March have not	
		gone well, according to SPEEA. 'I'm flabbergasted by	
		how badly Boeing has bungled these negotiations so	
		far,' said Ray Goforth, executive director of the Society of	
		Professional Engineering Employees in Aerospace. While	
		a SPEEA strike wouldn't shut down jet-making operations	
		like the Machinists strike, it would disrupt plane	
		deliveries, Goforth said, because engineers must sign off	
		on those planes when they leave the factory. And, given	
		the amount of engineering work needed to get the 787	
		ready to fly, that program would 'grind to a halt' if	
		engineers and techs walk out. To be sure, bread and	
		butter issues such as wages, pensions and medical will	
		take center stage during the talks. But what has happened	
		on the 787 program, and the 747-8 program,	
		underscores the union's growing frustration, Goforth	
		said. 'We want some kind of say in these future	
		decisions (around outsourcing),' Goforth said in a recent	
		interview. 'The company ignored the advice of its	
		engineering and technical work force in establishing	
		the 787 model. And every single disaster that has	
		befallen that program was predicted by SPEEA. We	
		are not saying we told you so, but if you listen to your	
		professional work force upfront you can avoid these	
		problems.'	
		Mike Denton, vice president of engineering for Boeing	
		Commercial Airplanes, will be among the company's	
		negotiators during the so-called 'main table' talks with	
		SPEEA at the SeaTac DoubleTree Hotel. The company	
		wants to present the union with its best and final offer	
		Nov. 11. Denton, a former SPEEA member,	
		acknowledged in an interview that Boeing made	
		mistakes with the 787 business model and will make	
		changes when it's time to develop the next all-new	
		airplane. Boeing engineers will have more of the	
		detailed design work and more oversight of	
		engineering work done by partners, and <i>Boeing</i> will do	
		sugareering work done by partners, and boeing will do	

.

·····		
	more of the manufacturing, he said. Jim McNerney,	
	Boeing's chairman and CEO, has said the company went	
	too far in awarding global partners so much	
	responsibility for the 787. On past programs, Boeing	
	took the lead in manufacturing. But for the 787, Boeing's	
	partners in Japan, Italy, Kansas and South Carolina	
	produce the large composite structures and Boeing	
	workers assemble them in Everett. Boeing argues this	
	business model will significantly reduce the cost of	
	making airplanes. But its partners quickly fell behind	
	with the untested manufacturing and production system,	
	and Boeing engineers and Machinists have been forced to	
	play catch-up during final assembly of the first 787s. As a	
	result, the Dreamliner's maiden flight has slipped from	
	August 2007 until late this year. The Machinists strike has	
	probably delayed that until early 2009. Some customers	
	have been told their planes will be up to three years late.	
	Denton said he understands SPEEA members'	
	frustration about the 787 partner model. But Denton	
	and Goforth see the mood of the SPEEA work force	
	differently as the two head into the final round of talks.	
	Goforth said the engineers and tech people are fed up,	
	especially with Chicago, <i>Boeing's</i> corporate home.	
	'There is a sense that Chicago is ruining this company,'	
	he said. 'They actually want to get to a place where	
	Boeing doesn't manufacture anything anymore. We	
	only assemble parts created around the world and then	
	they slap the <i>Boeing</i> logo on and call it a <i>Boeing</i>	
	airplane. One side is celebrating this as the future; the	
	other side is mourning it as the loss of one of the	
	greatest manufacturing companies in the history of the United States.' Goforth said he has no doubt the union	
	membership is prepared to strike. Denton, however, is not so sure the picture is as bad as Goforth likes to	
	paint. 'There is a part of me that thinks Ray is just	
	wrong and that he is exaggerating things to the	
	advantage of the union,' he said. 'I get the sense of	
	some anxiousness around the whole idea and prospects	
	of a strike For me in this process, the most	
	important thing is that I want the engineers and	
	technical staff to feel we respect them and we value them and that as a management from we have learned	
	them and that as a management team we have learned	
	lessons from the things that have caused us some	
	problems over the last couple of years.' Unlike the	
	blue-collar Machinists union, which has struck <i>Boeing</i>	
	seven times since 1948, SPEEA has been much more	
	mild- mannered. The union struck <i>Boeing</i> for 40 days in	
	2000. The union's only other walkout, for a day, was	
	largely symbolic. Goforth said the mood today is similar	
	to 2000. 'A strike is a real possibility and for the very	
	same reasons it happened in 2000,' he said. 'It was a	
	sense that Boeing corporate was not listening to them,	
	was not respecting them, was making decisions that	
	were bad for the company.' But Denton said much has	
	changed since 2000, when there was even speculation	
	by outsiders that Boeing might exit the jet-making	

				business. 'Despite the challenges today, there is a huge future for <i>Boeing Commercial Airplanes</i> ,' he said. 'It's not a question of it we build another new airplane after the 787. It's just a question of when.' <i>Boeing's</i> engineering and technical work force is bigger today than at any point in the last three decades, Denton said. The 14,000 or so SPEEA engineers and other professional workers earn an average of about \$83,000 a year. Overtime and incentive pay can push that well above \$100,000. The nearly 7,000 technical workers earn about \$68,000 a year on average. With overtime and incentive pay, the average is about \$82,000. SPEEA isn't asking for a specific percentage pay raise. Goforth said it wants 'market leading' wages, and Boeing is offering 'market average' wages. Another big issue for SPEEA is <i>Boeing's</i> use of contract engineers. Denton put the number at around 2,300 in Puget Sound. Goforth points to the 747- 8 as an example of the problems of relying too much on non- <i>Boeing</i> engineers. 'That program is falling apart,' he said. Last week, during a conference call to discuss <i>Boeing's</i> third-quarter earnings, McNerney acknowledged cost and schedule pressure on the program. Goforth said he talked recently with a 747-8 engineer, and she had not had a day off in six months. She's been too busy fixing mistakes made by Russian engineers on the 787 and could not shift them to the 747-8. He defended the use of contract engineers. They allow <i>Boeing</i> to have a more stable work force, he said. In the past, <i>Boeing</i> has had to lay off thousands of engineers after major programs have ended and during down cycles. He also noted that <i>Boeing</i> has had a difficult time hiring seasoned aerospace engineers. There are too few for market demand, he said. 'To find experience we have had to turn more to contract engineers and even then it has been very competitive,' Denton said. But Denton is optimistic. 'We have tried to underscore their (engineers and technical staff) importance to our long-term competitiveness and su	
				It's not that complex. But they (<i>Boeing</i>) are not doing the basic things you need to do to advance this process.'"	
30 Oct. 2008	Seeking Alpha, "Boeing Heading the Way of <i>GM?</i> " (Stephe n Rosenm an.	Firm- Investo r	α	"The market is celebrating the likely end of <i>Boeing's</i> strike by ramping up its share price from a low of \$40 to yesterday's closing price of \$49.80. Unfortunately, for <i>Boeing</i> , the bad news has just begun. <i>Boeing's</i> dismal Q3 earnings only captured the first three weeks of the strike. That leaves all of October without commercial aircraft work, a loss that is estimated to cost \$100 million in revenue every day. This amounts to another \$3 billion in lost revenues over October. If the proposed contract is ratified, machinists reap large pay increases, a promise of job security, and no relief for <i>Boeing's</i> burgeoning	On a modular enterpri se architec ture's under- investm ent.

	D				
	Disclos			health care costs. Moreover, Boeing still faces difficult	
	ure:			negotiations with its engineering and technician union.	
	Author			The company, already burned for a two month strike, is in	
	holds a			a tough spot. Another strike would be devastating. The	
	short			engineering union is in the driver's seat. Expect significant	
	position			concessions which will hit Boeing's bottom line. Boeing's	
	in BA)			balance sheet in Q3 did not look robust. Its \$56 billion	
				in assets includes \$3.5 billion in goodwill (nothing of use),	
				\$2.2 billion in intangibles (ditto), and \$6.5 billion in	
				pension plan over funding (not a good fall back). Take	
				away those and you get \$44 billion. Meanwhile, their	
				very real \$46 billion in liabilities should get steeper.	
				Remember that they didn't solve their cost problems -	
				health care costs, payroll - those get worse. At the same	
				time, they bled cash this October. It's a very good thing	
				that Q3 did not end October 31. I suspect a great deal of	
				their \$4 billion stash reported on their Q3 balance sheet is	
)			gone. Before the strike, the financial community was	
				worried about <i>Boeing</i> . Those problems still exist. The	
1				only change is that <i>Boeing</i> is in a worse position. The	
				787 is further delayed (2009? who knows). Every country	
				is in crisis mode. Airlines may cancel orders or negotiate	
				lower plane prices. How badly will <i>Boeing</i> suppliers be	
				disrupted by the strike and delays? A new administration	
				probably will cut their military orders. <i>Boeing</i> , like <i>GM</i>	
				and Ford, has been torched by its unions. Much as has	
				happened to Ford and GM, Boeing is going down the	
				path of increased payroll costs in the face of a	
				deflationary economy. Boeing's balance sheet is	
				eroding. While nowhere near as bad as those of Ford and	
				GM, it's starting to look weak. Boeing's Q4 balance sheet	
				should show further deterioration both on the asset	
				and liability side, not a good thing to be going into a	
				worldwide slowdown."

Lunsfor d)Progra ms, Boeing Comm ercial Airpla nessuccess in Boeing's plants was accomplished 'sometimes through sher wilpower alone' as she challenged reluctant managers and machinists to learn new ways. She led the move to convert Boeing's 737 factory into a moving production line, where as many as six of the twin-engine jetliners roll nose-to-tail through the plant in an alumance conga line. Not only has Boeing cut the time it takes to turn out a 737 by more than half from 22 days in 1999 to 10 days in 2008 the company has generated record profits while simultaneously investing billions of dollars in new products such as the 787 Dreamliner. Now in charge of Boeing's overall production, Ms. Corvi has the challenge of duplicating her 737 success on much larger jetliners, such as the widebody 777 and 747. The results so far have been mixed while engineers invent ergonomically friendly ways to do away with heavy tooling that holds these 200-ton behemoths in place while they are being pieced together. Because Boeing relies increasingly on suppliers to build larger sections of its airplanes, Ms. Corvi must also find ways to get them to buy into Boeing's successful manufacturing techniques. In an interview last year, Ms. Corvi said the one thing she liked about her job is that if's never finished. 'No matter how efficient you are today, you can always do better,' she said.''On a a architee14Seattle ncer "CustoFirmα "Back in 1995, The Boeing Co. delivered its first 777 on time - to the very day it was promised, in fact - to Unide Airlines. 	"With 787, 747-8 Roll- outs Delayed , Runway Getting Bumpy for <i>Boeing</i> " (Joseph Lazzaro)				Leonard Bauer. Bauer, not one to wax philosophic, nevertheless takes a historian's like view of Boeing's actions – and the actions of numerous other companies – in recent years. 'It's as if we decided as a nation to place all of the most idiotic, self-defeating, and economically-damaging business decisions in one decade,' Bauer said. 'Its as if the whole business community attended the wrong business school.' Boeing may ultimately end up representing the most tragic figure, Bauer says, if lower sales ensue for the commercial aviation giant. 'The Boeing case can drive you up a wall. They had no serious competition, on a product and price basis, just Airbus, which had suffered repeated delays in key programs and numerous cost overruns. And Boeing had a weak dollar against a strong euro to make its products more price-competitive. All they had to do was deliver the 787 Dreamliner on time and cost-effectively roll-out the 747- 8,' Bauer said. 'So what happens? First contractor parts delays, then design delays for the 787, a twomonth machinists strike, then roll-out dlays for the 747-8. They're squandering any advantage they had.' So far, order delays and cancellations have not piled up, but if they do, Bauer said Boeing 'will not have to look very far to identify who to blame.'	se architec ture's non- systemi c approac h; as well as a systema tic mis- understa nding of the differen ces with an integral enterpri se architec ture (i.e. a focus on executio
18 Nov. 2008	Testimo ny to U.S. Congres s	Rick Wagon er, CEO, <i>Gener</i> <i>al</i> <i>Motors</i>	Firm	α	"Mr. Chairman, I do not agree with those who say we are not doing enough to position <i>GM</i> for success. What exposes us to failure now is not our product lineup, or our business plan, or our long-term strategy. What exposes us to failure now is the global financial crisis, which has severely restricted credit availability, and reduced industry sales to the lowest per-capita level since World War II. Our industry, needs a bridge to span the financial chasm that has opened before us."	100000000000000000000000000000000000000

21 Nov. 2008	Wall Street Journal "Rival's Strike Benefits Airbus (Daniel Michael s)	Tom Willia ms, Execut ive Vice Preside nt for Progra ms, <i>Airbus</i>	Firm- Labor- Suppli er	α & β	"Airbus says it benefited from a recent strike by factory at rival Boeing Co. – not by stealing jetliner orders, but by getting aircraft suppliers to work harder for the European plane maker. During the 58-day walkout at Boeing, which ended earlier this month, overstretched suppliers that work for both companies were able to focus more on equipment for Airbus, wuch as galleys, seats and other cabin features. That relieved some pressure at Airbus, which in August warned that delays in receiving such equipent were holding up jetliner deliveries and risked reducing the number of planes completed this year. Boeing missed its second-quarter earnings projections in July partly because three big wide-body jetliners awaiting interior equipment couldn't be delivered on time. At Airbus, the tight supply pressure has abated, said its top production manager, Tom Williams, executive vice president for programs."	On a modular enterpri se architec ture's
25 Nov. 2008	Wall Street Journal, "Airbus May Cut Producti on Levels" (David Pearson)	Thoma s Enders , CEO, <i>Airbus</i>	Firm	β	"European commercial aircraft maker <i>Airbus</i> isn't ruling our the possibility it will have to slow production if the economic situation continues to deteriorate, Chief Executive Thomas Enders said. Mr. Enders called on European governments to encourage their export agencies to privde more guarantees for <i>Airbus</i> 's aircraft contracts and improve financing conditions. Governments should also provide funding for critical aerospace suppliers that are caught in the credit squeeze. <i>Airbus</i> decided a few weeks ago to freeze a planned ramp-up of its aircraft production rate ' at least temporarily ' in view of the quickly deteriorating outlook for economic activity, credit availability and airline profitability. The plane maker 'simply cannot exclude at this point' a possible cut in production levels, Mr. Enders said. 'Anything else would be irresponsible or not credible. But obviously the freeze that we have enacted right now is not enough,' he said. Speaking to French aerospace journalists late Monday, Mr. Enders stressed that the move to freeze the production ramp-up was a protective measure . If the situation changes for the better, he said, the company can reverse the move next year . But if it continues to deteriorate, he said, 'Certainly we would not exclude that we have to take further action.' <i>Airbus</i> has seen industry downturns in the past, he noted. 'We know how to cope with it. We know what our flexibility is,' he said. <i>Airbus</i> is in the middle of a cost-cutting program that will reduce its work force by 10,000, and Mr. Enders said the company has flexibility to slim down further by trimming temporary employees. 'That gives us some breathing space in a downturn scenario,' he said. 'It has turned out to be an annus horribilis, but we'll have more order intake than we predicted,' he said. 'I'd call that not a bad year,' he added. Mr. Enders indicated that <i>Airbus</i> will probably have to provide more financing to customer airlines that are having difficulty in	On an integral enterpri se architec ture's views of stability

				 obtaining credit from traditional sources. He noted, however, that the company's exposure to customer financing at the end of September was at the lowest level in more than 20 years: \$1.2 billion, compared with \$6.1 billion in 1998 and \$4.8 billion in 2003, 'so we still have some margin' to increase. Reflecting its Franco-German origins, <i>EADS</i> has two headquarters: in Paris and in Munich. Mr. Enders said he favors the creation of a single headquarters, preferably in Toulouse, France, where <i>Airbus</i> is based." 	
Nov. 2008	Flight Internat ional, "Boeing 's Enginee ring Resourc es Are Stretche d Too Thin" (Stephe n Trimble)	Firm	α	"Dealing with the latent issues created by last year's schedule reshuffling was only one of the causes for the recent delay announcement. As the 787-8 production crisis came to light from September 2007 to March 2008, senior <i>Boeing</i> executives consistently maintained that the company had enough engineering resources to solve that problem as well as keep other development efforts, such as the 747-8, on track. 'There's obviously engineering resources that have shown up late on the -8, but we found ways to work around that by accessing engineers throughout the company and external resources,' <i>Boeing</i> chairman and chief executive Jim McNerney said on 24 October 2007. That statement has been contradicted by more recent remarks from <i>Boeing</i> executives. For example, vice-president Randy Tinseth wrote on 14 November: 'The [747-8] programme has also been affected by limited engineering resources within <i>Boeing</i> .' As the 787-8 kept commercial aircraft engineers busy longer than expected last year, <i>Boeing</i> assigned engineering firms in Asia, Europe and Russia and the USA to make up for the shortfall on the 747-8F. But it did not take long for <i>Boeing</i> to realise that the distributed engineering strategy had partly backfired. It became a difficult chore for <i>Boeing</i> simply to keep track of all the work. In April, Ross Bogue, <i>Boeing's</i> new vice-president and general manager for the 747-8 and Everett site leader, said the company would change its approach for the 747-81 would use as many external engineers, but they would be concentrated in a few key hubs rather scattered all over the globe, he said. Driving demand for more engineering resources were persistent and self-perpetuating design changes caused by the new, super-efficient airfoil. To meet <i>Boeing's</i> original performance targets for the 747-8, so heig so fight and the tail section of the wing forward, but this has caused a variety of new problems. 'When we changed the wing airfoil and ultimately changed the centre of gravity on the airfoil from the aft section	On a modular enterpri se architec ture's systemi c problem s

					then the leads in the official shares of as we have to	
					then the loads in the aftbody changed, so we have to change the aft body.' While the engineers struggled to make their sums add up, the 747-8 supply chain was left waiting to adjust tooling and place long-lead orders for new materials. 'We knew which suppliers were going to make what so getting that through is the same,' Teal says. 'It's just a matter of estimating the amount of time required to get all the change in their factories.'	
25 Nov. 2008	The Daily Herald, "Boeing Finds Faulty Parts on 747, 767 and 777 Jets" (Michel le Dunlop)	Scott Carson , preside nt of <i>Boeing</i> <i>Comm</i> <i>ercial</i> <i>Airpla</i> <i>nes</i>	Firm- Suppli er	α	 The Boeing Co.'s widebody jets, except the 787, need to be inspected for faulty parts similar to the problem the jetmaker recently had with its single-aisle 737. Boeing partner Spirit AeroSystems discovered that nutplates from one of its three suppliers lacked an anti- corrosive coating. Boeing disclosed earlier this month that the nutplates, which work like fasteners, had affected its Renton-built 737 jet. The company confirmed Tuesday that its widebody jets the 747, 767 and 777 also were affected by faulty plates. 'There's a potential that every plane built since September 2007 could be affected, including all the planes in production,' Boeing's Bev Holland said. Boeing has delivered 19 747 jets, 12 767s and 82 of its 777 aircraft since September 2007. Earlier this month, Scott Carson, president of Boeing Commercial Airplanes, said that Spirit addressed the problem appropriately, bringing it to Boeing's attention. 'It shows the system is working,' Carson said. Boeing has seen several setbacks recently, including delaying the first deliveries of its 777 Freighter and 747-8 jumbo jet. The company also pushed back the first flight of its delayed 787 Dreamliner following the Machinist strike. But Carson dismissed speculation of a larger structural problem at Boeing. 'There isn't anything fundamentally broken, he said. Company spokesman Tim Healy declined on Tuesday to specify which airplane lines will remain open over the holidays for the extra work by volunteers. Boeing Machinists receive what amounts to triple time for each day worked during the holiday period. Work over the holidays for the extra work by volunteers. Boeing Machinists receive should be able to take the time off,' Healy said. Boeing engineers have been working a 'treenedous' amount of overtime, particularly in Everett, said Bill Dugovich, communications director for the Society of Professional Engineering Employees in Aerospace. About 23 percent of SPEEA engineers have been logging in more than 144 hours of overt	On a modular enterpri se architec tur'e systemi c problem s.
2	Financi	Louis	Firm	β	"Last month, Louis Gallois, EADS chief executive,	On an
Dec.	al	Gallois			suggested it was perhaps time to scrap the European	integral

2008	Times, "EADS	, <i>EADS</i> Chief			Munich. Far better to concentrate decision-making in	se
1	Rearran	Execut			one spot, and the obvious place was Toulouse - the	architec
	ges	ive			Airbus headquarters. Mr Gallois is now going further.	ture's
	Deckch	Officer			He thinks it would be a good idea to rename EADS	propose
	airs				simply Airbus. After all, Airbus is not only the group's	d
I	Ahead				flagship and biggest revenue earner, but the name has	"rationa
	of				become a globally recognised brand, far better known than	lization
	Gatheri				the cumbersome EADS acronym - short for European	"
	ng				Aeronautic Defence and Space company. He also wants to	
	Storm"				reduce the number of divisions from five to three to	
	(Paul				rationalise its activities. Indeed, many believe Mr Gallois	
	Betts)				would ultimately like to cut <i>EADS</i> down to two divisions	
					- civil and defence. This would transform its structure	
					into a mirror image of its main rival, <i>Boeing</i> , but without the US group's more even balance between civil	
					and defence activities. For this reason, Mr Gallois is still	
	2				keen to expand <i>EADS's</i> exposure to the defence sector to	
					reduce his overall dependence on Airbus. But the old	
					Franco-German frictions that have dogged EADS from	
1					the beginning are again likely to frustrate Mr Gallois.	
					Integrating defence and space activities into a single unit is	
1					likely to be blocked by both his German and Spanish	
					partners. The Spaniards are keen to gain a greater share of	
					business and are expected to resist losing their role in the	
1					A400M military transport operations. The Germans would	
1					find it difficult to agree to a French executive running a	
					new integrated defence division given that EADS is part of	
					the Eurofighter programme competing with the French	
					Dassault Rafale. And the French are bound to insist on leadership in the defence unit for strategic reasons, not	
					least the highly sensitive role of some of these activities in	
					the country's nuclear arsenal. It is hard to see Mr Gallois	
					persuading his French and German political masters to	
					agree to such a reorganisation. In any case, industry	
					analysts seem to consider these proposals a side issue. The	
1					real challenge facing the group is preparing for what	
1					many expect will be the deepest crisis that Airbus has	
1					faced in its 30-year history. As one expert warned: "It	
					is a bit like rearranging the deckchairs when the	
1					Titanic is heading for the iceberg." The big issue is how	
1					Airbus will weather the storm ahead. It still needs to sort	
1					out problems in its A380 jumbo. Its future A350 project	
1					seems to be going nowhere fast. The A400M has been delayed by about two years largely because of engine	
					problems."

3	Flight	Steven	Custo	α	"ILFC boss urges Airbus and Boeing to remove 150	
Dec.	Internat	Udvar-	mer	&	narrowbodies from 2009/10 deliveries Airbus and Boeing	
2008	ional,	Hazy,		β	should cut single-aisle production by around 10 units a	
	"Cut	Chair			month next year to avoid a glut of airliners on the market,	
	Single-	man,			warns International Lease Finance chairman Steven Udvar-Hazy, who says the airframers are 'starting to	
1	Aisle Producti	Interna tional			listen' to his pleas to reduce output. 'We are putting a lot	
	on by	Lease			of pressure on them to do something on production rates,'	
	10	Financ			he told Flight's Airline Business Daily at the Latin Airline	
	Aircraft	е			Leaders Forum in Cancun in November. 'From the June	
	a Month	Corpor			2009 to June 2010 period, if they knock out 120-150	
	Next Year:	ation			single-aisle aircraft [from the total] it would not hurt the industry,' says Hazy. 'This is only a total of five a	
	Hazy"				month on each side. If they do nothing there's going to	
	(Niall				be a surplus.'	
	O'Keeff				Although ILFC has relatively low aircraft delivery	
	e)				commitments for the next two years, it is likely that there	
					will be distressed airlines that are unable to fulfil their aircraft orders. 'There could be opportunistic transactions	
					for us to pick up some new and young used aircraft,' says	
					Hazy.	
					Airbus executive vice-president of programmes Tom	
					Williams, who predicts that the airframer will achieve a	
					net order total of 800 aircraft in 2008, says that while the <i>Airbus</i> order backlog is 'significant' at 3,700 aircraft, he is	
					'under no illusions' that the financial crisis will cause	
()					some of this to 'disappear'. A review of the business	
					situation conducted in September concluded that there was	
					some softening in the 'outer years' of the backlog, says	
					Williams, and that it was 'prudent to have a pause in the production ramp-up'. <i>Airbus</i> chief executive Tom	
1					Enders told the <i>International Herald Tribune</i> last week the	
					airframer does 'not exclude further action if the situation	
1					deteriorates'. Williams describes recent the fuel price	
1					decline as 'a doubled-edged sword' as airlines could be	
					tempted to 'hang on to older aircraft for longer'. This	
					contrasts with the situation that existed back in July at the Farnborough air show when Williams noted that although	
1					financing was a problem, the tendency to defer new	
					aircraft and retire older, less-efficient types had been	
1					dampened by spiralling fuel prices. Now the trends in the	
					finance market and fuel prices are incentivising deferrals,	

3 Dec. 2008	Flightbl ogger "Exclus ive: Airbus Dreamli ner Dossier Reveale d" (Jon Ostrowe r)	"Boein g 787 Lesson s Learnt." Docum ent was compil ed by Airbus Head of Engine	Firm- Suppli er- Compe titor	α & β	but Williams is confident that vacated delivery slots will be snapped up quickly, citing the interest in <i>Skybus'</i> recent cancellations. There is still demand for fuel-efficient aircraft with lower maintenance costs, he says. While <i>Airbus</i> single-aisle production will rise from 34 a month to 36 by December, a plan to increase it to 38 in spring 2009 and 40 by the end of December has been deemed too aggressive, as it would stretch the supply chain. <i>Boeing</i> 737 output had been averaging 30 a month in the period immediately before the machinists' strike in September." "PRODUCTION ISSUES Among the 'lessons learnt' by the European airframer, <i>Airbus</i> cites <i>Boeing's</i> challenges with beginning 787 production across the whole of its supply chain. <i>Airbus</i> believes <i>Boeing's</i> early production issues fundamentally originated in a lack of oversight on both design and assembly integration for the high level of outsourcing. All of this was further exacerbated, according to <i>Airbus</i> , by 'low-wage, trained-on-the-job workers that had no previous aerospace experience' working at supplier partners. <i>Airbus</i> believes 'inadequate supplier capability in design' contributed further, citing as an example that ' <i>Vought</i> had no engineering department when selected' by <i>Boeing</i> . Combined with an 'insufficient supply of frame, clips brackets and floor	On a modular enterpri se architec ture's low trust with employ ees and supplier s, revealin g the
	ner Dossier Reveale d" (Jon Ostrowe	ent was compil ed by			assembly integration for the high level of outsourcing. 		Burkha rd Domke and was present ed			addition, parts that did arrive complete to final assembly were 'found to be completed incorrectly' requiring additional rework in Everett. In addition, <i>Airbus</i> cites a quality assurance cycle time that was not in line with the production rate demand, as well as a 'lack of qualified non-destructive inspection / quality assurance personnel (NDI/QA) and equipment at Tier-	strategic errors.
		interna lly on 20 Octobe r 2008			2 and -3 suppliers.' With the pressure to expedite pre- assembly growing, <i>Airbus</i> believes <i>Boeing</i> and its partners chose to defer 'non-destructive inspection from its Tier-2 and -3 suppliers to Tier-1 partners.' The situation was only made more complicated by the additional deferral of NDI from its tier-1 partners	
					directly to Everett to rush major assembly. A shortage of fasteners has been a highly publicized challenge to the Dreamliner, yet <i>Airbus</i> delves deeper into the cause. The shortage, <i>Airbus</i> believes, was driven by a late redesign of a sleeved fastener for lightning strike protection that primarily impacted <i>Mitsubishi's</i> wing production. As a	
					result, Alcoa, Boeing's fastener supplier was unable to meet demand in time. Airbus says that at the time the redesign was completed, production lead-time was approximately 60 weeks, leading to 'limited availability of tailored-length fasteners.' As a result, fasteners were installed with stacks of washers as a work around for the improper length, forcing <i>Boeing</i> to publicly concede that thousands had to be removed and	

replaced to incorporate the proper design. <i>Alrbus</i> also believes the <i>Bachgy</i> fastener solution 'infringes a <i>BAE</i> patent owned by <i>Alrbus</i> , though it is not known if <i>Alrbus</i> has acted upon this alleged breach of intellectual property. WEIGHT GAIN & PERFORMANCE <i>Boeing</i> has publicly acknowledged that the Dreamliner is over its initial targeted weight, but the airframer has never specified the extent of the weight issue. An intensive weight reduction program is underway to minimize the impact on aircraft performance. Using a <i>Boeing</i> proprietary chart with additional labelling. <i>Alrbus</i> believes Dreamliner One has gained 21,696 lbb since firm configuration, which came in September 2005, three months later than initially planned. According to the chart, which appears to originate from a <i>Boeing Commercial Alrplanes</i> update that took place in April 07 2008, the significant weight growth originates from fuselage detail sizing and design, accounting for 3,250 lbs. Based on its April 2008 assessment, <i>Alrbus</i> such as weight of 4.5 tonnes higher than the original firm configuration of 95.5 tonnes. As a result, <i>Alrbus</i> estimates early 787 performance to be 6,570 km with 248 passengers in a two-class configuration, significantly legits Alar-02-00 with AlTOW of 238 tonnes, an increase in five tonney alrays and wertised by <i>Boeing</i> . Based on these <i>Alrbus</i> situates 7.670 km with 248 passengers in a two-class configuration, significantly legits than the 7,650 - 8,000 nm advertised by <i>Boeing</i> . Based on these <i>Alrbus</i> situates, this would impact launch customer <i>All</i> . <i>Night Alrows</i> anaxiums entry would offer an A30-200 with AlTOW of 237 sales by offering an A30-200 with a AlTOW of 238 tonnes, an increase in five tonnes, to blut the record 787 sales by offering an A30-200 with a base speculates that a 227.9 tonne. MTOW 787-8 variant will be introduced beginging with LO30. The report cits a photocopied <i>Baeing</i> proprietary document from a <i>Baeing</i> source dated Augus 2008' that baws beciales that both the center wing b	
patent owned by <i>Airbas</i> , 'hough it is not known if <i>Airbas</i> has acted upon this alleged breach of intellectual property. WEIGHT GAIN & PERFORMANCE <i>Boeing</i> has publicly acknowledged that the Dreamliner is over its initial targeted weight, but the airframer has never specified the extent of the weight issue. An intensive weight reduction program is underway to minimize the impact on aircraft performance. Using a <i>Boeing</i> proprietary chart with additional labelling. <i>Airbus</i> believes Dreamliner One has gained 21,050 lbs since firm configuration, which came in September 2005, three months later than initially planned. According to the chart, which appears to originate from a <i>Boeing Commercial Airplanes</i> update that took place in April 0 2008, the significant weight growth originates from fuselage detail sizing and design, accounting for 3.250 lbs. Based on its April 2008 assessment, <i>Airbus</i> expects the initial production 787s to have a maximum empty weight of 4.5 tonnes higher than the original firm configuration of 95.5 tonnes. As a result, <i>Airbus</i> estimates carly 787 performance to be 6.370 nm with 248 passengers in a two-class configuration, significantly less than the 7.650 + 8,000 mm advertised by <i>Boeing</i> . Based on these <i>Airbus</i> estimates, this would impact launch customer <i>All Nippon Airways</i> and Chinese airlines primarily. In September, <i>Airbus</i> sanounced it would offer an A330-vith comparable range to the initial 787 deliveries. At the time, Dereck Daviss, Investor Marketing Director for <i>Airbus</i> defined 'initial deliveries' as the first 20 787s that complete final assembly with a MTOW of 219.5 tonnes. Davies appeared to be quoting information used to create this intelligence briefing. <i>Airbus</i> speculates that a 227.9 tonne MTOW 787-8 variant will be introduced beginning with LN20. The report cites a photocopied <i>Boeing</i> proprietar document from a ' <i>Boeing</i> source dated August 2008' that shows 'a revised airframe supporting this weight and Rolls-Royce Trent 1000 engines are rumoured to have mi	replaced to incorporate the proper design. Airbus also
has acted upon this alleged breach of intellectual property. Based on these Airbus estimates, this would impact launch customer All Nippon Airways and Chinese airlines primarily. In September, Airbus amounced it would offer an A330-200 with a MTOW of 238 tonnes, an increase in five tonnes, to blunt the record 787 sales by offering an A330 with comparable range to the initial 787 deliveries. At the time, Derek Davies, Investor Marketing Director for Airbus, defined 'initial deliveries' as the first 20 787s that complete final assembly with a MTOW of 219.5 tonnes. Davies appeared to be quoting information used to create this intelligence briefing. Airbus speculates that a 227.9 tonne MTOW 787-8 variant will be introduced beginning with LN20. The report cites a photocopied Boeing proprietary document from a "Boeing source dated August 2008' that shows 'a revised airfame supporting this weight increase. This includes strengthening of the outboard wing, the center wing box, the wing leading edges, the MLG wheel well, and the center fuselage as well as enhancing manoeuve load alleviation'. Though Airbus believes that bot	is over its initial targeted weight, but the airframer has
minimize the impact on aircraft performance. Using a Boeing proprietary chart with additional labeling. Airbus believes Dreamliner One has gained 21,050 lbs since firm configuration, which came in September 2005, three months later than initially planned. According to the chart, which appears to originate from a Boeing Commercial Airplanes update that took place in April of 2008, the significant weight growth originates from fuselage detail sizing and design, accounting for 4,300 lbs, as well as wiring and installation, accounting for 3,250 lbs. Based on its April 2008 assessment, Airbus expects the initial production 787s to have a maximum empty weight of 4.5 tonnes higher than the original firm configuration of 95.5 tonnes. As a result, Airbus estimates early 787 performance to be 6,370 nm with 248 passengers in a two-class configuration, significantly less than the 7,650 - 8,000 mm advertised by Boeing. Based on these Airbus estimates, this would impact launch customer All Nippon Airways and Chinese airlines primarily. In September, Airbus announced it would offer an A330-200 with a MTOW of 238 tonnes, an increase in five tonnes, to blum the record 787 sales by offering an A330 with comparable range to the initial 787 deliveries. At the time, Derek Davies, Investor Marketing Director for Airbus, defined 'initial deliveries' as the first 20 787s that complete final assembly with a MTOW of 219.5 tonnes. Davies appeared to be quoting information used to create this intelligence briefing. Airbus speculates that a 22.79 tonne MTOW 778-8 variant will be introduced beginning with LN20. The report cites a photocopied Boeing proprietary document from a 'Boeing source dated August 2008' that shows 'a revised airfarme supporting this weight increase. This includes strengthening of the outboard wing, the center wing bissue'. In addition, Airbus believes that both the center fuselage as well as enhancing manoeuve load alleviation. Though Airbus specific fuel consumption targets by 2-3% and 3-4% respectively. 'We've conti	never specified the extent of the weight issue. An

248 passengers in a two-class configuration, significantly less than the 7,650 - 8,000 nm advertised by Boeing. Based on these Airbus estimates, this would impact launch customer All Nippon Airways and Chinese airlines primarily. In September, Airbus announced it would offer an A330-200 with a MTOW of 238 tonnes, an increase in five tonnes, to blunt the record 787 sales by offering an A330 with comparable range to the initial 787 deliveries. At the time, Derek Davies, Investor Marketing Director for Airbus, defined 'initial deliveries' as the first 20 787s that complete final assembly with a MTOW of 219.5 tonnes. Davies appeared to be quoting information used to create this intelligence briefing. Airbus speculates that a 227.9 tonne MTOW 787-8 variant will be introduced beginning with LN20. The report cites a photocopied Boeing proprietary document from a 'Boeing source dated August 2008' that shows 'a revised airframe supporting this weight increase. This includes strengthening of the outboard wing, the center wing box, the wing leading edges, the MLG wheel well, and the center fuselage as well as enhancing manoeuvre load alleviation.' Though Airbus speculates that the increased MTOW 'might also conceal a major impact of the center wing issue.' In addition, Airbus believes that both the General Electric GEnx-IB and Rolls-Royce Trent 1000 engines are rumoured to have missed specific fuel consumption targets by 2-3% and 3-4% respectively. 'We've continued to make tweaks to the engine and we will make fuel spec when we reach entry into service,' GE said. Rolls-Royce did not return calls seeking comment.

Trent 1000 low-pressure turbine could require Dreamliner	
One to switch to GEnx engines. Though, a 787 programme	
source confirms that Rolls-Royce compatible pylons had	
been recently reinstalled on Dreamliner One.	
RAMPUP FORECAST	
As far back as May 2003, Airbus had at its disposal the	
internal 787 (then 7E7) production guidance, when,	
according to the document, Boeing anticipated a peak	
production rate of seven 787s per month by 2010.	
However, by October 2005, with the order book	
swelling, <i>Boeing</i> shifted to a more aggressive ramp up	
with greater than 10 787s being produced per month	
by 2011. According to <i>Airbus, Boeing</i> upped its	
production guidance again in February 2007 as the 787	
order book climbed towards 500 to meet a rate of 10	
787s per month by the start of 2010. With the 787	
delays taking a toll on the projected ramp up, Boeing	
scaled back its delivery guidance in April 2008 to	
achieve rate 10 by 2012, two years later than planned.	
Airbus' own estimate, dated September 2008, of 787	
production does not have Boeing reaching rate 10 until	
2015. Airbus also cites one airline source that was,	1
'Advised by <i>Boeing</i> that the production ramp-up would be	
patterned after what was achieved with the 777 program.	
This would mean that only a rate of 7 would be achieved	
in 2012.' Airbus cites the supply chain as the central	
constraint to achieving a higher production rate, even	
as Boeing is being encouraged by customers to build a	
second final assembly line. Airbus believes partners	
Kawasaki, Alenia and Hawker de Havilland are	
investing in new production equipment to support the	
ramp up, while Spirit AeroSystems, Vought and Global	
Aeronautica are preparing for a more gradual ramp	
up. Also detailed in the report is <i>Boeing's</i> relationship	
with wing producer Mitsubishi Heavy Industries, which	_
Airbus believes has only committed to rate 7 for wing	
shipments with a factory sized for rate 10. The report	
adds that, 'Any plan to increase to rate 10 put on hold	
due to differences with <i>Boeing</i> over financing' and that	
'MHI did have a preliminary order for additional	
tooling which was cancelled' with 'no intention to	
invest in production beyond rate 10.' Airbus speculates	
privately on the future of <i>Boeing's</i> San Antonio facility	
intended for refurbishment of the first 20 787s,	
pointing out that the 'Site is on seven year lease, what	
for?' Within this supply chain constraint is a central	
question of the fundamental material choices Boeing	
selected for the 787. The monolithic carbon fibre fuselage	
barrels are produced by tightly wrapping, or laying-down,	
uni-directional carbon tape around a mold. <i>Airbus</i> believes	
the tape lay-down rates are a central pacing item to a	
robust production ramp up. Airbus analyzed a public	
lecture given on 13 November 2007 by Al Miller, 787	
Director of Technology Integration, regarding the	
Dreamliner at University of Washington. Airbus recreated	

a graph by Mr. Miller detailing the material lay-do rates. His chart assumed material could be laid-down w a 2006 demonstrated rate of 80 lbs/hour with a sing head machine. However, <i>Airbus</i> competitive intelliger tells a different story. <i>Airbus</i> believes that <i>Boe</i> suppliers were actually only able to lay-down 8-9 lbs/ho at the time production began in 2007 and had gradue increased to 19 lbs/hour . <i>Airbus</i> expects the rate increase to 30 lbs/hour once a dual-head machine arriv well below the initial goal of 100 lbs/hour with a sing head machine. <i>Airbus</i> cites <i>Spirit</i> , a tier-one structur partner on the 787, as the source of this actual lay-do rate data. <i>Spirit</i> is a major structural partner on the A3 XWB programme, responsible for the fabrication Section 15, the central fuselage composite structure, a new facility being built in Kinston, North Carolina. T A350 XWB competes directly with <i>Boeing's</i> 787 and 7 aircraft. When approached for comment, <i>Spirit</i> says it unsure of how <i>Airbus</i> obtained this information and add that the company 'takes great measures to protect intellectual property of our customers.' For the compose A350 XWB, <i>Airbus</i> selected a composite panel desi rather than the 787s monolithic design for its fusela sections.	ith le- ince ing our Illy to es, le- ral wn 50 of t a he 77 is ed che ite gn
LOOKING AHEAD TO 787-9 Airbus completes its analysis of the 787 programme with look at the future of the Dreamliner in the 787-9. The airframer examines the larger 787-9 variant that we follow the 787-8 with an entry into service in 2012. Aird believes Boeing will design significant performant improvements into the -9 that will then be incorporated into a major block point change around LN100 for the 8.	the vill us icce eed

	uiij				head of engineering intelligence at <i>Airbus</i> , and presented	media's
					internally on Oct. 20 digs deeply into <i>Boeing's</i>	percepti
					development process. It examines nearly every aspect of	on of
					the 787 program, including the design of the aircraft's	the 787.
	1				wings, fuselage and engines. It provides succinct	
					summaries of the program's parts shortages, fastener	
					issues, quality control concerns and other production	
					woes. Even seemingly mundane issues like the plane's in	
					flight entertainment system are chewed over.	
					Elistet lagger hashe the stars this stars on a for writer	
					Flightblogger broke the story this afternoon after writer Jon Ostrower, who has made a name for himself	
					reporting on the inner workings of <i>Boeing</i> , obtained a	
					copy of the report from a source he declined to identify.	
					Ostrower told us shortly after posting the dossier that it is	
					unprecedented in scope. 'To my knowledge, there has	
					never been a comprehensive analysis of an airliner like	
					this,' he said. 'It looks at every angle of the program,	
					and analyzes it on a very granular level.' What makes	
					the breadth of the report so impressive is the fact Boeing is	
					still developing the 787. How did Airbus get its hands on	
					so much data about a plane relatively few have seen and	
					no one's flown. Ostrower says Airbus obtained	
					proprietary data and quizzed sources throughout	
					Boeing's global supply chain. 'One page explicitly cites	
					Spirit Aerosystems, which makes the 787 nose, as the	
					source of information about material laydown rates,' Ostrower told us, adding that <i>Spirit</i> claims to have no idea	
					how <i>Airbus</i> got its hands on the information. Ostrower is	
					even more intrigued by what appear to be seven slides	
		8			marked ' <i>Boeing</i> Proprietary" and written in a format used	
					in <i>Boeing's</i> internal presentations. 'How did they get	
					those?' he asks. "That's a big deal."	
					Boeing is keeping mum until it sees the Airbus dossier,	
					Ostrower writes in his post, and Airbus told him the	
					presentation and its intelligence gathering methods are	
					perfectly legal. Ostrower says the Airbus report will	
					force <i>Boeing</i> to take a hard look at the non-disclosure	
					agreements it has with suppliers and examine the	
					security of its information networks. But in the grand	
					scheme of things, he says, the Airbus report is good	
			с.		news for <i>Boeing</i> . 'Sure, short term there are going to be	
					some questions about how the information was obtained,'	
					he told us. 'But take a look at the document. Nowhere	
					does it say that the program isn't going to work or that	
					the plane isn't going to fly. At the end of the day, the	

4 Reuters, Dec. "The Boeing Company is expected to announce further delays to its new 787 Decaminer next week, or shortly after, when it takes into account the damage of a two- month strike by its machinists and a number of architec Image: I		1			report is a vindication of the program."	
Dec. "Boeing Set to Amoun ce New 787 delays to ifs new 787 Dreamliner next week, or shorty- after, when it takes into account the damage of a two- set month strike by its machinists and a number of production problems nagging at the program. The U.S. article strike plane maker has already said the first 787 test flight wort the over the original target. The latent is over the original target. The latent delay will be the fourth major schedule slip on the airplane, severely testing the goodwill of Boeing's dout two years after the original target. The latent delay will ab the fourth major schedule slip on the airplane, severely testing the goodwill of Boeing's customers and the faith of Wall Street analysts, both at a further delay will also seriously upset customer airlines, leading to deferrals of orders or ouright cancellations. A number of problems have beset the program, from shortages of bolts to hold the plane together, to software glitches and shoddy work from suppliers. But the real issue, according to industry experts, is that <i>Boeing</i> 's bait to use of more almost all production of the plane's structure and components has backfired because suppliers without <i>Boeing</i> 's long engineering experience simply could not do the job well enough, and rushed to meet deadines. 'It was over-ambition from the word go,' said Richard Aboulafia, an analyst at consulting firm <i>Teal Group</i> . 'The problem with an unrealistic schedule, the more difficult the remedial action needs to be to get things right', said Aboulafia. The plane is also heavier than it was designed to be, which poase a problem for <i>Boeing</i> still doesn'f have the is anso norther <i>Bry</i> program,'said industry consultant Scott Hamilton in a recent commentary on the issue. Boeing sid at the end of the machinist strike in early November that it would updata lits delivery schedules, but it hash't said when that would happen. 'We are currently conducting an assessment of our program schedule and when	4	Routors	 Firm	a		On a
2008 Set io norm after, when it takes into account the damage of a two- ex New 787 enterprise Delays" (Bill Rigby) after, when it takes into account the damage of a two- production problems nagging at the program. The U.S. plane maker has already said the first 787 test flight wort industry-watchers think first deliveries of the carbon- composite plane wort take place until well into 2010, about two years after the original target. The latest delay will be the fourth major schedule slip on the airplane, severely testing the goodwill of <i>Boeling</i> is that a further delay will also schedule slip to the which championed the fuel-efficient plane early in its development. But the main risk for <i>Boeling</i> is that a further delay will also schedule slip on the software glitches and shoddy work from suppliers. But the real issue, according to industry experts, is that <i>Boeling</i> 's plan to outsource almost all production of the plane's structure and components has backfired because suppliers without <i>Boeling</i> 's long engineering experience simply could not do the job well enough, and rushed to meet deadlines. 'It was over-ambition from the word go', said Richard Aboulafia, an analyst at consulting firm <i>Teal Group</i> . 'The problem with an unrealistic schedule is that it was over-ambition from the word go', said Richard Aboulafia, an analyst at consulting from <i>Teal Group</i> . 'The problem with an unrealistic schedule is the more difficult the remedial action needs to be to get thing right', said Aboulafia. The plane is also heavier than it was designed to be, which poses a problem for <i>Boeling</i> hitting the market- changing range and fuel-efficiency promises it made to customers, and could prease further delays. actual profit comes from its credit operations, not its manufacturing work. But the GE model prevails at	
manufacturing work. But the GE model prevails at	
<i>Kooing</i> which means that worrying over short-term	
<i>Boeing</i> , which means that worrying over short-term costs trumps building for long-term survival. Had	
previous CEO Harry Stonecipher been able to follow	
his own ethics rules, <i>Boeing</i> would now be a dying	
company. He once bragged to me that he had made	
McDonnell-Douglas profitable without selling any	
airplanes. Not actually selling any of your product isn't a	
strategy, unless your goal is to go out of business.	
Stonecipher has been replaced by another GE disciple,	
James McNerney, who does at least seem to realize that	
you have to sell the product to stay in business. He may	
not value his current employees any more than Boeing	
ever has, however. Boeing argues that it has to	
outsource work in order to sell planes, which doesn't	
actually explain sending work to South Carolina. At	
the same time, the company effectively doesn't let its	I
own workers bid on those jobs, and then often spends a	
lot of money paying its workers to fix others' mistakes.	
This isn't a new phenomena, and <i>Boeing</i> engineers'	
mistakes on 787 fasteners show its persistence.	
Machinists' strikes routinely cost the company more	
money than simply meeting the Machinists' demands	
would have cost. But unions force companies to	
actually manage, and too many executives dislike	
having to treat their employees like something more	
than automatons. The same is true with layoffs. The	
production write-downs in the mid-1990s cost the	
company far more than laying off fewer workers in the	
early 1990s would have cost them, since having more	
experienced workers on hand likely would have	
negated the production problems."

	Dump			extraordinary because Boeing has a huge backlog of	percepti
	Boeing			aircraft orders. It might have given a little more to the	ons of
	Manage			union to avoid delaying the delivery of those planes and	Boeing'
	ment"			the customer discontent which accompanies it. Boeing	S
	(Dougla			management took to the ramparts and fought the	problem
	s A.			machinists. It may have saved some money over the	S
	McIntyr			three-year contract it cut, but it now seems certain that	
	e)			the incident and problems with parts will delay the	
	0)			delivery of its 787 Dreamliner again. This may push the	
				launch of the first plane out another six months. The	
				project had been delayed three times. Now, that will move	
				up to four.	
				According to The Wall Street Journal, In a recent	
				interview, Virgin Atlantic Airways Chief Executive Steve	
				Ridgeway voiced customers' growing frustration.	
1				'We're pretty fed up,' he said. 'We've got no clarity	
1				from Boeing.' The 787 trouble could well force some of	
1				Boeing's revenue into later quarters, undermining its	
				financial results. It could certainly put customers in a	
				position to ask for very large penalties for the late	
1				deliveries. Flying their older planes costs them more in	
				fuel and the opportunity to more efficiently configure their	
				fleets. <i>Boeing's</i> shares have dropped from a 52-week high	
				of over \$93 to \$39. That means they have fallen by over	
				55% during a period that the DJIA is off 35%. Almost	
				all of the plunge has been caused by poor labor	
				relations and bad sourcing and controls of components.	
				In other words, particularly poor management. Under	
				most circumstances, trouble at these levels causes a	
				board to make changes. At Boeing, now would be a	
				good time."

	1			Boeing is using new carbon composites instead of	
				aluminum in much of the 787, adding complications to a new manufacturing process. Suppliers in the U.S., Italy and Japan are supposed to build 70 percent of the plane and to ship completed sections to Boeing's Everett, Washington, factory for final assembly. The different languages and time zones involved hampered communication and stymied <i>Boeing's</i> ability to fix problems that cropped up, Joseph Campbell, an analyst with <i>Barclay's Plc</i> in New York, said in an interview yesterday. 'This program now has reached a level of delays and things going wrong that are really frustrating and beyond expectations' for both observers and long-time <i>Boeing</i> engineers, said Campbell, who has analyzed the company since the early 1980s. 'It's out of character for <i>Boeing</i> . Normally <i>Boeing</i> prides itself on being on- time and will overrun its budget in order to be on time.'"	
11 Dec. 2008	Bloomb erg "Boeing Delays Dreamli ner to 2010, Shuffles	Firm	α	"The jet won't fly for the first time until next year's second quarter, in part because factories were idled for eight weeks by a machinists' strike and some fasteners had to be replaced, Chicago-based <i>Boeing</i> said today. The company also shifted managers and created a new position to monitor operations by suppliers , who were blamed for previous delays.	On a modular enterpri se architec ture's systemi c
	Manage rs" (Susann a Ray)			'Not only is the timeline realistic, but the new organizational structure makes a lot of sense,' said Howard Rubel, a New York-based analyst with Jefferies & Co. who has a 'buy' rating on the stock. 'It's like deja vu, all these things coming back to haunt us fasteners, flight-testing concerns and further delivery	problem s
	0405			delays,' Rob Stallard, an analyst at <i>Macquarie Research</i> <i>Equities</i> in New York, said in an interview. His research note today was titled the '7 Late 7.'"	
11 Dec. 2008	Market Watch "Boeing Again Delays 787 Shakes up Jet Divisio n" (Christo pher Hinton)	Firm	α	"Boeing Co. restructured its commercial-airplanes division on Thursday, following an announcement that it would have to postpone the launch of its flagship 787 Dreamliner for a fifth time because of problems within its supply chain and the recent machinists' strike. In November, the Chicago manufacturer also announced delays in its 747-8 deliveries for the same reasons. On her way out was Carolyn Corvi, 57, in charge of airplane programs and responsible for streamlining the commercial division's supply chain. Boeing said the 34-year veteran will retire at the end of the year. Effective immediately, Boeing said that commercial	On a modular enterpri se architec ure's systemi c problem s, and apparen t blame attribute d to an
				airplanes-supplier management, fabrication and propulsion systems, as well as the manufacturing and quality groups will be part of a new organization, called supply-chain management and operations. Ray Conner, 53, who recently was vice president of commercial sales, will lead	d to an integral enterpri se architec

	the new group. Further, all current production and	t.
	development programs will be brought under a new	
	airplane-programs organization, headed by Pat Shanahan.	
	The new group includes the 787 program, previously run	
	by Shanahan. That looks like a well-deserved	
	promotion for Shanahan, 46, who they credit for	
	making progress with the 787's technical execution,	
	analysts said. Shanahan brought to the program	
	supply-chain management skills it needed, honed	
	during his tenure at the company's missile defense unit.	
	'The steps we are taking today will sharpen our	
	management focus and bring our organizational structure	
	to bear to improve execution in our supply chain, as well	
	as on our development programs,' Scott Carson, president	
	and chief executive of Boeing Commercial Airplanes, said	
	in a statement. The shakeup did little for Boeing's	
	stock, however. At last check it was down 1.3% to	
	\$41.14. Year to date, Boeing stock is down more than	
	50%, pummeled by concerns over the troubled financial	
	markets, slowing air traffic, a loss of defense revenue, the	
	machinists' strike, and delays in its 787 program. Boeing	
	said separately Thursday that the first deliveries for its 787	
	Dreamliner would now occur in the first quarter of 2010,	
	postponed from its most recent target of third-quarter 2009	
	about two years behind its original schedule. Industry	
	analysts have been highly critical of the 787 delays,	
	accusing the company of allowing sales and marketing	
	for the aircraft run too far ahead of its development	
	and technical execution, raising expectations it is now	
	struggling to meet. Further, it has tarnished the	
	company's reputation, raising comparisons to its rival	
	Airbus, which wrestled for years with delivery delays of	
	jumbo jetliner, the A380. The development of any new	
	aircraft can run into delays, said Jon Kutler, an industry	
	analyst and chief executive of Admiralty Partners. 'But	
	the A380 delays were so damaging to Airbus'	
	reputation that you'd think Boeing would have taken	
	every opportunity to do things differently,' he said.	
	Thursday's announcement marks the program's fifth delay	
	and raises concern that customers will demand more	
	penalty compensation, or even back out of their orders	
	entirely, at a time with air traffic is weakening. But to date,	
	only one order has been canceled due to the	
	postponements. 'I don't expect airline customers to cancel	
	their 787 orders,' Macquarie Research equities analyst	
	Rob Stallard said in an interview. 'The soft demand	
	environment at the moment is probably a helpful	
	coincidence in some cases, though I suspect that the	
	airlines would rather be making this decision on deferred	
	capacity themselves, rather than it coming from <i>Boeing</i> .'	
	Stallard added that some of Boeing's early customers	
	already have maxed out their contractual	
	compensation, and more recent customers are most likely	
	to seek compensation in the form of an interim aircraft,	
	such as a cheap 767. Boeing said it wasn't company policy	
	to discuss the compensation. Douglas Harned, an	
• • • • • • • • • • • • • • • • • • • •		

11	Internal	Scott	Firm	α	aerospace analyst with <i>Bernstein Research</i> , lowered his rating for <i>Boeing</i> on Thursday to market perform from outperform on anticipation that the delay could be pushed out to beyond mid-2010. 'Management has set several timelines that have broken, and we do not yet see evidence that the next one will hold,' Harned wrote to investors. 'We are concerned that there is no longer a clear bound on program risk.' Speculation that the 787 would see its fifth delay began soon after the machinists' strike came to an end in October, with customers and suppliers saying they didn't think a first delivery could possibly happen on time."	On a
Dec. 2008	Boeing Email	Carson , CEO Boeing Comm ercial Airpla nes			As you know, we currently have a record jetliner backlog, while at the same time we have encountered challenges in our airplane development programs and within our supply chain. The current economic slump is further compounding difficulties for our customers, who urgently need the newest and most efficient jetliners to help them succeed in today's dynamic and competitive environment. Today we are announcing a series of leadership changes and a restructuring to better align resources across development programs and strengthen our oversight of the global supply chain. • Carolyn Corvi, who previously led Airplane Programs, has decided to retire at the end of December after a 34-year Boeing career. Carolyn has been a driving force behind the company's successful implementation of lean production techniques. On behalf of everyone at Commercial Airplanes and the entire Boeing enterprise, I want to thank Carolyn for her outstanding vision and leadership in transforming our production system and dramatically improving our production system and dramatically improving our productivity throughout her career. • Ray Conner is named vice president and general manager of a new organization, Supply Chain Management, Fabrication, Propulsion Systems and the Manufacturing and Quality functional organization. Ray brings years of experience in sales, program management, manufacturing and supply chain manager of a restructured Airplane Programs organization. Pat reports directly to me, and his organization. Pat reports directly to me, and his organization is responsible for all current commercial airplane production and development programs, including the 787 and 747-8. Pat has an excellent track record as a program management executive in both Commercial Airplanes and Integrated Defense Systems.	modular enterpri se architec t's loss of its integral architec t.

		 		The new Airplane Descuence and Sumply Chain	
				 The new Airplane Programs and Supply Chain Management and Operations organizations will work together closely to drive lean initiatives, productivity and execution throughout the entire global value chain. The ultimate goal is to deliver value to our customers and protect our competitiveness in this challenging market environment. In addition, we're announcing the following leadership changes: Scott Fancher, who previously was vice president and general manager of IDS Missile Defense Systems, is named vice president and general manager of the 787 program, reporting directly to Pat Shanahan. Scott brings demonstrated leadership in program management, systems integration and technology development to the 787 program. Marlin Dailey is named vice president of Sales for Commercial Airplanes, replacing Ray Conner. Marlin, who most recently led the Commercial Airplanes Sales efforts in Europe, Russia and Central Asia, reports directly to me. All of these appointments reflect great depth and strength in our management team and position us for continued success. I look forward to the leadership of these individuals, and I'm counting on your support as we free the oballonge and appearent vision. 	
				face the challenges and opportunities in the year ahead.	
12 Dec. 2008	Bloomb erg "Boeing 's '7- Late-7' Dreamli ner Takes As Long As Pioneeri ng 707" (Susann a Ray)	Firm	α	Scott." "Boeing Co.'s latest delay means the 787 Dreamliner will take almost as long to develop as the planemaker's original model that ushered the U.S. into the Jet Age more than a half-century ago. The schedule Boeing announced yesterday would start 787 shipments to airlines in 2010, almost six years after the first order. That's about two years more than the average for other Boeing planes and rivals the six years and two months spent on the 707 in the 1950s. That aircraft, which started out as the Dash 80, was the forerunner of the more than 16,000 commercial jets the company has built since. Punsters have had their way with the 787 Dreamliner amid the four delays since October 2007: It's the '7- Late-7' and the 'Lateliner' in reports by Rob Stallard, an analyst in New York with Macquarie Research Equities. Newspapers including London's Daily Telegraph quipped about the Dreamliner turning into a nightmare. Chicago- based Boeing has lost 60 percent of its market value since the first delay. 'The 787 has seriously undermined the confidence that all stakeholders nreviously had in Boeing.' Stallard said in an e- mail	On a modular enterpri se architec ure's systemi c problem s
				previously had in <i>Boeing</i> ,' Stallard said in an e- mail interview. 'We think it will take a very long time to overcome the erosion to goodwill that has occurred.' The Dreamliner 'will be a phenomenal leap, but not without its problems,' said spokeswoman Liz Verdier in	

				Seattle, where <i>Boeing</i> has built commercial aircraft for almost a century. The Dash 80 made its first flight from Renton Field, south of Seattle, just two months after it rolled from the factory in 1954. The Dreamliner, in contrast, now isn't expected to have its first test flight until next year's second quarter, almost two years after it was unveiled to the public. <i>Airbus</i> has also suffered program delays, with its 525-seat A380 needing almost seven years before its first delivery last year. The superjumbo jet completed a test flight just three months after its roll-out, however, and encountered setbacks only once it entered production. 'The Dreamliner delays are likely to be as bad as the A380, or as some people called it, the A-3-Turkey,' said Richard Aboulafia, an analyst with aviation consulting firm <i>Teal Group</i> in Fairfax, Virginia. 'But it entered service successfully, and so will the 787.'''	
12 The Dec. Chicag 2008 Tribun "More 787 Heada hes f Boeing (Julie Johnss n)	e Cor	Firm- Custo mer	α	"Boeing Co. confirmed Thursday that its first 787 Dreamliner is again off course and won't be delivered to launch customer All Nippon Airways until the first quarter of 2010, nearly two years later than planned. But some in aviation circles question whether Boeing is setting itself up for even more delays. Chicago-based Boeing said the largely composite commercial jet won't make its first flight until the second quarter of 2009, a timetable that leaves it just nine months to complete flight-testing. One major 787 supplier told the Tribune that Boeing is more likely to need 12 months to gain certification for the all-new jet and to fix any problems unearthed during the flight-test program. Boeing's last new line of jets, the 777, required 11 months of test flights. 'It's going to take at least a year between first flight and first delivery,' said Richard Aboulafia, aerospace analyst with Teal Group, a Virginia-based consulting and market research firm. 'Of course, the production ramp-up schedule is going to suffer.' Boeing spokeswoman Yvonne Leach said the flight plan 'is aggressive,' but added that Boeing planned to operate flights around the clock, employing a platoon of more than 34 pilots. Boeing also has been extensively testing the aircraft and its components as the first planes wind through production. The string of delays is turning the Dreamliner into a nightmare for customers like Japan-based ANA, which had been counting on the aircraft to spur growth and cut fuel costs. Like other customers, ANA assumed the first aircraft would miss the latest delivery deadline of mid- 2009, given the strike that shuttered Boeing's production for nearly two months, the slow pace at which production has resumed and the discovery that thousands of fasteners on the first aircraft would have to be reinstalled. The greater concern, Mineo Yamamoto, chief executive of ANA, told the Tribune on Thursday how badly delayed subsequent 787s will be. Boeing has 895 of the planes on order, and analysts expect its production to be di	On a modular enterpri se architec ture's systemi c problem s.

			such savings will be much harder to achieve if Airbus has to trim production in a downturn, because fixed costs such as buildings and equipment will account for a higher percentage of total expenses. Airbus already has said it will postpone a planned increase in production rates, and CEO Tom Enders said last month the company could take 'further action if the situation deteriorates.' Evolution's Cunningham thinks production cuts are	
17 <i>Aimuina</i>	Firm	a	inevitable, as he predicts annual aircraft deliveries worldwide will fall as much as 50% from 2009 to 2013. What's more, the dollar is now weakening again."	On
17 Airwise, Dec. "Boeing 2008 , Airbus Seen Facing Mass Order Deferral s	Firm- Custo mer	α	"Boeing and Airbus could see up to 70 percent of the planes in their order book pushed back by struggling airlines as the global economic crisis puts a strangle hold on the recently booming travel industry, a leading analyst said this week. 'In terms of orders suddenly turning out to be firm as [jelly], that could be anywhere between 30 percent and 70 percent (of the backlog),' Richard Aboulafia, an analyst at <i>Teal Group</i> , told the Reuters Aerospace and Defense Summit in Washington. 'We are seriously in uncharted territory.' 'I'm not terribly worried about 2009; it's 2010 when we'll begin to see a shift,' said Aboulafia. 'Production cuts are inevitable after 2010,' said Aboulafia, as it will not be possible for airlines to put into service the thousands of new planes scheduled to be delivered, in the face of falling traffic numbers. Others in the industry who have a vested interest in the health of the plane production business have a more optimistic outlook. 'Most pundits talk about a tougher year next year, with air traffic flat to down a little bit, calling into question some deliveries,' Stephen Finger, president of jet engine maker Pratt & Whitney, told the summit. 'I don't think the delivery issue is as pronounced as some people worry it might be.' Airlines could bounce back from the downturn quicker than some expect, said Finger, keeping demand for new planes relatively strong. 'I don't dispute the flat-to-tough marketplace, but the optimist in me says we might see something by the second half of next year, with low oil prices,' said Finger. If airlines can get back into profit by next year, that would 'shore up the basics of aircraft acquisition,' Finger added, implying that deferrals and cancellations would not hit plane makers too hard. The coming dip in travel will not drastically affect plane makers in the long term, Tom Captain, leader of <i>Deloitle's</i> Aerospace and Defense practice, told the summit. 'The data says we are facing some rain clouds, but the longer term forecast is for 5 percent	On tempora l inconsis tencies in analysts of modula enterpri se architec tures. 					"Daria	
1					"Bogie,	
					I finished reading your essay for the second time. I get	

	more angry every time I think of the down hill slide of a once World Class touchstone. I would send your letter to all of the people you mentioned. Maybe it will cause someone to take some action. I think most of us who have been involved in new programs keep assuming that certainly they will do the right thing, but they aren't going to. It is amazing how the culture at a company can change so dramatically in such a short time and never recover. What a case study for MBA schools." "I don't know where you get the time to put something like this together but you hit the "nail on the head". I have great concern about the future of "our" <i>Boeing</i> , our state and our country. It looks like that generation of no failure,	
	I am owed, and no fault has arrived. I pray that my grandkids are listening and learning their lessons well."	
	"Hello Robert.your recent summary of everything that has gone wrong in recent years is truly amazing,very well done,a real eye opener and heartbreaking all at the same time.how could such a great company fall so far in such a relatively short time? This current report is so rediculous it's hard to understand how a general manager's concept of accomplishment could be so far off the mark.Does <i>boeing</i> still have a core objective to design and build the best enginerred,manufactured and delivered airplanes in the world? How do you think we would have faired if we had put out a report like that? Keep up the good work."	
	"Bob, when ready, your documents have to get in McNerney hands. It is powerful - much broader than mine. He has got to know the rest of his programs are in trouble. You started something- I am happy to participate - it is worthwhile. Do not give up"	
	"Bob, As always, you've cut through the fog and BS and said it like it is – just like Blue, Wilson, Sutter, Paul Sandoz, Ev Webb and all the others taught us! You ought to get an Oscar for this one. In trying to think of a practical way we can be of help to the current crew, I can think of no better way of having a crowd of us ex-90 series managers signing this and sending it to the BoD , and the Company senior management. However, we have to be prepared to actually DO something if they acknowledge they need help. People like Carolyn , Mike Denton (now VP of Engineering) et al should still understand this stuff and, at least Mike, is really in a spot where he can take some action (if he and his colleagues have the balls to make the decisions). They will have to admit they're in a bind and can use help – even if we offer it for free! Will their	
	egos let 'em?? Great job,"	

that know how great Boeing was and where The Company is today. With all the real leaders you have known and worked with I have no misconception you will remember me. I was the XXX for the first 777 assembly. Remember ? Those were the days when we went to the Suppliers and made sure our products were completed with Quality built in and on time. I remember calling back to Seattle and saying there was no way the first section would ever make it on schedule. Within days we had an entire cadre of Boeing people on site helping. Sure do miss THAT Boeing. I am still working so I would appreciate your not sharing my name with others. Every day is a challenge. The 'New Breed' has no conception on how to complete the task but they are really quick to get rid of anyone who is not a yes man. Working Together -Reduce Flow Time - Eliminate Redundancy (meaning Inspection) have become the Mantra. If you do not support that then you are destined to disappear. It gets tougher each day because the Managers I grew up with are all retiring and I do not have much influence without them. There are just too many who have come from the New Breed and I don't stand much of a chance when it is me vs. them. I will say that as long as I am able I will do The Right Stuff and NEVER drink the bath water that would compromise safety. Oh well Just wanted to say Thanks."

"Bob,

You and I first had contact 22 years ago when a letter I sent to Frank Shrontz was handed off to you. Your posting is making the rounds internal to Boeing and I've invited my managers have a read. I suggest that it may be uncomfortable, but necessary to look into the mirror that others are holding up. Whether as a retiree or someone recently returned to the company, it is very painful to realize where we are and try to figure out how we got here. When Bair got up to pitch the 7e7 status and I saw all green squares with a couple of yellows, I waited for Alan to pounce. After all, there is no way that a project taking on so much technology and schedule risk could possibly be riding along with no critical issues at that stage in development. The pounce never came. I was stunned. I knew Alan had the experience to know better, but I guess maybe he had already checked out. My worries for our management culture and competence have grown since then. I'm not schooled in organizational development, but I believe that a culture of 'yes men' has taken hold over the past decade or so. Engineers who provided analysis pointing to problems now plaguing the 787 program were shooed out of the room and off the program. I looked at the RFQ for some of the avionics systems and I was mortified. System integration was not addressed. I was roundly criticized for carrying significant contingent risk in the out years of my proposed schedule because I

predicted that we would have to provide significant
resources in support of integration and test that was
not in the scope of work. This has come to be true for
many suppliers. Subsequent decisions such as shipping
structural shells just to hold to the rollout date have no
doubt cost us hundreds of millions of dollars, if not
billions. That said, many of our supplier development
efforts are chronically deficient. Thank you for posting
your observations on Boeing delays and facilitating dialog
and comments. Sharing this can only help."
"A couple of years ago the chief engineer of xxx made a
statement addressing a newly formed study team. He said,
'We need to work hard to achieve our 50% share of this
market'. I stood up and said in front of many leaders,
including
some VP's 'What do you mean 50%? My <i>Boeing</i> has
lived with 80%. Don't
brainwash our youngsters into thinking 50% is ok. It's not
ok with me'. Not a soul stirred. To me that was the day
the music died."
the music treat
"Sad but true. Is this the start of the book? Sounds as if I
should be buying puts instead of calls?"
should be buying puts instead of cans.
"I doubt you'll get many kudo's from the big boys at
Boeing, but it does call a spade a spade. It will be
interesting to see how its rec'd."
intercound to be new harded.
"Would you mind if I sent it to Carson? Answer: No.
(Subsequently went to Carson.)"
"Bob, If you have a list of people you send your blog to, I
would like to be on it. We met a couple of times over the
years. I was in Flight Test from 1965 to 1998. Advanced
to xxx, got busted in 1997 for speaking out about what
you describe and retired in xxxx. I am hearing rumors
about changes in flight test that disturb me. Not only will
they not make their pipe dream of a schedule, but think
that because of inexperience the chances of losing an
airplane are greatly increased."
"TJ forwarded your article to me and it was a great
pleasure and delicious treat to read another Bogash screed
peeling hide from the guilty. After all these years, you
probably don't even remember my name but I certainly
remember yours from your days as our Tech-Rep in
Montreal holding hands with the Nordair guys in the early
days of our 737 gravel runway travails. How the mighty
have fallen! Our once proud and venerated <i>Boeing</i>
Company seems incapable of doing anything
demanding these days such as bringing a program in on
time and on budget. Much of this failure I attribute to
the products of that ill-advised Sloan Program which
selected promising young guys very early in their
careers, extruded them through the B-school die at a

	 tender age, instilled perfect confidence in their immature judgment and assigned them rank and responsibility far beyond the merits of their wisdom and experience. These guys were rotated through the various chairs at warp speed and from my observation, many did not gain much real knowledge in the process. Most were definitely good guys, really smart, and several I counted as friends but most lacked the tempering which the fires of adversity forge. They needed more time as front-line grunts working night and day under some obstreperous airplane on the flight line to drive home the realization that there were NO small problems which kept the machine grounded. If it did not dispatch on schedule, we had failed, period and excuses were small comfort; very small. During the early days of the 737 when we were plagued with trailing edge flap problems, I was absolutely delighted when Dick Ault of Western came to town to explain things to our leaders. Dick had a colorful way of clarifying the impact of an AOG in idiomatic English that our leaders could understand. He, John Borger, Frank Kolk and several others whose names elude me at the moment were real airplane guys who knew how to make things work. Unfortunately, the wisdom accumulated during that era seems to have been displaced by quarterly results and political correctness; the precious legacy forfeit. Geezers have complained about subsequent generations for all of recorded history but in this case the objective results furnish solid basis for dissatisfaction. It isn't just a nostalgia trip." "Bob, well said and to my way of understanding, right on the mark, with your permission, I'd like to forward it to some of my pen-pals, but will wait until you give the ok. It seems ready to go to me." "Hi Bob, long time no communicate. I feel fortunate to have received a copy of your 787 analysis and sincerely hope you have somehow gotten it to the attention of those people at the top who really need to see it. I too have been retired for several y	
	 the mark. with your permission, I'd like to forward it to some of my pen-pals, but will wait until you give the ok. It seems ready to go to me." "Hi Bob, long time no communicate. I feel fortunate to have received a copy of your 787 analysis and sincerely hope you have somehow gotten it to the attention of those people at the top who really need to see it. I too have been retired for several years now and I dismay every day at the 	

"I never did meet you but having reviewed you web site I wish that I had. I spent 32 years of my life at <i>Boeing</i> , ended up as the chief engineer on the xxx retiring in 20xx.
I first thought that Boeing was going astray when we
sat through poetry sessions under the sponsorship of
Condit. I don't know if you had to undergo these. I am a
firm believer in the process of a master schedule, the war
rooms that are a part of it, and with the responsibility that
everyone has to ensure its completion. In all of my time at
Boeing we never deviated from the belief that schedule
was the most important (after safety) thing for Boeing. Our
task was to deliver airplanes on time to our customers. No
excuses. Keep up the good work."
excuses. Reep up the good work.
"Bob,
I can't believe the mess McNerney's allowing to
develop in Longacres. I haven't been able to reach
Carolyn, but I am dismayed to no end that she is
leaving. What's really missing is replacement of
Carson and Albaugh – the two most recent disasters as
CEOs."
"Bob,
I've now read your piece a couple of times.
There isn't a thing that I don't agree with. I believe you
have put your finger exactly on what's wrong at Boeing
presently - a paucity of true leadership and
management. I wondered how some of the people
currently in charge at Boeing might react to reading what
you wrote."
"Hi Bob:
Not sure you remember me, but I was the guy that your
group hired to take over for xxx when he retired. I started
the day you left. I just finished reading the whole page
you wrote and cannot believe how much of it I have ranted
about for 15 years. The management that came in after
you have all been poor, they all want to disengage the
supply base and manage by MBA. BO and MS were the
worst managers I have encountered in my 35 years and
they ran the quality group into the ground. I have been the
lead of the xxx group for xx years and have dug in on the
747-8 and will not allow building and shipping hardware
that does not conform. It has cost me raises and
promotions, which just shows you the mentality of the
leadership at <i>Boeing</i> . The 787 leadership ran right over
us technical experts and did what they wanted without
regard to quality. Even AS9100 proves their mentality as
it is a washed out version if D1-9000. You will be happy
to know that some of us are starting to hold leadership
accountable, some of us have enough time that we do not
care what they think and guys like me are on them daily
when they make stupid decisions. I have been kicked out
of many offices over the last couple years, and proud of
it! I keep telling them that after 35 years, it is my job to
hold them accountable. Thanks for saying it, just

validates what some of us old timers have been saying for years. We need that old management style back or we are doomed!"
"Whoayou really did blow a gasket! Not unjustifiable. but very sobering and as you say, embarrasing."
"One theory I believe in, is that shortly before McD bought us with our money they went thru a cleansing with all managers being removed from their current positions and all having to re-apply. What this did was weed out the timid and reward agressiveness. It was that pack of wolves which survived to get introduced into the current flock of <i>Boeing</i> folks who had been hammered the past 5 years on 'Working together', 'team building', 'concensus decisions', ie, the sheep. The result was inevitable, the wolves dined famously on the sheep. We could always spot a McD transfer from other new folks by behavior. Middle management was taken over, not to mention many top spots."
"Hi Bob, Good to see you are still your same old self. How "right" on you are - Quite insightful. I retired, but came back as a contractor. Believe it or not the Quality Director in place when the 787 started up, at that time, (Now two Directors ago) decided that we, <i>Boeing</i> Supplier Quality, should not
be part of the oversight on the 787 Program. Didn't take too long to figure that was a wrong management decision. My little saying, which I have told our management: When I came to Boeing 40 years ago, it was 'Kick ass, take names, build planes', now it is 'Sit down, hold hands, build plans', Unfortunately all we do is build back -up plans for those we built in the first place !!
"Bob, I share many of your feelings. I can remember going to a 'team meeting'
and asking the 'dumb' question, "who is in charge?" It turns out that no one was in charge. The team concept came from <i>Toyota</i> , who have a flat management. Dollars to doughnuts, the <i>Boeing</i> management is far from flat. I am surprised that the Board of Directors, if it
has any technical people on it, hasn't taken firm steps. I read your essay, and agree with you! I am for sending your material to the BOD. (From a former Board member.)"
"Yesterday, Dec. 12, marked 52 years since I hired into the <i>Boeing Co.</i> It has fed and clothed me and my family for all that time, or at least gave me the wherewithall to do it. I've been terribly disappointed in how a great company has been run, and thought I could just wash my hands of it. However, that just aint so. I think they need to get

some "corporate memory" back at the controls as the	
boys in charge just have no internal compass and/or	
the pride it takes to make schedule king. Naturally, as	
an old Quality guy, King Schedule sometimes made me	
crazy, but when all was said and done, they product out	
the door was usually pretty damn good, and mostly	
on time. I believe those guys breathed a huge sigh of	
relief when those shanked fasteners were found on the	
a substant for a second s	
787 as it gave them another excuse to be late. If you can	
call McNerney, you should. Just to be sure he sees the	
article. I would think his reaction to it would dictate	
where it goes from there. Bob, I know your getting	
advice from all corners, but in the end its your call. And I	
know you didn't ask any advice from me. So whatever its	
worth, at least its free. If I can be of help just let me	
know."	
(ID_L	
"Bob,	
It's an interesting tome. Have you thought of sending	
to Mr. McNerney	
'as-is'? What I'd really like to see is a national business	
writer do a post mortum on the Boeing/McDonnell	
Douglas merger (acquisition if you like). This is the one	
Condit can be hung with: Tell me Mr. Condit; what on	
earth were you thinking of when you hatched this dumb-	
ass move? You stayed at Boeing too long and Mr. Wilson	
was right: he promoted you over your head. Bottom line?	
With MDD, Boeing acquired ZERO long term business	
base along with a MDD personnel culture of "me first"	
and 'everything else is tied for last'. Sears goes to jail -	
no <i>Boeing</i> loyalty, Stonecipher gets fired for ethics	
issues - no <i>Boeing</i> loyalty, Albaugh tries hard for the	
CEO job at BAE Aerospace - no Boeing loyalty.	
Reading this self-congratulatory, syrupy litany of trivia	
makes me feel like Alice in Wonderland. It's little	
wonder these guys can't produce airplanes; they are	
too busy sitting around in quality circles, holding	
hands and singing Kumbaya. Where in the world did	
the once mighty Boeing Company find this bunch	
pansies and what lunatic installed them in positions of	
power, power to make or break our beloved Boeing	
where we happily toiled for so many years? When I	
read pronouncements from the 'company leadership'	
occasionally, I never recognize a single name anymore and	
ask myself 'who is this weenie, where did he come from	
and what has he ever accomplished'? During my	
checkered career, I knew almost all of the 'movers and	
shakers' at Commercial Airplanes, even those who were	
still grunts in the trenches. It wasn't hard to spot even	
new graduates who had the 'right stuff', but if any are	
still on active duty they have been suffocated by all the	
PC BS and will remain anonymous. If any of the tough-	
fibered, old guard are still with us, they must be having an	
attack of the vapors. Guys like Sutter, Gissing, Tattersall	
and a hundred more whose names escape my feeble	
memory at the moment would be pulling their hair out by	

the roots. What a pathetic mess!"	1
ule roots. What a patient mess:	
"Bob,	
JM forwarded your 12/13/08 email to me. I just finished	
reading it with increasing sadness. Fascinating - great	
work. In 1987, when we first started talking about	
what would become 'World Class Competitiveness', I	
knew that if Boeing stayed the course (not just the	
usual 6 months for another "yes we can" program), we	
would demolish the competition and dominate the	
industry for generations to come. We did stay the	
course quite a while. Alan Mulally embraced WCC	
and led the 777 to a smashing success. For the first and	
only time, I truly loved to come to work. It was fun and we knew we were finally doing it right That really	
was a major reason that the 777 first flight was nearly	
flawless. We ran the SIL through every nasty failure we	
could dream up. We found stuff and stuff got fixed.	
When the 737NG was proposed, I suggested that it should	
be a new airplane, built as a miniature 777 with a common	
cockpit and systems. This would also be an excuse to	
miniaturize and improve the 777 systems package, which	
could then be offered as a retrofit to all previous Boeing	
jets, as well as Airbus and Douglas jets. The airlines could	
finally have "common" fleets of airplanes – that all looked	
like Boeing 777's. But no! We went cheap and built	
the 737NG. We pulled it off at great expense and	
effort, but it was the beginning of the end of WCC. With the 'early retirement' of 1995 coupled with the	
demographic age bubble in engineering as well as our pilot	
office, I could see that if the company did not provide for	
our replacements in time for us to train them, there would	
be a two-thirds wipe out of experience in about 10 years.	
As you describe in the 'Tome', it happened. I had great	
hopes for Phil. I knew him when I was a new aero	
engineer at Everett in 1972. But alas, he sold us out to	
MD. We should have waited until they went bankrupt	
and then picked up the pieces – sans their	
management. But no! We let them run us into the	
ground, just like they did with <i>Douglas</i> and then <i>MD</i> . Then they move headquarters to Chicago with the rest of	
the mosters. 'You are known by the company you keep.'	
Well, other than that, I don't have strong feelings in the	
matter. I retired in 2002 and built a new house. There is	
life after Boeing, and it is good. Everyday is Saturday.	
I'm so busy now; I can't imagine ever having had any time	
to go to work."	
"If it were me, I would consider sending it to	
McNerney and others on the board and ask them if	
they cared to comment on it before you give it wider distribution, such as the times, etc. Once you let this	
cat out of the bag they are going to go into a defensive	
mode and will never listen. If the main goal is to right	
the ship, perhaps they need to give your piece a	
scrutinizing squint, before it falls on them like an A-	

bomb."		
"This is typical 'everything is just fine' attitudeWe have gone way to far to the right in our approach to teaming and consensus decision makingand rewarding a 'didn't get it done' behavior in my opinion. There needs to be fatalities (not real) but people being told they don't have jobs based on their lack of managing a program, meeting costs, and deliverables on time, and oh, forgot about a quality product. Sometimes I think I am getting too old for this stuff"		
(Current Director in Chicago)		
"Bob, I don't know how you do it I could never type fast enough to write that much no matter how much I knew. But I bet ol' Jim B. is rolling over and over. Personally, I think things started going south about the time <i>Boeing</i> began trying to not recognize individuals as heroes and standouts. Instead, it was Working Together. For example we no longer put the names of the fight crew on the sides of the cockpit it was the WT term (777). I talked a lot to Jack Steiner. He bemoaned the fact that <i>Boeing</i> no longer had 'faces in the window' (his term) in the form of chief engineers, designers, etc. Instead, everything was WT and was being reduced to the LCD. The Sutters, Wygles and their ilk were pushed aside. But the result was there was no one for the employees to look up to and worship as examples."		
"I read the whole thing. Great. You hit it right on the head. Touchy feely my ass. A sharp hard kick in the ass is what's needed. <i>Boeing</i> has become a company of wimps managed by incompetent wimps. If this happened in China, a lot of people would be making small rocks out of big ones. And they would make schedule. The triumph of bullshit over performance."		
"I read Bob's material from end to end and I learned a lot more than I knew. The situation is much worse that I expected. I am in full agreement in his analysis of the management problems. It just seems there is no one in full control. Kind of like lost sheep. Jim, I certainly don't want to sound like I am a sexist and biased, but I think a lot of the problems started by promoting a lot of people, women included, into positions they knew nothing about, just to fill quotas. Next, education and degrees are wonderful, but a degree does not guarantee the holder could organize and manage a goat roping contest. It seems the company is now only reactive instead of proactiveWhen did they throw out source and receival inspections, along with onsite monitoring of the critical stuff? It may very well be that the suppliers are held up for late engineering data. We have seen that before. I		

they asked when they might possibly expect the engineering for a small change that would have worked a big problem? They had been waiting about two years. I called Red McCallum and he got the ball rolling and that problem was solved in about a week, but authorization to proceed with the new change was instant. That is where an onsite interface really pays off. It just seems that it is only a matter of time before we see a major collapse of the company. When that happens, the time will be ripe for <i>Toyota</i> to step in and take over, as they said they will become the transportation system of the world. A retired <i>Douglas/Boeing</i> employee forwards the <i>Boeing</i> magazine to my dentist friend who is an aviation enthusiast. My friend asked me why are there so many Vice Presidents at <i>Boeing</i> . I told him it wasn't always that way. Anyway, I want no part of it, except I want them to get their act together as I am still holding a lot of stock certificates. will be interesting to see the results of the changes in the next six months. Better close. Stay warm out there, and stay healthy. My old knees are giving me fits, probably to many years on the hard concrete. I don't want any more surgeries."
"From my little knot hole I believe you're dead on. I felt the bull shit would sink us long before I retired and was sent to people skills class over and over to some how change my theory x way of thinking, It never worked and I'm glad it didn't. When I was young and fighting incompetent management I use to say to my self that's ok you bastards I'll out live ya. Then when I got to a point and time to make a difference along comes political correctness and make everyone feel warm and fuzzy.
They deserve what they've made and if it weren't for the fact that I still feel a sense of loyalty to <i>The Boeing</i> <i>Company</i> I grew up in I'd say fuck em all. Truth of the matter is the people down there today couldn't handle the old ways of doing our day to day business. They've been made soft with all the bullshit programs and management that doesn't know how to call bullshit when these limp dicks get up and starts pumping out their excuses. Time to remember 'The initial objective is to build airplanes'".
"I think you're a little bit soft on the reasons for failures. (just kidding) I have said before (and you touched on it) that the educated idiots got control of the Company and started playing silly games instead of building airplanes. People who don't have a clue about what it takes to actually build a product. I wonder how long before our retirement plan is canceled?"
"Bob has compiled an outstanding analysis of the evolution of <i>Boeing</i> commercial airplanes. It is a very thought-provoking peice of work. The main issue as I see it is that the new leadership's view of all of this truth this

would differ from yours or mine. While one would hope	
it would be received with the respect it is due and	
actually result in some sort of leadership "revival", I	
believe that the current leaders will not receive it well.	
As Bob stated at one point, 'maybe Boeing is reflective of	
our society as a whole', is something to think about. Take	
a look at the auto industry, banking, financial institutions,	
etc. Most of the major organizations seem to be	
performing similarly. They have well educated leaders	
who have bounced around other major organizations,	
built up thier resume's, and are able to put a 'spin' on	
just about any situation (like many of the spins Bob	
captured for this document). I'll bet a very similar	
document could be compiled for Chrysler, General	
Motors and others. As far as a solution goes, the new	
leaders have hit critical mass, so I don't now if turning	
back to basics is possible. I commend Bob for this	
magnificent effort, though I am not surprised. For a long	
time, I thought I would join Bob's team at some point. He	
was interested in hiring me just before I came to work for	
you and several times after. I believe he has always tried to	
make a big difference for Boeing."	
"re the 787 and general demeanor it's all true. Several	
people my level thru out lots of orgs (I am on a lot of 787	
teams) are all saying the same thing nothing is getting	
passed on to the top. One really smart woman who was	
a 'nay sayer' was removed from her job for not	
shutting up!! We will see that she is right real soon. I	
also agree there are going to be more delays, and	
finacially I can tell you things (not on line) that will	
make your toes curl. Thanks for all of the effort and	
blood, sweat and tears that went into your treatise. You are	
right on! I fear that a solution is beyound the capability	
of anyone currently on the Boeing payroll. I would like	
to think that this too shall pass, but I am afraild that what	
will pass will be <i>Boeing</i> ."	
and pass with de boeing.	
"OK my put. It will be concise. Bogash has given us a	
most insightful well researched, historical, account. J. has	
given us a more concentrated and good analysis. B., as	
usual, has put some balance into the discussion. I agree	
that we did not train the next generation or lost it by failing	
to transition. But, I think you have all missed a major	
dimension. To the extent that we are talking about the	
787, we are not talking about the kind of program we	
participated in bringing to successful conclusion, relatively	
on time and within the money. This program gave away a	
large degree of engineering responsibility and asked for	
the delivery of complete assemblies. The 6 o'clock stand	
up meetings should have occurred in other corporation's	
plants. Their managements should have seen to	
comprehensive manufacturing and assembly plans and so	
on. And while we had earlier program participants living	
with our engineering and our engineers in a supervisory	
role at major subcontractors, coupled to experienced	

planning, tooling and manufacturing, people, we left these them to their own devices."	
"I think that you've hit the nail on the head Straight forward and to the point. But given <i>Boeing's</i> current management tree nobody is left that thinks the legacy way and I don't for see anything changing except our bottom line, going in the negative column. And I have always said from the time that Stone Dicker took over, <i>Boeing</i> was on a down fall because of his putting non aerospace personnel in high positions that new nothing about an airplane Still the practice today. Lots of educated people but most without any aerospace experience I don't see things getting any better any time soon. I think <i>Boeing</i> is in for some really tough times in the not to distant future. Thanks for sharing."	
"Excellent evaluation. We need to get this in the hands of the right people. But who is that? The Board must be asleep."	
"I sent That Bogash article to my brother in law who was a corp. director reporting to T Wilson when he retired. His comments: Hi Ray - A rather lengthy study on <i>Boeing</i> management. I read it all and I substantially agree with it. Things have really changed at the old shop - 1 remember when Bill Allen ran things that the pressure to keep schedule was enormous (I believe we even bragged that <i>Boeing</i> had not missed schedules for 4 or 5 years. I seem to remember that heads of mfg and eng even lost their jobs when we missed schedules. There is no question that the 787 represents a great technical challenge, but so did the 747 and the article you forwarded referred to schedule slides on all kinds of programs. I don't know who the guy is that wrote that article, but it represented a lot of work. Pete"	
"Dear Bob, I worked for you from 1991 - your departure. I was in Chicago when you traveled there [for our midwest] staff meeting. You spoke frankly in that meeting and I shall never forget that heartfelt speech. Thank you. My name is T. I began with <i>Boeing</i> , fresh out of college, in 1978. Like most of us, I worked for some excellent managers and some poor managers. It's just the way it is. Further to your writings, it is my observation that the most essential <i>Boeing</i> 'paradigm shift' the past 30 years has been this: In the 1970's and 1980's you could be damaged or fired for lying to executive management; more recently you can be damaged or fired for not lying to executive management. I have seen this and experienced it first hand. Like you Bob, I have many friends who remain in management at <i>Boeing</i> . Several were drafted into the 787 program. Their consensus of the program is that the problems are seldom technical in a networe. But mether at the formation of the program is that the problems are seldom technical	
in nature, but rather stem from management	

corruption - for lack of a better , <i>or worse</i> , term . If I could pass along one management recommendation to Mr. McNerney it would be to simply reward ' <i>functional</i> correctness' (my word) instead of 'political correctness' which became so overwhelmingly prevalent during the 1990's. Best wishes to you Bob Bogash!"
"Bob, I thought it is a well written article. I would have added a few comments like "Some how, <i>Boeing</i> must shed its <i>McDonnell</i> symbol, relocate its Headquarters back to Seattle, and shed its <i>McDonald & McDonnell</i> executives within the Seattle area <i>Boeing</i> facilities. <i>Boeing</i> must return to a Quality Assurance plan that was introduced on the 777, and provide on site support in Engineering, Quality Assurance and Program Management at its major suppliers.' The real problem is to convince any of them that a) there's a problem, b) it is fixable, and c) that you have the solutions. These solutions would have to be cost effective and somehow be made palatable to the existing folks. That means acceptance at the highest levels and top down enforcement by edict. That's a big row to hoe maybe impossible."
"If Wilson was still in charge we/they would not be in this mess. Maybe management should answer the question; WWWD, 'What Would Wilson Do?' After that they could go fouth and fire someone"
"Your piece was on target! Promotions while I was still there (end of 2000) seem to fulfill quotas rather than promoting personnel with the capability to get the job done. Sort of a quick dance through the chairs to higher levels. I would like to see a video of the 'Head Shed' reading your tome."
"Thanks for the humor. I needed a lift. A friend of mine bumped into Frank Schrontz the other day and asked him what he thought of the program delays and the leadership in Chicago. Frank just rolled his eyes. It was Condit more than anyone who considered <i>Boeing</i> a fine place for his social experiments. What business does the company have diluting the workforce for all these warm and fuzzy programs. It's time to go back to basics, focus on airplanes, cut the meetings, do the work. Oh well, our days in the saddle were not perfect but surely it is more satisfying to struggle with an engineering or production problem than meeting environmental goals, etc."
"Jeez, what tripe. This guy couldn't find his ass with both handsprobably spend two hours every morning on their makeup. God, help <i>Boeing</i> . Do they even know how to spell priorities."
"Kind of makes me want to puke, he (Carson) should

·····		
	have been candid about problems. Total dribble."	
	"Bob,	
	I have read your sixty some pages with interest, and have	
	taken the liberty of sharing them with others. I also must	
	say that I generally agree with the points you have made.	
	Since you have not read my analysis, here it is. I have not	
	read your latest draft, but I will. I have though, read your suggestions on what us old crocks can do. Some of us	
	have been thinking along similar lines, and have come up	
	with all the same suggestions, except the double box. And,	
	Oh yes, we did not limit participation in any solution to	
	retired 90 series, or execs. Will comment further on your	
	latest writing when I read it. But, I am on your side, and particularly agree with your post script."	
	"Bob,	
	In short, I think that all us old guys generally agree	
	that the root cause of the 787debacle, was the can do,	
	results oriented culture the company used to have,	
	going South and being replaced by a touchy feely,	
	efforts count, team oriented, culture. And it took about 20 years for that change. I don't see that any of the	
	suggestions for a fix that any of us have come up with	
	address that problem. First, the guys in charge, starting	
	with McNerney, have to agree that the culture has gone	
	to Hell. I don't think that they will do that, partly	
	because they don't have their ear to the ground, and partly because our general culture is tending to	
	embrace those values which we think are causing the	
	problem. They are apt to dismiss our concerns as	
	merely rants of old time Hard Ass management types,	
	out of touch with the times, who on principle, don't	
	think the new team knows what they are doing. But let's say that a miracle occurs, they agree with us, and	
	want to turn it around. How do you undo 20 years	
	worth of ingrained programming overnight."	
	"To a googer who has been 'out of the loop' for a very	
	"To a geezer who has been 'out of the loop' for a very long time, much of this sounds like touchy-feely,	
	PC bullshit. When did we cease responding to customers'	
	urgent requests for assistance and when did our Training	
	outfit cease to be 'customer-focused? What genius decided	
	that our business objective was demonstrating 'environmental leadership' rather than designing, building	
	and supporting the finest transport category aircraft in the	
	world? With such apparent confusion over a candid,	
	unambiguous mission statement among the leadership, is it	
	any wonder that the troops are confused and demoralized	
	or that things aren't getting done on time? I'm almighty	
	glad to be retired. Indeed, neither of us would have fit comfortably into what that outfit has become; we were	
	too much type A, let's get it done personalities."	
	"Gee Bob, you're on a roll!! I wouldn't have	
	expected Carson or Bogue or any of our 'leaders' to	
	highlight all the bad. I would like to think those	

responsible for the "bad", however, will be held accountablebut I doubt it." "I know the gay who wrote this quite well, Bob Bogash, have known him for probably 40 years and he has a unique window to see what is going on at the company today, and he tells it like it pretty much is. It is worth the time to read it if you wonder what is happening with the 787 and more importantly, the culture at Boding today. Those of you with fond memories of Boeing will be saddened." "If you want to understand what has happened to Boeing in the last 20 years, (I retired in 1990 & things were fine then) and have an hour of free time, (it's 20 pages long and I got to pg. 10 the first sitting), take a read of Bob's article below." "Read Bogash's attachment (its' overly long, but worth an hour of your time). I never knew the gentleman or where he was in the company, but he was somewhere where he really understood what it took to make a program a success. Supplier management really his home - so do the schedules. So do placing technical types into top management positions, even planners, instead of finance types and humanitarians. But as to what can be done now- maybe all of those concerned should volumeter to go go back and bail them out. Are you ready?" "The 777 program had a culture, as you say, of bringing ideas up, from below, early in the program, to make adjustments upstream involving suppliers, customers, FAA and others. The 787 has a culture of paralysis and indecision. Why is that? An engineer told me this story. He told his supervisor, "The supplier I monitor will not make their delivery date." How do you know?" 'I've worked on amay programs. I know what to look for. I talk to them on the phone, I've been to their facility, I know their resources – they won't make their delivery date." Have they missed a date, yet?' 'No' 'Tell me when they miss a date.' The engineer was furious, but he acknowledged the cultural message inherent in his supervisor's attitude. I told this story to senior 787 management. Their immedin

16	"Boeing	James	Firm-	α	 Similarly, the second level supervisor has no recourse. Even the program leaders I was talking to had no recourse, in the 787 business model, to act on information about pending problems. The 787 business model has no room for coordination costs. That's the whole point of the 787 business model. Write a contract. Give them their performance specifications. Snap the parts together. This will quickly create a culture of indecision and paralysis. To this day, engineers express frustration that the changes required now fall to them at <i>Boeing</i>, requiring duplication of effort, rework, and redesign. Even so, the computer tracking systems, decision-making processes and lines of authority have never been shifted to <i>Boeing</i> – everything is done on an ad hoc basis, and takes many times the effort and expense that it should. The fundamental business model has never been changed, and the culture it breeds cannot change in isolation. In the 777 program, change and authority and relationships were built into the program's culture. The 777 business model put <i>Boeing</i> in a decision-making position, and the other stakeholders were involved in close coordination. The 777 business model assigned authority and responsibility to suppliers. We gave them inadequate direction, poor oversight, no feedback, and let them fail at great cost. Now, we are paying the coordination costs downstream where they are messy, expensive and slow. The business model determines the program's culture. Outsourcing is not the issue, exactly. The program will work if it can do 3 things: Produce the best possible plan, Build in awareness of progress to the plan (meeting schedule, as you say) or timely awareness of deviation from the plan, and Reallocate resources to get back on plan. These conditions all require a capable and effective technical design and manufacturing community. The 777 program succeeded in all three. Predictably. The 777 program succeeded in all three requirements represent vertical integration, and	On the

Moviemakers bring together independent contractors—actors, camera operators, publicists—on a project basis for many films, avoiding the expenses of having all such staffers constantly on the payroll. By treating planes as such projects, advocates of outsourcing figured they could do the same in producing aircraft. 'It turns out that we're not the motion picture industry,' quips Stan Sorscher, legislative director of the SPEEA. He says staffers and project teams are not easily interchangeable in manufacturing products as complex as jets. Chief Executive W. James McNerney Jr., who took the helm at <i>Boeing</i> in mid-2005, inherited the aggressive outsourcing approach from prior CEOs. He appears to be amenable to dialing it back, if needed. McNerney would not be available to discuss his plans, a company spokesman said. However, in his interview with <i>Aviation Week</i> , commercial planes unit chief Carson said the CEO [McNerney] had 'concerns' about 'the deals we had done in the supply chain.' Added Carson: 'The fact that we're struggling with it now verifies that his concern was valid.'''	ture for further modular ization.
22 Bloomb Jan. erg, 2009 "Toyota 's Toyoda Plans to Replace Most Top Manage rs" (Alan Ohnsma n and Naoko Fujimur a)		Firm	β	 <i>"Toyota Motor Corp.</i>, the world's largest automaker, will replace most of its top management later this year as incoming President Akio Toyoda aims to return the company to profit, people familiar with the matter said. Toyoda, who will succeed Katsuaki Watanabe in June, will replace the company's other four executive vice presidents and "many" of the 19 senior managing directors, said the people, who asked not to be identified because the changes haven't yet been announced. Watanabe will become vice chairman. Toyoda, the 52-year-old grandson of founder Kiichiro Toyoda, will have to stanch the carmaker's sales slump as it forecasts the first operating loss in 71 years. He may curb the expansion strategy that allowed the company like <i>Toyota</i> and very refreshing,' said Koichi Ogawa, who helps oversee \$28 billion at <i>Daiwa SB Investments Ltd.</i> in Tokyo. 'The new management is going to break the past hierarchies.' Honorary Chairman Shoichiro Toyoda, Akio's 83-year-old father, and Adviser Hiroshi Okuda, 76, may step down from <i>Toyota's</i> board, Chairman Fujio Cho said on Jan. 20. Paul Nolasco, a <i>Toyota</i> spokesman, declined to comment on any changes in management. <i>Toyota's</i> American depositary receipts fell \$5.80, or 8.6 percent, to \$61.72 at 1:34 p.m. in New York Stock Exchange composite trading. The ADRs lost 32 percent of their value in the 12 months through yesterday. 'His Own Team' 	On an integral enterpri se's slow modular ization in the face of exogeno us crisis.

				independent auto analyst and consultant in Greenwich, Connecticut. 'A new CEO wants to put together his own team.' Toyoda's challenges include reversing last year's 15 percent sales drop in the U.S., for decades the automaker's main source of profit, even as companies and analysts cut their 2009 outlooks. Auto sales may fall to between 10 million and 10.5 million this year, the lowest level in 27 years, from 13.2 million in 2008, according to <i>IHS Global Insight</i> , a Lexington, Massachusetts-based market forecaster. <i>Toyota's</i> total sales last year fell for the first time in 10 as the global recession and tighter credit decimated vehicle demand worldwide. The economic slowdown has prompted the company and Japanese rivals including <i>Honda Motor Co.</i> and <i>Nissan Motor Co.</i> to cut jobs and production and driven Detroit automakers <i>GM and Chrysler LLC</i> to seek government aid to stay in business. Production Cuts Toyoda also must find ways to utilize plants opened in North America since 2006 that have given the company too much production capacity in the region as overseas sales declined 4 percent to 6.82 million last year. <i>Toyota</i> last week announced broad production cuts affecting	
				all U.S. and Canadian auto-assembly and engine factories through the end of the current quarter. Last month, the company indefinitely suspended construction of a plant in Blue Springs, Mississippi, that was to start making Prius hybrids in 2010. The company's sales slipped by 4 percent to total 8.97 million vehicles in 2008. That compared with GM's 8.35 million. Toyota in December forecast an operating loss of 150 billion yen (\$1.7 billion) in the year ending March 31. That compares with a previous profit forecast of 600 billion yen. Next fiscal year will be worse, as the yen strengthens against the dollar and the U.S. market continues to shrink, analysts	
				said. Focus on Customers Toyoda will focus on customers and spend as much time as possible on the company's production and sales, he said earlier this month. 'I want to be president closest to the site,' Toyoda said in Tokyo on Jan. 20. 'I'll try to make changes without being tied down by the past.'"

27 Jan. 2009	Bloomb erg, "Boeing Recover y May be Stunted as Custom ers Clamor for Credit" (Susann a Ray)	Firm	α	"'Boeing has been trying to put a rather upbeat face on the reality of the market, and I think they're behind the curve,' said Jon Kutler, chairman of Admiralty Partners Inc., a Los Angeles-based investment firm that focuses on closely held aerospace companies. 'It's going to be a tough year.' 'Operationally, 2009 will be a much better year than 2008,' said William Alderman, president of Alderman & Co. Capital, a broker dealer specializing in aerospace and defense in South Norwalk, Connecticut. 'But financially, we are in the midst of a deep global recession, and the financing sector is in pretty bad shape.' Boeing shares still may be attractive if the company meets its development goals with the 787 and other delayed programs and ships as many or more planes than in 2008, Alderman said. The company's average 12-month target price is \$48.71 in a Bloomberg survey of 14 analysts. 'There are troubles on the horizon for Boeing, but they're not operational or technological, they're purely financial," said Alderman, who doesn't own Boeing stock. 'Long-term, I'm wildly optimistic for	On a modular enterpri se architec ture's non- systemi c understa nding of its problem s.
28 Jan. 2008	The Wichita Eagle, "Boeing to Report on 787, More" (Molly McMilli n)	Firm- Investo r	α	 Boeing."" "Boeing is expected to give a status report on its much-delayed 787 and aircraft delivery outlook today as it releases its end-of-year earnings and hosts a conference call with analysts and reporters. It has been a tough year for Boeing stock, which closed Tuesday at \$43.22. Boeing shares have lost 45 percent of their value in the past year the Standard & Poor's 500 index is down 39 percent in the same period and are 60 percent off their October 2007 high of \$106.65. Today's conference call needs to go beyond the norm, Barclays Capital analyst Joseph Campbell said in an analysts report. Boeing must make an extra effort to clarify what's happening with its financials, he said. The company suspended financial guidance during the Machinists strike last year. 'This hiatus has left the investment community in the dark about much more than the strike,' he said. Shareholders have more unanswered questions than any time in recent memory, Campbell said. It should also provide insight on why the production and delivery rates are what they are, especially given lower demand for travel and requirements for aircraft, he said. Investors have numerous questions on the 787, which has had four schedule slips and a two-year delay, Campbell said. They want a road map of milestones that must be met on the 787's first flight, scheduled dates of delivery of each test aircraft to the flight test program and milestones for 	On a modular enterpri se architec ture uneven informa tion flow to investor s.

2009 rs I into <i>Boe</i> 'Fi (Cai Gut z)	vesto Look ings iture	Firm- Investo r	α	certification, he said. They also want details of the planned production ramp-up for the 787-8 and how the current schedule compares with the original one and with the last revised one, he said. That way, it is 'transparent whether and when <i>Boeing</i> is planning to recover to previous delivery commitments,' Campbell said. <i>Boeing</i> also has been quiet about the impact of the 787 program on its financials, he said. 'With the 787 program now two years late, it is clearly overrunning its cost targets, it has significant penalties to customers, and we feel it is time for <i>Boeing</i> to shed more light on what is going on with the 787 costs and how the 787 is affecting the overall <i>Boeing</i> financials,' he said.'' "Airplanes don't have rear-view mirrors, and neither, it seems to investors in aircraft makers. <i>Boeing</i> offered an expectedly weak fourth-quarter earnings report on Wednesday, but its shares rose after the company offered a reassuring view of its future. 'It was a relatively neutral performance compared to what was anticipated,' said Paul Nisbit of <i>JSA Research</i> , referring to the fourth quarter, 'but it's history now, and it looks like everything else is going to go along according to plan.' The aerospace and defense firm's performance over the final three months of 2008 was defined by a labor strike, which the company said led to passenger and cargo jet deliveries falling by more than a half. But even though Wall Street was fully aware of the strike, the Chicago- based company's 27.4% drop in sales was still short of analyst expectations. In addition to crippling deliveries, <i>Boeing</i> also blamed the 58-day machinists strike, which ended in early November, for the quarter's loss, because of an estimated \$1.09 per share charge it produced. <i>Boeing</i> also had a heftyand unexpected61 cents per share charge because of changes it had to make to its 747 line after finding its structure wasn't strong enough. There were other charges too, <i>Boeing</i> sid, like a legal reserve that cost nine cents per share. <i>Boeing</i> s	On the investor s' systemi c over- confide nce in their investm ent.
Jan. n 2009 Reu Res	ters ney, earc Chair	Firm- Investo rs	u	Starting with slide two, 2008 was a challenging year for our company. While we made progress on many fronts, that progress was outweighed in our results by the	modular enterpri se
h, exce fror The Boo	n CEO,			machinists' strike during the fall, the impact of delays on key development programs, and the effects of the unprecedented crisis in the financial markets. Across Boeing, the vast majority of our programs are	architec ture's interacti on with its

	Q4	James	have a big impact to overall results, and we are	focusin
	Earning	Bell,	addressing that reality in our plans for 2009.	g on
	s Call	CFO,		exogeno
	Transcri	The	On the topic of development programs, let me first talk	us
	pt	Boeing	about the 747-8. The work statement on this airplane has	events.
	-	Compa	expanded since the start of the program to meet	
		ny	performance commitments to our customers, and to	
		, in the second s	recover from our original underestimation of the scope	
			of engineering work that needed to be done on this	
			airplane. The resulting design changes, which have been	
			substantial, coupled with limited availability of	
			engineering resources to do the work, drove the schedule	
			change we announced in November. Since then, a full	
			assessment of the supply chain impact of these and other	
			additional design changes, along with increased pension	
			costs, resulted in the reach-forward loss we recognized	
			in the fourth quarter. James will talk more about this	
			charge in a moment.	
			I'm disappointed that we weren't able to provide you	
			insight on this charge sooner, but our full assessment	
			was only completed earlier this week. I'm also	
			was only completed earlier this week. I in also	
			disappointed with the outcome. But let me say one more	
			thing. Notwithstanding the challenges this program has	
			presented us, we still believe the 747-8 is a very	
			competitive airplane with a strong future in a	
			significant market niche. It is worthy of investment and	
			will provide great value for our customers.	
			Turning to the 787, that program made notable progress	
			in 2008, including Power On in June, successful tests of	
			the landing gear, horizontal stabilizers and wing box, and	
			high pressurization of the static airframe. The FAA also	
			approved the 787 maintenance program. In spite of that	
			progress, however, we also endured challenges, including	
			delays from the machinists' strike and the requirement to	
			replace certain fasteners, all of which resulted in the	
			revised schedule we announced in December.	
			The fastener replacement activity is moving along and is	
			largely behind us on the first two flight test airplanes. We	
			are on track for first flight in the second quarter. Prior	
			to that, we will be exercising a series of gauntlet tests	
			during which we run the airplane systems on the ground as	
			if it were flying. After those tests and the ground vibration	
			test on airplane number two, it's all about getting airplanes	
			in the air and successfully completing the flight test and	
			certification process.	
			We also continue to make progress with our 787 program	
			partners to improve the condition of assembly of airplanes	
			coming into our Everett factory. Our main focus now is	
			working with the supply chain to get the production	
1			system into a rhythm and [rather] work back to normal	

	levels. As we've mentioned before, our plans call for reaching a production rate of ten airplanes per month in 2012, and we will evaluate possibilities to increase and/or accelerate that rate.	
	We are having ongoing discussions with our customers on how the delays and the current business environment are affecting their business models, and what steps we can take to constructively mitigate the impact. The 787 backlog remains high at about 900 airplanes. Although we booked 93 new orders in 2008, we do expect some puts and takes on 787 orders in 2009, with one customer's orders for 15 787s late in the next decade coming off the books this week. Despite a modest level of orders churn, we are confident in the long-term value of the 787 for our customers.	
	To address what has clearly been unsatisfactory development program performance at BCA, Scott Carson and I have undertaken a fundamental realignment and strengthening of the BCA organization, its processes and leadership. We are reintroducing rigorous functional discipline with clear lines of sight and accountability, and tighter integration of program, business unit and corporate decision making. We both believe it's time to end the era where development programs were stood up to operate as islands of their own.	
	While this structure served a purpose to foster the kind of tremendous innovation like the 787, our recent experience has shown it to do so at the expense of execution and predictable performance. Our objective is to advance a new era and operating model characterized by seamless integration of business unit and corporate functions, reliable and disciplined execution, and responsible and accountable program leadership.	
	More specifically, late last year we substantially reorganized BCA to strengthen airplane programs and supply chain management. We put all airplane programs together in one organization under Pat Shanahan to allow for more disciplined and efficient management of program resources. Notwithstanding this change, Pat will continue to own the 787 until its introduction; though we continue to add leadership to the program most notably Scott Fancher, the new program leader, who comes to us from managing some of the more difficult, technical and supply chain programs in IDS.	
	We also elevated the supply chain management function and we consolidated within it management of both internal and external suppliers under Ray Conner. With Scott's leadership, Ray and Pat are working closely together to improve both development	

	program performance, and overall operational performance and productivity at BCA. We will be taking the results of their work and additional measures to further strengthen the team and the operating model will be critical to our success in 2009 and beyond.
	Now, despite the significant challenges we faced in 2008, there were many areas of the business that performed very well. Virtually all of our production and services programs in both defense and commercial are executing to plan or better. Programs like the FA-18, the 737, commercial services and defense support systems, to name just a few, are providing customer value and delivering strong double digit margins .
	There are also many development programs, like GMD, FCS and the 777 freighter, that are achieving both technical and financial milestones according to plan. As we begin 2009, a year that no doubt will test us again, we are reassured by the fact that our fundamental product and services strategy and competitiveness remain intact.
	Fundamentally, this is a solid company with a strong growing core business.
	While it's hard for us to know the final impact of all of this, we can and must prepare for the continued market uncertainty, while ensuring our ability to fund our growth initiatives. In that regard, we have stepped up our drive to get more competitive and productive. We are being ever more aggressive in managing both costs and investments. Specific actions we are taking include streamlining organizational structures, reducing discretionary and capital spending, eliminating unnecessary work, and reviewing staffing levels, all to drive higher levels of productivity. Part of that, unfortunately, will mean reduced employment in certain areas of the company. We are targeting these reductions to exceed 6% of our current workforce, or approximately 10,000 positions to support our productivity efforts and infrastructure reduction. This will occur through a combination of attrition, retirements, reduction in some contract labor, and layoffs. While difficult decisions must be made, we will do as much as we can to assist our employees who are affected by them.
	Despite this challenging environment, our backlog is holding. In 2008, we had but six order cancellations at BCA and accommodated about 110 aircraft deferrals. The deferrals represent about 3% of our commercial backlog, which is not out of the norm. We do expect to see an increase in the numbers of deferral and cancellations in 2009. However, the size, diversity and quality of our backlog provides greater flexibility than we've had in the past to accommodate our customers.

As you all know, the financing environment also remains challenging. Boeing Capital regularly examines overall
financing capacity as well as specific financing sources for each aircraft to be delivered by BCA. In 2009, we believe
financing sources are sufficient to meet expected
requirements for our products. We are assuming in our
guidance that BCC will need to do about \$1 billion of new
financing in 2009. The actual amount could be more or
less, but we feel will be in a range that's manageable.
Let me summarize by reiterating that we are indeed facing
one of the more difficult commercial and financing
markets that most of us have ever seen. However, we have
a solid foundation from which to work through this environment with half our business in defense, strong
commercial products and a large backlog. Equally
important is the fact that the actions we are taking now
are not business as usual.
Looking forward this year, our 2009 EPS and cash flow
guidance prudently balances pension and other cost
headwinds with an aggressive productivity plan, while
recognizing both operational and market uncertainties.
James Bell (Boeing):
Thank you, Jim, and good morning. I will begin with our
2008 results on slide four. Revenue for the year was \$60.9 billion, which was down 8% from a year ago. Results were
impacted by the strike, which reduced commercial
deliveries by about 105 airplanes and revenue by an
estimated \$6.4 billion. Earnings per share was \$3.71, and
was impacted by an estimated \$1.63 per share due to the
strike. Operating cash flow for the year was a use of \$400 million, reflecting the strike impact of about 2.5 billion
and planned inventory buildup on the 787.
Now let's take a look at the fourth quarter performance on slide five. Revenue of \$12.7 billion was down 27% from
the prior year. The strike reduced fourth quarter revenue
by an estimated \$4.3 billion and commercial deliveries by
about 70 airplanes, including the recovery of the galley-
delayed deliveries from the third quarter.
Earnings per share was a loss of \$0.08, driven by the strike
impact of an estimated \$1.09 per share, the 747 charge of 0.00
\$0.61 per share and a litigation related reserve of \$0.09
per share.
Now let me talk about BCA in a little more detail on slide
six. Commercial Airplanes fourth quarter revenue of \$4.6
billion reflects an estimated \$4.3 billion strike impact. Operating margins were significantly impacted by both the
strike and the 747 charge. The 747 reach-forward loss
was \$685 million. Late maturity of the 747-8 design
drove substantial changes for our supply partners. This
coupled with the already existing schedule pressure

caused significant disruption throughout the supply	
chain resulting in the charge we took this quarter.	
Now, about 50% of the charge is related to the late	
maturity of wing design driving new load requirements	
into the fuselage and statement of work changes for our suppliers, causing both schedule disruption and increased	
recurring production costs. Approximately 15% is related	
to later than planned transition of component	
manufacturing to lower cost suppliers due to their	
production readiness. Another 10% is due to design and	
load changes, which resulted in reduced commonality	
with the 747-400 causing some of the procured	
components and systems inventory to be obsolete. 10% is	
the impact to our internal production process as a result of	
the issues facing our supply chain. The remaining 15% is	
due to, as Jim mentioned earlier, the higher pension costs	
in our program accounting cost base.	
Earlier this week, we concluded our detailed analysis of	
these impacts and recorded the charge. For the year, BCA	
delivered 375 airplanes and captured 669 gross orders,	
ending the year with a backlog of \$279 billion. This	
backlog continues to reflect the strength in the market	
demand for our commercial product portfolio.	
For the year, IDS delivered a solid 10.1% margin on \$32 billion of revenue, as all its business segments	
delivered outstanding performance that help offset the	
AEW&C charge from second quarter. IDS continues to	
pursue growth opportunities through targeted acquisitions.	
During the quarter we completed the acquisition of	
Federated Software and Digital Receiver Technology.	
Now let's turn to slide eight and talk about our backlog. As	
Jim mentioned, our backlog is at unprecedented levels. In	
the current market environment, we expect some of the	
backlog will get deferred to a later date or canceled. But	
the size of our order book provides us much greater	
leverage and flexibility than we've had in prior economic	
downturns. If deliveries move out, we have more	
opportunities to move other deliveries forward. It also	
provides us a solid foundation to continue improving	
productivity and financial performance.	
Other and unallocated costs declined during the quarter,	
primarily due to lower pension and environmental	
expenses. Within the unallocated segment, we recorded a	
reserve of approximately \$0.09 per share related to	
satellite litigation.	
strente augustoni	
Now let me turn to our pension plan performance in 2008.	
The overall equity market performance significantly	
affected our pension plan funded status. Our asset	
returns were down about 15% in 2008. The strategy we	
implemented last year to reduce volatility in our net	

pension obligations has paid off. Transitioning our assets from a high equity concentration to more fixed income assets matched with our liabilities, resulted in substantially better performance than the overall equity markets.	
Since the third quarter discount rates have turned down sharply which has increased our pension liability. Our discount rate at year end was 6.1%. The company's pension plans are now 83% funded on a financial accounting basis, down from 110% funding at the end of 2007. This resulted in an equity adjustment of approximately \$8 billion in the fourth quarter, which produced a negative book equity as of year-end. This accounting adjustment will not impact our ability to pay dividends or comply with our debt covenants.	
Now let's turn to slide ten and discuss cash flow. During 2008 we used \$400 million of operating cash flow reflecting the strike and planned working capital increases. During the year, we also paid down about \$700 million of debt at Boeing Capital, used about \$900 million for eight targeted acquisitions and used \$2.9 billion to buy back 42 million shares.	
Now let's turn to slide 11. Despite the significant challenges we faced last year, our financial position remains solid. We ended the year with \$3.6 billion in cash and marketable securities, and we reduced our debt loads. However, because of the strike and development program delays, we ended the year with a cash balance that was lower than in prior years.	
Turning to slide 12, our financial guidance reflects good performance at our businesses in an uncertain market environment. We're setting 2009 EPS guidance at \$5.05 to \$5.35 per share. Our 2009 revenue guidance is \$68 billion to \$69 billion, and includes the 787 and the 747- 8 schedules announced in fourth quarter.	
Our baseline assumption is that in-production commercial airplane programs remain at stable delivery levels over the next several years. However, our financial guidance does consider risk around operational performance and market uncertainties, including the risk of potentially having to take modest production cuts at BCA.	
We expect first quarter revenue, earnings per share and cash flow to be the lowest of this year based on timing of volume and deliveries. Our 2009 commercial delivery forecast is between 480 and 485 airplanes. We expect higher levels in 2010 as we begin delivering our 787s. Our 2009 operating cash flow guidance is greater than \$2.5 billion. This assumes continued inventory buildup on our development programs and an assumption that BCC will need to provide new aircraft financing of about \$1	

billion.
billion.
Now we will leverage our new aircraft financing with debt so the impact to our cash balance will be significantly less than the amount of airplane financing. For 2009, pension funding is assumed to be approximately \$500 million. Mandatory funding in 2009 and 2010 is expected to be less than \$100 million in each year. Future year's required funding will increase, unless markets rebound significantly. For example, in 2011 if markets don't recover, requirements could be in the range of a couple of billion dollars.
Total company pension expense is expected to be about \$1 billion in 2009. Our forecast reflects the actual 2008 asset returns, a 6.1% discount rate and a long-term expected rate of return of 8%, which is 25 basis points lower than our assumption last year. The business units will be recognizing greater pension expense than they have in the past. Essentially all the \$1 billion of pension expense in 2009 will be recorded at the units. IDS will realize about half of the expense, and we expect a portion of that to be reimbursable under government contracts in 2009.
We expect total unallocated expense to be approximately \$900 million in 2009, with other segment expense forecasted to be approximately \$300 million. R&D expense is forecasted to be between \$3.6 billion and \$3.8 billion, reflecting the 787 and the 747 program delays announced in the fourth quarter. We're not forecasting any supplier cost sharing payments in 2009. We expect R&D expense to decrease substantially in 2010.
Share repurchase will decrease significantly in 2009 to approximately 200 million, which will offset dilution from our compensation plans. We are forecasting total capital expenditures to be \$1.4 billion in 2009, which is nearly 20% lower than in recent years as we manage down discretionary spending.
Now let me turn to slide 13 to discuss how we will bridge our 2008 performance to our 2009 guidance. In 2008, we had significant impacts from the strike and charges that we don't expect to incur in 2009. Overall, pension expense will be higher by about \$300 million. We realized deferred compensation income in 2008 due to lower stock prices. We expect to recognize expense this year as the markets improve. Because of lower cash balances and short-term interest rates that are close to zero, we are forecasting significantly less interest income in 2009.
BCA is realizing greater cost absorption on existing programs because of the strike and development program delays offset by the business's aggressive pursuit of infrastructure cost reductions that Jim talked about earlier. Our 2009 guidance also considers

all of this, plus the operational and marketplace	
uncertainties. We plan to provide 2010 financial guidance	
later this year as we continue to evaluate the impact of market uncertainties on our business.	
market uncertainties on our ousiness.	
Jim McNerney:	
Thank you, James. To close, let me simply say that despite	
progress and strong performance in many areas, we were	
not satisfied with our results in what was a very	
challenging 2008. For 2009 and beyond, our driving focus	
is on improving execution where we have been	
underperforming, bolstering productivity across our long	
list of programs that are performing well and preserving	
financial strength to deliver growth through this difficult economic climate.	
economic chinate.	
While recognizing the risks at hand, we do feel we are	
relatively well positioned with the fundamental	
competitive strength of our product and services, the size	
and diversity of our backlog, and the long-term outlook for	
the markets we serve. I remain optimistic about this	
company's future and our ability to become the	
strongest, best and best integrated aerospace company	
in the world.	
Ron Epstein (Bank of America/Merrill Lynch):	
Jim, just a follow-up on your comments on how you are	
changing the product development process. You	
suggested that the programs can't be islands any more.	
Can you give us some more color on there? Because it	
almost seems like what happened on 787 cascaded into	
747-8, and in the past it doesn't seem like program development was as big an issue as it's become.	
development was as big an issue as it's become.	
Jim McNerney (Boeing):	
I think Boeing went through an era where creating	
islands in the name of innovation and entrepreneurship	
during a period, end of last decade, beginning of this	
where we needed entrepreneurship and innovation,	
was a very successful strategy. But I think as we look back on it, we waited too long to move as the	
requirement for execution around this innovation. We	
took too long to move back into a model that integrated	
functions that spanned the entire business that had	
disciplines, that allocated people most effectively, that	
shared best practices across programs. We waited too	
long to move back to that model.	
New executional them are being for example	
Now organizational, there are horses for courses and	
organizational models fit different times, different places. We are at a place where execution of supply chain	
and development are fundamental and we need to move to	
an organization that is single mindedly designed to do that.	
That's the discussion we've had internally. Those are	
That's the discussion we've had internally. Those are the moves you began to see at the end of last year. There	

and approval processes, around those. But it's all about execution and accountability, and leveraging the skills and size that we have as a company.	
Ron Epstein: So what do you have to change I guess?	
Jim McNerney: As I mentioned, we have to use an aerospace term, we have cored up our supply chain and development teams in BCA. We have reintegrated the engineering function more tightly into both the supply chain and the development programs. The supply chain and engineering were in the name of creating entrepreneurial programs which were somewhat isolated from other programs. Now they have to be tightly integrated and we also have review processes that are more, shall we say, more often and harder hitting.	
Doug Harned (Sanford Bernstein): On the 787, when you look at the flight test program that's planned, as it has been, it's a shorter flight test program than we've seen in the past. I know that's predicated on more integrated system testing and advanced and also more parallel flight test work. Could you talk about the timing of when you are likely to see flight test units two, three, four, and what you need to have out there in order to make sure you can deliver on that timeframe?	
Jim McNerney (Boeing): Doug, this is Jim. Obviously, getting the first two airplanes completed and into the program on the timing that we've talked about is step one and we are feeling comfortable with the timing around those. As we mentioned, some of the rework is largely the rework on those airplanes is largely completed. The software integration is moving I would characterize it as normally. We're integrating the systems with real pilots on real airplanes, and we're getting ready for the groundwork now. So we're feeling comfortable there.	
The next two airplanes are on schedule. You are right. It is a tight schedule on paper, although as you know we've been able to get a lot of work done. One of the benefits, I guess you would say of, the delay, a lot of the systems work done, and some certification work done earlier, which gives us a little bit of a tailwind. Just to specifically answer your question, the schedule has all six of the airplanes being in the air within four months of the first airplane being in the air, and it sort of comes out every few weeks from the first airplane. We see no reason to say that that schedule is not on track.	
<u>Cai von Rumohr (Cowen and Company):</u> Yes, thank you very much. IATA is, as you probably know, forecasting a 3% traffic decline this year. What sort	

of risk do you see to your out-year delivery schedules? Could you explain a bit more you talked about the accrual rates assume the schedules are flat, but you have a risk provision for lower rates. Are you assuming it flat or lower rates? I guess I was a little confused by that.	
James Bell (Boeing): Cai, let me take a shot, and then Jim can jump in. So the baseline assumption in our operating plan is that these rates will stay stable throughout the planning period. The reason for that is obviously we're under contract to deliver airplanes that would require the stable rates in order to meet those obligations. Now, we also said in our guidance, we've taken in consideration operational and market uncertainty, and so we have tried to provide for this, although we think '09 is pretty stable, and I think you'd probably agree it is also, but the out years are less certain. There is no question about things which could happen as the backlog moves around, and so we've tried to provide in our '09 guidance the eventuality if some of that does happen. But it won't impact our ability to make this guidance, because we're not naive to the fact that even though we have it in the backlog and under contract that there can be some uncertainties out there that could cause that to move.	
Jim McNerney: I think the only thing I would add, Cai, because you'd probably want some more definition around that knowing you. But it really is hard to predict. We've made a modest assumption in here. But as you know, until you understand timing, model mix, derivative timing, it's very hard to come up with a specific kind of assessment. So we've made a general, modest, should we say, sort of provision in our guidance.	
Heidi Wood (Morgan Stanley): James, I know there are different ways to account for the 787 delay, and its costs. I am aware these can include discounts on 777s and zero margin 767, so I'm going to approach the question from a different tact. If I were a Board member of <i>Boeing</i> asking you for an estimate of the all-in costs of the 787 between R&D, customer penalty payments, supplier support payments, discounts on other aircraft, everything, will the 787 cost to <i>Boeing</i> , does it range about \$15 billion, \$20 billion, \$25 billion? Can you help us just round to the nearest \$5 billion? Thanks.	
James Bell (Boeing): No, if you were a Board member you would be an insider, and we'd tell you exactly what the number is, Heidi, in terms of what our thinking and assumption is. But I think the best way to characterize it is we are working closely with our customers. We are doing better. I bet it's early yet than what we've assumed we would do	

	using all of what you said as ways to come to a way that deals with the customer needs, while maintaining a business case for <i>Boeing</i> that continues to have us believe this plane will bring value to the company and also deliver value to our customers. But you know we can't get into specific numbers.
	<u>Heidi Wood:</u> A range of \$5 billion is not specific. You can't give us any kind of a range just so we can have an outside sense as to what this could cost?
	James Bell: No, but let me just say this. When you think about the 87 and its introduction, as compared to other airplane models and other new introductions we've done in the past, we've sold almost a thousand of these airplanes, and obviously you know in terms of a profitability assessment of new products the most difficult assumption is that of market. Here even though this market has some risk, it's a lot lower than we've done in the past. The fact that we do have the stability of about a thousand units, we'll be able to work all these issues over time and be able to, I think, work them to a point that's satisfactory to both us and our customer sets. The same holds true with the productivity on the airplane being able to set the production rates for an extended period of time having sold so many planes that we still believe, and we do this assessment every quarter that this airplane is going to deliver value to our customers and to us. But I can't get into specifically the cost elements, Heidi.
	Heidi Wood: Okay. Then maybe one you can give us color on. Can you maybe then break us down the \$2.5 billion cash drain on the strike? That was pretty remarkable. How does that compare versus prior strike cash impact, James?
	James Bell: I think that the strike had a lot to do with the amount of advance payments we would've gotten on the 787, so those moved. Also some of the development issues that moved the schedule caused that issue as well as the 747-8. But all the production models obviously moved. Now at the early stage of the strike, our customers were still paying advances, so we had to true that up.
	Joe Nadol (JPMorgan): I'd like to get just a clarification, and as well as question, James. To clarify, could you help us with what the unit margin assumption that's baked into the BCA number for 2009 is relative to the 10% program? On the question, Jim, just on the 47-8 can you walk us through the cost benefit analysis you went through looking at the program as to why you are still going forward with

.

it and all components of it? There's the \$685 million charge. There's obviously a lot of R&D, and there's the cash that you are going to be out in the next couple of years that you are recovering at the end of the program. So significant costs on this debt aren't sunk yet. Just wondering why you are still going forward with the program.
Jim McNerney (Boeing): Let me answer the second part while James gets set for the unit cost question. Look, obviously, we have applied a judgment here that says we have a very competitive airplane here that has already got a good start on orders. If we didn't believe that the revenues would outweigh the costs, you are right, we wouldn't go forward with it. I suppose if the airplane didn't have the margin of competitiveness that we see on both the freighter and the passenger side right now, we would stop it. But we are committed to customers who value this plane highly, and when you add it all up we still see a viable business proposition here. Now, obviously, if we ever got to the point where we didn't, we'd have to work with our customers to come up with a different answer. But that's not what we see right now.
<u>Joe Nadol:</u> Okay. Did you bake in, in your cost benefit analysis significant orders in addition to the 114 that are in backlog that will be more profitable at the end?
Jim McNerney: We did assume, like in most programs, where you've got 900 orders out of the chute. Most programs, if you look through our history, have many, many fewer orders, more are characterized sort of at the level of the 747-8. You typically assume an accounting quantity that reflects your view of reality, which is in general more than the actual bookings you have at that time, and it's that kind of thinking that we're applying to this 47-8 right now.
But, Joe, the accounting quantity is relatively conservative, and we've contacted units outside of this current accounting quantity. So we still think that this airplane is going to deliver value to us.
Robert Stallard (<i>Macquarie Research</i>): Jim, just a quick question on the deferrals. You said we could expect deferrals to increase this year. Could give us an idea of the scale of these. At what point you would start to be concerned that this would have a negative impact on your production forecast for 2010?
Jim McNerney (Boeing): As I mentioned, it's very hard to predict the deferrals we're going to see. I think our sense of it comes as we talk to our customers, who we talk to every day, is that they will be

				some respects is different. But that doesn't many that	
				some respects is different. But that doesn't mean that longer term we're immune from fundamental changes	
				in demand or fundamental changes in the credit	
				markets, and that's not what we're saying here today.	
				What we're saying here today is, in this long cycle	
				business that we're in, we have visibility on the next ten	
				to 12 months and we feel comfortable with it. We're not	
				issuing guidance for 2010. We need to read and react and	
				see what the impact will be longer term. But we are	
				different in the sense that we do have a little more visibility over the medium term than a lot of other	
				companies do.	
				companies do.	
				Lynn Lunsford:	
				Great. One last question with regard to the 787, where	
				do you see the [long pole] at this point that did	1
				somehow threaten the schedule that you are already	
				working on?	
				Jim McNerney:	
				I think the only thing that would concern me now, just	
				answering your question, would be something	
				unexpected that comes up in flight test. Some anomaly	
				or some operating characteristics of plane that we would	
				have to deal with. Now I don't worry that we couldn't deal	
				with it, but it could impact the schedule. There is a lot more modeling done these days before these airplanes get	
				in the air, so you have a higher degree of confidence. But	
				that the unknown in flight test is a possible long pole in the	
				tent.	
				Susanna Ray (Bloomberg News):	
				A UBS survey last week was suggesting that almost a	
				third of airlines are likely to defer their orders this	
				year. I think just a few minutes before you were talking	
				about anticipating a cancellation or deferral impact of $\frac{1}{2}$	
				just 2% to 3%. So I am wondering what makes you so much more optimistic.	
				-	
1				Jim McNerney (Boeing):	
1				All I can say is that we're talking to every airline every	
				day, and we are working through it. As I said, I think we had modest amount last year, and I think the numbers you	
I				just quoted were last year. We think there will be more this	
1				year and we're comfortable that we can deal with it. If it's	
				worse than our assumption, we'll be back to you."

					a business environment that will be very difficult for	nver.
					Boeing going forward. Shares of Boeing hit a floor of	
					\$40 per share during the October/November stock	
					market collapse. That was before the carnage in the	
					airline industry became apparent. Since that time,	
					conditions have only become worse for the group. The	
					way to survive in such an environment is to cut capacity.	
					That is not a good thing for <i>Boeing</i> , and why I made it	
					one of my Top 10 Stocks to Avoid in 2009. Thus far, I	
					have been dead on with my list that <i>included Delta Air</i>	
					<i>Lines (NYSE: DAL) and United Airlines (NYSE: UAUA).</i> Both of those stocks are down big in 2009. <i>Boeing</i> , on the	
					other hand, has traded flat. In my opinion, the market is	
					missing something here. <i>Boeing</i> should be down in tandem	
					with these giant carriers. The fact that it is not, provides	
					investors an opportunity to sell before the market	
					catches on to the weakness. Wednesday Boeing	
					announced poor fourth-quarter results. The company	
					posted a loss of \$56 million, or 8 cents per share in the	
					period. Analysts had expected the company to make a	
		× 1			profit of 78 cents per share. This is a big miss made	
					worse with a weak forecast for 2009. The company now	
					expects to make \$5.05 to \$5.35 per share in 2009. That is	
					less than the \$5.68 per share analysts now estimate. Go figure. But the stock was up \$1 per share on the news.	
					Can you say inefficient? I can and I will. I would have	
					expected shares to be down 10% or more on this type	
					of performance. The real kicker for me is that 2009 is	
					baked into the cake due to the advance time for orders.	
					The fact that they are reducing that number is telling and	
					does not bode well for 2010."

Earning		these development programs are underway and making	
s Call		solid progress. We are also making progress on	
Transcri		establishing our new Spirit Malaysia manufacturing	
pť"		facility. Spirit Malaysia is on schedule to be operational by	
		the end of the first quarter of 2009. Spirit Malaysia's initial	
		focus will be on Airbus products but overtime we'll	
		provide value to products across the Company. And we'll	
		add value immediately in 2009. Additionally we	
		announced and commenced construction of a	
		manufacturing facility in North Carolina. This new facility	
		will support Spirit's new business content on the Airbus	
		A350 XWB. Spirit North Carolina is expected to be	
		operational in mid 2010. I continue to be pleased with our	
		performance on the 787 program. Our team continues to	
		work well with the customer and our suppliers regarding	
		future production plans. I'll provide you additional	
		thoughts on the 787 programs later in the presentation.	
		Now let me provide you with my perspective on the	
		challenges we faced in 2008. As I've mentioned before,	
		I'm extremely proud of how the Spirit team planned	
		and executed our business during the two months	
		strike by machinists at <i>Boeing</i> . Our internal planning,	
		partnering with our customers, and working with our	
		unions representing Spirit employees allowed Spirit to	
		maintain production while avoiding layoffs and	
		furloughs. The reduced work week schedule enabled	
		the Company to execute a balanced approach to	
		address this difficult situation. This plan successfully	
		balanced the requirements of our customers, our	
		suppliers, the employees and shareholders, while	
		minimizing the impact to our communities and	
		maintaining the health of our business. I'm proud of our	
		team's ability to take challenges head on and deliver solid	
		performance in a non standard business environment.	
		Pension asset performance and the discount rate also	
		impacted our results for the fourth quarter and full year 2008. However, as you know our U.S. plan was frozen	
		when <i>Spirit</i> was formed and pension income and expense is a non-cash item. The plan remains fully funded at year	
		end 2008. Now let's talk about some of the specific	
		accomplishments across the business beginning on slide 3.	
		All three of our business segments revenues and	
		operating margins were impacted by both the	
		machinists' strike at <i>Boeing</i> and the higher projected	
		pension expense which Rick will discuss in his comments.	
		Airbus products remained on track and our European	
		MRO operation is open at the Prestwick facility. And the	
		previously mentioned <i>Spirit</i> Malaysia facility is planned to	
		be operational in the first quarter of 2009. Now let me	
		turn to slide 6 and give you a brief update on the 787. We	
		delivered aircraft number five in late January and aircraft

5 Feb. 2009	The Street.c om, "Boeing Mulls Producti on Cuts"	James Bell, CFO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	 amortized straight line again over those first 500 units." Heidi Wood (Morgan Stanley): "Jeff, I had a follow-up which is I'm just wondering you talked about the contractual commitments that you had with the OEMs. I'm just wondering if you've got any kind of an appetite to talk to them and renegotiate, just given that the world has changed so substantially. I mean just given the R&D that you're going to be spending on some plans where the outlook may be changed, do have much appetite to do that?" Jeffrey Turner: "Well, I think in general Heidi, I think we were open to negotiations that are appropriate, that's a pretty broad question I think. I mean clearly we feel good about the business that we won, the programs that we wanted on, and we feel very good about the long-term viability of the market. I think, I mean clearly things have changed in the short-term here. But we've been very conservative in the way we manage our business. So, we don't see anything on the horizon that would put us in a position where we had to go, renegotiate. So, if it makes sense to our long-term relationships and short-term needs, we certainly will. But, nothing really pops to mind that's having needed to do that at this moment." "Despite its bulging current order book, <i>Boeing</i> showed more signs Thursday that it is being impacted by the global recession. The company said its orders fell 72% in January and also disclosed that it may slow production in 2010. 'Our 2009 financial guidance considers the risk that we might have to make modest production cuts starting in 2010,' CFO James Bell told an investor conference. It was the first time that <i>Boeing</i> has acknowledged the possibility of production cuts, said Scott Hamilton, publisher of an online newsletter that monitors aircraft manufacturers. 'At last week's earnings call, <i>Boeing</i> sub it received just 18, down from 65 a year earlier, according to a posting on its We bsite. In his presentation, Bell said that the 'weakening g	On a modular enterpri se architec ur's focus on short term- pressure s, resultin g in unstable long- term growth.
					2009. <i>Boeing</i> has a backlog of \$352 billion, or five times its annual revenue, including \$279 billion in commercial aircraft orders. When the previous slowdown occurred, following the Sept. 11 terrorist attacks, the commercial- aircraft backlog was \$83 billion, Bell said. However,	

5 Feb. 2009	Cowen and Compan y Aerospa ce/Defe nse Confere nce	James Bell, CFO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Firm	α	Cai von Rumohr: [Regarding the 787] "I think you said on your Q2 call when you still had it in the forecast that you were assuming break-even but actually still hoped that the revenues would exceed the costshow do you feel today, is this going to be like a very low margin plane for a long period of time?" James Bell: (laughing) "No, obviously we're not going to expect that but right now, given what we know, this early on we're still guiding to zero margin on the initial deliveries and we're going to grow that over time, and for us to grow it there are a number of thing we're going to have to do. We're really going to work to get the productivity accelerated and a lot of that will be in the supply chain, and so we have plans in work to make that happen, and then obviously we're going to have to do a good job in negotiating with our customers on the delay penalties. So I think with those two things and the fact that we've sold a thousand of these airplanes it gives you the production level predictability over time that you need to go work those longer-term productivity issues. So we're still optimistic that this airplane is going to provide good value not only for our customers but for our shareholders." Cai von Rumohr:	On a modular enterpri se architec tur's over- promise and under- delivery
6 Feb. 2009	Seattle Post- Intellige ncer, "Virgin Group Founder Blasts Boeing" (Dan Richma n)	Richar d Branso n, founde r of the Virgin Group	Firm- Custo mer	α	"Terrific". "Sir Richard Branson, founder of the Virgin Group, blasted The Boeing Co. at a celebration of a new Virgin airline, held Friday morning on Boeing's own turf. 'If people in Seattle build our planes and deliver them on time and, to be frank, don't go on strike, then we'll continue to work with Boeing. If we have our airline completely messed up, with tremendous damage done to our own work force, then we'll go to Embraer or Airbus.' 'The delay on the 787 has been an absolute nightmare, and it's cost us a fortune. It really does make us think, 'Do we want to take a risk on Boeing in the future?'' Branson said. 'The strike hurt hundreds of thousands of our passengers,' Branson told reporters. 'It messed up Virgin Atlantic, it messed up Virgin Blue in Australia, it ruined people's Christmas holidays. It was absolutely and utterly ghastly.' He continued, 'If union leaders and management can't get their act together to avoid strikes, we're not going to come back here again. We're already thinking, 'Would we ever risk putting another order with Boeing?' It's that serious.' Boeing spokesman Jim Proulx said later Friday in an e- mail, 'We never want to disappoint our customers to such an extent. We are committed to doing everything we can in the future to satisfy our customers in the	On the further disintgr ation of firm- custome r link in a modular enterpri se architec ture.

6 Seattle Feb. Post- 2009 Intellige ncer, "Virgin Group Founder Blasts Boeing" (Dan Richma n)	Steven Udvar- Hazy, CEO of Interna tional Lease Financ e Corp.	Firm- Custo mer	α	"At the same event, the CEO of International Lease Finance Corp. said Boeing and rival Airbus could see production drop as much as 35 percent in two years. 'It will come down in steps until it reaches equilibrium,' Steven Udvar-Hazy told Bloomberg News. 'It wouldn't surprise me if in 18 to 24 months there were cuts of as much as 30 to 35 percent at both Boeing and Airbus. Airlines are focused on survival, not ordering planes.' Both companies have predicted a drop in orders this year. Udvar-Hazy said the slump will be longer than the decline after the 2001 terrorist attacks. 'This could be a year where the number of net cancellations and deferrals actually exceed genuine new orders,' Hazy told reporters at the event. While Hazy said he's not predicting that, 'certainly the elements are out there for that to happen.' Indeed, Boeing has started 2009 losing more orders than it has won. Boeing said Thursday it won 18 orders in January and lost 31 through cancellations."	On the percepti on of homoge neity of enterpri se architec tures among competi tors.
 8 The Feb. Seattle 2009 Times, "FAA to loosen fuel- tank safety rules, benefiti ng Boeing's 787" (Domini c Gates) 		Firm- Regula tors	α	"The Federal Aviation Administration (FAA) has quietly decided to loosen stringent fuel-tank safety regulations written after the 1996 fuel-tank explosion that destroyed flight TWA 800 off the coast of New York state. The FAA proposes to relax the safeguards for preventing sparks inside the fuel tank during a lightning strike, standards the agency now calls 'impractical' and <i>Boeing</i> says its soon-to-fly 787 Dreamliner cannot meet. <i>Boeing</i> has worked closely with the FAA to make the change in time for the 787 Dreamliner, whose airframe built of composite plastic makes lightning protection a special challenge. But the move has stirred intense opposition inside the local FAA office from the technical specialists — most of them former <i>Boeing</i> engineers — responsible for certifying new airplane designs. The national union representing about 190 Seattle-based FAA engineers this past Tuesday submitted a formal critique to the agency, calling the new policy 'an unjustified step backward in safety.' In a lightning storm, the critique said, the less stringent rules could leave a commercial airliner 'one failure away from catastrophe.' FAA management, contradicting its own technical staff, argues that relaxing the spark-prevention standard is balanced by new technology to reduce fuel-tank flammability that will increase safety overall. Jim Hall, the former National Transportation Safety Board (NTSB) chairman who oversaw the TWA 800 investigation, said he's disappointed in the FAA but not surprised. 'It appears that management has overruled the judgment of the people that have day-to-day responsibility for the safety of aircraft,' Hall said. The rules the FAA is now reinterpreting have been in place since 2001 after the investigation into the TWA 800 fuel-tank explosion that killed all 230 people on board the 747 jumbo jet. In a detailed briefing on the 787's protection systems, two high-level <i>Boeing</i> lightning experts — who spoke on	On a modular enterpri se architec ture's integral relation ship with its govern ment regulato r.

					condition that they not be named — said the	
					Dreamliner cannot meet the requirement. 'Boeing	
					spent years trying to develop triple layers of structural	
					lightning protection for every 787 fuel-tank fastener	
					and joint, but we were unable to identify the technical	
					means at many locations in the wings,' one said. The	
					FAA will accept formal comments on the policy change	
					through Feb. 13. The critique submitted by the FAA	
					certification engineers' union, the National Air Traffic	
					Controllers Association union (NATCA), acknowledges	
					that the existing regulation is strict. It may have to be	
					revised in some way, said one FAA certification specialist,	- 1
					who, like other agency engineers interviewed for this	
					story, asked not to be named to avoid retribution. 'A	
					bunch of us are in agreement as to how we can do that	
					and maintain safety,' he said. 'But it's not what our	
					management is trying to do in allowing catastrophic	
					single failures.'	
					By all accounts, the 787's inerting system is very effective.	
					But there's a catch: The FAA is not requiring that it be	
					'full time.' If a 787's inerting system breaks down, to	
					save the expense of grounding the plane, an airline will be	
					free to continue to operate it for 10 days while waiting for	
					replacement parts. That's despite an internal	
					recommendation from one of Boeing's own safety-	
					engineering team leaders in November 2005 that the	
					787's inerting system should be required to be working	
					before takeoff. 'This inerting system, if it was full time,	
					it would definitely be an acceptable level of safety,' said	
					a second FAA engineer who has worked on the 787's	
					certification. But without that assurance, he said, to fly	
					on a Dreamliner out of a lightning-prone airport in the	
					summer is a risk he's not prepared to take. 'I wouldn't	
					put my family on a 787 out of Miami,' said the	
					engineer, who formerly worked for <i>Boeing</i> .	
					engineer, who formerly worked for <i>Boeing</i> .	
					EAA Pasing too place? Tomasa DiDasla MATCAL	
					FAA, Boeing too close? Tomaso DiPaolo, NATCA's	
					aircraft-certification national representative, charges that	
					when FAA engineers raised their safety concerns	
					internally management simply removed them from the	
					team developing the new policy. The FAA ignored its	
					own technical people, he said, while making sure	
					Boeing agreed with the policy change. 'It's another	
					example of the FAA getting too close to industry,' said	
					DiPaolo. 'It appears that whatever Boeing wants,	
					Boeing gets.' A Boeing internal document reviewed by	
					The Seattle Times shows the company had a 'team to	
					assist FAA in wording of interpretation' of the	
					lightning rule for the 787 as far back as August 2004,	
					just eight months after the new jet program launched."

					But behind that lies a production system that continues	enterpri
					to operate and improve itself at incredible rates. We began what we call our 'Lean journey' on the 737 product	se.
					about eight years ago. During the ensuing years, we have	
					reduced factory flow on the product by 50%, and we have	
					reduced our cost of quality by some 31% and continue	
					our relentless pursuit to drive even more cost out. Our fundamental factories are running well and have not been	
					adversely affected by the challenges we face on the two	
					development programs.	
					We are absolutely focused on continuing the journey of	
					driving productivity through our factories on the	
					current products. And this journey of Lean is a	
					journey that will continue forever.	
					Joe Campbell:	
					"The company has said that the 787 – whatever the	
					production quantities that you calculate your profits over – we should plan on the initial quantities being zero."	
					we should plan on the minut quantities come zero.	
					Scott Carson:	
					"Correct."	
					Joseph Campbell:	
					"But that means that - for example on the 747, you've	
					taken a forward charge so presumably any cushinon that was on the 747 has been stripped out and you really are	
					operating right at zero – but in the 787 you don't have that	
					and so the question really gets to whether or not for the	
					entire block of 500 airplanes or whatever the number turns out to be - you haven't disclosed - whether you really	
					think that we should as an investor group be thinking –	
					however long it takes you to ship 500 airplanes - you'll	
					have zero margins."	
					Scott Carson:	
					"No. You shouldn't be thinking that. So this is the	
					initial launch of the program, the initial deliveries and we've guided you in that direction, specifically for the	
					initial series of aircraft."

11	Seeking	Firm-	α	"Much has been written about Boeing's murky future.	On a
Feb.	Alpha,	Investo		Will its customers cancel orders? Will the 787 ever be	modular
2009	"Boeing	r		delivered? What new production snafu will happen	enterpri
	's Bad			next? However, little has been mentioned about its	se
	Balance			crumbling balance sheet. In two previous articles, I	architec
	Sheet			wrote about Boeing's weakening financials (Boeing Can't	ture's
	May			Afford Another Strike and Boeing Headed The Way Of	systema
	Doom			GM?) and predicted a miserable Q4. Boeing did not	tic
	It"			disappoint. Its balance sheet saw tremendous asset	underin
	(Stephe			destruction this quarter. Cash and cash equivalents	vestmen
	n			were more than halved from Q4 2007 to Q4 2008.	t.
	Rosenm			Short term investments went from \$2.3 billion to	
	an.				
	Disclos			practically zero. Pension plan assets tumbled from	
	ure:			\$5.9 billion to nothing. In the meantime, inventory	
	Author			climbed from \$9.6 to \$15.6 billion on the halt in	
1	holds a			commercial plane productionwhile goodwill and	
1	short			other intangibles rose from \$5.2 to \$6.3 billion (not	
	position			much to hold onto).	
	in BA)				
				The liability side grew. Pension plan liabilities soared	
				from \$1.2 to \$8.4 billion. Ouch! All in all, tangible	
				equity dropped from \$2.7 to a minus \$6.8 billion, a	
				sad \$9.5 billion loss. Boeing goes into 2009 with a	
				weak balance sheet. It needed its cash, investments,	
				and pension plan assets, all victims of strikes,	
				production misteps, and a falling stock market. Those	
				cushions are now gone. It faces a large \$7 billion debt.	
				Moreover, it now faces a whole new problem in the	
				form of an \$8.4 billion pension liability that dwarfs its	
				debt. So far this year, Boeing has lost \$9.5 billion in	
				tangible equity. That's not how you want to enter one	
				of the most trying times in our nation's economic	
				history."	
				 Jake Berzon 	
				"Oh, who cares about fundamentals. Surely, US	
				government will rescue BA when its time comes -	
				they are a major government contractor, a huge	
				employer and our nation's pride and joy! :)"	
				• Marcap	
				"I agree with the author. <i>Boeing</i> is indeed in very bad	
				shape. With a negative book value for its shares,	
				and virtually no inside shareholders (less than 1/2	
				of 1%), it absolutely amazes me that their shares	
				are still trading at roughly \$40. Very scary indeed!	
				But perhaps the scariest of all, is just how much	
				they are cutting costs in the production of new	
				aircraft. It's certainly not a time that I would want	
				to be placing an order for any."	
				• Stephen Rosenman	
				"Tatertot: I wanted to dramatize the collapse of BA's	
				assets in one year. The market totally ignored the	

	 balance sheet. It will take a herculean effort to repair the balance sheet. Also the investing public ignored the looming problem BA faces with its new pension plan problems: pension plan assets went from \$5.9 billion to a \$8.4 billion liability. Someone needs to fire the guy in charge of the pension plan. Note above remark is a swing of \$13 billion in the pension plan." <u>o opa-opa</u> "Good article, but sort of useless for those of us who wants to know what will happen in the future, instead of what has already happened. But I guess it's easy to throw in words like 'doomed' these days and short everything to heck. Hope you shorts enjoy it while it lasts. The night is always darkest before the dawn."
	 <u>Stephen Rosenman</u> "Opa-opa: 'Doom' title was chosen by Seeking Alpha, not me. The future for BA is dimmer in great part because it has lost a vast amount of its assets. For those of us who have followed this company, it's pretty sad. Back, in 2005, tangible equity was \$8.5 billion. Now it's in the hole \$6.8 billion. That's \$15.3 billion in damages in 4 years! Who else could wreck so much equity and prosper? As to the future? Negative free cash flow, currency issues. higher salaries and health costs (from strike), customers walking or renegotiating contracts after BA's failure to deliver, decreased air travel, quality issues with fasteners, likely more 787 delays, pension plan pressure, all should create more than their share of problems for BA."
	 <u>lbrtkng</u> "Some smart account out there, please correct me if I have this wrong, but isn't the pension data presented here somewhat apples and oranges? Isn't the over-funded portion of the pension plan what is shown as a net asset on the balance sheet? And isn't the pension liability the actual long term pension obligation? As far as the cash situation, didn't <i>Boeing</i> make several acquisitions in the last quarter, thus using up some of their stash of cash? And wouldn't those acquisitions have just shown up as other assets on the balance sheet instead of cash? This piece comes across as not too well researched or insightful. And from a serious analyst perspective, the author's use of only two data points is just plain silly."
	 <u>Stephen Rosenman</u> "To lbrtkng: Per SEC 10K, BA has incurred an \$8.4 billion pension liability, largely owing to over a \$7 billion loss (read sour investments). Its pension

overfunding has disappeared, a \$5.9 billion gone. Therefore, the apples, oranges, together become one big tomato of a \$13 billion + drop in equity. Where are those acquisitions on the balance sheet? More goodwill, intangibles, and plants. As to 2 points, the market usually compares year over year earnings. This is a comparison to year over year equity, its breakdown into components of the asset and balance sheet."
 <u>Stephen Rosenman</u> "To lbrtkng: The balance sheet pension asset or liability is equal to the difference between pension assets and the actuary's estimate of pension liability plus or minus the unrecognized (unamortized) portions of past and prior service costs, actuarial/experience gains or losses. In other words, pension assets - liabilities are apples to apples."
 <u>Tatertot</u> "I understand that desire, but none-the-less, it would be useful to see whether these are one-time events or indicative of a trend. <i>Boeing</i> has already dropped from \$104 (peak) to about \$40, so I'm wondering how much this information has already been incorporated into the stock price. If we have a trend down, it may be worth going short side, but two data points don't allow for that kind of analysis. Like I said, I like the article, but I'd need more before really acting on it."
 <u>opa-opa</u> "Why don't you make a 2-point chart of BA's airplane order backlog from 2005 to 2009?"
 <u>Stephen Rosenman</u> "Tatertot: Tangible equity for 2004 was \$8.5 billion, 2005 dropped to \$8.2 billion, 2006 went to zero, 2007 \$2.7 billion. Now we are at minus \$6.8 billion. That's a 5 year trend, almost a \$4 billion dollar a year loss in tangible equity on average a year. The trend is worrisome. Opa-opa: This is a discussion about the balance sheet. However, looking at the above drops in tangible equity, it seems clear that BA has not been able to use its sales to keep its balance sheet in order."
 <u>PeteK</u> "You bet <i>Boeing</i> is following <i>GM's</i> footstep. The union is exactly the same as UAW or worse. They never LEARN. The STRIKE last year was a deadly BLOW to <i>Boeing</i>. What a timing to have a strike. They have to pay for their stupidity for sure." TFG
<u>• TFG</u>

	Wallace				the situation ourselves with the setbacks we had last	0
)				year with the machinists' strike and our performance	
					issues on key development programs. As I told	
					shareholders and analysts on our quarterly earnings call	
					last month, our strategy for weathering this storm is to	
1					improve execution on our underperforming programs,	
1					maintain strong performance on the vast majority of our	
1					programs that are performing well, and preserve our	
1				1	financial strength to enable continued investment in our	
1					business and our employees, including our pension and	
1					benefits plans. With that in mind, we have been taking	
1					decisive action:	
1						
1					* To improve programs that have not been performing to	
1					plan: We have bolstered program-management	
1					processes, increased functional discipline and	
1					oversight, applied additional resources and technical	
1					expertise, and made leadership changes where we	
					believed it was necessary to improve the team's	

performance . As part of that, we have also rebalanced our program-review schedule to place greater time and attention on underperforming programs . Reliable, disciplined execution across all programs is not merely an aspiration for us; it's an imperative. Our customers have choices, and disappointing them has consequences for our business and relationships.
* To maintain strong performance where it exists: We are asking all employees to redouble their efforts to focus on sustained, strong execution and to leverage our growth and productivity initiatives to drive even higher levels of efficiency and competitiveness. Sharing and replicating best practices, ensuring functional discipline and excellence, and raising issues and concerns early are all key to keeping the hundreds of healthy, successful programs inside our company healthy and successful.
* To preserve our financial strength: We have put a spotlight on cash and asset management. In prior years, we generated substantially more cash than we needed for daily operations. Despite strong performance across most of our programs, last year's strike, delays on development programs, and lower returns on our investments (due to the financial crisis) changed that. In response, we have reduced discretionary and capital- spending budgets. We have centralized and consolidated organizational structures to both slim and strengthen them. We are eliminating work that doesn't add value to our customers, and we are reducing staffing levels to support a trimmed-down infrastructure.
None of these actions are easy, especially those that affect employment of our people. But they are all necessary elements of our strategy to support our customers during uncertain times and to ensure our competitiveness and growth over the long haul. They require stepped-up responsibility and accountability by leadership as well as the involvement of every employee. As we work through them, it's also vital that we stay fully engaged with our customers. We cannot let our attention to internal efforts distract us from serving them, nor can we leave any impression that our focus on them has waned. Regarding 2009 employment plans: When we looked at it last fall, we said we expected reductions in excess of our normal attrition rate of 4 to 5 percent by the end of this year. Our current estimate of 6 percent, or about 10,000 jobs, is consistent with that initial expectation and the business assumptions behind it. It's important to note that while the planned reductions include some layoffs, they also rely on attrition, retirements, not filling some open positions, and cutbacks in contract labor. The mix of these elements varies by business area and geography, and the reductions, while weighted heavily in the first half, will be spread over
the course of the year. We're keeping close watch on the dynamics of our business environment and the factors that

affect employment. We will be sure to keep you informed	
should anything in our outlook change. More than a few	
of you have written to me asking whether we could	
avoid layoffs altogether by not paying incentive awards	
this year or by freezing wages across the board. While	
these actions would preserve some cash during the year	
and lessen the immediate impact on people, our	
judgment (and one shared by most major companies) is	
that they would put us at a competitive disadvantage	
when it comes to attracting and retaining the high-	
performing people we need to consistently perform for	
our customers. Having said that, I want to assure you	
that we have taken (and will continue to take) steps to	
mitigate the impact to our team. For example, we are	
consciously restraining salary growth this year in order to	
lessen the number of job cuts we need to make while	
retaining flexibility to fund growth projects and preserve	
key skills across the enterprise. We also continue to	
provide the best transition assistance we can to laid-off	
employees. The next 12 to 18 months promise us a steady	
flow of tough business challenges and increased	
opportunities to support our customers. Many experts	
believe the economic news could get worse before it gets	
better, and we've tried to anticipate some of that in our	
plans. While it's hard to know the final impact, we must be	
prepared should conditions worsen beyond the already	
difficult environment we have assumed. But, as I've	
mentioned above, we have a plan to deal with the situation	
and it is a good one. We know what we need to do to	
navigate this turbulence. If we execute well with	
integrity and always consistently with our values	
we will prevail through even the most difficult of times	
and emerge stronger when the economic tide turns.	
Thank you for all you are doing to support <i>Boeing</i> and our	
customers. Jim"

							and the state of t

					and has been updating its forecast annually ever since. <i>Airbus</i> began publishing 20 year market studies in 1988 - which crystalised as its 'global market forecast' in 1995 - but has not stuck to the annual publishing schedule of its rival. While short-term shocks such as 9/11, last year's oil price escalation dramas or the current global financial crisis have some bearing on demand in the near term, the tendency is to assume, backed by historic prerogatives, that any impact will be ironed out and will not influence long-term trends. For example, <i>Boeing</i> says in its latest current market outlook, produced amid the high fuel prices in 2008, that 'the forecast has been developed in a manner that considers today's market environment, but takes a long-term view of the market and the fundamentals that drive commercial aviation. These include economic growth, world trade and new aircraft capabilities.' So how close have forecasts come to matching reality? Comparing <i>Boeing's</i> 10-year outlook published in its 1998 current market outlook for fleet growth from 1997-2007 with the actual fleet data included in its 2008 current market outlook indicates that its demand forecast was optimistic. The fleet (excluding regional jets) was expected to grow to 17,700 airliners in 2007, but the data in <i>Boeing's</i> 2008 current market outlook shows that the 2007 fleet was 15,840 units. However, in 1998, <i>Boeing's</i> current market outlook did not include regional jets - the boom was still in its infancy then. This category is now included, putting the total airliner fleet in 2007 at 19,000 units. Significantly, back in 1998 when <i>Boeing</i> was still toying with ideas for a 500-seat airliner, it predicted that the fleet in this category would grow to 1,240 units, whereas in reality it would contract over the 10 years from 1,016 units to 910. <i>Airbus</i> has traditionally stuck to taking only a long-term, 20-year view in its global market forecast, failed to predict the size of demand for the A380 from Emi	r demand.
					However, it is worth pointing out that its 2003 global market forecast failed to predict the size of demand for the A380 from Emirates as it did not include the airline's Dubai base among its forecast of the top 10 large-aircraft hubs. In the wake of Emirates boosting its A380 orders to more than 50 aircraft, <i>Airbus</i> quickly remedied this omission in its next global market forecast and now has Dubai placed third in the rankings behind London

u and		its cars and factories. It spawned technological	
John	Watan	advances, but led to cars that were often costlier to	
Murphy	abe,	produce. The 52-year-old Mr. Toyoda is also working to	
)	outgoi	fix a pricing strategy that put the company at odds	
/	ng	with some U.S. dealers, who felt its cars were getting	
	Preside	too expensive, according to people familiar with the	
	nt,	situation. Auto makers world-wide are in pain, and <i>Toyota</i>	
	Toyota	is much stronger than rivals such as General Motors	
	Motors	Corp., which is flirting with a bankruptcy filing. Still,	
	Corpor	Toyota is expecting its first annual net loss in 59 years.	
	ation;	Mr. Toyoda may shutter factories in North America and	
	Akio	Japan, where <i>Toyota</i> bulked up in recent years and is now	
	Toyod	stuck with too much manufacturing capacity. It might	
	a,	also be faced with its first layoffs in Japan since 1950,	
	incomi	when 3,000 workers were let go. Mr. Toyoda blames	
	ng	more than the recession, according to people familiar	
	Preside	with the matter. He is sending the message that his	
	nt,	predecessors worsened the problem by straying from	
	Toyota	core ideas of thrift and efficiency. Among other things,	
	Motors	there's a move away from technologically sophisticated	
	Corpor	in-car gizmos like a solar-powered cooling system	
	ation	designed for the new Prius. In addition, an expensive new	
		assembly-line technique of dipping car bodies into a vat of	
		paint and swirling them around nicknamed shabu shabu,	
		after a popular Japanese hotpot dish is under the	
		microscope. Toyota said in a statement that it feels its	
		management decisions made in the past were appropriate	
		for their time. Mr. Toyoda is the first member of Toyota's	
		founding family to take the helm in 14 years. 'I think	
		Toyota probably over-expanded a little bit in order to	
		compete with the American auto makers,' said his	
		father, Shoichiro Toyoda, 83, who himself was the auto	
		maker's president during the 1980s. 'There are a lot of	
		things that we have to review.' The younger Mr. Toyoda's	
		appointment as president is pending shareholder approval	
		in June. Mr. Watanabe, whose appointment as vice	
		chairman was announced along with Mr. Toyoda's	
		promotion, had been president since June 2005. The	
		shakeup reflects the sense of crisis within Toyota as it	
		navigates one of the toughest periods in its 70-year history.	
		For the past decade, it expanded at breakneck pace.	
		Under Mr. Watanabe, 67, <i>Toyota</i> posted record net profit	
		1.72 trillion yen in the ended March 2008. Last year it	
		unseated rival GM as the world's biggest auto maker in	
		terms of unit sales. Now, it is forecasting a 350 billion yen	
		net loss for the current fiscal year, ending March 31. And	
		not only are sales plummeting, but earnings are getting	
		further hurt by the strong yen, which means money earned	
	1 1	abroad isn't worth as much when converted into Japan's	
		currency. In a recent sign of the distress, at a meeting late	
		last year Mr. Watanabe appealed to mid-level managers	
		to 'share the pain' code for a salary cut then made	
		them wince by asking them to also consider buying a	
		new car to help shore up sales, according to people who	

attended the meeting. An unprecedented number of unsold cars in Japan has forced <i>Toyota</i> to stockpile them in the parking lots of Fuji Speedway, a company- owned track near Mount Fuji. Koichi Shimokawa, a professor of business administration at Tokai Gakuin University in Nagoya, says <i>Toyota</i> was so focused on becoming the world's largest auto maker that it failed to cut production quickly enough last year as economic crisis struck the U.S., its largest market. ' <i>Toyota</i> was overconfident in its competitiveness and they just kept pressing the accelerator,' he says. Until late last year, it appeared to be a horse race for the presidency between Mr. Toyoda and Mr. Kinoshita, 63, the righthand man to Mr. Watanabe, the current president. As recently as late last year, when <i>Toyota</i> 's powerful elders huddled to discuss who should succeed Mr. Watanabe at the end of his two- year term, some worried Akio Toyoda was too young. Others felt that a large, publicly traded company like <i>Toyota</i> should'nt pick a family member for the top job, even though Mr. Toyoda is a veteran who oversaw rapid growth in China, among other things. A turning point came in a meeting in November at the company's global
them in the parking lots of Fuji Speedway, a company- owned track near Mount Fuji. <i>Toyota</i> shouldn't pick a family member for the top job, even though Mr. Toyoda is a veteran who oversaw rapid growth in China, among other things. A turning point
even though Mr. Toyoda is a veteran who oversaw rapid growth in China, among other things. A turning point
growth in China, among other things. A turning point
come in a meeting in Nevember at the company's global
headquarters in Toyota City. Akio's father, Shoichiro
Toyoda, made a subtle remark to the assembled group,
according to people familiar with the matter. 'Why are
all the key decisions these days made by Watanabe-kun
and Kinoshita-kun?' the elder Mr. Toyoda said, using a
standard honorific for the two men. According to those
people, Shoichiro Toyoda seemed annoyed that Messrs.
Watanabe and Kinoshita had broken with Toyota
protocol last year by singlehandedly deciding what
vehicles would be built at a factory under construction
in Mississippi. They had switched to the Prius, a gasoline-
electric hybrid, from the Highlander, a sport-utility
vehicle, without first consulting other key executives. The
language was subdued. But the comment, along with
additional criticisms from other executives in other
meetings, ultimately tipped the scale in Akio Toyoda's
favor, the people say. Shoichiro Toyoda says he doesn't
recall the meeting. Toyota said in its statement that it
decided a new management team was needed to tackle the
tough situation it faces. It's not clear if a back-to-basics
approach will be enough to revive growth at the
sprawling firm, particularly amid the weakening global
economy. Other auto makers have promoted founding-
family members, with limited success. Ford Motor Co.'s
own founding-family scion, Bill Ford , took over from
Jacques Nasser in 2001. But Ford failed to launch popular
models, while sales of its profitable SUVs wilted as
gasoline prices rose. In 2006, Mr. Ford handed over the
CEO position to a nonfamily executive, Alan Mulally, a
former <i>Boeing</i> executive, who is still struggling to right
the ship. Asked whether the family name influenced the
choice of top executive, Shoichiro Toyoda said: 'We never
know who is going to be president. The current president
made the best decision about who is appropriate for the

	
	next president, and it just happened to be my son.' The
	family controls roughly 2% of Toyota stock. Akio
	Toyoda himself, as one of five executive vice-presidents,
	isn't entirely free of blame for the company's recent woes.
	Since June 2007, he has overseen the Japanese market,
	where sales and market share continue to fall. Toyota now
	aims to generate 'reasonable profits' even if is global
	sales (excluding sales of its two main affiliates, car maker
	Daihatsu and truck company Hino) slump to seven
	million, down from an all-time high of 8.4 million it
	sold in 2007. Toyota currently has capacity to produce
	about 9.7 million vehicles, according to an estimate by
	consulting firm CSM Worldwide. Akio Toyoda has long
	preached a traditional Toyota practice called genchi
	genbutsu, a leadership maxim that boils down to get
	out of your office and visit the source of the problem.
	For the past year, Mr. Toyoda has been practicing genchi
	genbutsu to quietly collect evidence that the company
	had strayed, according to people familiar with the
	situation. They say he was particularly concerned that
	Messrs. Watanabe and Kinoshita placed strong
	emphasis on achieving two trillion yen in annual
	operating profit, a level it passed in the year ended March
	2007. Driven by that profit objective, Toyota executives
	reasoned American consumers would be willing to pay
	a premium for a <i>Toyota</i> a change from a long-held
	strategy of pricing cars at a value. Two years ago,
	<i>Toyota</i> started raising prices on an array of models
	including the redesigned <i>Corolla</i> , one of its most
	prominent vehicles, launched in early 2008. Toyota's U.S.
	sales arm had tried to price the <i>Corolla</i> about \$1,000 to
	\$1,500 above what its U.S. dealers thought people would
	pay for a basic family car, according to U.S. dealers. Not
	surprisingly, sales were weak. <i>Toyota</i> sold 21,000 Corollas
	in February 2008 down 25% from a year earlier. When
	Mr. Toyoda got wind of the slow Corolla sales, he flew to
	the U.S. to meet with dealers and investigate for himself.
	Cliff Cummings, a veteran southern California dealer,
	warned Mr. Toyoda over a steak dinner with a dozen other
	dealers last March that premium pricing was the wrong
	way to go. Toyota had built an image of sturdy
	affordability, 'but now they were wrecking it,' Mr.
	Cummings says he told Mr. Toyoda. Based on
	subsequent conversations with the younger Mr. Toyoda
	and other executives, Mr. Cummings says he expects the
	company to overhaul its pricing strategy. The company
	is also reining in its engineers, who have been designing
	new features that occasionally appear to be out of
	character with the company's utilitarian roots. For
	example, the new <i>Prius</i> , launching this year, has an option
	for a solar-powered ventilation system designed to keep
	the interior cool when parked. Gizmos like these helped
	lift the car's retail price to an estimated \$28,000, according
	to analysts, compared with the \$22,000 currently.
	'Frankly, that does worry me,' says Earl Stewart, one of
	the top Prius dealers in the U.S., based in North Palm

					Beach, Fla., He anticipates stiff competition from <i>Honda's</i> new low-priced hybrid, Insight. 'I am already drastically discounting my Priuses to maintain my sales rate,' Mr. Stewart says. Then there's the shabu shabu paint system. <i>Toyota's</i> manufacturing division is one of the company's proudest operations, having developed a highly efficient 'lean manufacturing' philosophy that has been emulated over the years by everyone from <i>GM</i> and <i>Hewlett-Packard</i> to hospitals and supermarkets seeking greater efficiency. Mr. Watanabe, the current president, had backed the new technology as he encouraged his engineers to radically shorten the painting process. To replace the traditional system of slowly dragging a car through a 115foot-long bath of anticorrosion undercoating, <i>Toyota</i> engineers came up with a new process in which a car body gets picked up by a robot arm, then swished around in a pool of paint, cutting the length of the line. Engineers compare it to shabu-shabu, which involves picking up slices of meat and swishing it around in a hotpot to cook it. However, the new system costs roughly four times as much to set up as the traditional process, while producing what Mr. Toyoda felt were minimal improvements in the quality of the paint job and its efficiency, according to people familiar with the situation Also likely to be axed: A new 'ecological plastic' that emits less carbon dioxide over the course of its life than more traditional alternatives, but which is costlier to produce. Another tough area Mr. Toyoda must tackle promptly is the excess manufacturing capacity in Japan. In the late 1990s, when a strong yen made Japan a costly place to make cars, <i>Toyota</i> slashed capacity at home and added production overseas. But the yen reversed its direction, weakening to as low as 120 to the dollar between 2005 to 2007. <i>Toyota</i> decided to take advantage and do more of its manufacturing at home, since a weak yen has the effect of making exports more

He predicts a 1.4% drop in global domestic product this year, and falls in passenger and cargo traffic of 3-5%, and 5%, respectively – 'the largest decline ever seen in the market,' he noted. With that background to customer funding needs, the US manufacturer predicts a modest \$1 billion gap that it will address from its own sources. But Tinseth is impressed by airline response to the downturn: 'I've never seen operators so fast to react; adjusting capacity and schedules, and parking aircraft.' Tinseth size, Historically, cycles in global revenue passenger miles on international scheduled services have followed closely (but exaggerate by about a half) world GDP trends. Generally, peaks and troughs have lasted two or three years before the cycle reverses –, that is until the boom in the past mid- decade, which saw record orders placed over an extended period. Those fat years prompted BCA CEO Scott Carson to speculate in early 2007 that the established pattern might be about to change, but Tinseth suggests the jury is still out: 'We must wait: [the present downturn] confirms the market is [still] cyclic. There is no empirical evidence to de-link gross domestic product from airline traffic.' What has changed is <i>Boeing's</i> overall market approach, which these days relies much less on domestic business. "In 2001, 61% of our backlog was American; now it is 11% – more diverse, more global.' The latest boom has seen that backlog increased constantly for five straight years, but growth has stopped. "We expect our 'bill-to-bock' [ratio]							
over the next 12 months. Every month we talk with production." <i>Boeing</i> has learned from past mistakes. "The benefit of this cycle is that we can take a very thoughtful approach to [change] to avoid 'yo-yo-ing' suppliers. That's what we learned in 1997 and 1998 [after ramping up 737 production too quickly]. Tinseth believes operators will continue adapting to market developments. He predicts a 1.4% drop in global domestic product this year, and falls in passenger and cargo traffic of 3-5%, and 5%, respectively – 'the largest decline ever seen in the market,' he noted. 10 Mar. 2009	Forbes, "Boeing says 787 Remain s on Schedul e"	Scott Carson , Preside nt, Boeing Comm ercial Airpla nes	Firm- Investo rs	α	spars due to premature buckling. <i>Boeing</i> said at the time that aircraft seven would be the first 787 to have that change incorporated at the supplier level, whereas the first six test-flight aircraft required a retrofit to be added on the final assembly line in Everett. In addition, to better enable the forthcoming production ramp-up and to speed up final assembly time, a terminal fitting has been relocated from the wing to the integrated centre fuselage section, although this change presented a unique challenge to the 787 supply chain. By relocating the fitting for its first incorporation with aircraft seven, <i>Boeing</i> found that the width of the centre fuselage had increased, causing a 'slight interference' with a damage indicator panel within the 747 LCF Dreamlifter's cargo bay, preventing optimal loading. The interference was enough to warrant a simple retrofit to the Dreamlifter that will be prepared in time for the first delivery, which is expected in the second quarter. <i>Boeing</i> plans a service bulletin to address this issue across the LCF fleet." <i>"Boeing Co.</i> said Tuesday the initial test flight and delivery of its long-awaited 787 jetliner remain on schedule. The Chicago-based aerospace company has postponed the introduction of the next-generation aircraft, built for fuel efficiency from carbon composite parts, four times due to production glitches and a two-month strike last fall. The delays have cost <i>Boeing</i> continues to work toward the inaugural 787 test flight in the second quarter of this year and the first delivery in the first quarter of 2010. 'The progress on a daily basis is gratifying,' he said at an investor conference in New York. 'We have now cleared all the equipment on the airplane for first flight and are continuing to work through the integrated software and hardware testing.'" 10 Mar. 2009	CNN, "EADS Profits Take off Despite Downtu rn"	Louis Gallois , CEO, <i>EADS</i>	Firm- Investo rs	β	"European aerospace group <i>EADS</i> has announced 'satisfying' results for 2008, posting a net profit of $\in 1.572$ billion (\$1.987 billion), despite the economic downturn. <i>EADS</i> CEO Louis Gallois announces the 2008 results during a press conference in Munich. In a statement on its Web site, the company revealed earnings before interest and taxes (EBIT) for the period amounted to $\in 2.8$ billion (\$3.55 billion). This compared to a $\in 446$ million net loss in 2007. The Munich and Paris-based company attributed the results to its excellent underlying performance and significant positive foreign currency effects. 'We made significant headway in reshaping the company,' Louis Gallois, chief executive of <i>EADS</i> , said."	On a modular enterpri se architec ture's "reshapi ng" efforts to become more efficient
10 Mar. 2009	Wall Street Journal, "Corpor ate		Firm- Investo rs	α	"The corporate bond market has been strong in March, as companies with high credit ratings and solid balance sheets take advantage of investors' appetite for yield. Energy and utility companies have favored smaller issues - - usually averaging \$300 million to refinance maturing	On a modular enterpri se architec

	Bond Supply Remain s Strong in March" (Kellie Geressy)			debt. Investors see those sectors as much less risky than others, including banks and finance companies. Boeing Co. is also in the market with a \$1.85 billion offering which will include five-, 10- and 30-year pieces. The aerospace company is taking advantage of historically low interest rate levels combined with investor demand for high-quality names, according to Todd Blecher, a spokesman for Boeing. The proceeds will be used to support the company's general liquidity position, which may include debt repayment, repurchase of common stock, acquisitions, capital expenditures and pension funding, he said. Boeing is an infrequent issuer in the corporate bond market, having last been seen in the U.S. market on Dec. 22, 2003, when it sold a miniscule \$11 million medium-term note. 'Now is a good time to take a step in building our liquidity, given our overall debt structure. It seems a prudent step to have a cushion in place on our balance	ture's financin g strategie s.
13 Mar. 2009	"Boeing 's McNern ey was Paid \$14.8 million in 2008" (Domini c Gates)	Firm	α	sheet, given what's happened in the economic spectrum,' Mr. Blecher said." "With Boeing's poor 2008 performance, especially in the commercial airplane division, the compensation of its top executives was lower than it could have been. But somehow, despite the stock's dive and the depressed profits, pay still rose for three out of the top four. Chief executive Jim McNerney earned 14 percent more than the previous year. Only Commercial Airplanes chief executive Scott Carson took a real hit. His total compensation fell 19 percent from the previous year. Adjusting figures reported Friday to reflect true 2008 compensation, McNerney got \$14.8 million in salary, bonuses and perks. That compares to \$12.9 million in 2007. Carson's total compensation was \$3.2 million, down from \$3.9 million in 2007. The pay for top company executives was detailed in a filing Friday with the Securities and Exchange Commission. Boeing's filing noted 'below target' economic performance in 2008 largely due to 'product development delays.' The company's 787 Dreamliner program was further delayed to almost two years behind schedule, and the 747-8 was pushed out by nine months. However, the Boeing board's compensation committee did not let another problem — the two-month Machinist strike in 2008 — factor into its executive pay awards. The compansition measure that factors in the company's economic performance was specifically adjusted 'to eliminate the impact of the IAM strike' to ensure that the awards 'reflected underlying growth and performance,' the filing said. McNerney requested cuts to his annual and long-term incentive plan bonuses to reflect the depressed profits, and the company board accordingly shrunk each by 25 percent, knocking about \$2.2 million off his compensation. His 2008 annual bonus was 65 percent lower than in 2007. But that was more than made up for by the long-term incentive plan bonus, which is based on a	On a modular enterpri se architec ture's executiv e compen sation, based on the labor strike and firm perform ance.

16	Flight	Firms-	α	three-year performance from 2006 through 2008 and was buoyed by good results in the first two years. The perks McNerney received in 2008 included \$287,000 worth of personal use of <i>Boeing</i> private jets, \$67,000 in personal legal services, and \$60,000 for personal use of a company car and driver. Top <i>Boeing</i> executives receive individual performance scores annually that are one factor in calculating their bonuses. McNerney's and Carson's individual scores came in below target. The head of the defense unit, Jim Albaugh, and chief financial officer James Bell both received individual scores above target. Albaugh got \$5.1 million in 2008 salary, bonuses and perks, compared to \$4.1 million in 2007. Bell's total compensation was \$4.6 million, compared to \$3.7 million in 2007. Both men were up 23 percent on the previous year."	On the
Mar. 2009	Global, "Future Aircraft and Engines : When Will they Hit the Market? " (Max Kingsle y-Jones)	Suppli ers	&β	models face even bleaker prospects for new orders in 2009. But of more immediate concern to <i>Airbus</i> and <i>Boeing</i> is the need to get to grips with production issues that have dogged both their programmes. <i>Boeing</i> , which has accumulated orders for 106 747-8s (78 -8F freighters and 28 -8I passenger models) since launching the <i>General Electric</i> GEnx-powered family three years ago, should now be flight-testing its 747-400 successor. But after a series of schedule delays - and two changes of programme leadership within 18 months - assembly of the first 747-8F (the lead variant) is still not complete and first flight is at least three to four months away. Deliveries to launch customer <i>Cargolux</i> , which were due to begin late this year, will now start no earlier than mid-2010. <i>Boeing</i> blamed the slip on a combination of issues including supply chain problems, engineering requirements (including the need for revisions to the wing design), the 787 crisis and its machinists' strike. 'After we got to the 90% release milestone of engineering drawings in early third quarter of 2008 and started to begin production we realised we weren't getting the parts in on time. A lot of [the issues] came home at that point,' said 747 chief engineer Michael Teal when the slip was announced last year. <i>Airbus</i> , meanwhile, has just reached the 200-order threshold for the A380 and has delivered 13 aircraft since the first went to <i>Singapore Airlines</i> in October 2007. But it is still battling with the overspill from production issues that have dogged the programme. 'Production is not fully under control, we've still got a bit of work to do,' says <i>Airbus</i> executive vice-president programmes Tom Williams. Output was due to rise from 12 aircraft in 2008 to 21 this year (having been reduced last year from the earlier target of 25) and this has since been revised further downwards to 18 as assembly lines struggle to transition from the almost hand-built process used for early aircraft to secome the fourth customer to receive the giant, at yea	future rate of technol ogical (quality) innovati on in the ecosyste m and its supply ecosyste m.

 end. The near-term commercial prospects for both the A300 and 747-84 look difficult, with few if any new customers on the horizon. Indeed Atbwar chief salesman John Leahy predicted in January that A300 alses would be flat this year - in the order of 10 aircraft. Until recently All Nappon Airways had been the most serious new-customer prospect for an ultra-large airliner deal. However, in December last year the airline 'suspended' the actions of its large aircraft selection committee and said that any deal would have to wait 'until the market conditions look right'. The lack of any serious new sales campaigns might be a pain for the A380 sales team, but it could be far more serious for the 747-8, which accrued just three orders in 2008. To make matters worse, Baading has managed to land only one airline customer for the - 81 passenger version - Luffhamas – which became launch customer for the 450-sater in 2006. Like the freighter, the -81 has been subject to schedule slips with Luffhansa's first delivery sliding from mid-2010 to the second quarter of 2011. In the meantime, the market for the freighter version - which is by far the stronger of the two variants commercially - has disappared as the cargo industry faces a crisis of rapidly declining demand. In the wake of the 747-8 delay - and the related 5658 million charge - Bacing chile executive Jim McNerney hinted in January that continuation of the programme should not be seen as a foregone conclusion: 'We still see a viable business proposition here', he said. 'Now obviously if we ever got to a point where we didn't, we'd have to work with our customers to come up with another answer.' Faced with thes development and commercial issues. Bacing is understood to have privately studied various options for the programme, including terminating the 747-81 and running the 747-87 as a standalone. In contrast to the current woes at Bacing, Airbus has eloyed a priod of good publicity as the A380 lanch airlines have experienced a relatively trouble-free introduc		
customers on the horizon. Indeed <i>Arbus'</i> chief salessman John Leaby predicted in January that A380 sales would be flat this year - in the order of 10 aircraft. Until recently <i>All</i> <i>Nippon Airways</i> had been the most serious new-customer prospect for an ultra-large airliner deal. However, in December last year the airline 'suspended' the actions of its large aircraft selection committee and sales campaigns might be a pain for the A380 sales campaigns might be a pain for the A380 sales team, but it could be far more serious for the 747-8, which accrued just three orders in 2008. To make matters worse, <i>Boeling</i> has managed to land only one airline customer for the - 81 passenger version - Larghthursa - which became launch customer for the 450-seater in 2006. Like the freighter the -81 has been subject to schedule slips with <i>Lufthansa's</i> first delivery sliding from mid-2010 to the second quarter of 2011. In the meantime, the market for the freighter version - which is by far the stronger of the two variants commercially - has disappeared as the cargo industry faces a crisis of rajidy declining demand. In the wake of the 747-8 delay - and the related S685 million charge - Boeing chief executive Jim McNerney hinted in January that continuation of the programme should not be seen as a foregone conclusion: 'We still see a viable business proposition here,' he said. 'Now obviously if we ever got to a point where we didn't, we'd have to work with our customers to come up with another answer.' Faced with these development and commercial issues, <i>Boeing</i> is understood to have privately studied various options for the programme, including terminating the 747-81 and running the 747-8F as a standahone. In contrast to the current woes at <i>Boeing, Airbus</i> has enjoyed a period of good publicity as the A350 launch airlines have experienced a relatively trouble-free introduction and expanded their networks with little drama. 787/A350; The composite twins (<i>Jon Ostrower in</i> <i>Washington</i>) The commercial ascepace industry is fi

In contrast to the current woes at Boeing, Airbus has enjoyd a period of good publicity as the A380 launch airlines have experienced a relatively trouble-free introduction and expanded their networks with little drama. 787/A350: The composite twins (Jon Ostrower in Washington) The commercial aerospace industry is finding that a technology bottleneck runs through the mid-size long-range widebody aircraft market. For Boeing, two years of production and design problems have plaqued is flagship 787 programme resulting in expansion disruptions for airlines. Yet on a deeper level, development of both larger and smaller aircraft is eagetly awaiting the answers that will come out of the Dreamliner's experience. The lessons learned by airlines operating the 787, which is	a new second constrainty many langes of a support of the second constraints of the second s	
far more serious for the 747-8, which accrued just three orders in 2008. To make matters worse, <i>Boeing</i> has managed to land only one airline customer for the -81 passenger version - <i>Lufthansa</i> - which became launch customer for the 450-seater in 2006. Like the freighter if 2011. In the meantime, the market for the freighter version - which is by far the stronger of the two variants commercially - has disappeared as the cargo industry faces a crisis of rapidly declining demand. In the wake of the 747-8 delay - and the related 5685 million charge - <i>Boeing</i> chief executive Jim McNemey hinted in January that continuation of the programme should not be seen as a foregone conclusion: 'We still see a viable business proposition here,' he said. 'Now obviously if we ever got to a point where we didn't, we'd have to work with our customers to come up with another answer.' Faced with these development and commercial issues, <i>Boeing</i> is understood to have privately studied various options for the programme, including terminating the 747-81 and running the 747-87 as a standalone. In contrast to the current wees at <i>Boeing, Airbus</i> has enjoyed a period of good publicity as the A380 launch airlines have experienced a relatively trouble-free introduction and expanded their networks with little drama. 787/1A350: The composite twins (<i>Jon Ostrower in Washington</i>) The commercial acrospace industry is finding that a technology bottleneck runs through the mid-size long-range widebody aircraft market. For <i>Boeing</i> , two years of production and design problems have plaqued its flagship 787 programme resulting in expansion for both larger and smaller aircraft is cagerly awaiting the 787. Nich is sepacted to fly in the second quarter of this year and enter service with Japańs <i>All Nipon Airways</i> in February 2010, will validate or condemn the extensive us of composite technology. <i>Boeing</i> has attempted to answer all these questions in advance to the best of its		
three orders in 2008. To make matters worse, Boeing has managed to land only one airline customer for the -81 passenger version - Lufthansa - which became launch customer for the 450-seater in 2006. Like the freighter, the -81 has been subject to schedule slips with Lufthansa's first delivery sliding from mid-2010 to the second quarter of 2011. In the meantime, the market for the freighter version - which is by far the stronger of the two variants commercially - has disappared as the cargo industry faces a crisis of rapidly declining demand. In the wake of the 747-8 delay - and the related \$658 million charge - Boeing chief executive Jim McNerney hinted in January that continuation of the programme should not be seen as a foregone conclusion: 'We still see a viable business proposition here,' he said. 'Now obviously if we ever got to a point where we didn't, we'd have to work with our customers to come up with another answer.' Faced with these development and commercial issues, Boeing is understood to have privately studied various options for the programme, including terminating the 747-81 and running the 747-8F as a standalone. In contrast to the current woes at Boeing, Airbus has enjoyed a period of good publicity as the A380 launch airlines have experienced a relatively trouble-free introduction and expanded their networks with little drama. 787/A350: The composite twins (Jon Ostrower in Washington) The commercial aerospace industry is finding that a technology bottleneck runs through the mid-size long-range widebody aircraft market. For Boeing, two years of production and design problems have plaqued its flagship 787 programme resulting in expansion disruptions for airlines. Yet on a deeper level, development of both larger and smaller aircraft is eagerly availing the answers that will come out of the Dreamliner's experience. unanticipated strengths and weaknesses in the technology. With significant financial and engineering resources occupied on preparing the 787 for its first flight, certification and entry into service, the airframer has neither significant staff nor capital to devote to the future of the large-twin and narrowbody markets. As a result, Airbus is waiting on the 787 to fly to inform its own ongoing design and planning for its slightly larger composite A350 XWB, which is expected to make its first flight in late 2011 followed by a 2013 entry into service with Qatar Airways. The cyclical planning logic then returns to Boeing's doorstep as it waits for the larger 350seat A350-1000 and 314-seat A350-900 performance expectations to firm up so the US airframer can decide how to proceed with its 301 to 365-seat 777 programme. On the smaller end of the aircraft spectrum, narrowbody replacement appears to be pushed out beyond the next decade as robust build rates and backlogs on the Airbus A320 and Boeing 737 continue, though the material of such a replacement for Airbus and Boeing remains undefined. The manufacturers have each discussed openly that the benefits of composite technology in lowcycle long-haul operations may not carry over to highcycle short-haul operations. In the near-term, the question for *Boeing* is whether or not it can deliver the high performance expectations it has set for itself with the 787. Boeing has always touted a 10% better cash mile cost over the 767, 20% improvement in fuel efficiency and 30% savings in maintenance costs. Many of these ambitious performance considerations have been hit by reductions in the projected range of the aircraft from between 8,000nm and 8,500nm to between 7,650nm and 8,200nm, stemming from unanticipated weight gain and speculation regarding lagging fuel burn targets. Both Boeing and the 787's engine suppliers, General Electric and Rolls-Royce, are undertaking aggressive weight reduction and engine performance improvement that will be incorporated by entry into service as well as later block-point improvements. Some airlines have begun to publicly speculate as to whether or not the 787 will meet performance targets. For example, Aeromexico chief executive Andres Conesa recently expressed fears that the five Boeing 787-8s his airline has ordered may fail to meet original performance specifications including the ability to operate nonstop flights from Mexico City to Asia. Prior to the global economic collapse, both Boeing and Airbus accumulated orders for their respective mid-size long-range widebody jets at an unprecedented pace, garnering 878 and 483 firm orders respectively. Airbus may regard its 2013 entry into service date for the long-range twin as an unintentionally shrewd move that positions its first deliveries in line with an upswing for this inherently cyclical industry. Yet, Boeing's almost two-to-one 787 backlog advantage provides an example of aggressively tackling the replacement market of its own predecessor

ahead of its chief competitor. Whichever product claims	
the title of market leader, both will be instrumental for	
airlines with global long-haul ambitions. The A350 and	
787 will hold an overpowering advantage over the ageing	
A330 and 767 as they approach the mid- and later product	
life.	
Open rotor: Engines of the future	
(Niall O'Keeffe in London)	
Dramatic performance improvements are required of the	
next generation of narrowbody aircraft, and open rotor	
engines have been mooted as the means of delivery.	
CFMInternational, a GE-Snecma joint venture which	
provides engines for both the Airbus A320 and Boeing	
737NG families, is pursuing two programmes ahead of	
those families' replacement. LEAP-X, an advanced ducted	
turbofan due for certification in 2016, is targeted to	
deliver a 16% fuel-burn reduction 'relative to today's	
best of CFM', while an open rotor design, due by 'the	
end of next decade', will deliver a 26% reduction,	
according to the manufacturer. 'Given the potential fuel-	
burn improvement, we just can't afford not to go on	
investing and studying the open rotor potential,' says	
Ron Klapproth, LEAP-X programme manager. In	
Klapproth's view there is a natural overlap between	
CFM's two programmes. 'If you've got a great open	
rotor but you don't have a world-class core, you're not	
going to meet the kind of performance goals that we set	
out.' From April, GE and NASA will conduct wind tunnel	
tests of counter-rotating fan-blade systems at the latter's	
Glenn Research Center in Cleveland, Ohio. These tests are	
geared toward noise limitation, a significant hurdle in open	
rotor design due to the absence of a fan case. 'By looking at variations in blade number and blade diameter and	
spacing, as well as advanced shaping of the airfoils, we are	
pretty optimistic that we're going to be able to make	
significant improvements over what we flight-tested back	
in the late 1980s,' says Klapproth, referencing prior	
research into unducted rotor efficiency. Among airlines,	
the open rotor concept has a vocal supporter in the shape	
of <i>easyJet</i> , which in June 2007 proposed an open rotor-	
powered 'ecoJet' as a solution to aviation's impact on the	
environment. 'If you're going to spend \$10-\$15 billion	
dollars on a new plane, it's got to be considerably	
better,' says easy.Jet strategic planning manager Hal	
Calamvokis. 'If you don't go open rotor you don't really	
deliver those significant benefits.' By this reasoning, the	
required performance gap simply cannot be bridged with	
crew productivity and maintenance cost improvements	
alone. The potential fuel savings steer Calamvokis toward	
open rotors. 'The price of jet fuel is not going to go down	
in the long term and in the long term carbon will be priced	
in some way, shape or form,' he says. 'For this generation	
of aircraft, it's fuel burn that we should be solving for.'	
On the noise issue, Calamvokis predicts that open rotor-	
powered narrowbodies will be quieter than the aircraft	

they replace. He cites the investigative work of <i>Institute of Sound and Vibration Research</i> at the University of Southampton. Even the lower speed of rotor-powered aircraft (Mach 0.75 against the of narrowbodies' Mach 0.78) is not, in Calamvokis' opin major drawback. 'As the price of fuel goes up wo

narrowbodies' Mach 0.78) is not, in Calamvokis' opin	
major drawback 'As the price of fuel goes up w	
rational airlines, who are incentivising their	
correctly, flying slower,' he says, adding that some	of the
time lost in cruise can be clawed back through	faster
climb-out and descent. But enthusiasm for open	rotor
designs is not shared by all. 'Initial hopes that	open
rotors would be as fast as turbofans and have	better
fuel consumption have proven unfounded,' argues	s Alan
Epstein, vice-president of technology and environm	ient at
Pratt & Whitney, which plans to develop a version	of its
geared turbofan (GTF) engine for the next generat	ion of
narrowbodies. 'Open rotors' specific fuel consumption	on per
pound of thrust might be lower, but this is mislea	ding,'
says Epstein. 'The fuel burn required to push the air	
is what's important Open rotors will add tonnes of	extra
weight.' He insists that the GTF represents a 'faste	
enormously quieter' option. CFM's Klapproth of	
very different assessment. 'We see no real advantage	
geared turbofan configuration, but we see som	
headwinds in terms of operational relia	
particularly,' he says. Rolls-Royce has kept its	cards
close to its chest, but battle lines are clearly being dra	wn in
the race to power future narrowbodies. It is now the t	ask of
Boeing and Airbus to decide which option is best pla	ced to
deliver a bold leap forward. 'It's actually possibly	quite
fortunate that given the 787, A350, etc, they're ju	
physically capable of doing anything quickly, which	
us time to think radically," says easyJet's Calamvokis	S.
Narrowbody replacement: Receding pressure	
(Mary Kirby in Philadelphia)	
Less than two years ago, airlines seemed largely un	ited in
their demand that Airbus and Boeing accelerate pla	ans to
develop single-aisle replacement aircraft. But the pr	
on airframers has subsided, for now, as carriers for	
	f epic

17 The Mar. Seattle 2009 Times, "Jet Financi ers Sei Product on Cut Coming Throug Throug	directo r of Germa	Firm- Custo mer's Investo rs	α & β	for 30 of the type, firming its 2008 initial commitment for up to 60 of the new jet. But other firm deals for the aircraft have not yet surfaced. 'Airlines still need to replace aircraft in 2013 – that's the year CSeries enters service. What we are finding, understandably, is that given the current financial situation many airlines are focused on short-term issues rather than completing their fleet negotiations for the long term," says Bombardier. If <i>Airbus</i> and <i>Boeing</i> feel threatened by the 110/130-seat CSeries, they are not showing it. Neither of the two firms has defined replacement plans for the A320 and 737. The lack of clarity has not slowed interest from engine makers, which are working to introduce significantly more efficient products. But, as it stands today, no new airframe is expected to appear until at least the last few years of the next decade. <i>Airbus</i> has been clear on this point. While remaining closed-mouthed as to how it aims to keep its A320 family competitive in the interim, the European firm's chief operating officer John Leahy says he does not expect a replacement aircraft to come available before 2020. That gives <i>Bombardier</i> 'a competitive advantage to be sure, particularly as CSeries is the only current family of aircraft designed specifically for the low-end, single- aisle market', says <i>Bombardier</i> . The company estimates the needs of the 100- to 140-seat commercial aircraft market to be 6,300 aircraft, representing more than \$250 billion over the next 20 years. Should the CSeries fail to gain traction, however, the industry 'should probably mourn rather than cheer', says Aboulafia, as it will give airframers little incentive to move forward their timelines for replacement narrowbodies, especially in light of today's 'major impediments' to such development – slack passenger demand, cheap fuel and pressured research and development budgets. 'This is going to have a damaging impact on the arrival of new technology,' he says. <i>Air</i> <i>France-KLM</i> has been trying to persuade <i>Airbus</i> an	On modular and integral enterpri se architec tural approac hes to

		[]		Bertrand Grabowski, a managing director of Germany's	
				DVB Bank, a major European financier of airplanes, said	
				that with the airlines facing rapidly falling demand, the	
				only question is how much and how soon both Airbus	
				and <i>Boeing</i> will cut production for 2009 through 2011.	
				'They will have to do it. It's a matter of fact,' said	
				Grabowski in an interview. 'How would you like to see	
				your client bleeding by taking delivery of aircraft they	
				don't need?' He expects production cuts starting later	
				this year, and worse to come in 2010 and 2011. That	
				assessment, in line with those of other analysts who asked	
				not to be named, contrasted with the presentation by	
				Mark Pearman-Wright, head of leasing and investor	
				marketing at Airbus. Pearman-Wright insisted funding	
				for this year's Airbus deliveries is secure and that the	
				plane maker will flatten rather than cut production in	
				2010 and 2011. 'We don't see a problem in funding the	
				deliveries until the end of the year,' he said, echoing the	
				message of Boeing Commercial Airplanes Chief Executive	
				Scott Carson to a Wall Street audience last week. 'I've	
				noticed the manufacturer mindset is more bullish,' said	
				Pearman-Wright. 'It's not so much Airbus versus	
				Boeing. It's the manufacturers versus the financiers.'	
				In a sobering assessment to kick off the conference	
				Monday morning, respected industry economist Adam	
				Pilarski, of <i>Avitas</i> , at least agreed with the manufacturers	
				that this year's deliveries are relatively safe. But Pilarski went on to forecast that production will 'fall off a cliff' in	
				2011. 'The crash has to happen and it will be severe,'	
				said Pilarski. His prediction of combined <i>Airbus</i> and	
				Boeing production for that year is an ominous 666	
				airplanes, a 30 percent drop from today. Pearman-	
				Wright protested: 'We don't see that at all.' Yet across	
				the conference, the complaint is that credit is frozen and	
				money is not available. Leasing companies in recent	
				years have had ready access to debt to finance the bulk	
				of their purchases of new airplanes. They have sold	
				either older airplanes or stock to raise the cash for the	
				roughly 20 percent equity they must put up with such	
				purchases. Now, they have access to neither cash nor	
				credit. 'Raising equity and debt has become more than a	
				challenge,' said ISTAT President Mike Platt, chief	
				investment officer with jet-leasing company Aircastle.	
				Pilarski ended his presentation grasping for optimism. He	
				agreed that eventually air traffic will return to its historic	
				upward climb and the industry will recover. 'The long-	
				term future of aviation is still solid,' said Pilarski. But as	
				DVB Bank's Grabowski put it: 'The problem is 2009,	
			6	2010 and 2011.'

A380	defense giant <i>EADS</i> , was clearly in high spirits as he r	ration.
Defects	reported on the group's successes from the previous year.	ation.
"	Sales rose by 11 percent and profits increased to about	
(Dinah	\in 1.6 billion (\$2.1 billion). <i>EADS</i> even exceeded its	
Deckste	internal cost-cutting targets. But Gallois became	
in) –	significantly more subdued when he was asked about the	
translate	coming months. He said that he had no idea how many—if	
d from	any-aircraft orders will be cancelled by customers in the	
Der	near future. The A400M, a military transport plane which	
Spiegel	has been delayed for more than four years, also	
online	apparently poses a considerable potential threat to Airbus	
	and its parent company, EADS. Gallois conceded that if	
	the buyer countries pulled out of the prestigious project,	
	the group would have to repay close to €6 billion (\$7.8	
	billion) to their governments. This would put an enormous	
	dent in <i>EADS's</i> ample financial cushion of around €9	
	billion (\$11.7 billion).	
	There is another over more pressing problem, and that the	
	There is another, even more pressing problem, one that the band of $FADS$ preferred not to even mention. And yet it	
	head of <i>EADS</i> preferred not to even mention. And yet it has triggered consternation at its most important	
	subsidiary, <i>Airbus</i> . In mid-February, senior executives	
	from <i>Airbus</i> and the airline <i>Emirates</i> , the biggest customer	
	for <i>Airbus's</i> A380, attended a crisis meeting in Toulouse to	
	discuss the super-jumbo. Last summer, after a roughly	
	two-year delay, the Arab airline took delivery on the first	
	of 58 A380s it had ordered. The airline currently operates	
	four jets in this series. Nine others are in use at Singapore	
	Airlines and the Australian airline Qantas. The Airbus	
	executives could not have liked what they were told and	
	shown by the <i>Emirates</i> representatives. In a 46-slide	
	presentation, the aviation experts painstakingly listed	
	what they viewed as the giant jet's serious growing pains.	
	To illustrate their points, they included snapshots of	
	singed power cables, partially torn-off sections of	
	paneling and defective parts of thrust nozzles in the	
	engines as evidence of what they described as a shoddy	
	work ethic at <i>Airbus</i> and its suppliers. The confidential	
	manufacturer's information has since been leaked to employees, triggering a mood of panic. 'Many good	
	people have resigned and are trying to move to other	
	projects,' reports a concerned insider. <i>Airbus</i> is doing its	
	best to calm the waves. 'We take our customer <i>Emirates</i> '	
	criticism very seriously and are doing everything in our	
	power to correct any reports of deficiencies as quickly as	
	possible,' says an Airbus spokesman. He also confirms a	
	'number of individual incidents that have impaired the	
	operation but not the safety of the aircraft.' Crisis	
	meeting? Cable problems? These words are reminiscent of	
	a humiliating chapter in the company's more recent	
	history, one that Airbus managers and their CEO, Tom	
	Enders, would rather see stricken from the annals of the	
	company. Because of production problems and labor	
	disputes in recent years, the mega-plane, celebrated by	
	experts and aviation fans alike, has been the cause of vast	
	amounts of additional work and a significant loss for its	

producers in the past few years. Some senior executives
are even suspected of having lined their pockets through
stock deals and of having concealed the true extent of the
A380 debacle from outside shareholders for far too long.
Through a massive effort, the group did manage to deliver
12 of its flagship jets last year. It expects to build another
18 this year and hand them over to customers. The
problems seemed to have been corrected, and the
company recently began a gradual shift from the costly
and time-consuming manual assembly of the A380 to
the long-planned commercial series production. Airbus
seemed to have cleaned up its act, only to be confronted by
the incendiary information from the Middle East. The list
of defects was long on clear language and short on
diplomatic niceties. On one of the slides, the experts
provide a detailed list of the prestigious plane's various
breakdowns. They say that the A380 has already been
grounded nine times, which represented a loss of close to
500 operating hours. In 23 cases, say the Emirates
managers, replacement aircraft had to be obtained at short
notice. Minor glitches, the critique continues, happen in
Emirates' A380 fleet about once every two days. In the
medium term, the Emirates experts write, the airline could
face the 'threat of a loss of confidence in the aircraft
and the brand image of the Emirates A380.' The Airbus
managers want to make sure that this doesn't happen. They
have sold only about 200 of their flagship jets to date.
According to industry estimates, Airbus will have to sell
about twice as many A380s to recoup its costs. Enders
and his staff are now doing everything possible to placate
angry customers. Each individual problem report is
analyzed and simulated. 'Defects are traced back to their
origin and corrected,' explains an Airbus spokesman.
'We have already made great progress in this respect in
recent weeks.'
Both Airbus and Emirates have reacted to this story since
it was released on Saturday ahead of publication in
Monday's edition of <i>Der Spiegel. Airbus</i> said Sunday it
was taking <i>Emirates'</i> criticism of the A380 'very
seriously.' 'We are doing everything we can to overcome
the issues,' an <i>Airbus</i> spokeswoman told <i>Reuters</i> .
<i>Emirates</i> for its part told the news agency that it has a
'good relationship with <i>Airbus</i> ' and that it would
'continue to work closely with them to address these
technical matters.' The <i>Emirates</i> spokeswoman said
that the airline remained confident in the A380 and
had no plans to cancel orders. In addition, the aircraft
manufacturer is storing additional replacement parts
directly on-site in places where the super-jumbo is now
in use, so as to be able to respond more quickly to
problems as they arise. Airbus also plans to expand the
rapid response team it created specifically to address A380
concerns. It is even considering making some changes to
individual components. In private, Airbus executives point
out that problems are also encountered with other new

aircraft models when they are used in commercial	
aviation. Some 23,000 individual parts are used in the	
cabin area alone, managers say, meaning that teething	
problems cannot be ruled out completely. After all, they	
say, the reliability of all parts and systems can only be	
proved once the aircraft is in operation. Whether these	
and other explanations will convince Emirates remains to	
be seen. In its damning presentation, the company also	
sharply criticizes the production processes at Airbus. For	
example, the Emirates report concludes, the A380	
models were not sufficiently tested before being	
delivered to customers. Experts, on the other hand, note	
that no other jet has ever been as thoroughly tested as the	
giant Airbus. Nevertheless, they say, not all conceivable	
scenarios involving every single part could have been	
simulated in the dry runs. Some of the problems could	
hardly have been foreseen, such as one involving the	
plane's shower facilities. So far Emirates is the only A380	
customer to provide two showers in first class. A	
determined female passenger who was unable to operate	
the showerhead promptly tore out the entire fixture-and	
flooded the shower room. The Emirates experts believe	
that Airbus should choose its suppliers more carefully	
and limit their numbers. They also say that the	
constant transport of parts and employees among	
Airbus's locations throughout Europe makes it more	
difficult to comply with prescribed quality standards.	
'Our work is well organized and properly inspected,'	
counters an Airbus spokesman. He also points out that	
A380 production is becoming more and more	
normalized. It is still not clear how the spat between the	
aircraft maker and its dissatisfied customer will end.	
Competitors Singapore Airlines and Qantas have also had	
to ground their A380 jets several times in recent weeks	
and months. The Asians have had trouble with the fuel	
pumps and the on-board electronics. The Australians	
noticed that the highly sensitive measuring sensors in the	
tank were not working properly, although it is still unclear	
whether the problem was attributable to the devices	
themselves or was caused by impurities in the fuel.	
Unlike Emirates, Singapore Airlines and Qantas have	
taken a more relaxed approach to the problems.	
However they, unlike the Arabs, have not just ordered	
dozens of new A380s. Since the end of last week, the	
Dubai-based airline has however tried to defuse the	
conflict. 'Technical problems are to be expected in a	
new aircraft, especially one in which so many new	
technologies are used,' says an Emirates spokesman.	
He is also quick to point out that order cancellations	
are not planned. The A380, he says, is an 'outstanding	
airplane.'''

		Lease			reassured. His company is owned by AIG, the giant insurer	
		Financ			that's still struggling despite billions of dollars in federal	
		e e			bailout money. 'When a bomb explodes, the light flash	
		Corp.;			travels a lot faster than the sound,' said Udvar-Hazy.	
		Bertra			'The flash occurred in September. But the sound hasn't	
		nd			reached Seattle and (Airbus headquarters in) Toulouse	
		Grabo			yet.' He and other leading airplane-financing experts	
		wski,			spoke at the annual conference of the International Society	
		managi			of Transport Aircraft Traders (ISTAT). They suggested	
		ng			the funding gap caused by the virtual freezing of bank	
		directo			lending is much bigger than Skowronski's estimate,	
		r of			anywhere from \$10 to \$20 billion, and that Boeing would	
		Germa			face severe consequences, such as:	
		ny's			• Cutting production rates as early as the fourth quarter,	
		DVB			eventually reducing output by as much as a third —	
		Bank			which inevitably would mean slashing jobs.	
					• Having to finance airplanes itself, putting in up to three	
					times the \$1 billion it anticipates, yet still not closing the	
					funding gap.	
					Debart Marin was president of the federal Furnet furnet	
					Robert Morin, vice president of the federal <i>Export-Import</i>	
					<i>Bank</i> , said the government is ready to offer as much as \$10 billion in guarantees to help finance U.S. airplane sales	
					billion in guarantees to help finance U.S. airplane sales going overseas, mostly for <i>Boeing</i> jets. But that likely	
					won't be enough to close the gap, said the experts at	
					ISTAT. <i>Boeing</i> executives offered repeated assurances	
					that all deliveries for this year are financed. But Bertrand	
					Grabowski, managing director of Germany's DVB Bank,	
					called that an 'act of faith.' In an interview, he said	
					troubled banks have made soft commitments to both	
					Boeing and Airbus customers that they may not be able to	
					keep. 'Some of the <i>Boeing</i> deliveries are not secure for	
1					the last quarter of this year,' Grabowski said. Some	
					and have quarter or and jour, Gradowski suid. Some	

					recently European nationalized banks "have absolutely no clue if they can deliver what they signed term sheets for," he said. European banks have dominated aviation financing in the last decade. Udvar-Hazy said at least half of those that used to be in aviation are now 'totally shut out' of the market. Grabowski forecast that \$5 to \$7 billion of deliveries scheduled for 2009 — mostly for <i>Boeing</i> and <i>Airbus</i> and with a few for Brazilian jet maker <i>Embraer</i> — will 'evaporate' by year-end. <i>Boeing</i> and <i>Airbus</i> would then have two choices, said Robert Martin, chief executive of <i>BOC Aviation</i> , a Singapore-based leasing company owned by Bank of China: 'They either fund those deliveries themselves or cut back production.' <i>Boeing Capital's</i> Skowronski said the company expects to have to provide about \$1 billion in financing to its customers this year, but is ready to give more. 'If it were to go to \$2 billion or \$3 billion, that's generally not going to be a problem,' he said. The U.S. government, represented by the <i>Export-Import bank</i> , will close part of the gap by increasing its loan guarantees from a typical \$4 billion to \$5 billion a year, to \$9 billion or \$10 billion. Ex-Im's Morin said 2009 could be the toughest year of the down cycle. He expects to finance 150 to 170 airplane deliveries in 2009, mostly <i>Boeing</i> wide-bodies. The <i>European Export Credit Agencies</i> will offer a similar dollar amount in loan guarantees to support between 200 and 300 <i>Airbus</i> deliveries, mostly less expensive narrow- bodies. 'This is making 9/11 look like a speed bump,' said <i>DAE</i> 's Genise. 'The liquidity crisis is not turning	
					around in three months,' he said. 'It's not turning around in six months. It's a major disaster for the global economy and it will be a major disaster for the airline industry	
18 Mar. 2009	Air Transpo rt Intellige nce news, "ILFC Chief Recom mends Airbus and BoeingS lash Producti	Steven Udvar- Hazy, CEO <i>ILFC</i>	Firm- Custo mer- Custo mer's Investo rs	α & β	and the manufacturers." "Leasing companies today recommended that Airbus and Boeing should slash production by about 25 percent due to the current difficulties faced by operators and lessors in financing aircraft in today's economic environment. <i>ILFC</i> chief Steven Udvar-Hazy believes a 25-to-30 percent cut makes sense, while others on a leasing panel today at ISTAT suggested 'similar' reductions, albeit at a slightly lesser range. Whatever the amount, Udvar-Hazy believes it is 'inevitable' there is going to be production cuts, 'it's just a matter of when and to what degree'. Most speakers this week at ISTAT have identified a significant funding gap in aircraft ordered and those that will be financed. Responding to these comments, a <i>Boeing</i> executive in the	On modular and integral enterpri se architec tural approac hes to managi ng capacity
	on 25%" (Mary Kirby)				audience said aircraft are committed to production in 2009 and if an airline can't finance it, 'we'll have whitetails'. But in 2010 and beyond <i>Boeing</i> 'will be looking very carefully at supply and demand so that we don't overproduce', he says. An <i>Airbus</i> executive in the audience also chimed in, noting that <i>Airbus</i> is currently producing 34 A320s per month, down from a previous rate of 40 per month. 'We continue to monitor it' and <i>Airbus</i> is	

				being 'realistic and proactive', he says."	
18 Air Mar. "Rest assured that the first batch of 787s will be overweight,' said Udvar-Hazy in response to a question posed by ATI. The <i>ILFC</i> chief notes that Boeing is injecting a lot of resources 'into rectifying that problem' and rectifying the additional 'empty weight' on the first 787s. 'In the long run, this will be an excellent aircraft. But I pity the airlines that get the first ones. Obviously those aircraft will not be the same standard as those 787s later on.'"	On a modular enterpri se architec ture's over- promise and under- delivery
Kirby)19SchaeffeMar.rs2009Research,"WallStreetSentiment SoursonTheBoeingCompany"(JoceylnnDrake)		Firm- Investo r	α	"The Boeing Company is struggling to climb into the black this morning after some negative brokerage comments hit the Street. Falling freight demand is likely to bring about more delivery deferrals for <i>Boeing's</i> popular 777 jet plane, <i>JPMorgan</i> stated in a note. Before the open, the brokerage firm slashed its earnings-per-share estimate for <i>Boeing, Precision Castparts Corp.</i> , and <i>Spirit</i> <i>Aerosystems Inc.</i> . The brokerage firm cut its delivery expectations for the 777 this year to 80 from 82, and to 70 deliveries next year from 80. 'The correction of global economic imbalances, particularly the credit-fueled bubble of American consumer demand, has significant implications for the 777 perhaps more than any other aircraft,' <i>JPMorgan</i> said. 'We believe the announcement of a production cut could be in the cards in the coming weeks.' Sentiment on Wall Street has somewhat bearish leanings at the moment. <i>Zacks</i> reports that the security has earned 7 "buy" ratings, 10 "holds," and 2 "sells." Considering the stock's weak technical performance, there is still room for potential downgrades, which could pressure the security lower. What's more, the average 12-month price target for BA stands at \$49.37, according to <i>Thomson Reuters</i> . This estimate implies that analysts are expecting the shares to skyrocket more than 46% during the next 12 months. Any price-target cuts from this group could also have negative implications for the shares. Technically speaking, the security has rolled higher from its March low and is currently sitting on support at its 10-day moving average. However, the stock is still below staunch resistance at its declining 10-week and 20-week moving averages. These intermediate-term trendlines have guided the shares lower since mid- October 2007, resulting in a loss of more than 67%. Not surprisingly, this negative price action has garnered the stock some pessimism from options players. The Schaeffer's put/call open interest ratio for BA comes in at 1.14, as put open interest outnumbers call open int	On the mental models of investor s of a modular enterpri se architec ture.

					that antions playars have been more possimistically	
					that options players have been more pessimistically aligned toward the shares just 7% of the time during	
	,				the past year. This preference for puts can also be seen in	
					the action on the International Securities Exchange.	
					During the past 10 trading sessions, 5 puts have been	
					purchased to open for every 1 call purchased to open. This	
					ratio of puts to calls is higher than 98.8% of all those taken	
					during the past 12 months, pointing to extreme	
					pessimism among options players. Digging into the	
					stock's open interest configuration, we find that peak put	I
					open interest in the March series sits at the 30 strike, with	
					nearly 4,500 contracts. The April 30 put also has open	
					interest of nearly 4,500 contracts. Meanwhile, the bulk of	
					the stock's put open interest sits in the May series. The	
					May 50 put has open interest of 21,400 contracts, the May 25 put has open interest of 18,700 contracts, and the May	
					35 put has open interest of 18,700 contracts, and the May 30 put has open interest of 10,100 contracts. On the other	
					hand, peak March call open interest sits at the 35 strike	
					and numbers fewer than 4,100 contracts. The April 35 call	
					has open interest of 8,800 contracts. Meanwhile, peak May	
					call open interest sits at the 35 strike, with 15,200	
					contracts. The overall preference for puts over calls	
					indicates that investors have low expectations for the	
					shares during the near term. However, considering the	
					stock's weak technical performance, this pessimism is to	
					be expected. One group hasn't jumped on the bearish	
					bandwagon. Short sellers have avoided this stock, as	
					less than 2% of the company's total float has been sold short. If the equity continues its downtrend, it's likely	
					to attract some of these bears. An increase in short	
					selling could pressure the security lower."

					cycles,' Tinseth says. 'That gives us flexibility as we go	
1						
1					through this downturn.'	

·····		
	DREAMLINER: Boeing's long-awaited 787 may	
	finally take to air	
	Scott Carson, CEO of the commercial airplanes division,	
	told investors at the JPMorgan Chase conference in New	
	York earlier this month that over the next 20 years the	
	market 'is a rich opportunity for us,' whether the ultimate	
	demand for commercial jets is 29,000 planes, as Boeing	
	projects, or just 27,000 if cancellations continue. 'We're	
	playing from a position of strength,' he said. Are	
	Boeing's leaders just whistling past the graveyard by	
	believing that economic forces that have engulfed many	
	large and successful companies in the past six months	
	won't ensnare the manufacturing giant? Richard	
	Aboulafia thinks so. 'Yes, Boeing has a record backlog,	
	but only a fool would believe in it,' says Aboulafia, an	
	aircraft manufacturing analyst at Teal Group in Fairfax,	
	Va. If airlines in the USA and around the world are	
	flattened financially by severe recession and deeply	
	diminished demand, they will not hesitate to forfeit down	
	payments and walk away from so-called firm orders for	
	new planes, he says. Even if carriers negotiate delivery	
	deferrals rather than cancellations, Boeing won't get	
	hundreds of millions of dollars in the next few years that it	
	expects to be paid upon completion of those planes, he	
	says. Boeing will start feeling the pinch in 2010,	
	Aboulafia predicts. He says financing is available for all	
	the planes that Boeing and its chief rival, Europe's Airbus,	
	plan to deliver to the airlines this year. 'But after that,' he	
	says, 'all bets are off. In a serious downturn — and this	
	certainly is one — production typically falls by about a	
	third. I can't see why in this downturn it would be	
	different.'	
	Others much less confident	
	Others are more pessimistic. Robert Stallard at	
	Macquarie Research in New York lowered his rating on	
	Boeing in January, warning that the company 'is	
	underestimating the potential for lower airline	
	demand.' Joseph Nadol at JPMorgan last week cut his	
	earnings estimates for Boeing and Airbus for this year and	
	next. In addition to rapidly weakening demand for	
	passenger planes, Nadol said, the cargo version of	
	Boeing's 777 is in particular trouble because air freight	
	volumes have 'collapsed' by 25% from a year ago.	
	Giovanni Bisignani, head of the International Air	
	Transport Association, the airlines' global trade group,	
	warned last month that Boeing and Airbus might not be	
	able to deliver up to half the commercial planes they	
	build this year. In Boeing's case, that would be about	
	240 of the 485 planes it is scheduled to deliver.	
	Bisignani said he based his prediction on conversations	
	with several airline CEOs who told him they can't afford	
	to pay for the new planes. Even more chilling was the	
	warning shot fired last month by Steven Udvar-Hazy, head	
	of International Lease Finance, the world's largest lessor	
	of commercial airplanes and the largest single customer of	

		both Boeing and Airbus. Speaking with reporters at a	
		Boeing media event in Seattle, he predicted that both	
		airplane makers will be producing 'white tails' by the end	
		of this year. 'White tails' are planes completed without a	
		buyer, so they have no logo on their tails. Chris Tarry, an	
		independent industry analyst and consultant based outside	
		London, estimates that 1,600 to 1,800 already-ordered	
		Boeing 737s and Airbus A320s, both of which carry	
		about 150 passengers, are in danger of not being	
		delivered over the next three to 10 years. '(Airlines)	
		simply don't need them,' he says. If there's anything	
		Boeing understands, it's the wildly cyclical nature of	
		the aviation business. Past downturns have led to massive	
		layoffs, regional economic upheaval and larger U.S. trade	
	,	deficits. <i>Boeing</i> officials believe they can avoid most of	
		that pain this time by better managing production.	
		Carson told investors at the JPMorgan Chase conference	
		that the company won't decide until May or June	
		whether to slow production of planes scheduled for	
		delivery in the last half of 2010. Planes to be delivered	
		then would go into production early next year.	
		Suppliers need about six months advance notice of a	
		change. 'There's lots of uncertainty in 2010,' Tinseth,	
		Boeing's marketer, admits. 'That's why I'm trying to sell	
		some additional planes in the back half of 2010 in	
		expectation that there'll be some 'melt-away' from our	
		backlog, through deferrals mainly. 'But we've been	
		pretty successful in managing our business the last few	
		years during our biggest sales boom ever. We've been	
		very measured in our approach to increasing	
		very measured in our approach to increasing production rates. We're not producing planes at nearly	
		very measured in our approach to increasing production rates. We're not producing planes at nearly the rate we did in the past, and that should keep us	
		very measured in our approach to increasing production rates. We're not producing planes at nearly	
		very measured in our approach to increasing production rates. We're not producing planes at nearly the rate we did in the past, and that should keep us pretty healthy during the downturn.'	
		very measured in our approach to increasing production rates. We're not producing planes at nearly the rate we did in the past, and that should keep us pretty healthy during the downturn.' There are other danger signs, however. In the first two

31 Mar. 2009Financi Gallois The Fananci Attribute Custom ers Over Future ofFinanci Financiβ"EADS is prepared to accept a limited cut in orders for the Attribute to custome and proceed and space of the company's lending arm, is expecting to make \$1 billion in credit available to customers this year after not extending any the last three years. The French government, a shareholder in Airbus parent EADS — European Aeronauic Defence and Space — is making more than \$6 billion available to airlines buying or leasing Airbus planes. Free-trade advocates may decry government financing as an intervention in the market, but the United States does much the same thing for Boeing's foreign customers via the U.S. Export-Import Bank. Last year, the Export-Import Bank backed \$5.5 billion in aircraft loans on 97 Boeing-built planes sold to 17 airlines and two leasing companies outside the USA. Robert Morin, head of the bank's transportation lending group, expects 2009 to be a record year, with \$7 billion to \$9 billion in loan guarantees issued to foreign cariters and leasing companies. About 90% of the planes Boeing expects to deliver this year ard destined for companies outside the USA. Morin says he's hopeful that bank- supported aircraft leasing will decline next year and beyond as commercial lenders warm back up to the market. Though it's too early to call it a trend, Morin says, commercial lending on airplanes picked up a bit in the current quarter after extraordinarily tight lending at the end of la trend \$2009 with \$100 to \$100 the planes government clients grow restless over rising costs and long delays. Louis Gallois, it gof an integral enterprise archite ture, in a bid to keep Europ's biggest defence contract alive as government clients grow restless over rising costs and long delays. A400M seven governments that launched the troublesome €20bn		10120203010					

	"				(\$26.3bn) project in 2003 that they should not push too	
	(Peggy				hard for concessions. Mr Gallois' comments came as	
	Holling				EADS sought to reassure customers and the market that it	
	er and				remained committed to the A400M programme, already	
	Sylvia				€2bn over budget and three years late. Doubts over	
	Pfeifer)				EADS's determination to continue with the programme	
					were raised at the weekend by Tom Enders, head of the	
					group's aircraft arm Airbus, who suggested in an interview	
					with Der Spiegel magazine that he would rather scrap the	
					programme than continue under the current contract.	
					Cancellation could force EADS to pay back \in 5.7bn in	
					advance payments, more than half its net cash. Occar, the	
					pan-European procurement agency that placed the original	
					order for 180 aircraft, is preparing to launch official	
					negotiations with EADS over the terms of the contract.	
					This month, the governments agreed a three-month	
					moratorium on cancellations from today to allow the talks	
					to go on. But talks come as the enthusiasm of some of the	
					original customers - notably Germany and the UK - for the	
					aircraft may be waning. Mr Gallois said yesterday he was	
					confident a solution would be found. The EADS chief	
1					appears to be betting that politicians will put pressure on	
		-			defence ministries to resolve the disagreements over	
					penalties in order to preserve jobs in a highly sensitive	
					sector. 'This programme is going to fly because the	
					defence and industrial challenges are considerable,' he	
					said. 'They need this plane and it is also about 40,000	
					highly qualified jobs in Europe. We have to find a	
					solution together.' Nonetheless, the UK government,	
					which ordered 25 aircraft and urgently needs a new	
					transport aircraft for operations in Afghanistan, increased	
					pressure on <i>EADS</i> yesterday, warning it would 'not be	
					content with a gap in capability'. John Hutton, secretary	
					of state for defence, told MPs the delays were a 'matter of	
					extreme regret' that posed 'very serious questions' about	
					the future of the UK's military logistics capabilities. He	
					said the government would decide whether to go ahead	
					with the programme at the beginning of July but warned:	
					'We will not be content with a gap in capability.' The UK	
1					is considering alternative options to bridge the delivery	
1					gap, including extending the out-of-service dates of the ageing C-130 Hercules aircraft, and buying more C-17s	
					from <i>Boeing</i> , the US jetmaker. Mr Gallois said he	
1					expected <i>Airbus to</i> deliver a new timetable to customers	
1					after agreeing a delivery date for the propulsion system	
1					software, known as Fadec."

Meanwhile, said Carson, <i>Boeing</i> continues to make 'solid progress' toward a third-quarter 2010 first delivery of the 747-8, the first wing for which was ready to come out of its jig and be placed into the so-called lay- down position in preparation for attachment to the fuselage."	
3 Apr. 2009	Wall Street Journal, "Boeing Shuffles 787 Order Book; No Takers for First Six" (Ann Keeton)		Firm	α	"Boeing Co. has reshuffled the customers for initial deliveries of its delayed 787 and set aside plans to send the first six aircraft into commercial use, according to a published report. The move would see launch customer All Nippon Airways take 11 of the first 30 aircraft, while Chinese carriers appear to have slipped from the first deliveries scheduled for next year, according to flightblogger.com published by U.Kbased Flight International. Boeing declined comment on the report, which comes ahead of the first test flight scheduled for June. The 787 is more than two years behind schedule, with its launch delayed several times by supply and design problems. According to flightblogger, Boeing is switching some aircraft to ANA that had been destined for Chinese airlines, who originally hoped to have the 787 in time for last year's Beijing Olympics. The Japanese carrier declined comment."	On the addition al costs associat ed with an overly- aggressi ve design and producti on schedul e of a modular enterpri se architec ture.
6 Apr. 2009	The Wall Street Journal, "Airbus Aims to Pul back Without Stalling " (Daniel Michael s)	Tom Willia ms, <i>Airbus</i> VP of Operat ions	Firm- Suppli ers	β	"Airbus production boss Tom Williams has spent the past five years raising the European plane maker's output. Now, as airlines defer deliveries and cancel orders, he faces a difficult balancing act: downshifting factories without killing prospects for a recovery. Airbus said Friday that it booked orders for just 16 planes in March, compared with 54 orders in March 2008 and 37 orders the previous year. The company has said it may capture only between 300 and 400 new orders this year, down from 777 orders minus cancellations last year. Building jetliners is so complex that slamming on the brakes can be almost as tough as hitting the gas. Factories that Mr. Williams had recently optimized for fast production by adding equipment and staff must pull back without letting the fixed expense per plane rise painfully. Airbus's dozens of suppliers, which provide components ranging from tiny rivets to massive landing gear, can't get stuck with warehouses full of unsold parts or idle factories, or they will be too weak when demand returns. And laying off skilled workers could cause a brain drain that slows an eventual recovery. 'It takes a long time for us to train our folks who design and assemble planes, so we've got to be careful,' said Mr. Williams, Airbus's executive vice president for programs, in an interview at the company's headquarters here. Since 2003 Airbus has increased production of its planes by 60%, to a	On an integral enterpri se architec ture's approac h to stable growth.

			record 483 deliveries last year. But in October the unit of	
			European Aeronautic Defence & Space Co. shelved plans	
			for further increases, and in February said it would reduce	
			deliveries of its popular single-aisle models to 34 a month	
			from 36 and consider further cuts. Airbus is trying to	
			trim output without hurting chances for a recovery.	
			Airbus, and U.S. rival Boeing Co., which said it would lay	
			off 4,500 workers but keep output steady this year, are	
			reacting much more cautiously than other major	
			industrial companies to the global economic slowdown.	
			United Technologies Corp., which makes aerospace	
			equipment, air conditioners and elevators, in March said it	
			will cut 5% of its work force, or 11,600 jobs. Caterpillar	
			Inc., which makes construction equipment, has announced	
			some 24,000 layoffs as it slashes output and mothballs	
			production lines. Airlines and industry officials predict	
			Airbus and Boeing will have to cut output more	
			drastically to avoid producing planes that customers	
			can't take. Douglas Harned, aviation analyst at Sanford	
			C. Bernstein & Co. in New York, predicted in a report	
			published last month that Airbus and Boeing will have	
	1		to cut deliveries next year by 20% from current plans.	
			Aircraft lessors recently called on both plane makers to cut	
54			production to avoid glutting the market and undermining	
			the value of planes on their balance sheets. Airbus and	
			Boeing officials say building jetliners is different from	
			other industries because the planes, which carry	6
			catalog prices ranging from \$50 million to \$300 million,	
			take roughly a year to build. As a result, the cycle	
			moves more gradually. Boeing's experience shows that	
			sudden shifts in production can be crippling. A decade	
			ago, the plane maker tried to boost output in a short	
			period and quickly faced shortages of parts and	
			qualified staff. Dozens of unfinished jetliners sat	
			outside factories under tents as workers scrambled to	
			finish them. Resolving production problems pushed	
			Boeing deep into losses even as it delivered a record	
	1		number of planes. Since then, both Boeing and Airbus	
			have tried to avoid big swings in production volumes.	
			European labor restrictions mean Airbus can't cut staff	
			as easily as Boeing does. That's why over the past few	
	1		years the European plane maker has hired an	
			increasing number of part-time workers and outside	
			contractors, who predominantly work in less-skilled	
			areas. Mr. Williams says that by using them less, he	
			can cut output by roughly 20% without firing full-time	
2			staff. Mr. Williams's first retrenchment over recent	
			months has been to reduce overtime shifts, which	
	1		Airbus had been using to meet strong demand, said the	
			56-year-old Mr. Williams, who has 37 years experience	
			THE REPORT OF THE PARTY OF THE	
			making motors, jet engines and aircraft. Managing	
			suppliers poses a bigger challenge. More than 80% of	
			the value of each Airbus plane comes from outside	
			companies, according to EADS CEO Louis Gallois. Some	
			of these suppliers are much smaller and financially	
			weaker than the plane maker, and so aren't as well	
		·		

					equipped to handle a downturn, executives say.	
					Trimming production to 34 jets 'isn't such a big shift	
					for Airbus,' said Henri Courpron, a former	
					procurement boss at Airbus who now runs the aerospace	
					practice at aviation consulting firm Seabury Group. 'But if	
					in that process you kill one supplier, you may lose the	
					ability to build those 34 at all.' In 2005 copying a	
					model originally developed by <i>Toyota Motor Corp.</i> and	
					adopted by <i>Boeing Airbus</i> started working more closely with its suppliers. Instead of simply ordering up	
					parts, Airbus gave its contractors more leeway to	
					design components and choose materials, while also treating them more as partners by sharing information	
					and seeking greater feedback. Now, Mr. Williams said	
					Airbus procurement staff are 'walking the shop floor'	
					at suppliers' factories to spot signs of weakness, such as	
					thin staff or insufficient inventories. Suppliers say they	
					like Airbus's new openness, but still face a delicate	
					balance between meeting its needs and preparing	
					themselves for a sharper downturn. Claude Bolette,	
					director general of <i>Belairbus</i> , a consortium of <i>Airbus</i>	
					suppliers in Belgium, says that in addition to consulting	
					<i>Airbus</i> , he talks with other contractors to judge the market.	
					'Of course we'd like to have more robust information,	
					but it's very difficult for Airbus themselves to have an	
					accurate forecast,' Mr. Bolette said. In France, the	
					government has said it can now help small aerospace	
					companies that hit trouble by tapping a special fund of	
					up to [euro]100 million (\$136 million) that was	
					established last year. Dubbed Aerofund and financed	
					partly by EADS, the kitty was initially envisioned to	
					help suppliers grapple with the strong euro and the	
					challenges of investing for expansion. Mr. Gallois at	
					EADS recently urged other European governments to	
					follow the model. Even as Airbus and its suppliers	
					throttle back, Mr. Williams is planning for an eventual	
					upturn. From the day Airbus decides to boost or cut	
					output, its supply chain needs around a year to react	
					through steps such as hiring staff, buying machine	
					tools and sourcing raw materials. To shorten that	
					period, Mr. Williams' team has violated a key tenet of	
					lean manufacturing keeping parts inventories to a	
					minimum and squirreled away extra supplies of	
					components that take particularly long to prepare,	
					such as the metal forgings inside landing gear. 'With a	
					limited investment, we'll buy strategic components	
					with very long lead times and carry them ourselves,'	
10	The	Saatt	Firm	~	Mr. Williams said. 'It gives us more flexibility.'	On a

(Domini		planned no slowdown in output. In the most significant	
c Gates)		production change, <i>Boeing</i> will slow monthly output of	
e cuito)		its large 777s in June 2010 from seven planes a month	
		to five — a 28 percent cut. The planemaker also said it	
		will delay previous plans to modestly increase production	
		of its 747-8 and 767, each currently at about one per	
		month. Some cuts to jet production were widely	
		anticipated. Last month, Boeing Commercial Airplanes	
		Chief Executive Scott Carson said a 10 percent	
		production-rate cut was possible next year. But the	
		company has downplayed industry observers'	
		predictions of wider slowdowns. Boeing's airline	
		customers, especially those buying cargo jets, have been	
		postponing scheduled deliveries. World air-cargo traffic	
		declined by almost a quarter in 2008, according to Seattle-	
		based consultancy Air Cargo Management Group. The	
		production cut's effect on Everett employment may be	
		offset somewhat when assembly of the new 787	
		Dreamliner ramps up at the plant. But that will take some	
		time. An executive at a Boeing supplier said the 787	
		program is no longer planning for a furious buildup, as	
		many customers are likely to defer their Dreamliner	
		deliveries, too. 'Rather than ramping up, the (787	
		suppliers) are really slowing things down,' the	
		executive said. If the global economic crisis continues	
		and air travel doesn't recover, further cuts are likely at	
		other local Boeing plants. Though Boeing said that 'at	
		this time' it intends to hold production steady at its	
		single-aisle 737 assembly plant in Renton, aviation	
		experts believe a slowdown will occur there, too. Rob	
		Stallard, a financial analyst with Macquarie Research,	
		cited 'a widespread expectation that this is just the first	
		of several cuts for this downcycle, with the 737 rate likely to be the next that goes down.' Because of the	
		shorter lead time needed to build parts for the much	
		smaller 737, Stallard said <i>Boeing</i> still has a couple of	
		months before it has to finalize the narrowbody production	
		rate for 2010. He predicted a cut from 31 per month this	
		year down to 25 per month in 2010. In a note to clients,	
		Stallard also warned that because some parts for the large	
		777 have longer lead times, 'The impact of the cut to the	
		777 rate will likely be seen in the aerospace supply chain	
		before the end of this year.' That could trigger some	
		layoffs at suppliers. Boeing warned that the	
		production decisions and unfavorable pricing trends	
		will reduce its first-quarter earnings 'by approximately	
		\$0.38 per share. ' That's a hit of about \$275 million, or	
		about 30 percent of Wall Street analysts' average first-	
		quarter profit estimate of \$1.24 per share. With reduced	
		deliveries, Boeing has to spread its production costs	
		over fewer airplanes, resulting in higher costs per	
		, source per	

13 Apr. 2009	Market Watch, "Boeing Lowere d to Underp erform at <i>Cowen</i> " (Christo pher Hinton)		Firm	α	plane and lower profits. 'These are extremely difficult economic times for our customers,' Carson said in a statement. 'It's necessary to adjust our production plans to align supply with these tough market conditions.' Boeing insisted that the production slowdown is purely a result of deferrals and not outright cancellations. Airlines have canceled 32 orders for the 787 so far this year, but no 767, 747 or 777 orders have been canceled." "Boeing Co.'s announcement last week it would cut commercial aircraft production is likely just the beginning of a long downturn, said Cowen & Co. in a Monday research note that downgraded the aerospace giant to underperform from neutral. 'The last three delivery declines averaged four years with 14% average annual drops,' said analyst Cai von Rumohr. 'But this cycle's early [airline] traffic dip is worse, and lower oil prices and limited airline credit availability will restrain replacement when the cycle turns.' Boeing shares were down about 5% in premarket trading to \$37.12"	On a modular enterpri se architec ture's value in a downtur n.
16 April 2009	Businee ss Week, "South west's Red Ink and Baggag e Fees" (Justin Bachma n)	Gary Kelly, CEO, Southw est Airline s	Firm- Custo mers- Investo rs	β	"Would Southwest Airlines have turned a profit the past quarter if it had charged checked-baggage fees? That was the interesting question posed during the company's conference call to discuss its \$91 million first-quarter loss, which was a penny per share worse than Wall Street had expected. A year ago, Southwest (LUV) earned \$34 million. Operating revenue dropped 7% to \$2.4 billion from \$2.5 billion. The company's vaunted oil-hedging strategy turned sour late last year when oil prices collapsed, and caused another \$65 million hit in the most recent quarter. Moreover, the airline anticipates second-quarter revenue to fall short of the same quarter of 2008, although CEO Gary Kelly said weekly sales declines that accelerated throughout March have stabilized. Southwest is offering all employees but senior management a buyout package to leave, but says it has no targets on how many of its 35,500 workers it wants to shed. Southwest is working to align staffing to capacity reductions. 'Honestly, we don't know how many people will take this offer in this environment,' chief financial officer Laura Wright said. 'We think that whatever number takes it will be good.' But it is the bag fee issue that cuts to the heart of why Southwest will succeed or, if the lousy economy turns truly draconian, becomes yet another ailing airline where the revenues don't match the costs. The question was proffered by Morgan Stanley airline analyst William Green and spurred a somewhat spirited discussion (by the relative standard of a Wall Street earnings call). In the aggregate, \$91 million is not a large sum for a huge airline like Southwest to amass across its system and a \$15 fee certainly could have yielded more than that in the first quarter. If one figures that only half of Southwest's 19.7 million revenue-producing passengers had checked a bag, the take totals \$148 million. "Why not put those in place?"	On an integral enterpri se architec ture'e mainten ance of custome r loyalty and lock-in

		1		Croop asked	
17WallAprilStreet2009Journal"AirbusSaysGovernmentsShouldAssistPlaneSales"(Adam)	Thoma s Enders , CEO, <i>Airbus</i>	Firm- Gover nmen- Custo mers- Suppli ers	β	Green asked. Save for JetBlue (JBLU), every other major carrier has imposed a fee and they have been pleased greatly by the new revenue. So why won't Southwest do it? 'I'm not at all convinced it would be revenue positive and it would certainly be disruptive to all the things we're trying to do on behalf of the brand,' Kelly said. 'It is a very competitive environment out there. We know that for a fact.' What's more, Southwest operates firmly committed to the belief that it stands alone in the airline industry with a unique relationship to its customers, who are extraordinarily price sensitive Southwest's average one-way fare is under S114 - but fiercely loyal. 'If you lose one customer that's the equivalent of a handful, if not ten or 12, bag fees,' Kelly said. Southwest also thinks its ubiquitous 'No Hidden Fees' campaign is taking hold among consumers and reaping positive business results. Mike Linenberg, a Bank of America analyst, further suggested that bag fees could help Southwest maintain its financial lead over the rest of the industry. As many others restructured in bankruptcy, the cost advantages Southwest once enjoyed have eroded, and its once-stellar revenue performance is no longer remarkable. Kelly bristled at that line of argument. 'The bottom line is that we don't believe it would be revenue positive anymore than we could argue that we could push through a S10 fare increase in this environment,' he said. 'There's just so much that can be done there.' The airline stressed repeatedly that it has no plans to charge bag check fees. But if 2009 continues along the same dismal path in terms of traffic, revenues and red ink, Kelly can expect the chorus calling for a checked bag fee to grow increasingly persistent.'' "Governments should help provide financing for airlines to buy planes, stepping in where credit channels are blocked, Airbus Chief Executive Thomas Enders said Thursday. Speaking to journalists after a meeting of European aeronautics companies, Mr. Enders said aircraft makers	On an integral enterpri se architec ture's dampin g of the value chain.
Sales" (Adam Cohen)				struggling as airlines around the world cut routes and postpone orders amid a steep decline in passenger traffic. In addition, low fuel prices give airlines little incentive to upgrade their aging fleets with more fuel-efficient planes, according to industry analysis. <i>Airbus</i> , a unit of <i>European</i> <i>Aeronautic Defence & Space Co.</i> , earlier this year said it would trim production of its single-aisle A320 planes. The company's U.S. rival, <i>Boeing Co.</i> , this week said it would cut the number of wide-body 777 planes it produces next year by 29%. Mr. Enders declined to say whether <i>Airbus</i> is planning further production cuts. 'Every one of us has	

18 April 2009	The Seattle Times, "Boeing Parking Jets Around Puget Sound, the Desert As Buyers Stuggle " (Domini c Gates)	C	7irm- Custo ners	contingency plans,' he said. The industry estimates a \$10 billion-to-\$20 billion shortfall in the funding needed to support 950 to 1,000 Airbus and Boeing deliveries this year, according to a presentation delivered at Thursday's meeting of the AeroSpace and Defence Industries Association of Europe, an umbrella organization representing 17 companies and 30 national associations. Earlier this year, the French government offered €5 billion (\$6.6 billion) in loans to help airlines buy Airbus jetliners. However, this facility hasn't been used yet, said Mr. Enders." "They look like ghost airplanes and they are a bad \$300 million omen for the airplane business. Two brand new Boeing wide-body freighter jets painted all white are parked at Paine Field outside the Everett assembly plant. Two more freighters freshly painted in the colors of China Southern and worth another \$300 million flew this week not to Asia, but to a jet parking lot in the Arizona desert. Meanwhile at Boeing Field, three 737 single-aisle jets have been parked outside for many weeks awaiting delivery to Arik Air, of Nigeria. Next to them is a completed but idle AirTran 737. And in Renton, outside Boeing's single-aisle assembly plant, two 737s originally ordered for a Chinese airline are now repainted in the livery of a Dubai-based airline that doesn't start service until June. Because of a global downturn in air traffic, with the airfreight sector particularly hard-hit, many airlines don't need new jets. In some cases, they can't use the planes they have committed to take from Boeing. Boeing insisted Friday that even the all-white airplanes are not technically 'white tails,' industry jargon for planes that have been built but don't have a customer to take them. 'We have no white tails,' said Boeing spokesman Jim Proulx. 'We have not built any airplanes that are not designated for delivery to customers.' What Boeing clearly does have is customers.' What Boeing clearly does have is customers.' What Boeing clearly does have is	On a modular enterpri se architec ture's dealing with capacity problem s upon entering a downtur n.
				are not technically 'white tails,' industry jargon for planes that have been built but don't have a customer to take them. 'We have no white tails,' said <i>Boeing</i> spokesman Jim Proulx. 'We have not built any airplanes that are not designated for delivery to customers.' What <i>Boeing</i> clearly does have is customers in distress and some airplanes sitting as expensive excess inventory far longer than the plane	
				of the jet from seven to five per month from the middle of next year. One of the ghostly white-painted jets in Everett is a 777 freighter owned by <i>Air France</i> . The list price is \$256 million, though according to data from airplane valuation firm <i>Avitas</i> , after discounts it has a value of \$150 million. The second is a 747-400ERF cargo jet ordered by <i>LoadAir</i> , a Kuwaiti airfreight company. Its list price is \$253 million, worth about \$147 million after discounts. A second <i>LoadAir</i> 747 freighter, the last 747- 400 that will ever be built, rolled out of the Everett factory Thursday and will join its all-white twin. 'Those 747s for <i>LoadAir</i> are on target for delivery in September,' Proulx said. In February, <i>Air France</i> took delivery of the first 777 freighter off the line and a second one days later. The carrier has yet to decide whether to store the third 777, an <i>Air France</i> spokeswoman who asked not to be identified	

	T	r	T			·a
1		1			told Bloomberg News. Painting the plane white perhaps	
1		1			is to leave open the option of leasing it to someone else.	
					The airline said in February it will defer delivery of two	
1					more 777 freighters to sometime between 2010 and 2012.	
					As for the two China Southern 777s now in Arizona, the	
					airline hasn't yet accepted delivery of the 777s. They were	
					stored by Boeing, an airline executive told Bloomberg	
					News on Friday from Guangzhou. Boeing declined to	
					comment on whether the aircraft have been put in storage.	
					China Southern, the nation's biggest carrier, said this week	
					it will save \$1 billion this year by delaying aircraft	
					deliveries. It will delay delivery of the two 777s until the	
					end of this year or early 2010 and is discussing the timing	
					of two more planes now in production, the airline	
					executive said. 'We're working with them on their	
1					delivery schedule,' said <i>Boeing's</i> Proulx. 'The fact that	
I				1	two of the largest cargo operators in the world are	
I					parking brand-new freighters is a sign of just how	
I					awful the global airfreight numbers are,' said Douglas	
1					Runte, managing director at <i>Piper Jaffray Cos.</i> in New	
1					York, in an interview with <i>Bloomberg</i> . Global air-cargo	
					volumes will probably fall 5 percent this year, outpacing a	
					3 percent decline in passenger traffic, the <i>International Air</i>	
					Transport Association said last month. The 737 jets at	
					Boeing Field and Renton are passenger jets.	
					boong ried and renton are passenger jets.	
					When asked about Arik Air's parked 737s last month, the	
					airline's managing director, Michael McTighe, said they	
					were being phased in and would be delivered by the end of	
					this month. He insisted that Nigerian aviation is not as	
					affected as elsewhere and 'Arik Air is set for major	
					expansion throughout West and Central Africa.' But at	
					least two of the planes have been parked at <i>Boeing</i> Field	
					for more than two months, creating a financial holdup for	
					Boeing. Airlines generally make down payments when	
					they sign purchase agreements and then pay the rest to	
					Boeing upon delivery. The AirTran jet parked beside the	
					Arik Air jets may also be slow to deliver. AirTran has cut	
					back its fleet plans and either deferred or sold 47 of the	
					Boeing jets it ordered. That includes two 737s it sold to	
					Arik in 2007. And Boeing was forced to look for a new	
					customer for two 737s in Renton originally destined for	
					delivery to OK Airways, a private Chinese airline. The	
					Chinese government suspended OK's service in December.	
					The two jets are painted in the colors of FlyDubai, which	
					doesn't begin operating until June. Boeing said the two	
					airplanes are parked waiting for refitted interiors."	
20	ATW	Gary	Firm-	β	"Southwest Airlines Chairman and CEO Gary Kelly	On an

21 April 2009	Financi al Times, "Airb us and Boeing' s Plans Fly in the Face of Recessi on" (Paul Betts and Kathrin Hille)	Firm	α & β	"Airbus and Boeing seem to be in denial. The two civil aircraft makers are not fully facing up to the worst recession in decades, which has sent air traffic into a tailspin and many airlines into the red. The International Air Transport Association expects the industry to lose about \$4.7bn this year as revenues fall by \$62bn, or 12 per cent compared with last year. It is not only the weaker airlines that are suffering. Last week Air France-KLM, Europe's largest carrier, said it was planning to cut 2,500 to 3,000 jobs by 2011. The week before, it warned that for its fiscal year ending March 2009 it would be reporting its first operating loss since the merger of the French and Dutch airlines six years ago. It warned that it was unlikely to return into the black this fiscal year. It is not surprising to see more and more airlines deferring or cancelling orders for new aircraft placed during the boom years. As in previous cycles, the first sector to suffer is demand for more expensive wide-body airliners. Qantas, China Southern and Cathay Pacific have all in recent days announced plans to delay delivery of some 93 mainly long-range aircraft including nine A380 super jumbos. Air France-KLM a couple of weeks ago said it was planning to delay delivery of two A380s. This is bad news for European aircraft manufacturer, Airbus, since delays in the delivery of its flagship jumbo will put pressure on the financial viability	On the modular enterpri se architec ture of the media.

					of its programme. But its US rival <i>Boeing</i> is in the same boat and is cutting production of its 777 wide-body aircraft. Both <i>Airbus</i> and <i>Boeing</i> expect to deliver the same amount of aircraft this year as last, largely because airlines are unlikely to cancel or push back orders for aircraft due for delivery this year given that they have paid about half the cost of these airliners with their downpayments and progress payments. The problem the two manufacturers face is with deliveries next year and beyond. Cash-strapped customers will increasingly seek either to delay or cancel orders for aircraft they can no longer afford, or negotiate more favourable terms with the manufacturers. The current cycle is proving more challenging than previous ones largely because of the credit crunch. Industry analysts estimate a \$10bn to \$30bn shortfall in funding needed to support 950 to 1,000 <i>Airbus</i> and <i>Boeing</i> deliveries. Yet the two big makers are insisting the shortfall will only involve \$4bn to \$5bn. France, for example, has offered €5bn (\$6.5bn) in loans to help airlines buy <i>Airbus</i> aircraft. Both manufacturers admit that the big test will come next year and they are bracing for more customer deferrals and cancellations. But they remain relatively optimistic that the cycle will turn and pick up in 2011, hence their resistance to making sweeping production cuts in 2010. They have so far only announced 5-10 per cent production cuts in their various aircraft ranges next year. Most industry watchers believe this is wishful thinking. Cycles in the boom-and-bust civil aircraft business are long and the manufacturers will probably be forced to cut production by 20 per cent to 30 per cent, if not by as much as 40 per cent, according to a UBS study."	
21 April 2009	China Daily, "Crisis not Dampen ing Airbus China Assemb ly Target"		Firm	β	"Airbus, the world's major aircraft producer, plans to cut its monthly global production of A320 in October, but its assembly target in China will not change, a senior Airbus official said Tuesday. Due to the global financial crisis, Airbus will cut the monthly production of A320 passenger planes from 36 to 34, but its target to produce 11 planes this year in China will not change, Marc Bertiaux, vice president of Airbus Cooperation and Partnership with China told Xinhua. By the end of 2011, the Airbus Final Assembly Line in north China's Tianjin City will produce four A320 aircraft per month, mainly for the Chinese clients, he said. Since China was not as badly impacted as some other countries by the financial crisis, the country's economic growth has been maintaining a sound momentum, he said. 'The stable and fast economic growth of China has also strengthened our confidence to stabilize our aircraft production.'" We need to have a culture where we're not afraid to talk to each other, where we don't allow ourselves to become intimidated by or intimidate others in our communications if we are going to be successful and survive. And so I would ask all of us to think about it in that context and to act in the future as if ethics is our responsibility and not the responsibility of the Ethics Office. It's important in our business dealings, but it's even more important in our personal dealings inside the enterprise today." "Jim McNerney (<i>The Boeing Company</i>):	ethical leadersh ip
April 2009	n Reuters Researc h excerpt from "The Boeing Compan y, Q1 2009 Earning s Call Transcri pt"	McNer ney, Chari man and CEO; James Bell, CFO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny</i>	Investo r		Thank you, Diana, and good morning everyone. Let me start today by discussing our first quarter performance and the unprecedented market environment that we're currently facing. As part of that I will talk about the things we're doing to respond to those challenges. After that James will walk you through our results and then we'll take your questions. I will start with Slide 2 please. Our first quarter results reflect the impact of the steep global economic downturn on the commercial airplane market, which overshadowed the otherwise good performance in our Commercial Airplanes business and continued strong performance of our Defense business. As announced earlier this month we had decided to bring 777 production rates down from seven to five airplanes per month, affecting deliveries beginning in June 2010. We are also delaying plans to modestly increase our 747-8 and 767 production rates. In addition, the weak global economy has driven significant declines in the indices that are the basis of our price escalation forecasts for commercial airplane deliveries. Together the production decisions and the lower escalation forecasts reduced our first quarter earnings per share by approximately \$0.38 most of which represented a charge on the 747 program. Commercial market factors aside, our underlying business performance remained solid in the quarter. BCA production programs continued to execute well and improve cost performance. Our Commercial Services business generated strong earnings in margins even with softening revenue from spares and passenger to freighter conversions. We're making progress on the 747-8 program with fuselage and wing assembly continuing on the freighter airplane. The first freighter is scheduled to deliver in the third quarter of 2010. We are also working on the detailed design of the 747-8 Intercontinental, however with the softening freighter market and the resulting decision to delay a planned increase in 747 production first delivery of the Intercontinental, is now expected to move fro	modular Enterpri se Archite cture's defense of its finanaic al perform ance

	airplane systems, including engines, are cleared for first
	flight. We've also completed the structural testing on the
	static airframe that is required for first flight. Final
	analysis is underway, but the results are positive. Earlier
	this week we completed a full simulation of the first flight
	using the actual airplane. The simulation exercised all
	flight controls, hardware, and software. In the coming days
	airplane #1 will move out of the factory to the flight line.
	There it will be fueled and its engines operated prior to
	doing a final systems check and the high-speed taxi tests
	that lead to first flight. We are also making excellent
	progress on airplane #2 on which ground vibration tests
	need to be completed before first flight. Those tests are
	expected to begin later this week. The 787 backlog
	remains strong with 886 orders from 57 customers around
	the world. This includes previously disclosed cancellations
	of 32 airplanes and the order for eight 787s finalized with
	Gulf Air last week. As mentioned last quarter, we expect a
	modest level of orders churn on the 787 during the year.
	Even so, the backlog is unprecedented for a new
	airplane and we are confident in the long-term value of
	the 787 for our customers. Our total company backlog
	remains large at \$339 billion. While that number is down
	from last quarter due to current period deliveries, modest
	cancellations, and price adjustments from lower escalation
	it still represents nearly 5x our current and annual
	revenues. New orders include the U.S. Air Force contract
	for 15 C-17s that were previously funded under the fiscal
	2008 budget, as well as integrated logistics and support
	contracts. Fundamentally, this is a solid company with
	strong core businesses. We are of course, like all
	companies, facing a very challenging market environment
	which I will address on Slide 3.
	The global economy has further deteriorated and we are
	facing economic times that are more difficult than many of
	us have ever seen. This, of course, is impacting our
	commercial customers in the form of lower air traffic
	growth and challenging financing conditions. These
	pressures, which are being addressed by various
	governments' economic recovery packages, are also
	putting pressure on defense budgets. Because of the
	commercial and defense market uncertainties, we continue
	to step up our drive to become more competitive and
	productive. As discussed last quarter, we are
	aggressively managing both costs and investments.
	Unfortunately part of this means a reduction in
	employment in certain areas of the company. We are on
	track towards the estimated 10,000 position reductions we
	expect by years end. We will continue to evaluate the
	appropriate infrastructure levels at the Company,
	especially in light of our recent decision to reduce
	commercial production in 2010, as we get more clarity on
	the U.S. Defense budgets. Despite the challenging
	environment our backlog is holding strong. The only
	commercial airplane cancellations so far this year have

87s I mentioned earlier. We have, however, g with customers to defer airplanes in he unprecedented economic environment. In rter we accommodated about 60 airplane a 2010 and 2011 into future periods. We are of working on more deferrals beyond that all factored into our production decisions made nonth. Deferrals are occurring across all all models. I should point out that our this time to hold 737 production rates practice of over committing 737 deliveries y, which have so far offset the current and eferrals. Now I have just a word on cisions. I want to emphasize that these are ecisions for the Company and are not simply today's view of the market. The market is ctor. It is obviously a factor. But, we also omer contracts, significant cost elements and ment implications. While we monitor it all e scope, and impact of these calls are d need to be made deliberately. As you all financing environment continues to be <i>coeing Capital</i> conducts a bottoms up as well malysis of financing requirements by tracking	
<i>Coeing Capital</i> conducts a bottoms up as well malysis of financing requirements by tracking each commercial delivery while at the same of the sources of global capital availability. still believe financing sources are sufficient eted requirements for our products in 2009. cludes an assumption that BCC will need to t \$1 billion of new financing this year. recognize the financial markets are fragile ge quickly. We believe we are in a good ndle any resulting outcomes this year. Let ze by saying, again, that we are in 1 times right now, but I believe we have a tion from which to work through this with strong products and services and a large ortantly, we are aggressively managing our e, costs, and investments.	
ation impact are recorded in the current all units in the accounting quantity as ecording the impact over time as the units iscuss BCA in a little more detail on Slide 5. Airplanes recorded first quarter revenue of	

•	
\$8.6 billion which is 5% greater than the prior year.	
The increase was driven by higher airplane deliveries	
offset by lower commercial service revenues. Operating	
margins of 4.9%, seven points lower than last year, were significantly impacted by the \$347 million charge	
driven by production rate decisions and lower	
escalation forecasts. Our Commercial Airplane	
contracts have escalation provisions which state prices	
in current year dollars at time of contract signing and	
allow for economic adjustments to be paid by	
customers at the time of delivery. These adjustments	
are determined from broad price indices. During the	
first quarter the global recessions impact on	
commodity and retail prices, coupled with moderating	
wage growth, significantly reduced these indices. This	
change does not affect current year commercial	
revenues since pricing is fixed approximately 11	
months before delivery, but it does impact our forecast	
of future revenues. Lower revenue forecasts reduced	
program accounting gross margins during the quarter	3
for our profitable programs and increased the loss recorded on our 747 program. The first quarter impact	
of escalation was approximately \$235 million, \$180	
million of which were increased the 747 reach forward	
loss. The Twin-Isle production decisions, which impact	
production rates beginning in 2010, also affect current	
period gross margins. Rate change disruption costs and	
redistribution of hard to vary costs over fewer units in	
the accounting quantity are the principle drivers. The	
impact recorded in the first quarter reduced earnings by	
approximately \$200 million, \$175 million of which was	
included in the 747 charge. This impact was net of a	
favorable adjustment to our prior 747 cost estimates. The	
BCA team is focused on right sizing its infrastructure and the associated costs to address the current market	
challenges.	
Now let's turn to Slide 7. Boeing Capital delivered	
another solid quarter with pre-tax earnings of \$37 million	
on revenue of \$163 million. BCC had modest new aircraft financing in the quarter of approximately \$135 million	
which was offset by portfolio run-off. Our guidance still	
assumes that we will finance about \$1 billion of new	
aircraft sales during the year. Now I want to remind you	
that as BCC reduced its portfolio from a high of \$12	
billion to the current level of \$6 billion we have been	
preparing for this time of reentering the financing	
markets. We are well positioned and are entering the	
markets in a disciplined and a prudent manner.	
Now let's turn to Slide 8 and discuss cash flow. We	
generated \$200 million of operating cash flow in the	
quarter reflecting cash from earnings and liquidation of	J.
inventory that we paid for during the strike last year. This	
was offset by continued planned working capital build up	
on our development programs, lower cash advances, and	

timings of receivables. During the quarter we paid	
approximately \$300 million in dividends and used \$50	
million to buy back 1.2 million shares. We have	
significantly reduced our share repurchases in light of the current business realities.	
the current business realities.	
Now let's turn to Slide 9. Our financial strength	
remains solid. We ended the quarter with \$4.7 billion	
of cash and marketable securities including proceeds	
from the \$1.8 billion of new debt issued in March.	
After our announcement to reduce commercial	
production rates S&P put our A+ long-term credit	
rating on watch, but confirmed our short-term rating.	
Moody's reaffirmed our A2 long-term rating and our overall credit ratings remain among the strongest in the	
industry.	
Now I will turn to Slide 10. We are upgrading our	
financial guidance to include the lower price escalation	
forecast and the resulting charge on the 747 program.	
Earnings per share for the year are now expected to be	
\$4.70 to \$5.00 per share. Now, we expect second and	
third quarter earnings to be lower than fourth quarter earnings reflecting revenue and R&D profiles. 2009	
revenue guidance is unchanged at \$868 to \$869 billion.	
The 2009 commercial delivery forecast also remains	
between 480 and 485 airplanes. 2009 operating cash	
flow guidance remains at greater than \$2.5 billion. We are	
diligently managing our cash and have action plans in	
place to preserve our strong financial position. Having said	
that, there are risks to our cash flow due to market	
uncertainties and in particular its potential impact on advances for commercial airplanes. We continue to	
assume pension funding this year of about \$500 million.	
Total company pension expense is expected to be about	
\$900 million in 2009 with slightly more than that recorded	
at the business unit and a small offset in the unallocated	
segment. The R&D expense forecast is unchanged at \$3.6	
to \$3.8 billion and we continue to expect R&D expense	
to decrease substantially in 2010.	
Now let me turn to Slide 11 and discuss our change in our	
earnings guidance in more detail. As we mentioned last	
quarter, our guidance at the time considered the potential	
impact of modest production rate cuts. Had the Twin-Isle	
production decision has been the only impact this quarter,	
we would have maintained our earnings per share	
guidance. However, the lower escalation forecast had a	
sizable impact on our results, which is the principle driver of our reduced EPS guidance. We're expecting somewhat	
lower pension expense since last quarter, but higher	
interest expense from the new debt issued in March.	
We plan to provide 2010 financial guidance towards the	
end of the year.	
Jim McNerney:	

	Thank you, James. To close let me simply say that we are diligently working on improving productivity, right sizing our infrastructure, and preserving our financial strength given the current uncertainties in both our commercial and defense markets. While recognizing the risks at hand, we continue to feel that we are relatively well positioned with the fundamental strength of our products and services, the size and diversity of our backlog and the long-term outlook for the markets we serve.	
	Ronald Epstein (BAS-ML): I have a question on the 787 program. As we start to think beyond kind of the flight test program and into the ramp- up, what I have heard is <i>Global Aeronautica</i> is still a bit of a long tent pole that the center fuselage integration is taking over what 300 days per section. How do you work through that and how should we think about the ramp of the program?	
	Jim McNerney: Well I think the Global Aeronautica bottleneck, as you characterized it, is something that is not unusual. I mean the main body join is typically a challenge. But, there is nothing we see, as we work through it, that will prevent us from meeting our ramp schedule. As you know, after the ownership change awhile back we have taken more direct control of that factory, which I think has moved along process improvements significantly and we're making good progress there. While it has represented a bottleneck we are confident that it won't as we meet our production schedule.	
	Ronald Epstein (BAS-ML): Okay and if I can I have a follow up question on 78. When you look at the suppliers, and different suppliers are developing either parts or subsystems for the program, you have seen multiples of their original R&D budget that they thought they would be investing. When we think about the <i>Boeing</i> investment on 787 can you just broadly say, I mean, how many times is it what you thought it was originally going to cost the company?	
	Jim McNerney: Well there is not an integer involved in the multiple, okay? There has certainly been some pressure on research and development, as you know, on some non- recurring costs and there have been some cost pressures that both we and our supplier partners have born. But, it remains a very economic proposition over time. I think this is a very innovative product that did cost more and take longer, but the market has recognized it as an innovative product by ordering many multiples times any commercial airplane that's ever been ordered before. So, we have a base over which to spread some of these increased costs, but I wouldn't characterize it quite as direly as your	

 	-	
	question implied. We have been wrestling with	
	pressures and they're slowly getting back into the box.	
	I mean the condition of assembly by our partners from	
	airplane 7, which is the first production airplane, on	
	out has improved dramatically. We are in very good	
	shape and quite frankly, I'm heartened by what I'm	
	seeing in the ramp-up right now.	
	Howard Rubel (Jefferies & Co.):	
	If I did the math right you did about 8.5% to 9% margins	
	in commercial and about 17.2 per R&D and that compares	
	with 19.8 a year ago. There are two parts to this question.	
	What are you going to do to recover part of the loss of	
	deflation? I mean the index works against you, but there	
	should be a lot of opportunities with the rest of the	
	industrial commodities being down to get some of that	
	back. The second part of this is cash is clearly a	
	challenge. Could you be a little more specific in terms	
	of what you're doing to try to improve the balance	
	sheet fund, but could you make it even better?	
	James Bell:	
	Let me try to answer that. As you know, on the escalation	
	side, particularly in the commercial airplane where this	
	impact has been felt, every quarter we get different	
	escalation forecasts and we basically have two	
	commodities, one is the CPI index and the other is for,	
	which is the consumer index, and the other is more	
	commodities related. They do change over time, so we	
	will naturally see some of that happen. As it deals with	
	the costs associated with that, the timing is different. As	
	you know we have long-term contracts which are fixed	
	price with our subcontract community, so to the extent that	
	some of those costs are going down we will have an	
	opportunity to renegotiate future contracts at lower prices	
	and then there are some contracts that we do have that see	
	an immediate impact, but it's minor. You will see some of	
	that and some of that is already into the impact you saw on	
	that escalation provision. But, over time it generally	
	balances it out. If we go into an inflationary period you	
	could see that change pretty rapidly. On the cash side,	
	clearly we're looking at a number of things relative to	
	how we manage our cash and be more disciplined	
	relative to inventory turns. Be more efficient with just	
	in time. We're looking at making sure as we move the schedules on production rates and on the deliveries out	
	that we also align that as perfectly as we can with the	
	subcontract community so that we're not getting	
	inventory before we need it. We've cut back on capital	
	expenditures. We are really looking at everywhere that	
	we spend money that doesn't affect or go into the	
	product. We're cutting back on all things that we	
	would call non-essential. We're having daily cash calls	
	where we're making sure we're monitoring advance	
	pays and we're monitoring our disbursements to make	
	sure that we're paying just in time in accords with our	

contract terms and that we are aggressively pursuing our payments as they are required by contract. We think the combination of all of that is going to make a strong balance sheet even stronger. <u>Robert Spingarn (Credit Suisse):</u> James, could you walk through your cash flow guidance? You know with a flattish quarter here in the first quarter, you talked to some of the pressures and things that are going on in the beginning of the call, but how do you get to generate operating cash of \$2.5 billion in an environment where we would suspect your building 787 inventory the advances are drying up from the absence of orders and you'll be increasing financing	
through out the year.	
James Bell: There are a couple of things. First of all, the advances really aren't drying up as a result of the orders. We are not expecting a lot relative to cash receipts on the orders. In fact it is a relatively modest number because the deliveries are so far. The orders that we would write today are for deliveries so far out in the future. The real issue is we do have quite a bit of receipts that are associated with deliveries after 2009 and those are the PDPs that are set on the payment schedules and the inventory; so clearly, we're looking at making sure we stay on track and we are able to collect those. The financing, as you know, is going to be leveraged, so even though it is included in the total in cash in the cash balance, it is not going to have a major impact, but we have included the billion dollars already in that guidance. Again, we've only done \$135 million so far this quarter, but we think we'll do the whole billion over the course of the year. We think we're in pretty good shape and with the run rate in terms of what we'll deliver this year, and with the other initiative that we put in place to manage cash we think we're going to be in pretty good shape.	
Joe Campbell (Barclays Capital):	
I have a question about the numbers, which I think Jim gave us, on the 60 deferrals from 2010 and 2011 that you saw in Q1 that moved to the out years. Now, I think that the number, I don't know, we probably guessed it or triangulated, that the number of wide bodies that moved was something a little over 50. So, it sort of suggested there really wasn't much movement in all the other	
airplanes. I was wondering if that is about right. I mean, I would have thought that there was a lot of in and outs	
and that that was what you were trying to convey. If	
you could give us a sense of even if the 73s, which are apparently so far okay, can you give us some sense of	
how many moved out and somebody else moved in so	
that we can get a sense for the fluidity of the 73?	
Jim McNerney:	

Yes. The number is more like half-and-half narrow
body and wide body deferrals. As I also said in my
comments, we're working others beyond the [interposing].
In Comphell (Parolaus Canita)
Joe Campbell (Barclays Capital): But Jim you moved, I mean if you cut the production of
seven 77s from seven to five than that is going to be more
than 30 airplanes, so how could it be half-and-half? I
mean we cut the wide bodies by almost that much, I would
have thought.
Jim McNerney:
I'm sorry, would you say it again Joe? I mean, we're
talking about 60 airplanes, a little more than half of which
were narrow bodies, a little less than half of which were
wide bodies, and we're working some additional deferrals
right now, as I commented on; when you add that all up
that does roughly true up to the production decision.
Remember, we are taking into account some things we're
working now beyond just the 60.
Joe Campbell (<i>Barclays Capital</i>):
Yes, okay, but what I really wanted to talk about was
what is actually going on in the narrow bodies?
Presumably there is movement even though it nets out,
apparently, to a number that's consistent with
production. I just want some sense of whether it is 100
guys moved out and 100 guys moved forward or
whether it's five guys moved out and five guys moved
forward.
Jim McNerney:
There is more moving out than moving forward, but
what you have to remember, I think, Joe is that remember
we restrained production rates. The big picture is that
Airbus and us had roughly the same number of narrow
body orders over the last few years. They ramp up
much more aggressively on production rates and we
were restrained. Remember they were in the high 30s
we were in the low 30s, so we had a lot more over
ordering in our backlog, anticipating that someday
there may be a softening, which is what we're seeing right now. So, we are working through the over ordered
portion of the backlog and when you look at what we
deferred within the 60 plus the other ones we're working
now and are estimating based on that experience, we still
think we're in good shape on the production rates. And, it
is because we had a much larger margin of unslotted
orders that we took, okay?
Heidi Wood (Morgan Stanley):
I want to take a step back for a moment. In the first quarter of '08 the 747-8 was described as on track, and
over the span of four quarters things went so awry that
you took over \$1 billion in charges. Even as recently as
the January call you described the -8 as a viable

business and adding a lot of value to customers. While acknowledging that the 787 is likewise going to deliver value and is a viable business can you describe the key under pinnings that anchor why the 787 won't be susceptible to reach forward loss kind of four quarters from now?	
Jim McNerney: There is a specific accounting calculation, Heidi that I know you are aware of, but I think the big picture is a large accounting quantity when the time comes to make that decision, which will be when we deliver the first airplanes. Having worked through a lot of the non- recurring up front costs and having a much better handle now on the cost curve that is in front of us, when you make the assessment it trues up to where we are. There is not a loss on the program right now. Could things change, yes, but there just isn't. It is largely driven by the market acceptance of this product.	
James Bell: Heidi, let me just add one comment. Traditionally when you look at us on a new airplane development program, at this stage in the program we've only sold 100. So, the major risk is the risk to market and the pricing associated with that. The fact that we've sold so many has given us a lot more cushion on this particular airplane in terms of a forward loss, because we really, having sold them we have the market and we have the pricing pretty much set. Then obviously there are a lot of moving parts on the cost side, but as Jim mentioned, as we move through time we're getting a better handle on that. Now, could something happen in four years and four months? I mean unless it was dramatic, I think something coming out of the flight test program that would cause a major new cost element obviously that is always a potential because it is a development program, but generally I would say to you we are in much better shape on this program to avoid that than we have been on any prior program.	
Heidi Wood (Morgan Stanley): That's excellent and James, how do cancellations flow through to relieve the presumed costs on customer penalty payments? I mean doesn't early cancellations relieve the entire skyline and presumably save you quite a bit of money?	
James Bell: Obviously if a customer cancels you have more space to work with. The space was crowded otherwise so it does provide you more opportunities to move airplanes up and back depending on what the customer needs are. But, as you know, cancellations are not what we're looking to achieve in order to deal with our penalties. We would rather just go ahead and get this program back on	

			track, but obviously you get some relief, but that is not	
1			what we're aiming for.	
			Myles Walton (Oppenheimer & Co.):	
			The \$787 deposits on the 880 aircraft or so, are those at	
			this point, are those refundable deposits or are they both	
			still nonrefundable deposits?	
			James Bell:	
			They are non-refundable.	
			Joseph Nadol (J.P. Morgan):	
			Back on the 747 program, I am just wondering if we could	
			get sort of a bigger picture update, Jim, on where we are	
			there. I mean freighter demand is part of the reason	
			you cut the 777 rate and that's where if it's only part of	
1			the backlog for 777 it's most of the backlog for the 47.	
1			You have this delay in the Intercontinental by a couple	
1			quarters which may have not been disclosed previously,	
1			but you decided that a number of months ago. In any case,	
1			anytime anything goes wrong anywhere in the commercial	
			business whether there is a 37 cut, an 87 slide, anything.	
1			Are you going to have another 47 charge? I am just	
1			wondering what your comfort level is here with the	
			backlog, the freighter demand, and that we're not	
			going to have significant more problems down the	
			road.	
			Jim McNerney:	
			Well listen, the economic situation is uncertain and it has	
			had significant impact on the freighter market, as you have	
1			seen. We can't predict with absolute certainty that our	
			current read of the market will hold forever; so adjusting	
			production rates is part of this business. We think	
			we've got it right now, but we'll have to keep reading	
1			and reacting. Now that is a separate question from do	
1			we have a good business. You have to live through	
1		1	some ups and downs. Unfortunately we're getting a	
1			down here in the midst of the development phase of the	
1			program. But, we have seen very few signs that	
1			customers are running away. We see signs that	
1			customers want deferrals and in fact want to hold onto	
1			the business and are willing to keep making the	
			progress payments required to have it. It is more of a	
	r I			
			story of an adjustment to a very difficult economic	
			story of an adjustment to a very difficult economic environment than it is a story about a program that

Joseph Nadol (J.P. Morgan): I think where I'm going, Jim, with this is the 87, I think we can all agree, has unprecedented demand and it's going to be a great platform for airlines over the very long term. The 47 just seems to me much, much ore in doubt. The basis of it is freighter demand and we're in a loss position now. I guess I am trying to get my arms around how much worse things can get on the 47. I mean what's the number?
Jim McNerney: Well, I mean the number is the number we've given you now, is what we think it is. Again, customers are not running away. There are a number of discussions for other orders that, admittedly, are doing slow in the current economic environment. We think this is a good niche airplane. I mean, this is not a brand new innovation like the 87 is to your point, but this is an airplane that fills a good, solid niche and we typically launch airplanes with 100 orders. This is more like the normal airplane we launch. Everything isn't the 87. Could it get worse? Sure. I mean if the market, the economic environment continues to tank for another three or four years I think the impact of deferrals and production rate changes could put additional economic pressure on it. Is it enough to kill the program? I don't think so. I think this is a good product that serves a good market.
Joseph Nadol (J.P. Morgan): Are we past the point where you could kill the program, or is that still a potential? Jim McNerney:
We don't intend to kill the program. <u>Cai von Rumohr (Cowen and Company):</u> In terms of opportunities, your commercial R&D was down sequentially in the quarter despite a lot of activity on the 787; should we expect it to continue on down sequentially in the second?
James Bell: No. We will be, it was sort of the timing that really impacted this quarter. You will probably see it a little higher in the second. Third quarter will probably be pretty stable and then we will come down in the fourth quarter. We should be down year-over-year, but don't take away from the first quarter. That is going to do down second and third, but it will go down in fourth.
Cai von Rumohr (Cowen and Company): Excellent, thank you very much and good quarter.
<u>Itay Michaeli (<i>Citi</i>):</u>

I wanted to dig in a little bit more on the two-year cash flow picture. Do you think you can get back to the cash flow power that would enable you to have the flexibility back into a billion plus in share buybacks in the next couple of year? How should we think about that playing out in the next two years?
James Bell: Relative to the buy back program, we'll look at what that looks like in the next year. Obviously we're going to minimize it this year given what we see as pressure on cash, but going into 2010 we'll take a look at and see where we are then and see whether or not we have the cash to continue to get back up to the buying levels we've experienced in the past. We obviously have the authority from our board to buy the shares, so that is not the issue. The issue is the priorities that put demands on cash and then how we address those with the current cash flow in the current environment.
Itay Michaeli (Citi): That's helpful. You did raise some debt opportunistically in Q1. Is there a minimum cash balance you like to have at this part of the cycle that we should be thinking about? You know, for you to maybe tap the market again if cash flow comes under some more pressure. How should we think about where you like to have your baseline fall?
James Bell: Well we need about \$2 billion for operation cash, so that's kind of it. Then in this environment you surely want a safety net, given the fact that we have two major development programs that haven't gotten through their flight certification programs yet; so you would want that. So we could possibly do more, it just depends on what the circumstances are as we view the opportunity in the market pricing wise and other factors.
Dominic Gates (<i>The Seattle Times</i>): I have a very specific question about the 787 flight test plans. First, I just want to clarify my own understanding of a response you gave earlier to Ron Epstein, when he asked about the multiple in terms of the spending on the 787, you said no integer involved. I am taking it that means it is less than two, correct?
Jim McNerney: Yes. Dominic, I was being somewhat facetious in response to a question that implied that it was some egregious multiple. I think, as you know, there have been some cost pressures that both us and our suppliers have faced and we're dealing with it.
<u>Dominic Gates (<i>The Seattle Times</i>):</u> But it hasn't doubled from what you originally

					expected in '03? From that response you gave, is it	
					right of me to make that assumption?	
					Jim McNerney:	
					I think that's true, Dominic.	
					Dominic Gates (The Seattle Times):	
					All right and to my own question, the first six tester planes are apparently now unallocated after you refigured your	
					customer delivery schedule. Are there concerns about	
					selling those planes, getting those planes placed, given the weight problems that they have and where do we	
					stand on weight with the ones that follow on?	
					Jim McNerney:	
					Listen, the first production airplane that will be delivered	
					is airplane #7 as I mentioned today. We will find homes for the first six airplanes. We have discussions ongoing	
					with people and I am confident that they will end up placed."

	Bumpy Ride"				those for lighting and bathrooms. One reason is that <i>Boeing</i> has redesigned 30 percent of the plane to	
	(Jeffrey Rothfed				reduce weight, an unprecedented degree of change for	
	er)				an aircraft this late in development. As one of many grim jokes making the rounds on <i>Boeing's</i> factory floor	
					goes, 'Maybe they meant a bad dream.'	
					The Dreamliner's delays are expected to cost Boeing as	
					much as \$10 billion in canceled orders and compensation to airlines. The fiasco has become an	
					object lesson for manufacturers in how not to do global	
					outsourcing and has eroded <i>Boeing's</i> reputation for efficiency and innovation.	
					Now, on the eve of its big launch, the Dreamliner carries	
					the company's hopes of recapturing lost revenue and	
1					repairing the damage to its image. If the plane passes the rigorous yearlong series of flight tests that begin this	
					spring, it could lead Boeing out of the financial crisis.	
					But if the Dreamliner fails, <i>Boeing</i> could become the <i>General Motors</i> of the skies, with enormous repercussions	
1					for the U.S. economy and the U.S. manufacturing base.	
1					Although <i>Boeing</i> announced in January that it was laying off 10,000 workers, it still employs more than 150,000	
					people in the U.S. and is the nation's No. 1 exporter.	
					About 70 percent of Boeing shares are held by	

institutions, including all of the major mutual funds and Bank of America Corp., its biggest shareholder.
Indeed, a machinists strike last fall crippled <i>Boeing's</i> production and contributed to a 6.2 percent decline in the U.S. gross domestic product in the fourth quarter. <i>Boeing</i> is so vital to a recovery that if it sputters, the federal government may be forced to bail it out, as it has automakers <i>GM</i> and <i>Chrysler LLC</i> .)
The plane fell victim to infighting between <i>Boeing's</i> bean counters and engineers, who had to gamble on a low-cost—but unrealistic—manufacturing strategy. 'We may have gone a little too far, too fast' with the technology and materials and in outsourcing production, <i>Boeing</i> chief executive James McNerney told <i>Condé Nast Portfolio</i> . 'The program was more than we could handle.'
The Dreamliner debacle would be bad news in good times, but it is a nightmare for <i>Boeing</i> in this global economic crisis. <i>Boeing</i> has received about 900 advance orders for the Dreamliner, the most of any new plane, at about \$200 million apiece. But with air traffic down from last year, carriers have begun to cancel orders. 'I'd have concerns about every customer right now,' says Richard Aboulafia, a vice president at <i>Teal Group Corp.</i> , a consulting firm that follows the aerospace and defense industries. Aboulafia estimates that between 30 and 70 percent of all orders for jets industrywide will be at least deferred, if not canceled. In his worst-case scenario, 630 orders would be postponed or dropped outright, a potential loss of \$126 billion in revenue.
Airlines could seek as much as \$4 billion in compensation for losses linked to delays, and <i>Boeing</i> is not expected to make any money on the first 100 or so Dreamliners it delivers. Some carriers, weary of waiting for the Dreamliner, bought or leased planes from <i>Boeing's</i> biggest rival, <i>Airbus SAS</i> , a European consortium. 'We're pretty fed up,' says the chief executive of one major carrier that ordered 15 Dreamliners. 'We've gotten no clarity from <i>Boeing</i> .'
Perhaps worst of all, <i>Boeing</i> has forfeited a significant revenue stream—from Dreamliners that would have been delivered and paid for—that could have propped up the company through the downturn. <i>Boeing's</i> cash reserves plummeted during 2008 from \$7 billion to \$3 billion, which will make it difficult to develop new planes.
While conceding that the next few years will be tough, CEO McNerney dismisses the notion that the Dreamliner's moment has passed. Because of the long lead time from conception to delivery, he says, it's not unusual for a new plane to bump up against a recession. And since <i>Boeing</i>

	can make fewer than 100 Dreamliners a year, the company would have a five-year backlog even if half of the 900 orders were canceled. 'The fact is that 95 percent of the pipeline for the Dreamliner would have been exposed to this financial crisis even if we delivered on time,' says McNerney.	
	The Dreamliner's problems have exacerbated the broader decline of <i>Boeing</i> , once one of the world's most admired manufacturers. In the past year, <i>Boeing's</i> stock price has lost about 60 percent of its value, more than the Dow Jones industrial average. In trying to fix the 787, <i>Boeing</i> shifted engineers away from other projects, causing a lag in developing freighters and other passenger planes. <i>Boeing's</i> revenue dropped 8 percent, and its operating income fell 32 percent from 2007 to 2008. The latest results offer no comfort. In early April, <i>Boeing</i> reduced expectations by 38 cents a share for first- quarter earnings, which will be announced April 22, and said production of the 777 will be trimmed from seven to five aircraft per month starting in June 2010. In response, a number of top analysts downgraded <i>Boeing's</i> stock and <i>Standard & Poor's Rating Services</i> began a review of the company's debt for a possible downgrade. And after dominating jet manufacturing for decades, in 2008 <i>Boeing</i> fell behind <i>Airbus</i> in orders and shipments by more than 100 planes.	
	Boeing's slide can be traced to the company's ill-fated \$13 billion purchase of McDonnell Douglas Corp. Under chairman John McDonnell and chief executive Harry Stonecipher, McDonnell Douglas starved its design and engineering operations and became little more than a sales organization, barely surviving on offshoots of its aging DC-9 and DC-10 models. The 1997 acquisition infected Boeing's forward-thinking culture, emphasizing cost-cutting at the expense of innovation.	
	McDonnell and Stonecipher, both of whom joined Boeing's board, successfully argued for improving profit margins on existing lines instead of introducing new commercial jets. Boeing cut its annual research- and-development budget for commercial aviation from more than 4.5 percent of airplane sales in 1997 to slightly more than 3 percent in 2003. At the same time, Airbus' R&D budget topped 8 percent of sales.	
	But by 2003, Alan Mulally, who headed <i>Boeing's</i> commercial-airplane division, was convinced that <i>Boeing</i> needed a fresh plane. Inspired by <i>Toyota's</i> combination of technological prowess and lean efficiency, Mulally had spearheaded development of the 777 in the early 1990s, transforming <i>Boeing</i> into a world-class manufacturer. Now he believed that to preserve its eroding market-share leadership, <i>Boeing</i> had to produce a jet that would capture	

the imagination of the airlines and the attention of Wall Street. Originally called the 7E7, Mulally's baby was renamed in a public contest that drew 500,000 online voters. By a large majority, they dubbed it the Dreamliner.
Mulally's ambitions collided with the frugality of the former <i>McDonnell Douglas</i> executives. Conceptual drawings showed that the Dreamliner's cost would at least match the \$10 billion-plus price tag of the 777. After becoming chief executive in 2003, Stonecipher said he intended to seek board approval for the Dreamliner. However, the unspoken message was 'but not at the current price,' says Jon Ostrower, an aviation insider who writes for Flightglobal.com. Mulally was told that the plane's projected development costs would have to be 50 percent or more below the 777's.
To meet this demand, Mulally came up with a wildly unorthodox plan: He would farm out the design, engineering, and manufacturing of the 787—virtually everything except final assembly—to suppliers that would shoulder more than \$9 billion of the project's \$13 billion cost, in exchange for lucrative, multiyear guaranteed contracts and a slice of the plane's sales. These outside companies would coordinate with one another to produce whole sections of the plane, stuffed with assembled components, systems, ducting, insulation, and wiring. <i>Boeing</i> workers in Everett would merely have to connect the major parts of the aircraft.
No large manufacturer had ever before so audaciously turned over control of the entire process—from concept to shipment—to outside firms. In a critical oversight, no provision was made for monitoring the suppliers. Mike Denton, vice president of engineering for <i>Boeing's</i> commercial-airplanes division, recalls that the vision for the Dreamliner was 'not to encumber the partners with the <i>Boeing</i> way of doing everything. So we erred on the side of giving them more free rein than in retrospect we should have.'
By the end of 2003, the company had greenlighted the Dreamliner. Moving quickly, <i>Boeing</i> signed up dozens of suppliers. Japan's <i>Mitsubishi Corp.</i> agreed to make the wings; France's <i>Messier- Dowty SA</i> took on the main landing gear; and Italy's <i>Alenia Aeronautica SpA</i> would build the 64-foot-wide horizontal stabilizer. The vertical fin, the sole piece of the airframe slated to be made in the Seattle area, would connect to a rudder from Chengdu, China, and a front-facing edge from Shenyang, China.
In 2005, Stonecipher was fired for having an inappropriate relationship with a female executive. After McNerney was chosen as chief executive, Mulally left <i>Boeing</i> in 2006. Whether Mulally could have made a success of the

outsourcing strategy, had he stayed, is one of the great what-ifs of the Dreamliner saga. He became chief executive of <i>Ford Motor Co.</i> , where he introduced more efficient techniques in the automaker's factories. In part because of Mulally's streamlining, <i>Ford</i> has been able to wave off government bailout money taken by its rivals.	
The suppliers were expected to deliver their completed parts in early 2007, giving <i>Boeing</i> enough time to assemble the initial Dreamliner for its first public display on July 8, 2007—or 7/8/07—a date chosen to match the plane's model number. Under pressure from <i>Boeing</i> , the suppliers sent to Everett as much as they had finished. Sections arrived in an incomplete or defective state, or failed to fit adjacent parts made by other suppliers. The Dreamliner that <i>Boeing</i> rolled out to the applause of 15,000 workers and their families and friends resembled a mismatched model airplane.	
Unbeknownst to Boeing, one important supplier was being pared down by a prominent private equity firm. Vought Aircraft Industries Inc. was supposed to build the two aft barrels of the fuselage in a new factory in Charleston, South Carolina. Once completed, these parts were to be sent next door to another new factory—a joint venture between Vought and Alenia Aeronautica—to be connected to fuselage sections, wiring boxes, and the main landing gear.	
But <i>Boeing</i> didn't realize that the <i>Carlyle Group</i> , which had acquired <i>Vought</i> in 2000, was starving it of resources while making a few cosmetic improvements to attract potential buyers—a once-common private equity tactic. By early 2006, <i>Vought</i> was facing a severe 'liquidity crisis' and nearly went bankrupt, chief executive Elmer Doty told analysts. It couldn't afford the new plants, employee training, and fuselage design and assembly and had to 'reconstitute' its engineering department. 'We are among the riskiest, if not the riskiest' of the Dreamliner suppliers, Doty acknowledged.	
When <i>Vought</i> sent empty fuselage barrels that were short of vital fasteners, <i>Boeing</i> finally took notice. The company compelled <i>Vought</i> to fire the executive in charge of operations in Charleston and then acquired <i>Vought's</i> 50 percent stake in the joint venture with <i>Alenia.</i> After having spent almost \$300 million on the Dreamliner project in 2008, <i>Vought</i> had to borrow \$200 million more last year, when it finally shipped the first of its fully completed fuselage sets. <i>Vought</i> has asked <i>Boeing</i> to redraw its contract to cover more up- front expenses. So have other hard-pressed suppliers, potentially costing <i>Boeing</i> hundreds of millions of dollars.	

					McNerney says <i>Boeing</i> has learned from its mistakes and	
					McNerney says <i>Boeing</i> has learned from its mistakes and now monitors suppliers closely. Hundreds of <i>Boeing</i> employees were dispatched to suppliers to implement the 'Boeing way,' and McNerney has visited many of the factories, sometimes unannounced. 'We overwhelmed the suppliers with <i>Boeing</i> folks in reaction to not having enough early on,' he says.	
					Across from the Dreamliner's placid bunker, on the opposite side of the vast barnlike plant, <i>Boeing's</i> storied past and manufacturing prowess are impressively on display. A platoon of 777s is under construction on a production line superior to any other in the aerospace industry—one <i>Boeing</i> decided not to use for the Dreamliner because outsourcing was cheaper. Rather than assembling 777s one by one, parked side by side—the traditional approach for jet builders— <i>Boeing</i> has coupled its famed wide-body to a continuously moving platform	
					that creeps along at a scarcely noticeable 1.8 inches per minute. <i>Boeing</i> does its utmost to avoid assembly delays of even a few minutes. <i>Boeing</i> workers monitor each 777's exact coordinates on the factory floor from the time the jet ambles in from the plant's rear gate, with just its aft fuselage joined to its main body, to the time it reaches the 300-foot-wide hangar doors as a completed plane. <i>Boeing</i> consistently makes about seven "triple sevens" a month and boasts a backlog of about 350 orders for the \$250 million plane. In the first two months of this year, the	
					777 had a net gain of three orders while the Dreamliner lost 32. The moving assembly line in the 777 plant in Everett—and another in Renton, Washington, where the 737 is built—has produced impressive results that the Dreamliner program can only, well, dream about. Assembly time is down 21 percent, time spent in the factory has been reduced from 26 days to 17, and 20 percent of mistakes have been eliminated. By these measures, <i>Boeing</i> is at least four years ahead of <i>Airbus</i> .	
					Despite <i>Boeing's</i> recent failures, its innovative spirit— reflected in the 777 and in the Dreamliner's design— remains praise worthy. If the economy rebounds by the time the Dreamliner makes its first commercial flight next year, the plane could still become the blockbuster <i>Boeing</i> envisioned. But so far, it's just a cautionary tale. 'The lesson is that manufacturing programs cannot operate as islands,' McNerney says, but must meet companywide standards. 'I think we are centered on that now,' he notes ruefully. 'A little later than we needed to be for the 787.'"	
28 Apr. 2009	The Olympi an (Associ ated Press), "Boss	Jim McNer ney, Chair man and CEO,	Firm- Investo rs	α	"CHICAGO – The Boeing Co. Chairman and Chief Executive Jim McNerney assured shareholders Monday that the company is in strong shape to ride out the 'once- in-a-lifetime' downturn that has walloped its profits, jetliner orders and stock price. Putting an upbeat spin on a slump that has hit both the aerospace company and its customers hard, he cited as reasons for optimism: Boeing's	On a modular enterpri se architec ture's exogeno

	 Interview states and R 				commercial air travel declined. We've been taking the	
	Earning				appropriate actions over the past several months as we	
	s Call				focus on meeting our customer requirements and	
	Transcri				managing through the business cycle. I'll discuss	
	pt"				several of those actions we have taken in more detail in a	
					few minutes. During this quarter, we opened our new	
					Spirit Malaysia manufacturing facility as planned. Our	
					Spirit Europe team and Wings segment leadership did an	
					outstanding job of bringing the new facility online and the	
					new Malaysian team is doing a great job. As you know,	
					Spirit Malaysia's initial focus will be on Airbus products,	
					but over time, we'll provide value to products across the	
					company. The new operation is adding value immediately	
					in 2009. I continue to be pleased with our performance on	
					787 program. Our team continues to work well with the	
					customer and our suppliers regarding change management,	
					flight test preparation and production plans. We look	
					forward to making solid process on the 787 program	
					through the remainder of 2009. Now let me turn to slide	I
					six and give you a brief update on the 787. We delivered	
					aircraft number six in March, and aircraft number seven,	
					the entry into service airplane is progressing through	
1					systems installation process. Overall, product quality	
					remained high and we continue to work with the	
					supply base to enable a smooth production ramp up.	
					We are continuing to work closely with our customer as	
					we are continuing to work closely with our customer as we incorporate the necessary engineering changes on the	I
					we underline the necessary endineering changes on the	

initial end-service airplanes. Our internal efforts
remained focused on productivity improvement and
increased utilization of the capability we have in place.
We expect to restart forward fuselage production later in
2009. Now let me turn to slide seven, and provide you my
thoughts on the business environment. Clearly these are
challenging times. The global economy continues to
impact air travel across regions of the world. In the face of
these challenges, we are seeing our customers work to
match supply with demand. We've seen our customers
announce plans to delay development programs, to reduce
production rates on certain products, to forego previously
planned production rate increases on other products and
indicate caution yet continued solid demand for other
products. This tailored response by our customers due
to current market conditions from my view is a direct
result of the more measured increase in production
rates undertaken since 2006. The more measured and
tailored response is to market demand with the goal of
reducing the magnitude of cyclical swings to the extent
possible benefits stakeholders across the industry. We
know that the airplanes business go through cycles. And
we've learned much from the past that positions us well for
the future. We've structured business arrangements to
share upfront development costs for new programs. We've
maintained a continuous focus on cost and inventory
management as well as productivity improvement. We've
been prudently conservative in estimating future demand
for products, and we've taken aggressive proactive action
freezing executive management and some non-
management salaries, and are hiring only to revised (ph)
critical skills. At Spirit we've shown that our team can
respond effectively to changing business requirements in
difficult situations, and do so in innovative ways that keep
our company positioned to support our customers and to
create long-term value. We believe we are well
positioned to accomplish this at <i>Spirit</i> . Now let me turn it
over to Rick who will provide more details on our
financial results and outlook. Rick.
Rick Schmidt (Spirit Aerosystems):
Thanks Jeff, and good morning everyone. Slide nine,
summarizes our financial results for the first quarter
which continue to be influenced by the residual impact
of the strike at <i>Boeing</i> .
or the strine at boong.
Operating income margins were 11% in the quarter,
about a 160 basis points below the prior year period
largely due to the lower revenues from the strike and
the small negative cum-catch adjustment. Sequentially
margins were up significantly from the fourth quarter due
to higher sales volume in the absence of a \$27 million
negative cum-catch adjustment booked in the prior quarter.
a second a s
Jeff Turner:
Thank you, Rick. And I will wrap up on slide 18, with just
Thank you, thek. This I will mup up on shide to, will just

a few brief comments. Our core business is performing well. We are conservatively capitalized, and remain financially strong. While are passed the challenges posed by the strike, we are taking the necessary steps to successfully manage through this cycle, and our core businesses, and meet customer requirements on new programs. There is no question these are challenging times across the commercial aviation and aerospace industry. And we are well-positioned to manage through them. I believe that the current difficult economic time will pass, and when it does, Spirit is well-positioned to take advantage of future growth opportunities and to create value. We'll now be glad to take your questions.

Howard Rubel (Jefferies & Co.):

I want to talk about gross margin a little bit. I mean, it's significantly better than the fourth, but not quite as good as you've done. Could you put it in context of what you'd like to see for the balance of the year. And I mean, there are a number of offsetting items you have at some point of 320 rate change of 737, you might want to be preparing for some change there. And then, the 787 obviously becomes a greater part of the mix. So how should we think about what you're going to do with them, what you can do with gross margin to improve it from where it is and deal with some of the challenges?

Jeff Turner:

Well I think Howard. First of all clearly margins do come under pressure in reducing volume environment. Also I'd remind you of **the difference in margins as we shift to newer products, specifically the 787**, we've talked about that in the past. Clearly, we remained focused on working margins and productivity in our processes and so on. **But I do think we're in a period of time where margin expansion is going to be difficult,** and managing it to the right balance is appropriate for us, as we look to manage effectively through whatever downturn happens to be here, and prepare our self for the upside. Rick, you have anything to add to that?

Rick Schmidt:

Yeah, I would add to that Jeff. If you just look at margins for the remainder of 2009, and I got you saw from the margin percentage standpoint in the first quarter is pretty much what you'll see for the rest of the year. Now right now, all of our current contract locks largely extend through the end of this year. So, we're approaching to end of these locks and usually at the end of the blocks you don't have a lot in away of the prices or adjustments in your contract profitability, because most of it is driven by actual costs it's behind you. So, pretty consistent margins in the second half, Jeff mentioned mix, certainly, 787 as we've talked about in prior calls has lower margin on a base business. So that picks up, that will generate some downward pressure on margins. But offsetting that is

some revenue recognition and profit recognition on some of our newer programs, which have somewhat better margins than our legacy programs, and also our
aftermarket business continues to do well. And it has
somewhat better margins than our legacy business. Well,
for the near term, we those largely offsetting margins and
being fairly consistent over the next three quarters.
Doug Harned (Sanford C. Bernstein):
I am interested and wondering on the 787. And when you look at the design changes that you've tried, and seems
like there have been a pretty consistent flow of design
changes. How are you looking at now the sort of scale and
the timing of when you might get reimbursed from <i>Boeing</i> on this?
on uns?
Jeff Turner:
Well again I think we've talked about that in previous calls. There is a long term program, and a number of, the
number of pieces to that puzzle. I think it's sufficient for us
to say that we're making process with our conversations
with <i>Boeing</i> and we continue to work through the issues.
Doug Harned (Sanford C. Bernstein):
But you can't you don't know whether this will be
something that is likely part of the pricing that you have when you deliver as opposed to something that you will
receive in advance?
Jeff Turner:
Well, we've had some advances and Rick talked about that
from the impact on the finance of this quarter. And those
will continue in the future. But, I don't have anything to announce there in what we have other than the fact that
we continue to make progress. And we continue to have
discussions on a number of fronts. Rick, you want to add
anything to that?
Rick Schmidt:
No I would just I think Doug, you'll probably see a combination of both, as these issues get resolved.
Although I would say, given the kind of the current state
of discussions. It would gravitate much more towards
future price changes on products. Would be reflected over our contract lock and influence of the margins that
we've recognized in that lock.
Doug Harned (Sanford C. Bernstein): Okay. And than second question on labor , as you look to
the miscellaneous (ph) contract ending in 2010, how are
you approaching that today in terms of the way you are
thinking about discussions in advance, any kind of a timeline you may have for looking at those?
timenne you may have for looking at those?
Jeff Turner:
Sure. Let me just say, we've been approaching that for

	three and half years now. So, we see the relationship with our employees, and their representatives as a partnership that we have to work all the time. And clearly, we have a contract point mid-next year. But, you can rest assure that conversations are underway, have been. Clearly, we expect to reach agreements that are meet to needs our employees that are market based that clearly support the long-term viability of our company and achieve goals. It's in certainly, in the interest of the company and clearly in the interest of the employees that have a viable, vibrant spirit. So, I think we've approached that whole partnership from day one, as something that we need to keep in front of us all the time.	
	<u>Carter Copeland (Barclays Capital):</u> Okay. And one more on the 787, the inventory build in the quarter, how much of that was related to excess over average, relative to other?	
	<u>Rick Schmidt:</u> I don't have that in front of me Carter. But certainly, continuing to complete the units that are here, attracts costs. So, I would say the deferred costs certainly is a large component of the increase in the quarter.	
	Well certainly, as we start to get a more normal drumbeat of production, starting back up here on the 787 program, you're going to see the average cost per unit is going to come down dramatically. And then the units that we have in inventory today, both those that are nearing completion and those that are further back behind in our manufacturing process is been these units have been there now for a couple of years. Things continues to be build up, they continue to attract costs which makes the early units much more expensive than what we'll see going forward.	
	<u>Carter Copeland (Barclays Capital)</u> : But presumably, the benefits come from the units that are produced once you restart production, because all of the ones that are sitting there now are shouldering a lot of that cost over the past couple of years. So, you'll need to get through those units before you start seeing better excess over average performance.	
	<u>Rick Schmidt:</u> That that's absolutely right. But as you look at that graph though, the breakpoint, happens probably quicker than those people realize is. Again, this program has been in the stop and start mode for an extended period of time now . Now, once we really get going, I think you'll see that the play at which we hit the average. So right now, obviously our actual costs are over the average. But, the play that which we hit the average and start in effect eating into that deferred, I think will happen fairly quickly. It will	

happen within the first, 100 to 125 units.
happen within the mot, too to 125 units.
Robert Spingarn (Credit Suisse):
Rick, your guidance range is \$0.20. Could you talk about
some of the major swing variables that are in there?
Rick Schmidt:
Well I'm sure. Probably one big one that we've talked
about in the past is in the R&D area that the one
variable that we still have in R&D are the 787 derivatives. We have factored into our guidance some
spending, R&D spending for the derivatives. Now, how
much we actually spend this year is going to be based on
the schedule for Boeing schedule basically, for us
supporting them and bringing those derivatives to markets.
So, that is somewhat of an unknown yet, as to how much
will fall into this calendar year. I think at this point, we have been probably on the conservative side for how much
we think we'll spend this year. So, I think that's a variable
yeah certainly, revenues are always a variable. Right now I
think we have got a pretty good line of sight on what we
think revenues are going to be the rest of the year. And there is, the big variables would be how many 787 units do
we actually ship this year, how much revenue do we
generate from some of our new programs. And some of
those aren't based on shipping units. They are based on
completing engineering work and on milestones. So, I
would say those are the big ones. Gross profit obviously
follows the revenue. So, I think the gross profit absent some surprise that we can't foresee at this point, gross
profit will be in the range that we saw in the first quarter.
SG&A tends to be fairly predictable. We seen a fairly
constant level of SG&A over the course of the last year,
year and a half. So, I don't expect that to change much.
But I think its revenues R&D expense maybe a little bit in interest expense, obviously, with the draws on our revolver
that we've experienced in the first quarter, it carries some
interest expense with it. So, the timing when we are going
to be able repay those will have some influence. But I'd
say those are the big factors.
Robert Spingarn (Credit Suisse):
Okay. And then the other thing I wanted to ask about you
may have touched on this earlier, but how should we think
about 787 cash flow , as you start to ramp up deliveries.
And I am asking this in context of the advances that you've gotten from <i>Boeing</i> . So, can you walk us through how
those dynamics will evolve and then ultimately change?
Jeff Turner:
Well, what will happen is you might recall, we signed an
MoA last year, first quarter of last year. That provided additional advances in 2008. And the repayment
obligations for those units were that for those advances,
were that they basically, those advances basically
covered the first 45 to 50 units that we would deliver.

So, in effect, Boeing has already paid us for the first 45 to 50 units that we will deliver. So, as we deliver those units, that will -- that value of that delivery will apply a 100% to liquidate the advanced payment. So, the 396 million that we got in 2008 that will be repaid fairly quickly over the rest of 2009. And then we'll start to ramp up in 2010 and 2011. But once we have that behind us then we're back to the old schedule which was the original 700 million that we got, that was repaid 1.4 million a unit. So, once we get past this initial block of units, then we'll kind of revert to the schedule that we have before. Carter Leake (Davenport & Company Llc): And then any update on North Carolina facility. Is that still as far as timing, is that still on track as you mentioned on the last call? Jeff Turner: Yeah, it is still on track. Progress being made if you stop by Kingston, you will facility come in up out of the ground as it should, as you would expect and appreciate, we are being very prudent. It's frankly a good time in the environment to build. So, we are watching those contracts closely. And clearly being prudent as we know how to be the timing of those expenditures. That project is coming along very well. Joseph Nadol (J.P. Morgan): On the 787, can you update us on where you are in terms of your margin accruals there? And you noted in your slides mentioned that you are trying to get the perspective profits up there, what exactly are you doing? Jeff Turner: Well right now Joe, we are doing is preparing to speed up production. We have done a lot of work, if you will, analyzing the processes, and looking for a list of improvement options and opportunities, ones we get it running. The real key here for us to make improvements is get some production momentum. Once we do that then it comes off the drawing board to the reality of what's happening in the processes. And that's when we can really go to work, make any real improvements. So the most important thing for us is to get too drumbeat on that program and then make the in place improvements. Joseph Nadol (J.P. Morgan): And so we're still in a positive margin situation here in sort of a low single-digits, is that accurate? Jeff Turner: We are. We're in a small positive net margin for the three packages that we have on the 787.

<u>Cai Rumohr (Cowen & Company):</u> Yes, thank you gentlemen. On its call, <i>Boeing</i> described the pressures they're having from lower inflation escalations which they are unable to pass on to their suppliers and intimated they might make efforts to pass some of that pressure on. How are you positioned regarding inflation escalation and how far do your contracts are your contracts priced looking out on the legacy <i>Boeing</i> programs?
Jeff Turner: Legacy <i>Boeing</i> programs are priced through 2012. And I would just say parenthetically that all customers have price pressure on suppliers all the time.
Robert Stallard (<i>Macquarie Research Equities</i>): First on the 787, Jeff is there anything you could tell us in which month you expect to start delivering again and whether the monthly rate will be ramping up for a fairly consistent rate per month?
Jeff Turner: Well, a couple of volumes Rob, one is that we are delivering, now in fact we delivered unit number six in the first quarter. We have unit number seven in the final installation systems installation area and it will soon be ready for it poll. So, clearly the numbers that Rick gave, we're going to have to speed up production deliveries if you will to meet the demand for the rest of the year. The point that I made is that we have had the winding on the barrels the fabrication process shut down for quiet a while now and we will resume that later this year. The exact I did not mention and don't at this point intend to give the specific time when we start that back up. It will be very much dependant on the post signals that we get for the product. But we will be ramping up that airplane per the plan later on this year.
So if you look at the forward fuselage, it's still a little bit (inaudible) when exactly it's going to start and just something it sounds like its also a little bit time (ph) for what the exact rate will be per month as well?
Jeff Turner: But again, we've got a number of units in the process now. We've shipped through line unit six. I think we've told you before we wound through line unit 22. So, it's just a question of timing of as those pulls start and that pulls us back through our line when we fire up the winding process again.
<u>Rick Schmidt:</u> So I mean those are we were still on short work week for part of the quarter. Its when you have that kind of environment in your manufacturing facilities I mean

r						
					that always creates certain amounts of inefficiencies	
		(which end up showing up in deferred cost. So, I mean those will be unwound over the remainder of the contract	
13 May 2009	Seattle Post- Intelige ncer, "Boeing Worker Sues over Violate d Ethics, Wrongf ul Termina tion." (Andrea James)		Firm	α	lock." "An attorney who worked in <i>Boeing's</i> ethics policing division says that he was demoted to being an administrative assistant and then fired after raising concerns about violation of government regulations. Joseph Sicilia, who lives in Spokane, filed a lawsuit against <i>The Boeing Co.</i> with the King County Superior Court in April. A <i>Boeing</i> spokesman said Wednesday that the case has no merit. Sicilia worked for <i>Boeing</i> from 2001 until his firing in November 2007. For most of his time at <i>Boeing</i> , Sicilia worked in the Office of Internal Governance, which is the company's ethics department based at Chicago headquarters. He reported to supervisors in Seattle, the complaint says. One of Sicilia's responsibilities was to ensure that <i>Boeing</i> complied with promises it had made to the federal government to maintain its ability to bid on government contracts. In 2005, Sicilia perceived that certain policies enacted by his supervisor 'would result in the misrepresentation of compliance, thus equating to fraud,' the complaint says. Later on, other program changes made within <i>Boeing</i>	On allegati ons of a modular enterpri se architec ture's central trust mechani sms.
					further reduced corporate compliance with federal acquisition regulations, Sicilia believed. He reported his concerns up the management chain several times, but the lawsuit states that his complaints were never investigated. "Boeing's got a strong compliance monitoring system and effective mechanisms for reporting potential wrongdoing," Boeing spokesman Chaz Bickers said.	
					"The suit is clearly without merit and <i>Boeing</i> will defend it accordingly."	
					Sicilia's lawyer, reached by phone on Wednesday, says she intends to seek a jury trial. 'Boeing takes a scorched Earth litigation philosophy,' Spokane trial attorney Mary Schultz said. 'Never admit. Never acknowledge. Never say you're sorry.' 'This is one of these areas that the American public is very concerned about these days,' Schultz said, referring to the government contracting process. 'People like Joe Sicilia are very important for the integrity of the system.'	
					The lawsuit is filed in state court. <i>Boeing</i> faces at least two other wrongful termination suits in federal court."	
14 May 2009	Flight Internat ional, "Airbus	Tom Willia ms, EVP	Firm	β	" <i>Airbus</i> remains resolute that it sees no need for further single-aisle output cuts and could begin ramping up again by the end of next year. 'But we are on time, we are progressing along where we are meant to be with the maturity gates (milestones). We met the first important one on time and we are ready for the second one.' He said <i>Airbus</i> was standardising its processes to make sure suppliers used the same tools, the same methods and processes and that it reinforced a collaborative mindset. He pointed to a composites demonstrator program which built fuselage mock-ups as an example. Evrard said it was important to have the designers and manufacturing people working together on the platform from the beginning. Designers are also looking at simple and efficient aircraft systems aimed at improving reliability. These include opting for just three fuel tanks so there are pumps, a two-circuit hydraulic system, simpler air system architecture and design in the landing gear. <i>Airbus</i> estimates maintenance should be a 'base visit' every 36 months, with a structural overhaul required only every 12 years. It says this equates to about a 10 per cent reduction in maintenance costs on an A350-900 compared with the 787-9." " <i>Boeing Co</i> is confident that its new 787 aircraft will hit near-term milestones, including first flight in June and first delivery early next year, but it won't make money for a while, Jim McNerney, <i>Boeing's</i> chairman and chief executive, said Wednesday. 'The good news is that we have what I'm confident will be the best-selling airplane of all time, which gives us time to work on profitability,' McNerney said during the <i>Sanford Bernstein</i> Strategic Decision Conference. It is typical that new aircraft don't make money during the development stage, but the 787 experienced costly and unexpected manufacturing-related delays of nearly two years. Down the road, <i>Boeing</i> can improve profitability of the program by further tweaking the manufacturing process, as well as modifying the plane itself, he said. 'We can streamline supply chain and take more weight out of the airplane,' McNern	On a modular enterpri se architec ture's long- term views.

"	Compa	Nippon Airways early next year, will set the Chicago-	se
(Joseph	ny	based manufacturer apart from Airbus and other rivals for	architec
Weber)		years to come. But one thing the plane won't do is give	ture.
		Boeing much of a financial lift—at least not for several	
		years. First, Boeing will need to recover its research-	
		and-development costs, estimated at \$3.5 billion to \$4.5	
		billion. What's more, initial customers are expected to	
		pay a discounted price of \$130 million to \$170 million	
		per plane. That's far less than what Boeing pulls in on	
		such tried-and-true models as the 747, a bigger plane that	
		can retail for more than \$300 million. At first, a Boeing	
		spokesman says, the new plane will be a "zero-margin"	
		affair.	
		The air travel slowdown, which is punishing carriers	
		around the world, looks likely to keep the number of new	
		planes in the skies down for a while. 'This looks like a	
		three-year downturn,' says Richard Aboulafia, a vice-	
		president at aerospace consultant the <i>Teal Group</i> . Boeing	
		reported on June 4 that it received just 20 orders for all of	
	I	its commercial jets in May, down from 67 in May 2008.	
		Commercial plane sales are likely to account for as	
		much as \$33.7 billion out of <i>Boeing's</i> expected \$68.2	
		billion sales in 2009, BernsteinResearch analysts	
		estimate. But next year the commercial unit's sales will	
		probably slip to \$29.7 billion, they add, dragging down	
		Boeing's overall tally to \$64.6 billion. And net income	
		could slide from an expected \$3.3 billion this year to \$3	
		billion in 2010. Nonetheless, investors appear to be	
		excited about the Dreamliner's prospects—as well as by	
		reports that United Airlines may order as many as 150	
		planes from either Boeing or Airbus this fall. Investors	
1		have bid Boeing's share price up to about 50, the	
		highest it has traded since last fall and up sharply from	
		about 29 in March. Of course, Boeing shares fetched more	
		than 107 in the fall of 2007.	
		The company expects to roll out just a half-dozen of the	
		Dreamliners this year for testing. Then, once it is cleared	
		to fly commercially, Boeing is expected to deliver about	
		15 to carriers next year. The company says it will ramp up	
		manufacturing to produce as many as 10 planes a month	
		by the end of 2012, though analysts are skeptical of that	
		aggressive timetable. <i>Bernstein</i> analyst Douglas Harned	
		suggests the 10-per-month rate is more likely by mid-	
		2013; he expects only about 60 of the planes to leave	
		factories in 2012. Says Harned: 'The manufacturing	
		processes used to produce these aircraft are new, and the	
		ability to reach 2012 production rates has not yet been	
		demonstrated.' Boeing management contends it can	
		meet the production time lines. Even though the plane	

7 June 2009	The Washin gton Post, "Behind GM's Attempt to Change its Image is Ambiva lence about its Car of the Future" (Michae I Leahy)	Bob Lutz, Vice Chair man, <i>Gener</i> al <i>Motors</i>	Firm	α	is already two years late and still must convince regulators that it will be airworthy for the decades of service each is likely to see, executives argue that they have solved the supply-chain problems that dogged the program. 'The airplane will fly in June, and we will embark on the flight-test program,' Chief Executive Officer James McNerney Jr. said at a recent investor conference. Afterward the company will increase production to the 10-per-month rate. Says McNerney: 'We think that's manageable.' With airlines struggling with overcapacity and tight credit, <i>Boeing</i> will be hard-pressed to move more planes of any kind. The company has trimmed production plans for this year and is cutting its workforce by some 10,000 jobs, largely because of lackluster demand. <i>BernsteinResearch</i> figures the company will deliver just 386 planes of all sorts next year, down from an expected 456 this year. The firm estimates that <i>Boeing</i> will deliver only 301 models of its most popular plane, the 737, compared with an expected 358 this year. 'The real issue is: Do the airlines need the airplanes? In 2010 we believe they do not,' says Harned. Of course, analysts may have to rework their projections if orders such as the expected one by United come through.'' "Even now, as <i>General Motors</i> fights for survival, there is something ambivalent about its prescription for saving itself, a conflict implicit in a bit of symbolism that recently greeted arrivals to the Detroit Metropolitan Airport even before they reached baggage claim. One of <i>GM's</i> touted new automobiles sat on display in the center of the automaker's airport gift shop. It was not the coming electric car, the 2011 Chevrolet Volt, championed by Bob Lutz, the <i>GM</i> executive most identified with the Hail Mary that the vehicle represents for the bankrupt company, which faces the immediate future as a ward of the federal government. It was not even a mid-level sedan called the Chevy Malibu, which has received flattering reviews and awards, in part for its better-than-average	On a modular enterpri se architec ture's view of its integral competi tor
					efficient vehicles, the glory days can somehow be	

	the nucleus of the company's research and development	
	efforts. It is the kind of Detroit-speak he favors. 'Some	
	people don't care for those kinds of descriptions today	
	it's a different time,' says Lutz, who drives a gas-thirsty	
	2009 Corvette, a dream car of muscle lovers. 'But we	
	have new vehicles, too. We have the Volt. We are	
	committed to the electrification of the automobile. We	
	know this is the time.' If you were to believe that Lutz	1
	commissioned the Volt because he thinks the environment	
	needs to be saved from carbon dioxide emissions, or that	
	the United States has a moral obligation to lead a greening	
	of the planet, you would be wrong. 'If you look at most of	1
	the mainstream media, you get the impression that 95	
	percent of Americans today want a vehicle like the	
	Chevrolet Volt or a [hybrid such as the] <i>Toyota</i> Prius,'	
	says Lutz, until recently the former head of GM 's	
	global product development and nowadays the	
	company's vice chairman and senior adviser. 'And	
	that, by God, the reason General Motors is in trouble, is	
	that we have not offered a vehicle like that. But when	
	you look at the reality, at today's fuel prices, most	
	Americans still want a conventional car.' Why the Volt	
	then? 'Because it is an important symbol. We need it. It	
	has a chance to change our image,' he says. As GM's	
	situation has become increasingly dire, and interested	
	parties from President Obama to shareholders have	
	demanded that the company start making more fuel-	
	efficient cars, GM has pointed to the Volt as evidence of	
	its changing ways. But the values that have long shaped	
	this iconic company are deeply held, especially the	
	passion for pushing the envelope of automobile	
	performance and power. In many ways, the Volt, and	
	<i>GM's</i> subtle shift from old design priorities, represent a	
	contradiction of those values. Meanwhile, some	
	industry observers are unconvinced that the Volt, even	
	if it runs flawlessly, can be the company's savior, and	
	view it as a miscalculated effort to woo back customers	
	by awkwardly trying to demonstrate a new cutting-	
	edge bent. 'I just think GM is focusing on the wrong	
	thing,' says Daniel Roos, an engineering professor at the	
	Massachusetts Institute of Technology who studies the	
	automobile industry. 'The quality of its cars was horrible	
	in the '70s and '80s, but it's much better now. It has world-	
	class vehicles: the Malibu and the Cadillac CTS. They	
	should be [promoting] those and capitalizing on their	
	strengths.' While regarding the Volt as a sign of modest	
	progress within GM , some critics see the car as	
	basically another half-step in a company prone to half-	
	steps. They point to the Volt's internal-combustion	
	gasoline engine dubbed by GM as a 'range extender,'	
	meant to supply electricity to the motor after the vehicle	
	has exhausted its 40-mile range on battery power alone	
	as an indication that the plug-in electric car is not quite	
	what it purports to be. To these critics, the Volt neatly	
	reflects long-standing problems in GM's corporate	
	culture: a propensity for knee-jerk responses, an	

inbred caution even in the midst of reform and a
lingering preference for comfort over efficiency. Lutz
vociferously rejects such characterizations. Not only does
the Volt demonstrate GM's 'commitment to changing,'
he says, but also the car is simply 'the first generation of
an electric vehicle from GM' that will produce successive
generations of enhanced Volts, ultimately leading to a car
running entirely on electric power in excess of 150 miles.
Producing a car that does not scare away the customer
with its technology or cost must be GM's mission for
now, he says. The Volt has staunch supporters, too. A
school of automotive analysts thinks that the car represents
one of the last opportunities for GM to distinguish itself, to
lure environmentally conscious buyers, in particular.
Admirers and detractors alike largely agree on one point:
that, if GM is to recover, the Volt must be part of a broader
effort to reform the company's culture and push it toward
acquiring new automotive passions. The question
remains how GM executives, so proud of their
company's history, so in love with the cars of an earlier
generation, will cope with their own ambivalence to
change. And no one in the corporation embodies that
ambivalence more than Bob Lutz. Lutz strikes some
observers as an unlikely figure for launching an electric-
car program. The 77-year-old silver-haired, tanned and
gregarious former Marine aviator rides motorcycles, pilots
a helicopter that his <i>GM</i> colleagues say he lands on his
driveway, once called global warming 'a crock,' and
appeared on David Letterman's and Stephen Colbert's
shows to banter about <i>GM</i> 's hopes for the Volt. Just the
new language associated with environmentalism irks
him. He momentarily looks bewildered when asked
whether the place of the modern vehicle is undergoing
a change in the culture, whether in time Americans
might chiefly appreciate a GM car simply for its
'utilitarian' value, a reliable conveyor of riders from
point A to B. Lutz raises his eyebrows.'Utilitarian?' A
car is not an appliance, he says. A car is not a washing
machine the proof of which is that people do not lust
after their washing machines. They lust after a
beautiful car, he says. If you want reliable, go get
yourself a refrigerator. A gorgeous car, he says, is an
expression of power and yearning, especially for
owners who hope the vehicles will inject excitement
and romance into their otherwise mundane lives.
'Show me a washing machine that can do that,' he says.
energy and it historican even and the second state of the second s
For years, Lutz worked under GM chief executive Rick
Wagoner, a longtime company finance chieftain who
green-lighted the Volt but was preoccupied in the last
years of his tenure with issues of GM 's crushing debt and
how to keep the company from collapsing. Last
November, when Wagoner made the public relations
mistake of flying to Washington on a corporate jet to ask
congressional officials for government bailout loans, his
image was irrevocably damaged. A month later, in one of
inage was interocating damaged. A monur later, in one of

his last high-profile appearances, Wagoner rode in a Volt	
prototype along Washington streets before the second	
round of hearings on the nation's crippled auto industry,	
part of his effort to trumpet GM's evolving environmental	
focus. But by then the executive's fate was sealed, a	
consequence of the belief that he was linked with an out-	
of-touch company. Pushed out by the Obama	
administration, Wagoner gave way to new chief executive	
Fritz Henderson, who quickly reaffirmed the company's	
commitment to the Volt. During the tumult, Lutz went on	
working, a self-described car man ensconced at a safe	
remove from the finance men's woes and budget-slashing,	
and happiest when he is talking about horsepower,	
speed and performance. His office at the Technical	8
Center here in Warren sits amid a research-and-	
development behemoth. Security is tight; visitors are	
screened for camera equipment and anything else that	
might procure trade secrets about prospective vehicles.	
Near Lutz's office is a reflecting pool immense enough	
to be a large pond. Farther down is a building called	
Design North, where for decades, in a special showroom,	
executives unveiled new GM automobiles for the brand's	
dealers and other VIPs in a venue that once doubled as a	
theater of sorts for entertainment luminaries flown to	
Detroit to perform for the dealers, a roster that included	
Lucille Ball and the Beach Boys. GM's only real	
competition at the time came from Ford Motor Co. and	
Chrysler Corp., backyard rivals with nearly identical	
union-negotiated labor costs and roughly similar	
product lines. It was an era of near absolute power for	
the Big Three in the American auto market: They	
could set a car's retail price at virtually any amount,	
certain that consumers somewhere would buy it.	
Prodigious profits led in time to prodigious costs.	
Pressure and the threat of strikes from the United Auto	
Workers union, wanting its share of the Big Three's	
bounty, guaranteed not only rising wages that served	
as workers' ladder to the middle class but also lifetime	
health care and growing pensions. In time, GM was	
responsible for funding more than 1 percent of all the	
health-care costs in the United States. While smaller	
and fledgling auto companies in Japan and Europe	
were disciples of lean operations during the 1960s, in	
preparation for one day becoming viable competitors,	
GM preached expansion in the name of more product	
brands and winning vehicles, shying away from no	
expense if it might mean producing a more artful,	
powerful and extravagantly appointed car. 'A lot of	
waste in the glory days,' observes Lutz, who	
remembers former GM design chief Bill Mitchell	
authorizing the purchase of a new Ferrari V-12 engine	
just so he could demonstrate to subordinate engineers	
what he wanted the engine of another GM car, the 12-	
cylinder Pontiac Firebird, to sound like. 'He spent	
what today would be like \$75,000 to get the engine,' a	
laughing Lutz says. 'He could have done the same	
o o o o o o o o o o o o o o o o o o o	

things with a recording or he could have rented a	
Ferrari for a day. It's hysterical when you think about	
it, crazy. It was a flamboyant era.' That is all gone	
now. GM long ago stopped bringing famous entertainers	
to Design North. In late March, the car being shown off	
there is the four-door Volt, its metallic aquamarine paint	
job twinkling preternaturally under track lighting. Powered	
by lithium-ion batteries and scheduled for sale in	
November 2010, the Volt will be able to transport a driver	
as many as 40 miles on battery power alone before it needs	
to be recharged, a task as simple as plugging into an	
available outlet. The Volt was Lutz's idea, part of his	
goal to remake GM's image from that of a corporate	
dinosaur mocked for creating the kind of gas guzzlers	
he tends to favor personally into a cutting-edge 21st-	
century technological force capable of besting any of its	
Japanese competitors. No rival occupies so much of his	
attention as the company that has supplanted GM as	
the world's chief auto seller, Toyota. Lutz sees several	
reasons for Toyota's ascendancy, none more important	
than becoming the darling of media analysts and	
environmentalists in the wake of its seminal hybrid, the	
Prius. By early this decade, the Prius had become a	
genuine phenomenon, envied by competing auto	
executives less for its sometimes pallid sales numbers than	
for how the hybrid with the funny-looking sloped roof had	
stamped Toyota in consumers' minds as the industry's	
leader in technology, fuel-efficiency, reliability and	
forward-thinking environmentalism. In early 2006 -	
'much too late,' he acknowledges now a troubled Lutz	
saw that driving a Prius constituted nothing less than a	
values statement for many of its owners, a means to bask	
in the perception of their own enlightenment. Even more	
alarming, thought Lutz, was that some consumers not	
enamored of the Prius itself nonetheless saw its existence	
as proof of Toyota's wisdom. The Prius's presence alone	
was drawing people to Toyota lots, where the curious	
bought everything from bigger sedans to sport-utility	
vehicles and trucks with about the same gas mileage as	
their GM counterparts, groused Lutz. Part of what he	
called the 'halo effect.' One sporadically selling hybrid,	
he realized, had greened an entire company and	
catapulted nearly every vehicle in its product line. It	
was a disturbing sea change for GM executives. What	
the 1920s Model-T had been for Ford a transformational	
vehicle cementing the impression of the company's	
dynamism the Prius was proving to be for <i>Toyota</i> .	
Meanwhile, American automakers, including <i>GM</i> , suffered	
under the perception that they were stuck in yesteryear and	
saddled with cars of inferior quality. Personally, Lutz	
was scornful of much about the Prius. He thought it	
'pretty ugly,' he says, and technologically unexceptional. But he could not deny the shrewdness of	
Toyota's long-range strategy. He came to see a benefit in	
what he regarded as the Prius's homely features,	
particularly the sloped roof. 'That's where Toyota did a	

very clever thing: The Prius had its own unique
appearance,' he says. 'Just like the Volkswagen Beetle was
ugly in the '50s, the Prius had a certain ugly chic about it
that appealed to a lot of people, the same kind of
trendsetters who'd bought the Beetles long ago because to
do it was cool and showed you were not part of a
materialistic society.' If any moment presented GM
executives with an opportunity to overcome the
unfavorable perception of the corporation, Lutz thinks, it
came on the eve of the Prius's arrival in the American
marketplace. The Prius was already a moderate success in
Japan, where Toyota had introduced it in 1997, and GM
executives had to decide how, if at all, to respond to a
competitor's hybrid in the United States: Should they
enter the hybrid competition, too? Lutz and other GM
executives met at the company headquarters in Detroit
to ponder the matter. 'Somebody said, 'Do we have
[hybrid] technology?' ' Lutz remembers. " 'Oh, yeah,'
was the answer. 'Oh, yeah, we got the technology.
We've been building hybrid prototypes since the late
'60s.' Another executive asked what the cost of the
hybrid investment would be." 'Well, we're probably
talking about \$600 [million] to \$700 million,' "
someone answered, as Lutz recalls. Finally an
executive asked, 'What would we sell this thing for?'
Well, the answer was: No matter how we twist the
numbers, we were going to lose a couple of hundred
million dollars a year,' Lutz recalls. 'And Rick
Wagoner quite rightly, along with the finance people,
said, 'We can't do that. We can't go to the board of
directors and come up with a program [for hybrids]
costing the bigger portion of a billion dollars and when
the board of directors [asks] why are we doing this, we
say, 'Well, we're going to lose money on it, but, well,
we're doing it to show that General Motors is
technologically advanced and environmentally aware.'
You know, back then, that wasn't going to receive a
very warm welcome.' The decision was made not to go
forward with a hybrid program. For a while, nothing
that Lutz and other GM executives saw in the Prius's sales
number made them think they had made the wrong
decision, Lutz says. But within a couple of years of the
Prius's release into the American market, he began
wondering whether GM had made a serious mistake.
The halo effect had created the perception that all
Toyota cars and trucks, regardless of size, were imbued
with the company's famed fuel efficiency. Meanwhile,
Lutz noticed that the attention paid the Prius had not
diminished Toyota's eagerness to produce big
profitable trucks and SUVs. The rival was climbing in
every category. In early 2006, Lutz decided that GM
could no longer afford to be without a dramatic response
to the Prius and other competitors' models. He walked into
the office of Jon Lauckner, vice president of global
program management and director of the corporation's
advance design, and said he wanted a 'game-changing
auturio design, and said ne wanted a game-changing

· · · · · · · · · · · · · · · · · · ·		
	car' capable of reestablishing GM as the worldwide	
	technological leader. Determined to leapfrog the Prius	
	and all other hybrids, Lutz proposed a purely electric	
	car, powered by lithium-ion batteries, which would	
	have a range of 150 miles or so before needing to be	
	recharged. He was an ardent believer in battery	
	technology, following a three-year stint as the chief	
	executive of a battery company during the 1990s. It was	
	not the first time someone at <i>GM</i> had said he wanted an	
	electric car. The last such effort at the Technical Center	
	had not ended well: During the '90s, the automaker spent	
	more than \$1 billion developing a small two-seat electric	
	vehicle known as the EV1, using heavy nickel-lead batteries before concluding that it was cost-prohibitive for	
	consumers and scrapping it to the disgust of fervent EV1	
	fans and environmentalists. Lauckner, who had carefully	
	studied the EV1 and thought that the car would have been	
	wholly impractical with nickel-lead batteries, saw similar	
	problems with Lutz's vision of a car intended to go far on	
	lithium-ion batteries. 'Too expensive,' said Lauckner, who	
	made clear that with all the batteries needed for a vehicle	
	to travel about 150 miles, Lutz would merely be making	
	another battery-heavy, cost-prohibitive car. Known in GM	
	corridors as 'The Wizard,' Lauckner immediately had two	
	suggestions: a smaller battery pack that would at once	
	make the car affordable while guaranteeing the typical	
	American worker a ride long enough for a round-trip	
	commute each day; and a modest gasoline engine that	
	would kick in only if and when a driver ran down the	
	battery power. The engine would have an entirely different	
	use from the standard internal-combustion engine,	
	generating electricity to power the electric motor and, in	
	the process, extending the vehicle's range. Then Lauckner	
	removed a fountain pen from his pocket and started	
	furiously scribbling calculations that in time proved	
	prescient about everything from the necessary battery size	
	to the dimensions of the little gasoline engine. Later, with	
	<i>GM</i> surveys indicating that 78 percent of U.S. workers had	
	daily round-trip commutes of 40 miles or fewer, Lutz	
	posited that the vast majority of Americans who drove their electric cars would ordinarily never need a drop of	
	gas. Forty miles became what Lutz and Lauckner called	
	the 'sweet spot' for their new battery's range, the distance	
	at which they surmised that most buyers would feel	
	comfortable with their electric car's capabilities, knowing	
	they had the backup of a gasoline engine capable of taking	
	them more than 300 miles. What made the 40-mile battery	
	range so ideal, Lauckner said, was that the distance did not	
	necessitate a mammoth-sized battery pack that would put	
	the car out of the financial reach of all but the rich. For	
	the first time, Lutz thought he saw a viable plan. And	
	while the presence of a gasoline engine meant that GM	
	could not call it a purely electric vehicle, Lutz and the	
	marketing people finally settled on an alternative	
	description that struck Lauckner as just right: 'extended-	
	range electric vehicle.' Not every GM official has always	

shared the Volt team's confidence or agreed with the	
timetables of Lutz, who by early 2008 openly talked about	
the Volt coming out on the market in late 2010. Noting the	
ongoing questions about battery issues, Wagoner publicly	
indicated then that he was not so sure, saying only that a	
release date for the electric vehicle was 'fluid.' But in the	
summer of 2008, at a forum attended by other auto	
executives and then-presidential candidate Barack Obama,	
Wagoner recalibrated his position. Under increasing	
pressure from government officials to demonstrate $GM's$	
broad commitment to more fuel-efficient vehicles, the	
beleaguered chief executive confidently restated GM's	
goal to bring out the Volt in 2010. After Wagoner's	
resignation this year, the newly installed Henderson and	
his lieutenants reiterated the company's support of the	
Volt, despite indications, he said, that the car would lose	
money in its early years. For all the bold talk, the Volt	
project exudes caution. Only about 10,000 of the vehicles	
will be built in the first year, a limited production run that,	
with the considerable cost of the lithium-ion batteries,	
virtually guarantees a high market price, probably about	
\$40,000. Lutz is not worried: He expects the 10,000 cars	
to be purchased quickly by well-heeled electric-vehicle	
diehards who will receive a federal tax credit of \$7,500.	
While acknowledging that the price is a lot to ask of	
middle-income consumers, Lutz stresses that he sees the	
Volt falling to \$25,000 or \$30,000 in future generations as	
technological advances and economies of scale cut the cost	
of batteries. But no matter the vehicle's cost or loss in the	
early years, he thinks the Volt must be built for his	
desperate company to have any chance of displaying its	
competence and new attitude. Failure now would be a	
public relations disaster, he insists. 'We're talking about	
our image here $$ about remaking GM ; it is essential to get	
this done,' he says. Just the same, he would like to see	
more help from the federal government, perhaps a boost of	8
the \$7,500 consumer tax credit for the Volt, arguing that	
with the considerable support that Asian and European	
auto companies have received from their governments that	
such a subsidy is richly warranted. The Obama	
administration, however, has projected its own concern at	
times about the Volt, an ambivalence that in moments has	
resembled that of skeptics. While administration officials	
have offered flattering descriptions of the Volt's potential,	
Obama's auto task force noted the persistent questions	
about the car's expected losses and whether its high price	
tag might limit its appeal. Lutz senses the government's	
surprise over how much it will cost to realize its vision of	
a remade auto industry. Recalling a visit to the Technical	
Center by Obama task force leaders Steven Rattner and	
Ron Bloom, he says, 'We took them through a lot of our	
advanced technology plants. And I will tell you that when	
they saw the cost of some of these solutions' and	
technologies such as batteries and hydrogen fuel cells	
'they were stunned. These are very intelligent and well-	
informed people, but they, Bloom and Rattner, were just	

amazed about what a lot of this stuff is going to cost.'	
Despite the seeming worries, Lutz sees important social	
forces working in the Volt's favor, notably the passionate	
desire of influential environmentalists and the intellectual	
establishment to have electric cars succeed, he says, a	
movement that strikes him as already creating an artificial	
marketplace, a rigged game of sorts. His cynicism seeps	
out when he ponders whether a single vehicle can restore	
GM's charisma and consumers' confidence. 'Yes, it can,	
because sex and charisma are to a certain extent	
redefined today, especially by the media and especially	
by the government,' he says. 'The focus now is on	
conservation, the lowering of CO2s, sustainable energy	
and so forth. So today, to be frank, we've got two	
markets.' Lutz thinks something else is working on his	
side and that of the Volt: 'Obama has said that he	
wants a million plug-in vehicles on the market by	
2015." The federal government, which will effectively	
own about 70 percent of GM , must be heeded now, he	
realizes. For now, Lutz views the Volt as nothing less	0
than the vehicle that helped deliver a government life	
preserver to a drowning corporation. 'Think where GM	
would be now if we had not made the decision to	
productionize the Volt, a year and a half ago,' he says and	
leans back in his chair. 'That is the real question. You	
could argue that we were late but that the Volt has now	
become the focal point, the rallying point for the pro-GM	
forces. We can say, 'See, we can transform the automobile;	
we can be the company that electrifies the automobile.' We	
can say, 'Yes, we can.' " Lutz grins. Not everyone shares	
his view that it is the right car at the right time. Barry	
Bluestone, a political economy professor at Northeastern	
University whose late father spent years as a United Auto	
Workers vice president dealing primarily with <i>General</i>	
Motors, fears that the Volt will look far less attractive to	
consumers than an array of new and established hybrids	
selling for much less. 'The car isn't coming out for	
another year, and it has an extraordinarily high price,' he	
says. 'I don't see how many people are going to get excited	
about a \$40,000 car, even with a tax credit, when they can	
spend about half of that in some cases to get a hybrid. The	
Volt might be the car of the future, but it certainly isn't	
the car of the present.' The vehicle will face an array of	
competitors. Tesla Motors, a Silicon Valley company,	
already has produced and sold a small number of all-	
electric cars priced at about \$100,000, with reported plans	
to sell an estimated 1,500 cars this year. The Mitsubishi	
Corp. is launching its own electric car, MiEV, this summer	
in Japan. And China will soon present an electric vehicle	
that it eventually hopes to put on the foreign market.	
'There's already an enormous amount of competition and	
perhaps a global overcapacity,' MIT's Roos contends. But	
GM's greatest hurdle remains its own image. Lutz and	
other company executives are looking at what might be	
a Gordian knot. How do you continue promoting and	
selling the big powerful glory cars while arguing that	

you are a new GM? 'You do it with a car like the Volt,'	
Lutz says. 'But we can't make any mistakes with the Volt.	
We know we're facing a perceptual problem.' He frowns	
and encapsulates what the modern view of the company	
has become: 'It's that we make all our money off sport-	
utility vehicles and large pickup trucks and V-8	
engines, that we don't care about the environment, that	
we pooh-poohed the <i>Toyota</i> Prius as being	
economically unsound' he pauses and plunges ahead –	
'which, at today's fuel prices [about \$2.40 a gallon at that	
moment], it still is, by the way.' He knows how impolitic	
that will sound to some people. He smiles ruefully, not	
backing down. 'The customer will never recover the	
premium paid for the [Prius] hybrid system in fuel	
economy,' he adds. Lutz is of two minds when talking	
about the auto industry's evolution. The executive in	
him trumpets the Volt as a key to the company's	
future. The romantic in him wishes the government,	
the media and the critics would leave the big, powerful	
cars alone. He is already mourning what he sees as an	
inevitability: the slow, painful death of the dazzling	
machines. 'In time, the government is going to legislate	
out of existence cars like the Camaro, the Corvette, the	
Cadillac CTS all these acclaimed vehicles that have	
lately gotten rave reviews from the automotive press	
around the world,' he predicts. 'So, ultimately, we are	
driven by legislation into the kind of excitement provided	
by the Volt.' He says this without a scintilla of sarcasm.	
At his core, as he frequently tells people, he is a car guy,	
drawn to the technological challenge the Volt presents,	
fascinated by the potential of batteries, understanding that	
whoever prevails in the electric-vehicle competition may	
be immortalized along with his car. It is just that he	
cannot shake his conviction that, in the name of	
change, Americans are being asked to give up	0
something that defines them and their culture, a beauty	
and roar to which no monetary value can be attached.	
Few things in his existence give him more pleasure	
than driving his Corvette for the hour it takes him to	
get to his home in Ann Arbor. He smiles while talking	
about the 2010 Camaro, the car still sitting at that moment	
in the GM airport gift shop. 'Given the tough economic	
times and the high priority of fuel economy, we were	
almost wishing we hadn't done the Camaro,' he says. 'We	
looked at it as something radically mistimed.' But he says	
the high number of advance orders for the car has justified	
his skepticism about just how deep the public's love for	Č.
green cars will ever be. 'When you get out into the	8
marketplace, it's probably just 5 percent of the public	
that desperately wants something environmentally	8
sound and is willing to pay a premium for it,' he says.	
'I would say the East and West Coast intellectual	
establishment kind of lives in its own world. When you	
get to the broad American marketplace, excitement is	
still kind of defined in the way it used to be.' He is	ĥ
finished for the day. His career is winding down, he	

Evolution's Cunningham is advising investors to bet
against planemaker stocks now, rather than a few days
into the Paris show, when short-selling after the hoopla
of order announcements has been a common strategy.
The collapse in orders will be followed by a 'deep
decline' in deliveries spread over three to four years,
the analyst said. He favors selling shares of European
Aeronautic, Defence & Space Co., the parent of Airbus,
and also shuns engine manufacturer Rolls-Royce Group
Plc. John Leahy, Airbus's chief operating officer,
predicts that output won't change much in 2010.
Boeing hasn't given a forecast. The manufacturers plan
limited production cuts, even as airline traffic falls.
Singapore Airlines Ltd. says it will mothball planes if it
can't sell or lease them. British Airways Plc is
grounding aircraft and cutting winter seating by 4
percent. Southwest Airlines Co., the world's largest
discount carrier, will reduce capacity by 6 percent this
year. Global airline losses may total \$9 billion in 2009
as revenue drops 15 percent, the International Air
Transport Association said June 8, doubling a three-
month-old forecast. IATA Chief Executive Officer
Giovanni Bisignani said planemakers may deliver 30
percent fewer planes in 2010 and must trim production
accordingly. The forecast is close to that made in
February by the biggest Boeing and Airbus customer,
Steven Udvar-Hazy, CEO of International Lease Finance
Corp. He predicted that planemakers will cut as much
as 35 percent, starting in the fourth quarter. The
manufacturers reject that contention, yet a number of
suppliers are making contingency plans for drastic rate
changes. 'There's considerable skepticism in the
supply base that <i>Boeing</i> will be able to hold production
rates level on the narrowbody line, in spite of their
insistence that they've overbooked production slots
enough,' said JB Groh, an analyst at D.A. Davidson & Co.
in Lake Oswego, Oregon. GKN Plc, Britain's biggest
maker of airliner parts, predicted in January that
demand for single-aisle planes would plummet by
midyear. Narrowbody planes include <i>Boeing's</i> 737 and
Airbus's A320 series, and represent two-thirds of
deliveries. 'Narrowbodies is probably an area that will get
hit,' with reductions of as much as 25 percent in 2010 and
2011, said Zafar Kahn, an analyst at Societe Generale in
London. <i>Airbus</i> intends to reduce monthly output of
A320-series planes to 34 from 36, starting in October. It
also will freeze output of widebody A330s and A340s.
Boeing is slashing production of the 777 by 29 percent to
five a month, starting midyear 2010, and postponing rate
increases on 767s and 747s. The U.S. company said in a
May 21 meeting with investors that it won't need to
revise narrowbody plans. Analysts say otherwise, with
at least five predicting the next day that <i>Boeing</i> will
announce a 737 rate cut this year. Boeing reduced its
20-year growth forecast for commercial- jet deliveries
yesterday, saying there will be a market for 29,000 new

					planes, or 1.4 percent less than the number predicted a year ago. The company had increased the forecast by a cumulative 14 percent the previous three years. 'I'm not changing our forecast, and I'm not saying we're going to surprise ourselves, but we always do,' marketing chief Tinseth said in an interview. The state of plane sales is tempting some airlines back into the market with the hope they can squeeze manufacturers for discounts. <i>ILFC's</i> Hazy said June 8 that he will increase orders in anticipation of greater demand from carriers to replace older models. Hazy had planned 150 purchases through 2019 and may raise the number by 30 percent in the next 12 to 18 months."	
14 June 2009	Telegra ph, "Aviati on Industry Faces Year of Gloom, Warns Boeing Head" (Amy Wilson)	Scott Carson , CEO Boeing Comm ercial Airpla nes; Tom Enders , CEO Airbus	Firm	α & β	"Speaking ahead of the opening of the Paris Air Show on Monday, Scott Carson admitted he was 'a little more pessimistic' than the plane maker's in-house economists, but said he sees no sign of a recovery in the industry until the second half of 2010. The market is now at the bottom, he said. Mr Carson also dashed hopes that <i>Boeing's</i> much-delayed 787 'Dreamliner' would make its test flight this week to coincide with the air show, which celebrates its centenary this year. The 787 is still on course to make a test flight in June, as <i>Boeing</i> had forecast, but it will be later in the month. Tom Enders, chief executive of European rival <i>Airbus</i> , said this weekend it could withstand as many as 1,000 cancellations because it has an order book of 3,500 planes, which will ensure it can keep going at	On modular and integral enterpri se architec ts' vies on growth.
14 June 2009	New York Times "Airbus Warns Output could Drop as Much as 25% in 2010 and 2011." (Nicola Clark)	Louis Gallois , <i>EADS</i> CEO; Thoma s Enders , <i>Airbus</i> CEO	Firm- Labor	α & β	'maximum production' for the next five years." <i>"Airbus</i> executives warned over the weekend that output at their European factories could fall by as much as one-fourth over the next two years as the aircraft maker and its suppliers adjust to the sharp drop in air traffic and widening losses at the world's airlines. But the company insisted that it could absorb those cuts without resorting to large-scale layoffs — at least for now. Earlier this year, <i>Airbus</i> said that it planned to slow production of its A320 single-aisle passenger planes to 34 per month from a previous plan of 40, while output of its wide-body A330 was frozen at a rate of 8.5 per month, down from 10 per month. Deliveries of the double-decker A380 are being limited to 14, compared with an initial target of 18 per month. But those cuts, which amount to a slowdown of about 15 percent, may not be sufficient to meet the slide in demand from airlines, Louis Gallois, chief executive of <i>EADS</i> , the parent of <i>Airbus</i> , said Saturday. 'We have the flexibility to go further if needed ,' Mr. Gallois said. 'We are very sensitive to what will happen in the second half of the year, to see if we reach the bottom of the swimming pool,' Mr. Gallois said. 'We have no capacity now to see what will be the depth of the crisis.' Thomas O. Enders, the <i>Airbus</i> chief executive, said management could envisage production cuts 'somewhere in the range of between 15 and 25 percent' in	On integral and modular enterpri se arhitect ures' views on managi ng negative growth.

	1			1	the years 2010 and 2011 if the slump in air travel	
					continues.	
					Boeing has said it planned to keep production steady in	
					2009 while laying off 4,500 workers. So far, <i>Boeing</i>	
					foresees slowing output on one of its assembly lines — for the long-range, widebody 777 — by 28 percent in 2010.	
					Both Airbus and Boeing say they expect to deliver about	
					the same number of planes to customers this year as in	
					2008. 'There's a little bit of unreality,' said Nick	
					Cunningham, an aerospace analyst at Evolution Securities	
					in London. 'Things are very, very bad. It's just that	
					some people aren't feeling it yet.' Mr. Gallois and Mr.	
					Enders said Airbus expected to be able to manage its	
					production slowdown without any job cuts. 'But of	
					course this has a limit,' Mr. Gallois said. 'We need to	
					be careful in the way we manage our manpower,' Mr.	
					Gallois said. 'We have to be able to increase production	
1					again when it is needed.' <i>Airbus</i> is eager to avoid fresh layoffs in the current economic environment and after	
					eliminating 10,000 jobs in 2007 and 2008 as part of a	
					painful restructuring aimed at reducing its euro-	
					denominated cost base. 'Airbus will not countenance	
					any large-scale layoffs for social and political reasons,'	
					said Doug McVitie, managing director of Arran Aerospace	
					in Dinan, France. During the last downturn for the	
					aviation industry, after the terrorist attacks in 2001, Airbus	
					avoided layoffs and instead eliminated 6,000 jobs	
					through early retirements and termination of	
					temporary work contracts. Boeing cut its work force	
					by 30,000 and drastically cut back production rates.	
					<i>'Boeing</i> and <i>Airbus</i> do exactly the same thing commercially — they build airplanes,' Mr. McVitie	
					said. 'It's just easier to hire and fire in the U.S.'"

					the amount of state aid that each company can receive to	
					develop new products. It also complains that the loans	
					Airbus receives are at below-market rates, something that	
					Airbus denies. 'Such financing would violate the member	
					states' international obligations to abide by the rules of the	
					World Trade Organization,' Boeing said in a statement e-	
					mailed to news agencies. 'We are disappointed by	
					reports that the Airbus member states intend to	
					provide - and Airbus to accept - billions of dollars of	
					launch aid for the A350 just as the WTO is to rule on	
					the WTO consistency of such financing,' Boeing said.	
					'I'm not surprised that Boeing has complained. What	
					else could you expect? If I were them, I would want to	
					keep my advantage,' Enders commented Tuesday. 'So	
					far we have repaid governments 40% more than what	
					we have received. The U.K. government has been on	
					the record saying it's good business,' he added. Airbus	
					and ministers from France, Germany and the U.K. met	
					Monday but couldn't agree on funding of the A350	
					development. Ministers pointed to the absence of the	
					Spanish minister for transport as the main reason for a lack	
					of agreement. That led to speculation that Spain is	
					unhappy with its share of the A350 project. However,	
					Enders stated that <i>Airbus</i> has no conflict with the Spanish	
					government over the A350. In relative terms, he said,	
					Spain has benefited more than the other <i>Airbus</i> partners."

			, CEO			reaching 10 Dreamliners a month will require substantial	
			of			new investment as well as a revamp of the assembly	
			Spirit			methods at the MHI wing plant in Nagoya. 'Just a	
			AeroSy stems			speeding up of what we are doing' won't be sufficient, said Ichimaru, general manager of the civil aircraft	
			siems			and aero-engine department. 'We need a drastic	
						change in how we make some portions' of the wings.	
						Jeff Turner, CEO of Boeing partner Spirit AeroSystems,	
						said there's space in his plant to make 10 a month, but the	
						existing equipment and tooling can make only seven a	
						month. So he, too, has to make investment decisions and reach a contract extension with <i>Boeing</i> . 'We think	
						we understand the demands of that buildup,' said Turner.	
						'We have to negotiate what that higher level of production	
						would be.' Spirit, which makes the 40-foot-long front	
						end of the Dreamliner fuselage in Wichita, Kan., is	
						regarded as the most successful of the 787's first-tier partners. <i>MHI</i> and <i>Spirit</i> would have to ramp up	
						partners. <i>MHI</i> and <i>Spirit</i> would have to ramp up production correspondingly if <i>Boeing</i> built a second	
						assembly line. The first line in Everett was designed to	
						roll out only seven Dreamliners a month, and that's the	
						production rate all the partners originally signed on for	
						when they joined the jet program. In an interview	
						published on <i>Flight International</i> magazine's	
L						Flightblogger Web site, Pat Shanahan, <i>Boeing's</i> chief of airplane production, said in Paris that management is	
						studying possible locations for a second 787 assembly	
<u> </u>						studying possible locations for a second 707 assentibly	

	line. There are 'lots of geographical options,' he said. Ominously for the Puget Sound region, he implied that the Machinist strike at Boeing last fall will weigh against the Everett site. The real options are around 'How do you secure assurance of delivery?' " he told <i>Flightblogger</i> . 'That's been a discussion topic around some of the disruption we've realized at Boeing.' But Boeing spokeswoman Mary Hanson said there's no time frame yet for making a second 787 line decision and a decision is not imminent. The comments of the two top 787 supplier executives suggest it may take awhile. <i>MHI's</i> Ichimaru said he expects serious discussion with Boeing 'in the very near future' of the full cost of substantially raising production rates. Complicating the situation, he said, <i>MHI</i> has started detailed design on the wing for a second, bigger Dreamliner variant, the 787-9, with significant changes from the first 787-8 wing. And even though the final 787-8 design was set long ago, Ichimaru said, Boeing still sends in changes. The major cause for that was Boeing's effort to win Federal Aviation Administration certification of the wing's lightning protection. To avoid electrical sparks inside the wing fuel tanks, fasteners had to be removed and turned around, and seals had to be applied. On the production line, work that had been completed had to be undone. The lightning protection changes, the new 787-9 design, the plan to increase the rate — all of this is expensive even as little money comes in because <i>MHI</i> has made so few deliveries. Expanding production would mean 'we have to accumulate more investment on top of the investment we have already done,' Ichimaru said. 'We need to think of some way to recover that.' He said <i>Boeing</i> is being 'creative' in interpreting the contract and trying to help. <i>MHI</i> could produce two wings sets a month right now, but <i>Boeing</i> Everett is not ready for that pace and the current requirement is much less. With the bottleneck at the final-assembly plant in Everett, <i>MHII</i> has so far	
	arrived in May 2007. The next ship set is likely to go in August. Ichimaru said <i>MHI</i> plans to bump up its rate to between five and seven a month in gradual steps, each time adding one extra set of wings per month. For increases beyond that, improvements are needed, including a revamp of the wing-assembly process, which is much less efficient than the heavily automated production of the giant wing panels. Higher rates could also require a big cash outlay to buy a giant new autoclave, or high-pressure oven, or even to build a	
	new facility. In Wichita, <i>Spirit AeroSystems</i> produces its plastic fuselage sections by winding carbon-fiber tape infused with epoxy resin around enormous cylindrical molds, then baking them in an autoclave. <i>Spirit</i> shut down its fuselage winding and autoclave operation for most of the past year after the Everett assembly line choked up	

		I			on Dreamliner No. 1. It is still idle today. 'It's cost us,'	
					Turner said. 'We've a factory ready to produce and it	
					went to a standstill.' He'd like to see the added revenue	
					from pumping out more 787 fuselages, but it has to be	
					'profitable revenue,' he said. That means managing	
					costs, investing wisely and negotiating a realistic	
					contract with Boeing for the extra production. That	
					approach has left Spirit financially well positioned in the	
					economic downturn. The company avoided layoffs	
					through the 787 delays, moving workers to the 777 and 737 lines, which were ramping up. When the	1
					Machinists strike at <i>Boeing</i> put those lines out of action	
	-				for two months last fall, Turner put the workers on	
1					shortened weeks to avoid layoffs. Now in the economic	
					downturn, he faces further strain: a planned 29	
					percent cut in Boeing's 777 production rate in mid-	
					2010 that will begin affecting his plant in the fourth	
I					quarter and hit it hard early next year. Turner hopes	
					Boeing can stick to its plan not to cut the 737 rate too.	
					But he said he's prepared contingency plans in case it	
					does. He hopes more 787s rolling out will compensate at	
					least a little for the 777 cuts. Yet he knows a Dreamliner	
					ramp-up can't happen fast enough to make a big difference	
					soon."

Airbus Racks up A350 Orders" (Andrea Rothma	g, Carson Custo looeing , CEO mers Boeing 5 Comm 5 S Comm 6 S Comm 6 Comm 6 S Comm 7 S Comm 7 S Comm 7 S Comm 7 S Comm 7 S C	β	"Boeing Co.'s 787 Dreamliner, absent from the Paris Air "Show this week after two years of delays, may not be the jetmaker's biggest problem. <i>Airbus SAS's</i> bigger A350 has won almost 500 orders, 10 of them at the show, forcing <i>Boeing</i> to turn its attention to the market for bigger planes with more than 300 seats. The Chicago- based company is considering an upgrade of its 15-year- old 777. Airlines say it should spend billions on a new aircraft instead. 'What <i>Boeing</i> makes next is the big question,' said Doug Runte, a New York-based analyst at <i>Piper Jaffray & Co.</i> who estimates the U.S. company would need to spend \$15 billion to develop a new model. 'Airplanes require a huge investment of money and effort. If you get it wrong, the consequences are enormous and you have to live with it for a very long time.' <i>Boeing</i> , which said it had 'bet the company' in the 1960s when spending twice its market value on the 747 jumbo jet, faces a conundrum after adopting a rival strategy to Toulouse, France-based for the long-haul plane market. <i>Airbus</i> opted to build its 555-seat A380 superjumbo on the basis that surging economic growth would spur demand for bigger planes. <i>Boeing</i> argued that the increasing complexity of global business travel required smaller aircraft flying direct to a greater number of cities. It came up with the 260-seat 787, which is due to make its first flight this month. While both planes have proved popular, the Dreamliner has the edge in sales, ranking as the world's fastest-selling aircraft with 865 contracts worth about \$138 billion at list price compared with the A380's 200 valued at \$65.4 billion. <i>Boeing</i> , though, may become a victim of its own success. The Dreamliner proved so popular that when <i>Airbus</i> offered a similar plane its airline customers said they didn't need one and lobbied for a bigger aircraft altogether. That resulted in the A350, a model that has attracted 483 orders worth \$115 billion. 'The 787 had considerable early sales success, which forced <i>Airbus</i> to respond, Raymon	On modula and integra approa hes produce develo ment, a well a the modula media' covera e.

•

Airbus Chief Operating Officer John Leahy said Boeing has been forced to review its strategy because the A350 will be 25 percent cheaper to fly than the older 777. He spoke after the company announced 58 firm orders at the Paris show, including an A350 contract from AirAsia X of Malaysia. Boeing won two orders. 'Scott didn't just wake up one morning at the air show and decide that he had \$5 billion burning a hole in his pocket, so let's just rewing the 777,' Leahy said today in an interview in Paris. 'It's only when being faced with a threat that you want to spend money like that. He's going to lose the market if he doesn't do something.' Boeing will evaluate additions to its aircraft lineup for the next decade in terms of customer demand, competing products, available technology and the resources available, Seattle-based spokesman Jim Proulx said by e-mail. Tim Clark, CEO of Gulf carrier Emirates, which will become the biggest 777 operator later this year, has little interest in a larger-winged version of a plane with a fuselage made from metal rather than the light-weight composites used in modern designs, he said June 16 at the air show. Clark, who has also dismissed Boeing's proposed 310seat 787-10 as likely to be underpowered, said in Paris that a clean-paper design is the only way for the U.S. company to go. Even then, Boeing needs to act before Airbus offers a stretched A350 to narrow the capacity gap with the A380, a move that would leave Boeing with little room for maneuver. 'Given the challenging economic environment, the sector will be forced to set priorities and make difficult trade-offs about what programs they can really afford,' David Raistrick, a manufacturing specialist at Deloitte LLP, said in a note. Standing in the way of a new widebody is the multibillion dollar bill that could harm the company if the plane doesn't sell. Boeing must also decide whether pouring its energies into building a successor to the 777 will diminish its ability to compete with Airbus when the pair come to design a new generation of single-aisle planes. Both companies say they plan to replace their A320 and 737 short-haul jetliners in a little over 10 years, suggesting they will need to ramp up spending on research and development from the middle of the next decade. That may overlap with construction of a new Boeing widebody. 'That's part of the problem,' said Airbus's Leahy. 'That's the tough call they've got and I guess it's why a 777 derivative is tempting. You've got all these other things you need to do and you say, if I could just get away with five or six billion and come up with a good derivative that would hold my place against the A350, that would be the ideal solution. But history has shown that rarely ever works." Should Boeing opt for a rewinged 777 it could be first to the market with a singleaisle replacement, though any new plane will require a 'vast improvement' in fuel efficiency based around new engine technology, Morgan Stanley analyst Rupinder Vig

	1				said. 'If Boeing suddenly decides to come out with	
1					said. 'If <i>Boeing</i> suddenly decides to come out with something earlier, in around 2015, <i>Airbus</i> has told us	
					they'd have to do something very quickly,' he said. 'But I	
					think both of them now are comfortable with a later date	
					as they're grappling with their own problems in the

		Sundat			many opportunity to explain to them	

		
	rand	that when we say we'll deliver in 2009 as many aircraft
		as in 2008, we have that not only in the order book but
		airline by airline, we have the customers, we have the
		financing and we know we'll do it.' Boeing and Airbus
		were cautious in ramping up output amid a record three
		years of orders through 2007 that produced a combined
		backlog of more than 7,000 planes, or more than seven
		years worth of work. That means that now they don't have
		to scale back as much as they did in previous down-cycles,
		the companies said. The suppliers say they don't get much
		advance warning when planemakers decide to slow down,
		and lead times for some parts, such as landing gear, can be
		up to 18 months. Some companies don't get paid until the
		planes are delivered. To protect themselves, the
		partsmakers say they are doing their own research to
		forecast demand. 'I've seen at this show a great deal of
		energy by both Boeing and Airbus to assure the supply-
		base community that their forecast, particularly for
		single-aisle product, is robust,' said Jeff Turner, CEO
		of Spirit AeroSystems Holdings Inc., Boeing's biggest
		supplier. The Wichita, Kansas-based company builds the
		aluminum fuselage for the 737. 'It's my job as head of
		Spirit to forecast what I think will happen in the
		market.' Turner didn't say what his latest predictions are.
		Airbus tries to supply accurate forecasts to help
		suppliers keep production steady and to ensure the
		planemaker has parts when it needs them, John Leahy,
		chief operating officer of Airbus, said today in an
		interview. 'You can only make changes at a gradual
		rate,' Leahy said. 'The longest lead time item is
		somewhere around two years. It's not just that you call
		up today and they instantly have it. If you're trying to
		ramp up or ramp down, you want to have some lead
		time up to your deadline to smoothly do it.' Companies
		such as Spirit and Rockwell Collins have said they will
		hold to their contracts and deliver the parts Airbus and
		Boeing order. The question is whether they will be
		ready to ramp up again quickly when the planemakers
		want. Many of the big suppliers have already cut jobs
		or reduced hours. Scott Carson, the head of <i>Boeing</i>
		Commercial Airplanes, said in an interview this week
		that he's telling suppliers they need to be ready for a 10
		percent production swing in either direction, depending
		on the economy and the status of active order campaigns.
		Ryanair Holdings Plc and UAL Corp.'s United Airlines
		have said they want to take advantage of the recession
		to seek discounts on hundreds of new planes, which
		could compel a higher output rate, Carson said. Some
		suppliers hope to hold steady through aftermarket
		business. 'You're still flying airplanes, you have to do
	I	repairs,' and those will pick up in the second half after the
		busy summer season of air travel, said <i>Honeywell</i>
		Aerospace CEO Rob Gillette. Still, the work won't be as
		much as it was before because airlines have canceled
		routes and grounded planes amid the slump. 'Obviously
		the aftermarket has been impacted by much lower revenue

 _					necesarian miles than we were working with when we did	
					passenger miles than we were working with when we did our planning,' said Alain Bellemare, president of <i>Hamilton</i> <i>Sundstrand, United Technologies Corp.'s</i> aerospace systems unit. 'We took some very aggressive cost actions and right now we are waiting to see what could be the outcome.'"	
2009	Wall Street Journal, "Dream liner Still Far From Reality " (Peter Sanders)	Scott Carson , CEO Boeing Comm ercial Airpla nes	Firm	α	"Boeing Co., attempting to maneuver its 787 Dreamliner through the turbulence it has encountered so far, is expected to conduct the plane's maiden flight in coming days. But even after the plane is airborne, the aerospace company will still be under pressure to complete an ambitious schedule of test flights and government certifications. Any additional glitches could force it to again delay delivery to its launch customer, <i>All</i> <i>Nippon Airways Co.</i> , set for March 2010. 'We've got to get it up and flying, [and] we'll all take a deep sigh,' said Marlin Dailey, vice president of sales for <i>Boeing</i> <i>Commercial Airplanes.</i> 'We're looking forward to that milestone, but it's just another step in the journey.' The test flight, which <i>Boeing</i> has said will occur by June 30, will open a new chapter for the Chicago-based company. The Dreamliner, which was supposed to enter service in May 2008, is considered the most technologically sophisticated commercial aircraft ever built, but its complexity has led to production problems and postponed launch and delivery dates. <i>Boeing</i> has had to provide concessions to its airline customers because it has missed promised deadlines. The company has seen a spate of cancellations, while its credibility with investors also has suffered. <i>Boeing's</i> shares have risen about 45% since mid-March. According to a research note last month from <i>Morgan Stanley</i> aerospace analyst Heidi Wood, customers' financing concerns have eased and investors are confident in the company's order backlog. The shares could get a further boost once the Dreamliner makes its first flight but could suffer if the program hits new snags. After the plane's inaugural flight, <i>Boeing</i> test-flight programs usually have taken about a year to receive the necessary certifications from the Federal Aviation Administration. Scott Carson, president and chief executive of <i>Boeing Commercial</i> <i>Airplanes</i> , in an interview this week said 'one concern is the sheer volume of reports we'll be giving the FAA and their ability to proces	On a modular enterpri se architec ture's product / producti on system strategy.
					ing a gar and prepare for the next day's tests.	

a Blowou t, But AirbusAirbus snagged a deal for 50 of its A320 narrowbody planes, worth \$3.8 billion, from Hungarian discount carrier Wizz Air. A Hungarian discount airline? Don't snicker. Wizz, founded by a former CEO of Hungarian flag carrier Malev, is thriving by attracting budget-conscious travelers during the economic crisis. Its traffic was up 30% from January through May. It already has an all- s in. Airbus fleet, so buying from the same source makes sense – especially now, when Airbus is doubtless offering great deals to win scarce orders. In fact, many of Airbus's reportin airlines looking to take advantage of a buyer's market to build their fleets. Others included Malaysian carrier Air Asia, which ordered 10 of Airbus's new A350 widebody jets, and Cebu Pacific of the Philippines, which is taking at least 15 narrowbody planes. 'There are some architec ture ("It Wasn't a Blow-out",	19 June 2009	Busines sWeek "It Wasn't	Tom Enders , CEO Airbus	Firm- Custo mers	α & β	The last time <i>Boeing</i> launched a brand-new commercial aircraft, the 777 in 1994, the 11-month testing phase included nine planes that flew a combined 70 to 80 flight hours a month. The 787 testing phase could be three months shorter, and the six planes are expected to fly about 120 hours a month. In manufacturing the 787, <i>Boeing</i> essentially invented a new way to assemble a commercial airplane. Unlike the company's previous widebody aircraft, which are largely assembled at the <i>Boeing</i> factory in Everett, Wash., major portions of the 787 are fabricated by contractors as far away as Italy and Japan, and then shipped to the factory for final assembly. While <i>Boeing</i> initially believed the process would reduce costs and streamline manufacturing, the complexities. The program was further plagued by a two-month walkout by <i>Boeing</i> machinists last fall and bugs in the plane's software. The 787's problems, and the global recession, have rippled through other commercial-airplane programs at <i>Boeing</i> . The new 747-8, an update to the venerable two-deck jumbo jet that competes with <i>Airbus's</i> double-decker A380 aircraft, also has been delayed. Beyond the test flight, questions remain about how quickly <i>Boeing</i> can accelerate production of the Dreamliner to its goal of 10 airplanes a month by 2012. The company and its suppliers have cautioned that there remain potentially significant kinks in the manufacturing system that must be worked out before the plane's production rate can increase significantly."	On proof which niche an

ImageInd decided several years ago to disclose orders as soon is they were placed, rather than saving up big deals to announce at air shows. Trouble is, Boeing this year has had almost as mary cancellations as sales. It has logged 50 orders, including 53 for the 737. 10 for its 777 widebody and 13 for its forthcoming 787 Dreamliner. But airlines have cancelled 66 previous orders, including 58 for the 787, leaving Boeing with a net order tally of only 10. At/bus has had cancellations, too, though not as many as Boeing. As the air show opened, its net order tally sood at 11, including 21 cancellations. Orders booked during the show should boost the net tally to more than 100. True, there doesn't seem to be much chance that At/bus will meet its goal of 300 orders to bis year. But so far no customers have cancelled orders for its A380 mega jet - a fact that CEO Enders told me is 'quite a miracle, considering what that program has gone through.' (On the other hand, several airings have delayed taking delivery of their A380s.) And the order tally for the A350 now stands at a solid 493, well behind the 866 logged by the Boeing 787, but enough to get Boeing's streation. In fact, Boeing mit A 100 context and competes directly against the 777. Since July 2006, when At/bus began selling the A350 as currently configured, the two models in the same size range as the 777 have racked up 311 orders, while the 771 have racked up 311 orders, while the 771 have site som site on more reason to smile than their U.S. rivals do"On a modular one could all this air show a stuning commercial success for either Airbus or Boeing, But as they head back to Toulouse, the guys from Airbus will be one could all this ari how a struning commercial success for either Airbus or Boeing, But as they head back to roulouse, the guys from Airbus will be more reason to smile than		-					the second se

					troubled company will be blamed on the executives running the company in 2006, 2007, and 2008 and it should be.'	
20 June 2009	The Econom ist, "Hard Poundin g"	Jim McNer ney, CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny;</i> Louis Gallois , CEO <i>EADS</i> , Tom Enders , CEO <i>Airbus</i>	Firm- Gover nment	α & β	"The two aviation giants agree on one other thing: the industry will not get a successor to its ubiquitous short- haul workhorses, the 737 and the A320, for more than a decade. That is partly because the 15-20% efficiency gain that airlines say they want from the next generation is, says Mr McNerney, 'a bar that keeps moving north' thanks to the continuous improvements of 1-2% a year that the manufacturers are making to existing planes. Louis Gallois, the chief executive of <i>EADS</i> , the parent company of <i>Airbus</i> , denied there was anything odd about the timing: 'We do not plead guilty,' he said. 'Our support is much more transparent than <i>Boeing's</i> . We have fully repaid with interest the support we received for the A320 and A330 and we are already paying back on the A380 [super-jumbo].' Tom Enders, the chief executive of <i>Airbus</i> , added that the aid was aimed only at 'levelling the playing field' and that the European Union had described the 787 as the most subsidised commercial aircraft in history." 22 June 2009	Bloomb erg, "Toyod a Asks How Many Times <i>Toyota</i> Errs Emulati ng <i>GM</i> Failures " (John Lippert, Alan Ohnsma n and Kae Inoue)	Shoich iro Toyod a, Honor ary Chair man <i>Toyota</i> <i>Motor</i> <i>Corpor</i> <i>ation;</i> Takeo Fukui, CEO <i>Honda</i>	Firm	β	"On a mild day in February, <i>Toyota Motor Corp.'s</i> honorary chairman, Shoichiro Toyoda, summoned 400 executives to the redbrick factory in Nagoya, Japan, where his grandfather had built weaving looms a century ago. The managers filed in for one of the customary updates from <i>Toyota's</i> gray-haired, 84-year-old patriarch. What they got was anything but ordinary. Two months earlier, <i>Toyota</i> had forecast its first operating loss since Shoichiro's father began making cars in the same factory, now turned museum, in 1937. Then in January, about three months earlier than planned, the company announced that Shoichiro's son, Akio, would replace Katsuaki Watanabe as president. Akio is scheduled to assume his new job at a shareholder meeting Tuesday in Toyota City. Even with these signals, the managers were ill prepared for the normally reserved Shoichiro's litany of the carmaker's missteps and his dressing-down of Watanabe. 'How many times have you made a mistake?' Shoichiro grilled Watanabe, who sat silently among stunned audience members, according to a person familiar with the meeting. Shoichiro scolded the president for being so anxious to boost sales and profits that he'd let <i>Toyota</i> emulate now bankrupt <i>General Motors</i> <i>Corp.</i> and <i>Chrysler LLC. Toyota</i> had become addicted to big, expensive cars and trucks and had forgotten the customers' need to save money, Shoichiro said, according to the person's account. Shoichiro wasn't just lashing out at Watanabe. He was railing against the threat to everything his family had struggled to create. The Toyodas built their first car when Henry Ford was turning out almost 1 million a year in the U.S. During World War II, the family opened dry cleaning stores to get by. They adopted kaizen, the making of small and	On an integral enterpri se architec ture' quest to maintai n its integrali ty.

continuous improvements, to fine-tune manufacturing.	
They enhanced quality and squeezed costs to become one	
of the world's most admired companies. Across the	
Pacific, Ford Motor Co., Chrysler and GM were gorging	
on Americans' car lust. They failed to heed sky rocketing	
gasoline prices, declining workmanship and escalating	
pay. Last year, with help from its gas-electric Prius hybrid,	
Toyota pushed General Motors from its perch as the	
planet's biggest carmaker. In its June 1 bankruptcy	
filing, GM reported \$172.81 billion of debt, more proof	
of the U.S. industry's descent. Toyota's work isn't	
done. To avoid the four-decade decline that humbled	
GM, the Japanese company must fend off rising	
competitors and adapt to the global reality of slowing	
sales growth and shrinking profits, says John Casesa,	
managing partner of auto industry consulting firm Casesa	
Shapiro Group LLC in New York. 'If Toyota is unable to	
react to a changing world, it will risk its very existence	
over time,' says Casesa, who's covered the industry for	
two decades. 'If the company internalizes the <i>GM</i> lessons,	
it can maintain its leadership.' Akio's challenge is to cut	
Toyota's dependence on luxury cars and branch out	
from U.S. markets destabilized by easy credit. In its	
race to top GM, Toyota splurged on enough new factories	
to make 2 million additional cars a year. South Korea's	
Hyundai Motor Co. targeted small-car buyers in China,	
India and other emerging countries, where it sold 55	
percent of its vehicles last year compared with 31 percent	
for Toyota. 'Toyota went from being a scrappy	
newcomer to becoming convinced the market was just	
there for them to take,' says Maryann Keller, an auto	
analyst and president of Maryann Keller & Associates in	
Stamford, Connecticut. 'Toyota wrote the playbook and	
Hyundai read it: Build great cars with great value, and	
people will come.' Toyota investors won't see a quick	
revival, says Christian Takushi, a portfolio manager in	
Zurich for Swisscanto Asset Management AG, which owns	
1.7 million Toyota shares. After reporting record net	
income of \$17.7 billion for the fiscal year ended on March	
31, 2008, earnings took a \$22.2 billion nose dive. <i>Toyota</i>	
ended fiscal 2009 with a \$4.5 billion net loss and the	
company says it expects to lose \$5.7 billion more in	
fiscal 2010 . Earnings won't recover for three years, even	
if sales rebound, since <i>Toyota</i> is still paying for its	
expansion, Takushi says. 'Toyota has overdone itself	
with capital spending because they really wanted to be	
No. 1,' he says. 'They're paying a high price.' Not all	
investors are so pessimistic. 'Toyota is among the best,'	
says Wendy Trevisani, fund manager for Santa Fe, New	
Mexico-based Thornburg Investment Management Inc.,	
which held 17 million Toyota shares in March. 'They	
make every effort to address problems as seen by	
current initiatives including management shifts. Their	
balance sheet remains strong.' Toyota's \$52 billion in	
cash and marketable securities give it a comfortable	
cushion, according to Moody's Investors Service. And it	

		
	will get some relief in the U.S. from the misfortunes of	
	bankrupt rivals, says Kota Yuzawa, a Goldman Sachs	
	Group Inc. analyst in Tokyo. The Japanese automaker	
	may be able to boost American market share by a third	
	to 21.3 percent by 2011 as GM and Chrysler shut plants	
	and dealerships. This prospect, which would make	
	Toyota the top-selling carmaker in the U.S., helped	
	send Toyota's shares up 29 percent this year, to 3,690	
	yen on June 19. That's still 56 percent below their 2007	
	peak of 8,390 yen. ' <i>Toyota</i> should emerge from the	
	downturn in an even stronger position relative to	
	competitors,' says James Hunt, who helps oversee \$6	
	billion at Tocqueville Asset Management LP in New York,	
	including 37,000 Toyota shares. Hyundai's shares surged	
	84 percent this year to 72,500 won on June 19. Inside	
	Toyota, some chalk up the recent stumble to the	
	recession that's sent global car sales down 20 percent	
	since 2007. Shoichiro wasn't buying that excuse. He	
	told employees at the February meeting that Toyota fell	
	victim to hubris, according to the person familiar with the	
	gathering. Beginning in 2003, Toyota pushed to expand	
	manufacturing capacity by 25 percent to build 10	
	million cars a year. When Watanabe became president in	
	2005, he backed the growth plans and championed a \$1.3	
	billion pickup truck plant in San Antonio, Texas, calling it	
	'a dynamic symbol of our bright future.' Watanabe, 67,	
	sealed his fate by failing to predict that sales would	
	plunge last year and not acting fast enough to recover,	
	people familiar with the situation say. In October, $2 \frac{1}{2}$	
	weeks after Lehman Brothers Holdings Inc.'s bankruptcy	
	deepened the global credit freeze, a key <i>Toyota</i> lieutenant,	
	Executive Vice President Mitsuo Kinoshita, said sales	
	could rise to 9.7 million vehicles this year. In May, the	
	company predicted it will sell just 6.5 million vehicles in	
	the fiscal year ending in March 2010. 'If Toyota can't	
	adjust to a market that will be smaller, with less-	
	expensive cars, then somebody else will be heralded as	
	the next great automaker,' Keller says. It's up to Akio	
	Toyoda, 53, the first Toyoda in 14 years to run the	
	company, to ensure that that prediction doesn't come true.	
	First, he'll have to guide Toyota through unfamiliar times.	
	'We're facing a once-in-a-century crisis,' Akio said,	
	referring to the recession, in a January press conference	
	after his appointment as president. In a nod to Toyota's	
	new austerity, Akio, wearing a dark- gray suit with a pale-	
	pink tie, spoke in the lobby of the company's Tokyo office	
	instead of at the Palace Hotel or one of the other upscale	
	venues of previous years. 'I'll try to make changes	
	without being tied down by the past,' he said, reading	
	carefully from a script. 'I will consider measures	
	department heads to discuss ways to slow Toyota's	
	expansion without completely killing it, people familiar	
	with the meetings say. He's planning to appoint five	
	executive vice presidents in key regions such as North	
	America. They'll handle product development,	

 	-	
	manufacturing and sales locally. The heads of these	
	departments currently report to executives in Japan,	
	which slows decision making. 'Toyota has been	
	addicted to U.S. profits these last five years,' says John	
	Shook, a University of Michigan management instructor	
	and former Toyota engineer. 'They've been slow	
	everywhere else, particularly in China, where the growth	
	is. <i>Hyundai</i> could be the big winner.' The reorganization	
	is just part of Akio's makeover attempt. On May 18, he	
	unveiled the latest Prius to the Tokyo media. The newest	
	version of the hybrid boosts fuel economy by 8.6 percent,	
	to 50 miles (80 kilometers) per gallon. Akio said he hopes	
	to quadruple hybrid sales to 1 million annually during the	
	decade starting next year. 'Our answer to how a car	
	should be in the future is the new Prius,' he said. Then on	
	May 23, he traveled to Germany to drive a 500-	
	horsepower black-and-white Lexus sports car in a 24-hour	
	endurance race, finishing 87th in the 170-car field. Two	
	years earlier, in a blog he writes for Toyota's racing unit,	
	Akio said he admired Ulrich Bez, chief executive officer	
	of Aston Martin Lagonda Ltd., maker of fictional spy	
	James Bond's preferred car. He praised Bez for competing	
	in contests that underlings called too dangerous. 'Because	
	such a CEO leads the company, Aston Martin is able to	
	offer an emotional sports car,' he wrote. After another	
	race, Akio described a beer party with fans. 'We were	
	shaking hands, waving hands as if our arms would be	
	torn apart,' he wrote. 'It felt like it was the best	
	moment of my life!' Cliff Cummings, who owns two	
	Toyota dealerships in the foothills of the San Gabriel	
	Mountains near San Bernardino, California, says Akio is	
	starting to shake things up inside Toyota. He credits the	
	incoming president with pricing a no- frills Prius at what	
	Cummings considers a reasonable \$21,000, almost	
	\$11,000 less than fully equipped models. At \$19,800,	
	Honda Motor Co.'s Insight helped force Toyota's price	
	down, Cummings says. 'Akio is taking Toyota back to	
	its fundamental values of dependability and economy,'	
	he says. Akio, who is fluent in English, learned Toyota's	
	ways from the ground up. On Oct. 30 of each year, he	
	visits the Kosai, Japan, birthplace of his great-grandfather	
	Sakichi, who received the family's first loom patent in	
	1891. During his freshman year in 1973 at Tokyo's Keio	
	University, Akio spent six weeks at the Punahou School in	
	Honolulu, where U.S. President Barack Obama was a	
	seventh-grader. Akio graduated from Keio with a law	
	degree in 1979. Three years later, he got a Master of	
	Business Administration from Babson College in	
	Babson Park, Massachusetts. Akio joined <i>Toyota</i> in 1984.	
	After factory and finance jobs, Shoichiro, then <i>Toyota's</i>	
	president, tapped Akio to make the Japanese sales office	
	more efficient by cutting inventories of unsold vehicles. In	
	1996, Akio spearheaded a service called G- Book that uses	
	mobile phones and Web browsers to provide traffic	
	updates to drivers. Two years later, he left Japan to	
	become vice president of a Fremont, California,	

· · · · · · · · · · · · · · · · · · ·		_
	manufacturing operation. Toyota, feeling the stirrings of	
	international ambitions, had begun the venture 14 years	
	earlier to gain experience in the U.S. By 2002, Akio was	
	running Toyota's China unit. He headed purchasing in	
	2005 and moved to global sales in 2008. Some suppliers	
	and dealers resisted Akio's ascension to president, saying	
	he'll have a hard time breaking from Watanabe, people	
	familiar with the situation say. For one thing, managers	
	Akio is promoting supported Watanabe's expansion,	
	including Yoshimi Inaba, 63, who'll head North American	
	operations, and Yukitoshi Funo, 62, who'll run global	
	sales. During Watanabe's tenure as president, both Akio	
	and Shoichiro backed major decisions such as building	
	new factories, the people say. 'I don't think anybody	
	sees Akio as a highly original kind of guy, but he's	
	really earnest," says James Womack, chairman of the	
	Lean Enterprise Institute in Cambridge, Massachusetts,	
	which trains companies on the automaker's methods for	
	cutting production costs. 'He's been in the Toyota system	
	all his life. He doesn't know anything else but to go	
	back to the basics.' Watanabe, a Keio graduate like	
	Akio, joined Toyota in 1964. He rose through the	
	purchasing staff with a reputation as a cost cutter. From	
	2000 to 2005, he achieved 1 trillion yen (\$10.3 billion) in	
	savings by streamlining Toyota's use of 173 components,	
	from headlights to horns to steering wheels. The savings	
	helped pay for Toyota's new plants. By 2005, he was	
	running the company as president. Watanabe opened the	
	newest factory in Woodstock, Ontario, on Dec. 4. Three	
	weeks later, he delivered Toyota's second major profit	
	warning and even then avoided acknowledging that he'd	
	made a strategic mistake. 'We should have arranged a	
	little bit more kaizen when we were on a growth path,'	
	he told reporters. 'On the other hand, many customers	
	bought our cars, so it's really a difficult judgment.' Akio's	
	quest to fix Toyota will take him to the scene of one of its	
	biggest setbacks: a former cattle ranch in San Antonio	
	where 600-pound (270-kilogram) wild pigs roam the	
	underbrush. Back in 2003, Toyota announced the factory	
	in an effort to undermine Detroit's last great profit bastion:	
	pickup trucks. The Texas plant opened in November 2006,	
	just months before cracks emerged in the U.S. subprime	
	mortgage market and gasoline prices began their rise.	
	Timing was just one issue. 'There was a lot of non-	
	Toyota thinking,' says Shook, the former Toyota	
	engineer. 'San Antonio seemed kind of crazy.' Starting with its first U.S. factory in 1989. Toucta will the Commu	
	with its first U.S. factory in 1988, <i>Toyota</i> built the Camry midsize sedan and others that had first proved their	
	midsize sedan and others that had first proved their	
	popularity in Japan, Shook says. It designed each assembly	
	line to accommodate many models. In Texas, <i>Toyota</i>	
	broke these rules by dedicating a whole plant to the	
	largest pickup the company had ever conceived, the	
	Tundra. <i>Toyota</i> wanted to attract new buyers on their home turf. Shock says Watanaba authorized \$2 billion	
	home turf, Shook says. Watanabe authorized \$3 billion	
	for the effort, a person familiar with the situation says. He	
	planned to turn out 250,000 Tundras a year in San Antonio	

·····	-
	and Princeton, Indiana. Today, Toyota builds 100,000
	annually, only in Texas. Toyota was challenging Detroit
	where it was strongest, says Eric Noble, president of
	research firm Car Lab in Orange, California. As Toyota
	was learning the truck-building ropes, Ford redesigned its
	F-150 pickup. The new regular-cab F-150, with its 3,030-
	pound payload and 20 highway miles per gallon for the
	midsize engine, was an exemplary achievement in the
	same way that the Prius is <i>Toyota's</i> best, Noble says. By
	comparison, the Tundra had a 1,990-pound payload and
	got 17 mpg. Even better for <i>Ford</i> , the F-150 won a five-
	star safety rating from the National Highway Traffic Safety
	Administration compared with Tundra's four stars. U.S.
	carmakers are catching up in quality too. Chevrolet
	customers reported 113 quality complaints per 100
	vehicles in 2008, compared with 104 for Toyota, according
	to J.D. Power & Associates, which tracks consumer
	satisfaction. In 1981, GM had seven times the
	complaints of Toyota. On the luxury end, Hyundai is
	chasing Toyota's Lexus GS with its Genesis, a premium
	sedan that sells for \$10,000 less. Hyundai also is preparing
	to bring its top-end Equus to the U.S. For the Tundra
	pickup, the killer was price, dealer Cummings says.
	Toyota charged \$29,568 for a typical Tundra in 2007.
	That was \$4,000 too much based on what potential
	buyers told him, Cummings says. 'By charging too
	much, we forced customers to look elsewhere,' he says.
	,
	When Honda's retiring CEO Takeo Fukui looks at San
	Antonio, he says he sees a clear difference between <i>Toyota</i>
	and Japan's No. 2 automaker. <i>Honda</i> builds factories in
	stages, adding the capacity to make 50,000 vehicles at a
	time, instead of 250,000 at once. ' <i>Toyota</i> makes big
	investments,' Fukui, 64, said in Detroit, where he was
	attending an April engineering conference. 'Our idea is to
	start small and grow. We consider ourselves a small
	company, and the idea of having extra capacity is very
	scary.' A foggy March Tuesday in San Antonio proves
	Fukui's point about idle space and shows <i>Toyota's</i>
	determination to learn from its miscues. Dozens of <i>Toyota</i>
	workers, wearing green or orange vests that signify they're
	on temporary assignment, inspect unfinished trucks. These
	same workers cleaned parks and enjoyed yoga and Pilates
	on company time when a 15.6 percent sales drop forced
	Toyota to shut the plant for three months starting in
	August and then cut a second shift. Ray Tanguay,
	executive vice president for manufacturing in North
	America, sees a silver lining in the downtime. The
	company is using its kaizen process to build vehicles
	with fewer workers, aiming for more profit when sales
	pick up. 'We have to go back to our core values,' he
	says. 'This might well make us stronger.' Kaizen-
	sparked improvements are taking root in San Antonio.
	Production manager Dan Antis says employees studied
	everything from workplace diversity to how to hold a
	screwdriver. 'When you're chasing volume, you don't
	Jou to chusing totuite, you don t

have time to teach people,' Antis says. 'The kaizen we're capable of doing after the shutdown is endless.' Standing near the assembly line's end, team leader William Steubing says he wanted a better way to handle a 20-pound plastic box that carries parts alongside unfinished trucks. Initially, Steubing's team attached the box to metal frames holding the trucks. As the Tundras moved along the line, workers reached into the box for headlights and other parts. When they emptide the box, they'd lift it off the carrier and carry it back for refilling. During the shutdown, workers designed a conveyor to do that job. Now, as a truck moves forward, the conveyor tilts up a corner of the empty box and snaps it off the carrier. The box falls onto the conveyor and rolls back for refilling. The change saves 11 seconds of walking per truck. Steubing and his co-workers also got training in welding and metal cutting. Then they recycled old conveyors, spending \$2,000 compared with \$90,000 that <i>Topota</i> engineers had planned for a motorized conveyor. These and more than 400 kaizen projects are making an impact. Defects that workers reported in an internal audit fell to 0.2 per truck from 1.2, comparable with <i>Topota's</i> best word/wide. Productivity measured by trucks made per worker per day, not including temporary labores, nose to 0.91 from 0.73. <i>Topota's</i> North American factories need to run at 70 percent to 75 percent of capacity to break even, fraugua says. They were at 60 percent in March. He says he's cutting hundreds of millions of dollars per year in costs. Starting in September, the North American factories will break even, he says. 'If the market comes back, we're going to be in a very good position,'' Tanguay says. truck. Steubing and his co-workers also got training in welding and metal cutting. Then they recycled old conveyors, spending \$2,000 compared with \$90,000 that <i>Toyota</i> engineers had planned for a motorized conveyor. These and more than 400 kaizen projects are making an impact. Defects that workers reported in an internal audit fell to 0.2 per truck from 1.2, comparable with <i>Toyota's</i> best worldwide. Productivity measured by trucks made per worker per day, not including temporary laborers, rose to 0.9.1 from 0.73. <i>Toyota's</i> North American factories need to run at 70 percent or 75 percent of capacity to break even, Tanguay says. They were at 60 percent in March. He says he's cutting hundreds of millions of dollars per year in costs. Starting in September, the North American factories will break even, he says. 'If the market comes back, we're going to be in a very good position,' Tanguay says. Mhile money-saving kaizen improvements may help Akio on the factory floor, the recession has made strategic planning harder, U.S. sales chief Jim Lentz says. In his office in Torrance, California, adjacent to the 1-405 freeway and its crush of thousands of cars, Lentz says he can't predict with certainty how many vehicles Americans will buy in coming years. Nor can he tell what kind of cars people will want or which technologies governments will allow. Lentz takes out a black-and-gray chart based on <i>Toyota's</i> sconomic and consumer research. It shows that U.S. auto sales may rebound from an annalized rate of 9.6 million this year to 17.4 million by 2015. He draws a line with a blue pen showing that, conversely, sales could total 11.5 million in 2015 if the recession lingers. If that happens, <i>Toyota</i> may lay off full-time workers, not just temporaries. Even with President Obama's push to lift fuel efficiency for new vehicles to anationwide average of 35.5 mg by 2016, environmental challenges are hard to plan for. California's zero-emission-vehicle mandate means <i>Toyota</i> and bere venel weholes to a nationwide average of

Even with President Obama's push to lift fuel efficiency for new vehicles to a nationwide average of 35.5 mg by 2016, environmental challenges are hard to plan for. California's zero-emission-vehicle mandate means <i>Toyota</i> and other automakers must build tens of thousands of electric cars, fuel-cell vehicles and plug-in hybrids starting in 2012. 'Product planning is riskier than ever," says Bill Reinert, <i>Toyota's</i> U.S. manager for			
recession has made strategic planning harder, U.S. sales chief Jim Lentz says. In his office in Torrance, California, adjacent to the I- 405 freeway and its crush of thousands of cars, Lentz says he can't predict with certainty how many vehicles Americans will buy in coming years. Nor can he tell what kind of cars people will want or which technologies governments will allow. Lentz takes out a black-and-gray chart based on <i>Toyota's</i> economic and consumer research. It shows that U.S. auto sales may rebound from an annualized rate of 9.6 million this year to 17.4 million by 2015. He draws a line with a blue pen showing that, conversely, sales could total 11.5 million in 2015 if the recession lingers. If that happens, <i>Toyota</i> may lay off full-time workers, not just temporaries. 					whether the public will adopt very different forms of transportation.' Amid the upheaval, <i>Toyota</i> is making concrete strategic shifts. It's building more compact cars and setting up factories in emerging markets and countries with large reserves of resources like oil, Watanabe told reporters in May. It doesn't have much choice. Sales at the Lexus luxury unit had generated more than half of U.S. earnings, with 12 percent of sales, in the middle of the decade. Consumers' lust cooled when the average U.S. price for regular gasoline topped \$4 a gallon in July 2008. During the first quarter of 2009, <i>Toyota's</i> U.S. pickup, minivan and SUV sales plunged 40 percent. Lexus sales dropped 37 percent. The danger is that <i>Toyota's</i> moves toward smaller vehicles may cut earnings in half, even after the recession ends, says Koji Endo, an analyst at <i>Credit Suisse Group AG</i> in Tokyo. And nobody's sure how the price of gas, which has fluctuated by more than \$2 a gallon in the past year, will affect consumer desires. Even so, <i>Toyota</i> is banking on such cars as the iQ. At the New York Auto Show in April, a lime-green model of the micro- compact descended from the ceiling amid strobe lights and techno music. The iQ fits sideways in a normal parking spot, travels 65 miles per gallon and has nine air bags. <i>Toyota</i> is targeting with smaller cars. Along with affiliate <i>Kia Motors Corp., Hyundai</i> sold 4.2 million vehicles last year, more than half of them in emerging markets. <i>Hyundai</i> and <i>Kia's</i> combined profit dropped 7.9 percent to 1.56 trillion won (\$1.2 billion) in 2008, partly because the South Korean currency fell 26 percent against the dollar. Combined sales rose 0.5 percent in the U.S. during the January-March quarter and 50 percent in the u.S. during the January-March quarter and 50 percent in the u.S. during the January-March quarter and 50 percent in the u.S. during the January-March quarter and 50 percent in the u.S. during the January-March quarter and 50 percent in the u.S. during the January-March quarter and 50 pe	
23 June 2009	Internal Boeing Memo., posted on forums.j etphotos .net	Scott Carson , CEO Boeing Comm ercial Airpla nes	Firm	α	"***This message is being sent by Scott Carson, president and CEO of Commercial Airplanes, to all Commercial Airplanes employees.*** Postponing 787 flight testing There are times when making the prudent and right choice is the only choice. That's what we have done today with our announcement that we will take the time to reinforce an area within the side-of-body section of the 787 before we begin flight testing.	On a modular enterpri se architec t's views on choice.
L					Based on our preliminary analysis, and as recently as last	

					 week, we believed we could work through this issue and still begin flight test this month. Subsequent analysis over the last few days led us to conclude that a modification must be made before flight test. As we have stated in the past, we will fly only when our team is convinced that we are ready to fly and can conduct a productive flight test program. Our testing process is designed to identify these issues, and experience tells us that structural modifications are not uncommon for development programs. We gave consideration to a temporary solution that would allow us to fly as scheduled, but we ultimately concluded that the right thing was to develop, design, test and incorporate a permanent modification to the localized area requiring reinforcement. Now, it is important that our team has the time and resources to develop a solution, conduct the appropriate testing to validate the solution and incorporate the modification prior to first flight. First flight and first delivery will be rescheduled after we determine the required modification and testing plan. The emotions we feel today should not take away from the 787 team's incredible progress in recent months. We have had strong results from our engine tests, our systems tests and, with this exception, our structural tests. We believe in the technologies, the design and the systems that will make the 787 a revolutionary airplane for our customers and their passengers. As a team, we have worked through many challenges in bringing this breakthrough airplane to life. I am confident that as a team, we will work through this issue as well. We will stay focused on executing the best solution as quickly as possible, while keeping up the progress on the other areas of the program. 	
					I thank everyone on the team and everyone at Commercial Airplanes for the hard work, dedication and perseverance as we continue on this journey together.	
23 June 2009	Wall Street Journal, "Boeing Delays First Flight of 787" (Ann Keeton)	Scott Carson , CEO Boeing Comm ercial Airpla nes	Firm	α	Scott" "Boeing Co. delayed the first flight and initial delivery of its new 787 Dreamliner, saying wing-bending tests showed a structural weakness where the wings join the body of the aircraft. The Chicago company indicated Tuesday it plans to take some second-quarter charges related to the delay. It will be several weeks before the plane maker releases a new flight and delivery schedule, Scott Carson, head of Boeing's commercial airplanes unit, said during a conference call Tuesday. Financial impact to Boeing's second-quarter results will be disclosed when the company releases earnings data next month, the company said. Carson said it was premature	On a modular enterpri se architec tur's continu ed, systema tic and accelera ting

	to discuss the dollar impact of the delay, but that the	over-
	cost of small parts to reinforce the aircraft structure	promise
	would be 'immaterial' to the program. Boeing shares	and
	recently fell \$4.17, or 8.9%, to \$42.70 Tuesday as	under-
	investors expressed disappointment over trouble with the	delivery
	787, which is expected to help fuel Boeing's earnings in	
	coming decades. Carson said fixing the aircraft won't	
	slow the 787 production line, as already-assembled	
	aircraft can be modified with a number of small 'hand-	
	A REPORT A REPORT A REPORT OF A REPORT AND A REPORT AND A REPORT OF A REPORT AND A REPORT	
	sized' parts that can be added wherever the planes are	
	now in the assembly process. With more than 800 orders	
	for the 787, Boeing expects in its initial production plan to	
	finish two planes per month, and has said it may add a	
	second production line to ramp up production in 2012.	
	The news Tuesday is another blow to Boeing, which had	
	steadfastly maintained the first flight would take place	
	by the end of June. The 787 is already two years behind	
	schedule, suffering a total of five delays on	
	manufacturing glitches. First customer All Nippon	
	Airways had expected to receive the first 787 aircraft in the	
	first quarter of 2010. Carson said Boeing began talking to	
	customers about the latest delay late Monday evening. It's	
	not clear yet whether the delivery delay will match 'day	
	for day' the holdup at the factory since Boeing will	
	continue with other tests as it reinforces the wing joints.	
	Boeing said Tuesday the problem was discovered during	
	recent, regularly scheduled tests on the first test aircraft.	
	While preliminary analysis indicated that flight test could	
	proceed this month as planned, <i>Boeing</i> decided late last	
	week to delay the first flight, a key milestone in any new	
	aircraft development. Scott Fancher, head of 787	
	production, said Boeing found unexpected stress points	
	about one-to-two square inches in size, at 18 locations	
	on the joint between the upper side of each wing and	
	the body of the aircraft. He said a computer model	
	didn't show that stress, and the model will need to be	
	changed to reflect results from physical tests that	
	sharply bent the wing of the aircraft. 'Consideration	
	was given to a temporary solution that would allow us	
	to fly as scheduled,' Carson said, 'but we ultimately	
	concluded that the right thing was to make a	
	5 S	
	permanent change. Boeing will work on structure	
	reinforcement with parts suppliers Fuji and Mitsubishi.	
	'Structural modifications like these are not uncommon in	
	the development of new airplanes, and this is not an issue	
	related to our choice of materials or the assembly and	
	installation work of our team,' he added. He said the	
	structural weakness occurred where materials including	
	titanium and aluminum were used, along with new	
*	composite materials that have made the 787's design a	
	game-changer for the industry. The lighter weight of the	
	aircraft is expected to save some 20% on fuel and harmful	
	emissions. Early last week, Carson addressed reporters	
	at the Paris Air Show, assuring them the first flight	
	was on schedule for as early as Wednesday of this	
	week. He said Tuesday the first flight could have occurred	
	in the bala raceady the mornight could have occurred

By Raoul on June 23, 2009 10:05 AM "John, I enjoy your blog but I hope you and all the other writers (I consider you better than a mere blogger) will learn something from this. Especiall the so called 'Aviation industry analysts' Don't become so starstruck by <i>Boeing</i> and it's handlers that it impairs the facts. <i>Boing</i> mught give you data, it might toss out some swag and some shiney, but facts? You have to get those for yourself. Yes, I know, 'WTH is this guy talking about?'. Think about it John, you have been expertly stroked and groomed by one of the best PR machines in the world. You aren't writing about the hype, you have become part of it. <i>Boeing</i> is a very troubled company, and has been for a dozen years now. As shareholders lick their wounds over the past few days of sell-down, incurring massive losses(again) we again wonder where the truth begins and ends with <i>Boeing</i> , and particularly where managerial and executive competance is or is not present. It's our fault too. If we didn't choose to believe them we thought maybe, just maybe they couldn't blow it again at this late stage. Yes, I know, the focus of this blog is on the technical/commercial aspects of aerospace, it's not an investors symposium. But real damage has and is being done, not just to us, but to the company. This is not just another routine development difficulty. This smacks of a deep, deep flaw in <i>Boeing</i> 's current methodologies and philosopy of doing business. The sort of 'Go Fever' exhibited and egged on by <i>Boeing</i> itself is bad mode of thinking to be in. It cannot turn out well. I'm sorry, but it just cannot. Focusing on every minute detail right down to every engine start or the most meaningless movement of the aircraft on the ramp misses the point entirely. The bloggers, the aerospace press, et-al, just consistently give <i>Boeing</i> a pass. Nobody is digging, nobody is asking tough questions. It's my opinion that <i>Boeing</i> ne	On question ing data fidelity and rival hypothe ses for underde livery in a modular enterpri se architec tue's product s.
					with GO FEVER. And that is a very, very dangerous thing to have." By Roger Fields on June 23, 2009 11:49 AM "Boeing says that they delayed first flight because the flight envelope would be to small for productive flight testing. Sorry, don't buy that. Why getting all this	
					negative publicity if a first flight would have been possible? Why not performing first flight by June 30 while they were thinking about a fix? Believe me, the problem is bigger then <i>Boeing</i> admids, otherwise, they would have gone for first flight by June 30 regardless of the smaller flight envelope."

	pher				latest in a series of delays for what promises to be the	
	Drew)				world's most sophisticated passenger plane and a key to	
					Boeing's future. The company has more than 850 orders	
					for the plane, which is known as the Dreamliner and is	
					supposed to be lighter and more fuel-efficient than other	
					commercial aircraft. Analysts said the company's flight	
					test schedule was so tight that the delay of several	
					weeks would clearly push back plans to deliver the first	
					787 by next March. "'There's no way that will hold,'	
1					Richard Aboulafia, an analyst at the Teal Group, said.	
1					'This is a pretty late stage in the preflight test schedule	
1					to be finding structural showstoppers.' And that only	
					heightens concerns that Boeing could find more problems	
1					once the test flights begin. 'This removes any hope that	
					they'd gotten a handle around the likely risks of things	
					they could find during the flight test program,' Mr.	
1					Aboulafia said. 'It doesn't help the company's	
					credibility,' said Howard Rubel, an analyst at Jefferies &	
					Company. 'There's a sense of frustration that they were 90	
					percent at the finish line, and they're still at 90 percent of	
					the finish line.' Company executives said they	
		6			discovered the structural weakness last month. They	
					said they initially thought that it would not delay	
					having the first flight by June 30, an idea that they	
					continued to promote at the Paris Air Show last week.	
					But in a conference call with reporters and investment	
					analysts on Tuesday, Scott Carson, the chief executive of	
					Boeing's commercial airplane operations, said 'it became	
					apparent by Friday that the problem would limit how	
					rigorous the flight could be.""

					plans for the Sonic Cruiser, which would have traveled	enterpri
					near the speed of sound, and on Jan. 29, 2003, the	se
					company establishes a leadership team for the 7E7, its first	architec
					all-new airplane since the 777 in 1990. Composites are	ture.
					chosen as the primary material the next June.	
			10		STARTUP - All Nippon Airways of Japan orders 50 of the	
					planes, and <i>Boeing's</i> board of directors approves the	
					launch of the 7E7 program on April 26, 2004. In January	
					2005 the model name is changed to the 787, and at the end	

of the year the first deliveries are set for early summer 2008.	
FIRST GLITCHES - Boeing announces on June 9, 2006, that bubbles have been found in the composites used in a 33-foot prototype of a section of the fuselage. On Nov. 6, 2006, Boeing says it's confident the plane can be lightened by about 2.5 tons, enough to make it the most fuel efficient commercial jet in the air.	
<u>SALES</u> - Sales exceed 500 planes by April 3, 2007 , and <i>Boeing</i> begins looking for ways to accelerate production.	
<u>MORE GLITCHES</u> - <i>Boeing</i> reveals production snags on June 12, 2007 , including a gap where the left side of the nose-and-cockpit section is out of alignment with the fuselage. Another problem is an industrywide shortage of fasteners that hold the plane together.	
<u>FIRST DELAYS</u> - On Sept. 5, 2007 , <i>Boeing</i> says the 787 will begin flight testing in mid-November or mid-December, months later than originally planned. On Oct. 10, 2007 , <i>Boeing</i> delays first deliveries by six months.	
PERSONNEL CHANGE - Boeing announces on Oct. 16, 2007, that Michael B. Bair, vice president and general manager of the 787 program for the past three years, has been replaced by Patrick M. Shanahan, previously head of <i>Boeing's</i> missile defense systems in Wichita, Kan. Bair is named vice president of business strategy and marketing and, on Oct. 31, 2007, says some suppliers of major components for the 787 have fallen short of <i>Boeing's</i> expectations.	
<u>PROMISES, PROMISES</u> - On Dec. 11, 2007, <i>Boeing</i> <i>Commercial Airplanes</i> CEO Scott E. Carson says there will be no further delay in 787 development, but a three-month delay is announced on Jan. 16, 2008, and an additional six-month stall is announced on April 9, 2008, postponing the projected debut of commercial service to the third quarter of 2009 - the third revision to the delivery schedule and the fourth change in plans for first test flight.	
<u>LABOR DISPUTE</u> - An eight-week strike by the Machinists union that began Sept. 6, 2008 , and lingering production problems, including installation of improper fasteners, pushes the first test flight into the second quarter of 2009 and first deliveries into the first quarter of 2010 - the fourth schedule shift, making the first 787 nearly two years late. The top issue in the strike is job security as union members maintain that if more of the key production had been in-house instead of by subcontractors, the 787 would have been completed before the walkout.	
LATEST HANGUP - On June 23, 2009, Boeing	

					announces that flight tests will be delayed an	
					undetermined number of weeks for the design and	
					installation of reinforcements along the upper part of the	
					place where the wings join the fuselage. Carson says	
		101			deliveries also will be pushed back."	0
23	The	Mike	Firm	α	"On a sunny day in July 2007, the <i>Boeing Co.</i> welcomed	On a

	787"				new aircraft to market. 'You've got to get it right,' Bair	
	(Michel				said. From a technology perspective, Boeing got its	
	le				new 787 right. From a preliminary execution	
	Dunlop)				standpoint, Boeing got its 787 wrong. Standing there	
					next to their Dreamliner on 07-08-07, Boeing executives	
					surely had concerns about the aggressive schedule in front	
					of them. Even then, Bair and other company leaders	
					knew their first 787 was filled with temporary parts and lacked the wiring and systems it needed for first	
					flight, scheduled for late August 2007. But no one	
					imagined it would take <i>Boeing</i> not two months, but nearly	
					two years to put its 787 Dreamliner into flight. Within two	
					weeks of that day in July 2007, a series of schedule slides	
					began for the mostly composite jet. By early September,	
					the company had pushed the 787's first flight to December	
					but maintained the original May 2008 delivery date.	
					'Right now we don't see this translating into delays,'	
					Bair said. 'The most important thing is to deliver the	
					airplane on time.' In early October, <i>Boeing</i> marketing guru Randy Tinseth gave assurances the 787 was on	
					track. Less than 24 hours later, Scott Carson, president	
					of commercial airplanes, admitted that <i>Boeing</i> would	
					not deliver the first 787 on time. Over the next 14	
					months, the delays dribbled in, soiling Boeing's reputation	
					and spoiling a potentially wide lead Boeing could have	
					held over rival Airbus. Analysts and bloggers often	
					broke news of 787 setbacks before Boeing. And	
					problems underperforming partners, incorrectly installed	
					parts piled up, pouring over into other jet programs. After the Machinists strike last fall, <i>Boeing</i> announced	
					delays to its 777 Freighter and 747-8 programs, blaming	
					the 57-day work stoppage, design changes and a shortage	
					of engineering resources for the setbacks. The problems	
					on the 787 forced Boeing to keep engineers on the	
					Dreamliner longer than anticipated, the company said.	
					Therefore, the engineers were late transferring over to	
					the other programs. Meanwhile, as Boeing pushed the	
					787's first delivery date further, its rival Airbus picked	I
					up more orders for its A330. The European jet maker	
					saw a surge in orders for its A330 since <i>Boeing</i> first	
					announced delays to its 787 in 2007. Airbus received	

June Pec 2009 In: nc "F 78 Fl: De al De al De an Qe Tr pt (A	ost- atellige cer Boeing 87 light elay: echnic etails ad &A ranscri 	Scott Carson , CEO Boeing Comm ercial Aiprla nes; Pat Shanah an, VP and GM Airpla ne Progra ms Boeing Comm ercial Aiprla ne Progra ms Scott Fanche r, VP	Firm- Investo r	α	 198 net A330 orders in 2007 and another 142 in 2008. Boeing's gift to Airbus also meant the European jet maker's new A350 jet, also made mostly of composite materials, won't be far behind the 787 into service. The A350 is sized more to compete with Boeing's 777. Still, the Dreamliner will be delivered just three years before the A350. The 787's delays and extra costs give Boeing less time and cash to dream up a competitor to the A350. But Boeing's chief executive, Jim McNerney, sees some silver lining in the 787's delays and is confident in the Dreamliner's future, he said at the Sanford C. Bernstein strategic decisions conference in late May. The technology that Boeing is using on the Dreamliner will be used on aircraft for decades, he said. 'We've figured out how to build airplanes for the next 75 years,' McNerney said. Boeing is using a spun composite barrel for its 787. Airbus plans to use composite panels instead. McNerney isn't sure Airbus' strategy will pay off. Although Boeing's suppliers have struggled on the 787, the delays have allowed them to smooth out the process an advantage in the long run, McNerney said. 'I think that's a huge advantage,' he said of the 787's technology. 'Innovation is the key to us getting the lion's share of the market.''' Question: Joseph Campbell - Barclays Capital - Analyst "Just again back on the nature of the problem and where it is, can you is this problem isolated to a single structure?' So like is it I mean is it the Alenia piece? Is it the wing box from Fuji? Or does it involve stresses on several supplier components? Is it both starboard and port so that this is something that's symmetrical around the aircraft? Or is it a single sided kind of issue?'' Pat Shanahan - The Boeing Company - Airplane Programs VP and General Manager "I will jump in first and Scott can provide additional color.'So it's both the wing out of Mitsubishi, and Boeing, in developing a comprehensive long-term answer. Scott?'' <	On a modular enterpri se architec ture's explanat ion for under- perform ance
		<i>Airpla</i> nes; Scott Fanche			developing a comprehensive long-term answer. Scott?" Joseph Campbell - Barclays Capital - Analyst	

"So just to not hopefully this can be the end of this. Somebody asks before it was along the entire wing, so it's if you were to describe from the aft to tail or under the belly or wherever these are located, is it possible to take the multiple several inch one or two square inch places and identify how many of them are there and from the furthest point away, how big is the section affected?"
Scott Fancher - The Boeing Company - 787 Vice President and General Manager "This is Scott Fancher. Let me try and take a crack at that. As we mentioned earlier, we are talking on a one or two square inch area. It is along the side-of-body join between the wing and the side-of-body and particularly and specifically limited to the upper portion of where the wing and side-of-body join. And about 18 locations on either side of the aircraft for a total of 36 locations. The exact number may change a little bit as we analyze it, but that's approximately the number. And I really want to emphasize we are talking about a one or two square inch area along that upper wing join area in multiple locations. This is not a problem that extends out the wings or down into it is into the aircraft. It's a very limited area that needs structural reinforcement. The modifications, again to emphasize, we are talking about a handful of parts at each location and each one of those parts you could literally hold in your hand. They will be about the size of your hand or smaller. So not complicated by any means."
Paul Merrion - Crain's Capital Business - Media "Hi. I just wanted to go to the issue of the credibility in the company's schedule and predictions of schedule. You knew about this as of late last month, you said. Why wait until now to say anything at all about it? Including when the world's attention was on Boeing last week at the Paris Air Show."
Scott Carson - The Boeing Company - President and CEO "Paul, this is Scott Carson. When we were at Paris last week we had been through the preliminary analysis of the data and were of a mind that the airplane could enter flight test with a credible flight test envelope as we worked relatively minor modifications. The work done by the team through the week last week narrowed the envelope to the point where on Friday we determined that to fly would be such a small envelope for us that it would be an interesting exercise in having the airplane in the air but not particularly useful in terms of preparing the airplane for certification. So at that point is when we made the call to delay the process, identify the fix, test the fix, install the fix, and then enter a flight test program that is fully robust."
Paul Merrion - Crain's Chicago Business - Media

	"So what would have been the worst case if you had flown? Are we talking about cracks in the fuselage or the wings falling off or what if you hadn't made this fix before flying?"	
	Scott Fancher - The Boeing Company - 787 Vice	
	<u>President and General Manager</u> "The answer is our assessment is likely nothing would	
	have happened. This is an issue where stress concentrations departed from the model. Absent being able to anchor those two pieces of data together with confidence based upon our design process, we would have had to reduce the flight envelope we were willing to fly and that gets you into the line of logic that Scott just	
	outlined for you. So it really isn't a matter of yes and no. It is gee, because we've seen this departure and haven't been able to anchor the data back to the model with sufficient confidence, we need to narrow our margins and	
	that led us down the path that Scott described."	
	<u>Pat Shanahan - The Boeing Company - Airplane</u> <u>Programs VP and General Manager</u>	
	"And we are always staying in process. And when the process says stop, we stop."	
	Scott Carson - <i>The Boeing Company</i> - President and CEO "Absolutely, absolutely."	
	Howard Rubel - Jefferies & Co Analyst "Thank you very much. I mean you are talking about a number of parts that sound like you could put them in a grocery bag but maybe 50 pounds, 60 pounds. But can you talk a little bit about the dollar outcome, Scott, that we are seeing here? Are we talking hundreds of millions of dollars or are we talking just a few million to get this started and fixed?	
	Scott Carson - The Boeing Company - President and CEO "Howard, I think it is premature to forecast where we are in dollars. We understand the nature of the fix and I would say the nature, not the specifics of the fix yet, because we have to complete the models, run those models, and then test the solution. As we get through those steps, I think we will be in a better place to talk about the magnitude of the dollars. The fix itself does not appear to be a big dollar item. Obviously we need to understand the implications of the flight test program and first deliveries to assess that."	
	Howard Rubel - Jefferies & Co Analyst "Are we going to see though a day-for-day delay with this and the whole schedule or are there some other items that you might want to also incorporate to increase the margin for discovering additional unknowns?"	

—	1	1	1	1	Scott Carson - The Regine Commany Desident and	
					Scott Carson - The Boeing Company - President and CEO "We are going to continue to exercise the test program as Scott Fancher described in his comments. So whether it is day-for-day, I think again hard for us to call at this moment. We do believe we will be using the time productively however."	
					Howard Rubel - Jefferies & Co Analyst "So I just want to go back though the dollar amount. The fix itself just the titanium parts that you are talking about, is immaterial to the price of the airplane."	
					<u>Scott Carson - The Boeing Company - President and</u> <u>CEO</u> "Correct."	
					Posted by unregistered user at 6/24/09 1:45 a.m.	
					"Can you smell the BS in that conference call or what? They kept emphasizing that the mods would be insignificant as both planes 001 and 002 would not have to go back to the floor, yet they will require weeks to provide a fix and more weeks to provide new time table. I wish I was on that call and called them out on it. But then again, these media types have no spine. I hate to say this, but I believe <i>Boeing</i> is crunching the numbers as to how much it would set them back to pay penalties and loss of future revenue to just scrap this 7 Late 7 program. Mark my words. This is the end of <i>Boeing.</i> "	
					osted by fisquid at 6/24/09 9:34 a.m.	
					"The dollar amount is immaterial?? Customers are fuming to the point that they're canceling their orders, net 787 orders for the year is less than zero (!), and for the last two years they were supposed to be producing a plane a week or more, at \$150 million each, and the dollar amount of the delay is immaterial? Make no mistake. This delay is phenomenally expensive. No one is willing to admit it, but massive amounts of money are lost when you've got a product you can't sell. There's only a small window of time before the competition has similar planes to sell. The delay means MANY lost sales. Profits should have been in the millions on each plane. Instead, they sit on their hands through a time they should have been selling lots of planes at \$150M a pop. And Scott Carson is talking about the price of the bolts, like that's the cost of the delay! Sheesh! It's astonishing that the shareholders are willing to tolerate this level of incompetence. Immaterial, my foot."

June 2009	24/7 Wall St. "Boeing : Proof That Manage ment Incomp etence Needs Regulati on" (Dougla s McIntyr e)	Firm- Investo rs	$ \alpha $ $ i t $ $ i t $ $ a $ $ s $ $ s $ $ s $ $ s $ $ s $ $ r $	The federal government has set up a number of systems o effectively control the financial and credit systems along with most of the major firms that operate in the sector. The most aggressive, and perhaps most prudent step, the Administration has taken is to force the most poorly managed banks to restructure their boards. The Treasury put proposals before Congress to substantially increase the power of the Fed, in essence giving it life or death power over banks that become, in its judgment, rreparably crippled. The auto industry has fallen under the same government thumb. <i>Ford</i> may have dodged the imprecedented interference that comes with bailout dollars. <i>GM</i> and <i>Chrysler</i> are essentially wards of the state. The auto parts companies could end up in the same position if the government is forced to nationalize some of them to keep the car industry from running low on parts. What the government has failed to do is mandate that stupidity be pushed out of the executive suites of America's largest companies. Incompetence has always been the enemy of employees, shareholders, and customers. Each of these is much more evident in a eccession when the margin for error for creating profits often falls to zero. <i>Boeing</i> delayed the launch of its 787 Dreamliner again today, for the fifth time. This disaster will cost the company sales in upcoming quarters and will orce airlines which are flying old and inefficient planes to bay more to operate them than they would have if the new dircraft were delivered on time. The pressure on <i>Boeing's</i> margins may well lead to layoffs. Shareholders watched he value of the company's shares drop 6% yesterday. The first of the five product setbacks came in October 2007. <i>Boeing's</i> stock traded at just above \$100 then. It thanges hands at \$44 now. <i>Boeing</i> management made a number of mistakes that contributed to the delays. It	On a systemi c analysis of a modular enterpri se architec ture.

					did a poor job of managing the construction of the 787. Sets of fasteners were installed incorrectly. The company announced it would have to replace some of them last November. <i>Boeing</i> was greedy with labor, particularly when labor was critical to company	
					product release timetables. The International Association of Machinists and Aerospace Workers walked out on the company last fall. According to MSNBC, ' <i>Boeing</i> lost about \$100 million in revenue a day from the Machinists strike.'	
					The most stunning aspect of the 787 delays is that they have all happened under James McNerney, a losing contender for the GE CEO job, and the aircraft company's chief since 2005. This is almost as amazing as the fact that all of <i>Boeing's</i> board members have	
					served since before the first delay of the Dreamliner. No one has been held accountable. The board has not even had the good sense to replace McNerney with a more competent manager. McNerney is as much to blame if not more so than bank executives such as Vikram Pandit of <i>Citigroup</i> and Ken Lewis at <i>Bank of</i>	
					America are for the trouble at their companies. Pandit can argue that most of the collapse of <i>Citi</i> was underway when he moved to the corner office. Lewis can blame Henry Paulson and Ben Bernanke for shoving the <i>Merrill</i> <i>Lynch</i> acquisition down his bank's throat and undermining	
					its balance sheet. The best McNerney can claim is that he has been unlucky. Unlucky CEOs are even more dangerous than incompetent ones. Luck lacks the logical pattern that poor management has. The Administration is leaning toward giving shareholders more say in the selection and compensation of executives at	
					public companies. It is too early to tell how this will turn out. Corporations may effectively lobby that their boards are competent to handle the matter of hiring and paying senior managers. <i>Boeing</i> is proof that the case for an entrenched board is hardly compelling. A sixth delay	
24 June 2009	Flightbl ogger.c om, "Under standin g the 787 Structur al Reinfor cement" (Jon	Scott, Carson , CEO Boeing Comm ercial Airpla nes; Scott Fanche r, VP/G	Firm	α	of the 787 launch may even earn McNerney a raise." "Boeing yesterday announced it was postponing first flight of the 787 citing the need to reinforce structure where the wing box meets the center wing box at the side of body of the aircraft. FlightBlogger takes a closer look at exactly what the problem is and how Boeing came to yesterday's announcement. Because of the need to go back into the detailed design phase for this fix, combined with the need to fabricate, install and test at component and at full scale levels, several sources with a direct familiarity to the situation estimate that the fix will take 'months not weeks.'	On a modular enterpri se architec ture's potentia l understa tement of its problem
	Ostrowe r)	M Boeing Comm ercial Airpla			<i>Boeing</i> confirms that the stringer cap separated or 'disbonded' from the wing skin. Sources directly familiar with the situation say the shifting tension load from the stringer to fastener head also caused damage on the structure.	s.

	<i>nes</i> 787 Progra m		It took 63 days for <i>Boeing</i> to decide to postpone first flight of 787. <u>April 21:</u> <u>Boeing</u> experiences the first signs of trouble on the	
			static airframe. During that test, the wings of ZY997 were flexed to a deflection of over 17-feet and an equivalent of 120-130% of maximum load. During this test, which was the limit load test, the strain measurements on the stringer caps were reading higher than predicted. <i>Boeing's</i> official announcement yesterday said the company first discovered the problems in late May, but several sources indicate it occurred during testing on the static airframe in late April. 'We went in and did some inspections and saw a number of things indicative of what the strain gauges were saying,' said Scott Fancher, vice president and general manager of the 787 program, said on yesterday's teleconference, implying that the test had left visible damage to the structure.	
			[Real-time revision (30 minutes later) to above statement:]	
			Late May: Boeing experiences the first signs of trouble on the static airframe. During that test, the wings of ZY997 were flexed and the strain measurements on the stringer caps were reading higher than predicted.	
			Previously, on April 21st, <i>Boeing</i> conducted the limit load test which saw the wings deflected over 17-feet and an equivalent of 120-130% of maximum load.	
			Early June: Preliminary analysis showed that the aircraft was still cleared for first flight, though with a reduced flight envelope. Sources indicate that the original plan was to fly ZA001 and ZA002 on their respective maiden flights to BFI as planned then park the aircraft while a fix was developed that would allow an expanded flight test envelope. Scott Carson, CEO of <i>Boeing Commercial Airplanes</i> , confirmed this plan saying that 'the airplane could enter flight test with a credible flight test envelope as we worked relatively minor modifications.'	
			June 23: Boeing makes a formal announcement of the first flight postponement. The change in first flight was unknown to many of those closest to the airplane. As late as the evening of Monday, June 22, internal schedules indicated first flight had shifted to July 2nd at 10 am after holding at June 30th for more than a week before and during the Paris Air Show.	

				<u>By Gorbi on June 24, 2009 6:38 PM</u>	
				"Well, I don't know what to say. First off, THANK YOU	
				Jon for the extremely detailed analysis of the situation.	
				Coming from a former structural design engineer here	
				in the San Diego area, and having designed aircraft	
				structures from traditional aluminum materials, I can	
				appreciate the complexity of the problem. Although it	2
				sounds like a simple fix in layman's terms, it never is. The	
				reason it is more complicated is because we're dealing	
				with composites (plastics), and it's a much more difficult	
				material to predict than that of aluminum. I'm not so sure	
				that I would have gone with composite wing structures,	
				at least at the critical junctions such as the center wing	
				box/wing interface. Just like you're not going to build	
			ų – 1	composite landing gear structures, you might compromise	
				weight factors slightly, but you are assured of functional	
1				reliability which gives you proven confidence. Hopefully	
1				I am wrong, and overly alarmed, but I think this plane	
				may be overly 'plastic' in some areas, and I do believe	
I				Boeing may have been overly ambitious in their scheme	
				to build the 787 in such a manner."	
1				to build the /o/ in such a mannel.	
				By CBI on June 24, 2009 7:08 PM	
				"Congratulations for this post. If this is true the fix will	
				be far from being trivial. This is a major problem if it	
				did happen at less than 130% weight load! I would not	
				be surprised that the first flight not takes place before	
				Q2 2010, at the earliest."	
				Q2 2010, at the carnest.	
				By Wes on June 25, 2009 9:13 AM	
				"This airplane has been consistently plagued with	
				problems since inception. The timeline in this indicates	
				to me that the people at <i>Boeing</i> have been hiding a few	
				things from the general public, shareholders, and the	
				airlines. This story reveals, more than anything else,	
				that they knew they had a problem with the wing more	
				than 2 months ago. How big of a problem perhaps	
				required a little more time to understand, but the problem	
				was concealed none the less. I recall the frequent, public,	
				'It will fly in June' comments from Boeings top	
				leadership. Boeing has damaged it's credibility and it is	
				going to take a long time to fix it. I believe there will be	
				a severe and lasting backlash from the customer base to	
				the tune of several hundred cancellations, perhaps as high	
				as 50%. Airbus will reap a huge benefit from this with an	
				increase in A-330 sales. In short, Boeing blew it	
				bigtime. As of today, I will no longer be a shareholder	
· · · · ·				in Boeing."

				anito ano a to fato a for a fo	June- pri

(D' 1	delay in the melder second of \$74,001,2 p. 1, 1, 0	
(Rich Smith)	delay in the maiden voyage of 'ZA001,' <i>Boeing's</i> code for the first prototype 787. The stock promptly crashed down 6.5% on the day and has continued to burn today - down another 6% as of this writing. Which brings <i>Boeing</i> to a total of over 60% worth of market cap destroyed since the company first began announcing delays in the project. <u>Misery loves company</u>	se architec ture's overpro mise and underde livery.
	Nor does the damage end there. A whole string of suppliers from <i>Honeywell</i> to <i>United Tech</i> to <i>Spirit Aerosystems</i> depend on <i>Boeing</i> getting its act together so that they can bring parts operations up to speed. Meanwhile, customers such as <i>Continental</i> and <i>AMR</i> , parent company of <i>American Airlines</i> , who have ordered large batches of 787s, need the plane desperately in order to cut their fuel costs.	
	The 'SODDI' defense: Some other dude did it Boeing blames its woes on a series of unfortunate coincidences that have slowed development: parts shortages and assembly issues with its suppliers, redesigns, and of course, the crippling IAM labor strike late last year. But the truth is that this is a disaster of Boeing's own doing.	
	Once upon a time, I urged <i>Boeing</i> not to make promises it could not fulfill ('underpromise, overdeliver,' I believe is how the saying goes). Yet, since that April 2008 delay (according to <i>The Wall Street Journal</i> , the fourth in what is now a series of six and counting), <i>Boeing</i> pushed back the 787's arrival date in December in addition to the newest delay.	
	Worse still, <i>Boeing</i> admits that it was aware of the 787's structural defect the weakness in the plane's side- of-body near where the wings attach as far back as last month. Yet as recently as last week, <i>Commercial</i> <i>Airplanes</i> CEO Scott Carson was still telling investors that his bird 'could fly today.' A <i>Boeing</i> spokesperson averred by saying <i>Boeing</i> 'truly believed' that ZA001 would fly in June, but that after failing to fix the defect in time, Carson became convinced that canceling the test flight was 'while difficult, the prudent step for us to take.'	
	<u>Red ink, and red herrings</u> No one's disputing that, Mr. Carson. Certainly, your stock would have suffered far worse had you proceeded with the test only to have the ZA001's wings fall off in midair. I shudder to think of the legal liabilities, even lengthier delays in production, and lost sales that such a disaster would have caused. But that's not the point. Nor is the exact severity of the problem.	
	The <i>real</i> point is that you should never have promised us that the plane would be ready by X date in the first

	Even		we had heard recently, including in private	nication
	Disclos		conversations with multiple members of management	
	ed		just last week, we were shocked by this news,' wrote	
	Privatel		analysts Joseph Nadol and Seth Seifman in a research note	
	У		dated June 23. They titled the note, 'Oh no, not again' and	
	"(Andre		concluded that information dissemination is a 'major	
	a		problem' at Boeing. 'The structural issue that has	
	James)		caused the latest delay cropped up several weeks ago,	
			but there was not a hint of concern about it as	
1			management continually highlighted the impending	
			first flight, including last week at the Paris Air Show	
			both in public and in private,' they wrote.	
			'Management acknowledged on the conference call	
			that it discovered this issue last month but noted it only determined last Friday that it would cause a delay to	
			first flight. We believe that had management been	
			more up-front about this situation, perhaps the modest	
			level of credibility on this topic it had started to re-	
			establish over the past several months could have been	
			sustained.' Later, they add, 'We had expected further	
			problems with the 787 to materialize, but we were	
			thinking about Q4, and this press release came as quite	
			a shock.' They also mention that 'Boeing's need to	
			cancel first flight so close to the deadline also raises	
			questions about what other issues might crop up,	
			particularly since static testing is not yet complete.'	
			Dreamliner issues aside, the analysts also predict that	
			Boeing's 2009 and 2010 earnings should take a hit. Boeing	
			has said that the cost of reinforcing the 787 is negligible.	
			But the analysts expect further costs related to Boeing's	
			money losing 747-8 program and slimmer margins on	
			Boeing's other airplane programs. The J.P. Morgan report prompted a story in The Wall Street Journal about	
			Boeing's 'communications woes. ' The delay 'exposed	
			flaws not only in the plane's design, but also in the	
			company's lines of communication internally and with	
			business partners, investors and the public,' Peter Sanders,	
			of the Wall Street Journal, said. Doug Harned, aerospace	
			analyst at Bernstein Research, is quoted in the story as	
			saying, 'During the last two years some investors	
			described optimistic statements by management as	
			misleading. On the contrary, we saw the answers as	
			honest, which is the heart of the problem. Management	
			appears to have been operating without adequate	
			visibility into the details of program performance in	
			the 787 organization and at suppliers.'	

				Stock fallout J.P. Morgan did not downgrade its evaluation of Boeing's stock, instead it kept it at 'neutral.' But two other firms downgraded their expectations for Boeing shares. Analyst Myles Walton of Oppenheimer & Co. downgraded the stock to 'underperform.' He said in an investor note that he is concerned about falling demand for new aircraft and product development risk. And Morgan Stanley analyst Heidi Wood reduced her profit estimate for Boeing and cut her rating on Boeing's stock to 'equal weight' from 'overweight.' 'We believe first flight is three to six months further out which at a minimum pushes out a 787 relief rally we thought possible by the same time frame," Morgan Stanley said in a research note. Morgan Stanley expects 787 first delivery to be pushed to 2011."	
25 June 2009	The Guardia n, "Dream liner Delay adds to Boeing' s Long- term Woes" (Kyle Peterso n)	Firm	α	"Boeing Co has been pummeled this year by economic weakness and Pentagon budget cuts factors well outside the company's control but Boeing has no one to blame but itself for the biggest threat to its long- term outlook. The world's No. 2 planemaker this week said it would delay the first test flight of its 787 Dreamliner, the carbon-composite plane that promises to usher in an era of lighter, more fuel-efficient planes. Unlike previous delays that put the aircraft two years behind its original schedule, this one results from a structural flaw and not from supply-chain or labor problems. 'There's a whole bunch of setbacks, concerns and unfortunate events, and then one very big area of focus that kind of puts the others in the shadows,' said Richard Aboulafia, an aerospace expert at the <i>Teal Group</i> . 'It really is about the 787,' he said. 'This is something they're doing, and not something that's being done to them.' Customers with Dreamliner orders were disappointed by the latest delay. And experts wondered if cancellations might follow. Such a turn of events could take a toll on the company, which already has suffered its share of bad luck. 'We have been anticipating the 787 delivery, so it really is disappointing if our delivery schedule will be pushed back,' said a spokesman for <i>Japan Airlines Corp</i> on Tuesday. 'Someone could definitely make the argument that we're at the trough,' said Alex Hamilton, aerospace analyst at <i>Jesup & Lamont Securities</i> . 'The orders were so abysmal (this year) it's going to be pretty hard for them to get worse.' Boeing shares have fallen 5 percent since Tuesday, when Boeing announced the 787 delay. But the stock has dropped some 60 percent since October 2007, the year in which Boeing saw a record number of net orders 1,413. The number fell to 662 in 2008. Hamilton said that because the stock tends to track aircraft orders, investors are looking for signs of improvement in the financing markets and signs of stability in the order book.	On the media's percepti on of endogen ous vs. exogeno us factors in the perform ance in a modular enterpri se architec ture.

					away. Those with later delivery schedules said the latest	
					hold-up, announced Tuesday, has forced them to postpone	
					planning. 'It is a big problem for us,' said Frank Pray,	
					chief executive of AWAS Aviation Capital Ltd., a big	
	÷.				leasing company in Dublin that has six 787s on order and	
					had expected its first deliveries next year. 'As a lessor, we	
					are highly reliant on being able to place the plane.' The	
					Dreamliner-related disruptions, meanwhile, are helping lift	
					the market value of a rival: the Airbus A330. Lessors	
		3			holding A330s, made by European Aeronautic Defence	
					& Space Co.'s Airbus unit, are benefiting from firm	
					demand, even as a slump in air travel has eroded the	
					overall market. Aircraft lessors make their money	
					primarily by buying large numbers of planes at far	
					below list prices, and then renting them out to carriers	
					at profitable rates. Until recently, leasing companies	
					that placed early orders for Dreamliners were	
					positioned to charge airlines premium rents for the	
					sought-after planes. Boeing says the Dreamliner will be	
					20% less expensive to operate than existing models like	
					the Airbus A330. The Dreamliner was originally slated to	
					be delivered in May 2008. As recently as last week,	
					Boeing said that the plane would start test flights by June	
					30, and that the first commercial delivery, to Japan's All	
					Nippon Airways Co., would take place by April 2010. But	
					on Tuesday, <i>Boeing</i> said it wouldn't meet that timetable	
					due to structural problems discovered during ground	
					testing. That marked the sixth delay in the Dreamliner	
					program's six-year history. Boeing said it would	
					announce a new schedule in coming weeks, but the delay	
					has put existing lease contracts for the new jet into	
					question and interrupted lease negotiations with airlines,	
					lessors say. 'It is hurting our planning and talks with	
					potential customers,' said an official at a small leasing	
					company. 'It's all getting terribly complicated.' Another	
					lessor, Aviation Capital Group, a subsidiary of Pacific	
		1			LifeCorp, has five Dreamliners slated for delivery far into	

28 June 2009	Seattle Post- Intellige ncer, "Predict ion: First Deliver y of Boeing 787 will Push Until 2011" (Andrea James)	Heidi Wood, analyst , <i>Morga</i> <i>n</i> <i>Stanley</i>	Firm- Investo r; Firm- Gover nment	α	the production run. Partly due to uncertainty around delivery dates, it has 'deliberately held off any advanced discussions with potential lessees,' said Executive Vice President Richard Cherney. He said ACG will probably keep waiting 'until we have a better understanding of when to expect our aircraft.' Still, Mr. Cherney said, he is 'fully confident there will be solid demand' for 787s when they do arrive. Though <i>Boeing's</i> contracts call for it to compensate buyers of the Dreamliner for delivery delays, the hold-ups are taking some of the shine off the model. This year, buyers have canceled at least 73 Dreamliner orders. Gary Liebowitz, an equity analyst at <i>Wachovia Capital Markets</i> in New York, who tracks the aircraft-leasing industry, said 787 prices and lease rates also are likely to have slipped. 'The 787 was generating a premium price 12 to 18 months ago, but that's probably gone now,' he said. One relatively bright spot for lessors has been the <i>Airbus</i> A330. Lease rates for the A330, which first flew in 1993, have fallen as much as 15% over the past year due to the decline in air travel, said Mr. Liebowitz at <i>Wachovia</i> . Their asset value on lessors' balance sheets has declined as much as 20%. But, said Mr. Liebowitz, 'They would have dropped more if the 787 had been delivered on time.' <i>Virgin Atlantic Airways Ltd.</i> , which ordered 15 Dreamliners in 2007, said Monday that to tide it over until it starts receiving them, it will take 10 A330s for delivery over the next two years. Duch lessor <i>AcrCap</i> <i>Holdings NV</i> will provide financing for the six A330s the airline is buying from <i>Airbus</i> and will lease the other four to the carrier." "Last week, <i>Boeing</i> said that it would push back first flight of the 787 for an unknown amount of time, which shed doubts on whether <i>Boeing</i> would be able deliver the 787 in the second quarter of 2010 as promised. At least one analyst says that the first customers may have to wait yet another year for <i>Boeing's</i> all new 787 Dreamliner, which is already two years late.	On the investor s relativel y late, yet systema tic concern s of a modular enterpri se architec ture's executio n

	Posted by unregistered user at 6/28/09 5:52 p.m. "Boeing got a free pass from Wall St for a long time. That pass has now been withdrawn under the crushing weight of missteps, misstatements, evasiveness and now, outright lies. No amount of slick PR will overcome the sentimate, though I'm sure Boeing PR will give it herculean effort at McNerney's direction. Boeing can now look forward to a lot of completely justified cynicism from the financial community. A house cleaning is way past due, and shows no sign happening any time soon. The board of directors has utterly failed in it's duties, preferring to leave execution of the business plan to those with a proven track record of failure to perform. If MS is correct, there will be little to no revenues coming in from 787 before the bulk of Boeing's corperate debt comes due, forcing them to re-finance it at soon to be higher interest rates, and most likley having to engage in more bond sales, taking out new credit lines, and eliminating the dividend. The buyback is already gone, after years of Boeing having re-purchased it's own stock at vastly over valued prices. The company need fresh executive talent, and sooner than later."	
	Posted by unregistered user at 6/28/09 5:56 p.m. "It light of yet another snafu by management. I propose an employee buy out of <i>Boeing</i> and sacking of those Bolsevicks that run the company. I have no doubt whatsoever that an ESOP is the only way for <i>Boeing</i> to survive as an independent company."	
	Posted by gimmeabreak at 6/28/09 11:03 p.m. "McNerney is a fraud who is real good at artificially inflating stock values for awhile without adding any value to the underlying company itself (see 3M). Who else but McNerney could have the market handed to them on a silver platter by such an inept competitor as Airbus and STILL manage to screw up so spectacularly?"	
	Posted by unregistered user at 6/29/09 3:50 a.m. "I've said tis before and I will say it again. Boeing's 787 will not fly and will not ever. Boeing will end up scrapping this program which will trigger Boeing's demise."	
	Posted by J3 at 6/29/09 5:49 a.m. "To me the question for historians now and in the future is, How in detail, by what process, did <i>Boeing</i> management actually make its initial 787 decisions that have now proved so disastrous? Those decisions were to	

				make an all-composite plane construced using autoclaves	
				to defeat the A332, with major parts designed and	
				produced by partners around world, without active	
				supervision by Boeing, so that Boeing did not even know	
				in advance that the first fuselage sections it would get	
				would be short about 30,000 parts not the 1200 it	
				anticipated (last according to Mike (where is he now)	
				Bair). It is now clear that this business plan was	
				fundamentally flawed in virtually every way, including	
				perhaps most importantly the unverified assumptions	
				that composites would substantially reduce weight and	
				that new engines would produce fuel savings that GE	
				and RR so far have not achieved. The 787 is now so	
				overweight that it is unlikely that Boeing will ever be	
				able to achieve the weights it promised to customers, so	
				that there may in the end be no advantage to the	
				composite construction after all. Airbus is now	
				beginning to suggest that its new higher MTOW 332	
				(which Turkish Air Lines just bought), will perform	
				about as well as the overweight 787-8. Airbus has wisely	
				kept production rates high to meet the cascading	
				demand to fill the delivery gap for the 787-8, or,	
				increasingly likely, replace it. If the 332 is about as	
				good and the 787-8, airlines will line up to buy it	
				because it is cheaper and they will get it on time.	
				There are real signs the Boeing Comm. 'Planes is	
				collapsing under the pressure of not being able to build	
				the 787. AB got \$6B and \$6B Mous at Paris and Boeing	
				got almost nothing. No new 777 orders, no new 787	
				orders. Just a couple of 737s. Who could have predicted	
				this at Farnborough a year ago? Qantas has cancelled -8s	
				and Branson has excoriated <i>Boeing</i> and its unions for not	
				delivering on time. Flightblogger reports Branson is	
				negociating for 50 A350s. If that happens, <i>Boeing</i> loses its	
				fifteen 787-9s. At Paris, <i>Qatar's</i> chief raged against	
				Boeing. If he dumps his 60 787s, many will follow and the	
	5				
				plane will be the Boeing Com 'Planes because AB will	
				dominate the most lucrative markets, wide body 200-	
				350 seats, with the 332 and 333 and the A350-800-1000,	
				and <i>Boeing</i> will have no money to build a new competitor	
				in the 200-300 seat range or a new plane to replace the the	
				737. Regarding Alan Mullaly, it is way to early to	
				canonize him because he was deeply involved in	
				making the fundamentally flawed decisions that are	
				now destroying the 787, and possilby Boeing as a	
				commercial plane producer. Perhaps he did not leave	
				Boeing because he lost its presidency. Maybe Mullaly	
				forsaw all these problems and used McInterney's	
				appointment as a great chance to get out of Boeing	
				while the getting was good."

Daniel	clear. 'We want to discuss compensation, but Boeing	
Michael	hasn't opened the books,' said an official at one	
s)	Dreamliner customer. Already, the delays have cost	
	Boeing millions of dollars in penalties and concessions	
	to customers. 'Our focus is always on our customers	
	and as we've done throughout the development	
	program, we will work closely with them regarding the	
	program and the impact of this issue,' says a Boeing	
	spokesman. Even before the recent delays, some airlines	
	were getting frustrated with Boeing's frequent schedule	
	changes. Akbar Al Baker, chief executive of Qatar	
	Airways, threatened to cancel orders for both 787s and	
	larger 777s, which are now in production, because of	
	disruption caused by problems at <i>Boeing</i> . 'Boeing doesn't	
	realize how much they're hurting their customers' plans,' Mr. Al Baker said at the recent Paris Air Show.	
	<i>Qatar Airways</i> has firm orders for 30 787s and options for	
	30 more. The first were due for delivery in 2011 but that	
	arrival date is now uncertain. Actual cancellations are	
	rare, but last week Australia's Qantas Airways Ltd. said	
	it scratched orders for 15 787s and delayed deliveries	
	on 15 others slated to arrive in 2014-15. Qantas	
	which remains the largest Dreamliner airline customer	
	with 50 planes still on the books had some leverage to	
	cancel because of its large number of orders, industry	
	observers say. For Boeing, the cancellations have a	
	silver lining. The jet maker now has a little more	
	breathing room it can use to fill remaining orders more	
	quickly, thereby avoiding some penalties. 'From	
	Boeing's perspective, that's not necessarily bad news	
	when you have a rollout going this poorly,' says Peter	
	Barlow, an aviation attorney with Smith, Gambrell &	
	<i>Russell LLP.</i> 'The way purchase agreements are drafted, a savvy purchaser will obtain daily damages,	
	and if a plane isn't delivered on time, the customer	
	receives a daily penalty [from the manufacturer] that	
	can be a very big number.' Though the 787's list price	
	is roughly \$178 million, customers typically receive	
	discounts. The price negotiated at the time of the order	
	is rarely the price paid when the plane is delivered	
	years later. Typically, customers make 'pre-delivery	
	payments' every six months, beginning about 18	
	months prior to delivery, that amount to around 30%	
	of the total purchase price. Payments often escalate as	
	the delivery date approaches, says Mr. Barlow.	
	Everything in that process is negotiable, Mr. Barlow	
	says.	
	Several carriers, including Air New Zealand Ltd., British	

29 June 2009	Seattle Post- Intellige ncer, "Could Boeing' s 787 Cancell ations be Good News? Actuall y, Yes" (Andrea James)		Firm	α	 Airways PLC and Virgin Atlantic Airways Ltd., are coping with 787 delays by ordering current-model planes from either Boeing or Airbus, a unit of European Aeronautic Defence & Space Co. Virgin, for example, last Monday announced an order for 10 Airbus A330s, which are slightly larger than Dreamliners and not as cutting-edge, but are available next year and in 2011. 'We weren't prepared to have six years of no new aircraft being delivered,' said Virgin spokesman Paul Charles. He said Virgin is still talking to Boeing about compensation. 'We would like to see the compensation reflect the ongoing delays,' Mr. Charles said.'' "Last week, Boeing lost an order for 15 of its 787 Dreamliners an order worth \$3 billion. This is decidedly not good news. And there you have it. Boeing has somehow managed to engineer two pieces of bad news into a sliver of relief with the following equation: (development delays) + (canceled orders) = (reduced penalties)." Posted by unregistered user at 6/29/09 9:42 p.m. "What would be 'more effective' Public Relations and Executives? · · · ·		with The constriction memory for months gives	instance
		said. The acquisition, rumored for months, gives Boeing full control over a weak link in a global supply	inetegra
		chain stretching from Japan to Italy that the aerospace	enterpri
		giant assembled to design and construct the new plane	se
		and to lower its development costs. Once the deal	architec
		closes during the third quarter, <i>Boeing</i> will take over plant	turee.
		operations with an eye to speeding production. It had	turee.
		aimed to churn out 10 Dreamliners per month by 2012.	
		But after a series of delays, most recently for structural	
		problems disclosed in June, <i>Boeing</i> almost certainly has to	
		form a second production line for the 787, which is	
		assembled at its giant plant in Everett, Wash. 'Before, [a	
		second production line would have been nice. Now it's	
		mandatory,' said Paul Nisbet, aerospace analyst with JSA	
		Research. The Vought factory could serve as an	
		assembly line for the 787-9, the next version of the	
		plane, far removed from the Everett plant, where	
		worker-friendly laws and the deep-rooted labor	
		tensions have contributed to a series of strikes, most	
		recently last fall. 'A purchase of the facility could kill three birds with one stone' perospace analyst losenh	
		three birds with one stone,' aerospace analyst Joseph Nadol of <i>JPMorgan</i> said Monday in a research report,	
		'enabling <i>Boeing</i> to reduce 787 supply chain risk,	
		giving it a head start on some of the investment	
		required for a second 787 line, and providing it with	
		the opportunity to diversify its commercial aircraft	
		assembly operations outside of Seattle.' Proulx said	
		Boeing hadn't decided whether it would open a second	
		assembly line. But <i>Boeing appears to have paid a large</i>	
		premium to gain the factory from <i>Vought</i> and its	
		private-equity owner, Carlyle Group, at a time when	
		the planemaker's cash reserves are shrinking. <i>Boeing</i>	()
		held \$4.24 billion in cash as of March 31, down 45	
		percent from year-earlier levels, and faces penalties	
		from angry 787 customers and demands for cash	
		advances from suppliers. In 2008, Boeing paid \$55	
		million to acquire Vought's 50 percent stake in Global	
		Aeronautica LLC, a joint venture that joins fuselage	
		sections on the new jets. And <i>Boeing</i> would have faced	
		pressure to pump more money into Vought had the two	
		remained partners, Securities and Exchange	
		Commission filings show. Like most major Boeing	
		suppliers, Vought wouldn't have fully recouped its	
		costs for materials and production until the 787s are	
		delivered to airlines. The first Dreamliner was	
		supposed to be given to All Nippon Airways in May	
		2008, but may not arrive until 2011, analysts predict.	
		Vought had \$165.4 million in cash as of March 29 and	
		warned in its quarterly financial statement that it	
		anticipated it would need more funding from Boeing or	
		other sources 'to continue our participation in the 787	
		program.' From the outset, Vought had struggled to	
		keep pace with Boeing's aggressive production	
		schedule for the 787 and to meet its exacting standards.	
		Aviation analyst Richard Aboulafia said Vought had	
		the engineering know-how, but lacked the resources of	

					the aerospace conglomerates anchoring Boeing's	
					supply chain to resolve the design and production	
					problems that come with a ground-breaking aircraft.	
					'The chain broke pretty much where you'd expect it to	
					break,' Aboulafia said."

	c Gates)	State			Gov. Chris Gregoire said Boeing Commercial Airplanes	10001.
	(Gales)	Repres			CEO Scott Carson told her recently the company is	
		entativ			seeking a long-term no-strike agreement with the	
1		e; Chris			Machinists union. Carson also said <i>Boeing</i> will likely make its decision on the location of a second 787	
		and the second se				
		Gregoi			production line this fall, though Gregoire said he did not	
		re,			specifically link the two elements as an ultimatum. What	
		Washi			the politicians seem to envision is some kind of 'social	
		ngton			contract' with the union in which Boeing would	
		Gover			publicly commit to stay in this region in exchange for	
	l i i i i i i i i i i i i i i i i i i i	nor;			labor peace. Concern about the location of a second 787	
		Scott			line has intensified with news that Boeing is buying the	
		Carson			Charleston, S.C., plant of 787 supplier Vought Aircraft	
		, CEO			Industries. Dicks, the third-ranking member of the	
		Boeing			House Appropriations Committee, is an aggressive	
		Comm			lobbyist for Boeing on issues such as its bid for the Air	
		ercial			Force refueling-tanker contract and is close to the	
		Airpla			company's leadership. He said the ultimatum was laid	
		nes;			out for him and other members of the congressional	
		Jim			delegation by 'high-ranking people in the Boeing	
		McNer			Company' whom he declined to name. Dicks also said	
		ney,			that at a March meeting with Boeing CEO Jim McNerney,	
		Chair			arranged by Gregoire and held in the Washington, D.C.,	
		man			office of Sen. Patty Murray, 'McNerney was very	
		and			candid.' 'The message was that we need to get a	
		CEO,			resolution of this (strike) problem. We can't live with	
		The			this.' Both of Washington's U.S. senators and most of its	
		Boeing			representatives were present, Dicks said, as McNerney laid	
		Compa			out how Boeing plans to do a detailed assessment of where	
		ny;			to put a second 787 assembly line in an open competition,	
		Tom			with Everett as only one option among several. Rep. Jay	
	9	Wrobl			Inslee, D-Bainbridge Island, said McNerney made clear	
		ewski,			that 'the relationship with the labor community,'	
		IAM			particularly the question of strikes, 'was a major	
		district			component of the decision.' The International	
		Preside			Association of Machinists (IAM) has struck the company	
		nt;			four times in seven sets of contract talks over the past 20	
		Tom			years, most recently for two months last fall. Its contract	
		TOM			years, most recently for two months last ran. its contract	

Buffen	expires in 2012. Boeing spokesman Jim Proulx said the	
barger,	company 'can't comment on any conversations our senior	
IAM	executives may or may not have with government	
interna	officials.' Gregoire said the time frame offered by Boeing	
tional	for a decision on a second 787 line has moved around	
preside	somewhat this year. Initially it had been set for the spring,	
nt	then shifted to early 2010, before moving again to	
	'sometime this fall.' Before the decision is made, she	
	intends to go to Chicago to make the case for the Puget	
	Sound region before Boeing's board. Gregoire described	
	Boeing's goal of a no-strike agreement with its union as	
	ambitious, noting that it's something politicians cannot	
	achieve by legislation. It's up to the two sides to	
	negotiate it, she said. 'This is such a huge ask of the	
	Machinists,' Gregoire said. 'The idea of labor giving up	
	the right to strike is a huge issue for them. There has to	
	be something on the other side equally compelling. The	
	magnitude of this is really challenging.' Snohomish	
	County Executive Aaron Reardon said Boeing's legislative	
	agenda and its drive to improve the state's business climate	
	are now secondary to 'a resolution of the differences	
	between the union and the company.' Dicks said any	
	overarching no-strike agreement would have to involve	
	some kind of binding independent arbitration of	
	disputes between management and union. But IAM	
	district President Tom Wroblewski balked at the idea	
	of setting aside the union's strike weapon. 'Take away	
	our only power?' Wroblewski asked rhetorically. 'I	
	can't see ever taking our power away.' There have not	
	yet been any deep discussions on the subject, he said. 'If	
	we were to have these discussions, the company would	
	have to come through with something, guaranteed	
	employment of some sort,' he said. 'The trade-offs	
	would be huge.' Dicks agreed. 'This is a two-way	
	street,' said Dicks. 'I've urged the <i>Boeing</i> leadership	
	that there's got to be give on their side.' Yet Tom	
	Buffenbarger, IAM international president, said if <i>Boeing</i>	
	wants to talk about a social contract, 'the union's ears	
	are always open. Talk to us about it.'	
	How practical is Boeing's threat to build a second 787	
	production line elsewhere? Building one in Charleston	
	would take a big investment by <i>Boeing</i> and other	
	partners. Not only would a new assembly plant have to	
	be built, but also a costly and technically complex paint	
	hangar. And suppliers such as <i>Goodrich</i> , which makes	
	the engine pods, and <i>New Breed</i> , which delivers all the	
	small parts to the line, would also need adjacent	
	facilities. Buffenbarger believes it wouldn't make	
	financial sense. 'Given the country's economic condition,	
	it would be hard for <i>Boeing</i> or any company right now to	
	make the investments needed to put Charleston in the	
	realm of a first-class aircraft-assembly site,' he said. And	
	apart from that infrastructure, he said, 'It takes a trained	
	work force, and one that's developed over years and	
 	not over weeks or months.' The union will have to	

8 Foo July m 2009 "Ba r C 'She igan on <i>Boe.</i> (Ric Smi	nke Calls nan s' <i>ng"</i> 1	Firm- Investo rs- Custo mers- Suppli ers	α	decide whether Boeing's ultimatum is serious or a bluff. 'It's poker,' said John Monroe, a former Boeing executive who now consults for the Snohomish County Economic Development Council. 'It's a hell of a risk. We're talking thousands of jobs and billions of dollars. It's high stakes.'" "Boeing investors are finding it harder and harder to get a good night's sleep which is my clever way of saying that additional delays seem in store for the airplane maker's already-much-delayed 787 Dreamliner. To hear Boeing tell it, multiple complications with getting the new plane airborne will not prevent deliveries beginning in Q1 2010. Such assurance may please customers like AMR (NYSE: AMR), Delta (NYSE: DAL), and Continental (NYSE: CAL), and prevent their cancelling orders as Qantas did earlier this month. It may even incline investors to sigh with relief that the worst is over. It isn't. According to a report just out of Broadpoint AmTech, Boeing's Q1 2010 deadline is a pipe dream. Whereas the aerospace giant believes it can rush its 787 through FAA certification in as little as eight months, Broadpoint believes the FAA will still be poking around the 787's innards a year from now. This, plus	On a systemi c market valuatio n of a non- systemi c modular enterpri se architec ture.

		COO,		publicly a year later that the first aft fuselage barrel	infallibi
		Airbus		was only 16% structurally complete at the time of	lity of
				shipment to Everett. At the time the roll out festivities	"the
				came to a close, August 27th was the target for first flight,	architec
				one month and 18 days later. What followed is well	t" and
				documented. Almost exactly two years later, Boeing	the
				Commercial Airplanes CEO Scott Carson said	fallibilit
				assuredly to the gathered crowd of reporters at the	y of the
				Paris Air Show: 'We remain absolutely committed to	system
				our forecast that it will fly in the second quarter of this	below
				year. If you count the way I do, that means within the	it.
				next two weeks roughly.' Carson would also later tell	
				CNN at the show, 'The technical issues are largely all	
				behind us.' Just over a week later, Boeing revealed the	
				extent of the weakness in the wing to body join. Yet, in	
				that statement, there lies a question of how it got to	
				that point? How could an executive near the head of a	
				Fortune 50 company make such a statement? Was it	
				just a breakdown in communication? Or something	
				more telling about the state of the program? The	
				information, or the gravity of the information, didn't	
				flow where and when it needed to. Mr. Carson, in	
				responding to questions on the delay announcement said:	
				'When we were at Paris last week we had been through the	
				preliminary analysis of the data and were of a mind that	
				the airplane could enter flight test with a credible flight	
				test envelope as we worked relatively minor modifications.	
				The work done by the team through the week last week	
				narrowed the envelope to the point where on Friday we	
				determined that to fly would be such a small envelope for	
				us that it would be an interesting exercise in having the	
				airplane in the air but not particularly useful in terms of	
				preparing the airplane for certification. So at that point is	
				when we made the call to delay the process, identify the	
				fix, test the fix, install the fix, and then enter a flight test	
				program that is fully robust.' A program built on global	
				transparency did not live up to its own early expectation	
				and the lessons continue to be manifested in changes like	
			1	and the lessens continue to be mannested in changes like	

			the 50% acquisition of Global Aeronautica in March 2008	
			and the establishment of the Production Integration Center,	
			a mission control nervous system for the global supply	
			chain that became operational in December 2008, and	
			most recently this week with the Vought South Carolina	
			buy out. Many program sources have suggested	
			privately that as <i>Boeing</i> has improved its visibility	
			outward, it still struggles with communicating with	
	1 × 1			
			itself. Good news flows freely to the top, yet the bad	
			news is not elevated to an appropriate level. They talk	
			of a 'kill the messenger' culture has established itself	
		1 1	inside the program, where the push to move ahead and	
			show marked progress is often in conflict with	
			requiring the often uncomfortable task of ensuring that	
			'power' has 'truth' in its hands to make good decisions	
			and communicate progress outwardly. During my time	
			in Paris, I received a message from South Carolina on	
			Tuesday morning that told of 'emergent first flight issues'	
			with no other details available. Another message from	
			Washington, just a day later suggested a rumor about	
			possible delamination in the wingbox stringers, but the	
			source added, 'it is just a rumor to my knowledge.' From	
		1 1	the point of view of covering the program, those rumors	
8			were almost impossible to substantiate. Separating the	
			wheat from the chaff, takes a fine tooth comb that appears	
		1 1		
			much more difficult when nine time zones away. Yet, if	
			this outside observer could know of these two hints a	
		1 1	week before the delay announcement, how was this

A 2006 speech by Boeing CEO James McNerney given in the wake of the US Air Force tanker scandal tackled this culture head on: 'So then we had to ask ourselves some really tough questions: Were these lapses symptomatic of a larger issue with our corporate culture?...Did our people feel confident enough to speak up about ethical concerns without fear of retaliation?' McNerney discussed the solution to the problem: 'To make sure everyone understands this, I think that you have to create a work environment that encourages people to talk about the tough issues--business- or ethics-related--and to make the right decisions when they find themselves at the crossroads between hitting their numbers for the quarter and stepping forward when there's a problem.' Boeing should ask itself if McNerney's vision has yet to become a reality."

By Trapperpk on July 9, 2009 6:31 PM

"Jon, By the way, 'the emperor has no clothes' is common condition in corporate America. A Corporation's communication flow tends to filter critical data upward to protect programs and its leadership from the appearance of (actual)incompetance. The emperor is last to know about the naked truth and its embarisment. Usually this discovery is accomplished after speaking to large crowds in bold tones. Somebodies gettin wacked! Ouch!"

By Jery1t on July 9, 2009 7:14 PM

an excellent and appropriate "Jon, This is commentary.and It is written with balance and thoughtfulness. I am very pleased that you made these thoughts public as they are expressed in many blogging forums with more anger and criticism. I was outraged at the way Boeing handled this cancellation. These last minute problems may well be a part of the process but Boeing's record has been so blemished from the past that this call just seems to be a continuation of poor communication and credibility. There is something flawed in the reasoning that two days before the call, there was still a possibility of it flying. It indicates a rushed finish, an incomplete total diagnosis and promises that should never have been made.. One wonders whether Scott Carson and Jim McNearny are capable of changing the way this Company communicates and whether they are capable of being the leaders they are hired to be. They are now trapped by their own lack of credibility and have brought another cloud over this Company"

By The Big Question on July 10, 2009 3:05 AM

"I would love for someone to ask Mr. Carson if he is incompetent or a liar. Based on the happenings of the last month, he has to be, in my eyes, either one or the other."

By Pointman on July 10, 2009 3:46 AM

	"My question is' 'What is so different with the 787 as compared with other new technical marvels <i>Boeing</i> has achieved in the past- delivered on time with the 707/737/747/777 models?' From it's creation the 787 program has gone out of it's way to be 180 degrees opposite to every successful <i>Boeing</i> legacy manufacturing process. The 'New Breed' at <i>Boeing</i> expecting to put a revenue aircraft into the air using untested materials, partners, technology, drawings, managers, all at once was fantasy at best. This is the only program I know of where management failure is rewarded by promotion and bonus. Now we are 2 years and countingand the excuses keep coming."	
	By JR on July 10, 2009 10:00 AM "Boeing upper management is still running around in their little glass bubble oblivious to what happens down on the shop floor. Hiding in an office disconnected from 787 reality is nuts! It's time to leave your over stuffed suits in the closet. get down on the floor, out on the flightline and get to know every engineer, inspector, supply clerk, mechanic, truck driver right down to the janitors. It's 'OK' to reach out and put a finger on the pulse and yes it's 'OK' to listen! All the 787 problems just didn't pop up over night Boeing Upper management preaches one type of culture for the employees but yet there is a whole different culture that exists in the upper management structure. I keep hearing upper management running their lips tell the customers, press and the share holders the ship is finally sailing into smooth waters. The truth of the matter (and they know it) is, while they run their lips, the ship is sinking under them! It's time for a changeUN-STUFF THE SUITS!"	
	By eddietsunami on July 10, 2009 1:00 PM "Unfortunately, I have to agree with the poster who said that people in management (if they are indeed that out of the loop), have to be clownishly incompetent or huckster/liars. I am afraid it is the latter. The fact the first plane was a Disney-prop of incompleteness points this out. In my opinion this was un-ethical and stock manipulation to roll-out something so phony and misrepresented. It gave people the false hope that the scattered-all-over-with-no-control supply chain would actually work. With the purchase of <i>Vought</i> it becomes clear now, even from Scott Carson's own mouth, talking about 'efficiencies', that the outsourcing at all cost model is a historic failure. Even if the plane flies tomorrow the billions that have been lost, the lost deliveries, the time and technological advantage over <i>Airbus</i> that has been squandered, will never be able to be replaced. The purchase of suppliers now is damage control. The person who spoke of the 'emperor with no clothes', yes, that is exactly the nick name the moving line has been given. The purchase of <i>Douglas (Boeing</i> lost	

billions), the moving line (no one will speak on the record of the real cost), and now the great albatross of the 787. Sadly, the only way for someone above the level of the hundreds of vice presidents at *Boeing* can lose their job is to screw their secretaries. Simply doing a really, really poor job is not enough to be fired. Incompetence is sometimes transferred and usually covered up, and somehow described as a retroactive success (as buying *Vought* is now). There is no accountability at the top. The only people who truly care about the companies' long term success are those most personally invested in it, the longtime employees. Not the Johnny come latelies like McNerney that have no ties to the community or the company or its grand history."

By iloj on July 10, 2009 1:15 PM

"It comes down to two pssibilities: 1) *Boeing's* leadership is lieing, or 2) *Boeing's* culture does not promote truthful communications to leadership. The bottom line is that the company leadership sets the culture! Either way, the credibility and responsibility belong with *Boeing Commercial Airplanes* CEO, Mr. Scott Carson. Changing 787 program leadership (again) is not the solution - the responsibility is solely Mr. Carsons."

By Mel on July 10, 2009 1:24 PM

"As a supplier to the 787 program. I see a problem that hasn't gotten a lot of press. The partner model is seriously flawed. In the perfect world, each parner performs their tasks in lockstep with the others analogous to a rowing team. The reality is that each partner is lashed to its own suppliers in a sort of three legged race against the other partners. The problem is that no one wants to win - everyone wants to come in second to last. Losing, or being the one holding up the schedule, draws international embarrassment, so no one wants to lose. But, completing the assigned task more than a week or so before the slowest partner means holding very expensive (Smillions) inventory. This has created a stage for all sorts of theatrics. The partners can see, often more easily than Boeing managers, who is going to be holding up the program (keeping in mind that this race is like the Tour de France, where there are dozens of race segments.) But no partner is going to tell Boeing, 'We aren't going to hit our promise dates because we know that the spoilers will be late.' Instead, they brick wall over a 'spec change.' Or, they tacitly conspire to tangle fastener procurement to the point of non-functionality (FUBAR might be better used here.) Or, they find a Boeing selected single source supplier in their ranks and hobble that supplier so that a delay in the partner schedule is traceable back to Boeing. (The way they do it is like a kid tripping his little brother every time mom looks away and then claiming the little brother

	can't walk.) Boeing managers have dismissed the
	theory because they do not believe that the partners
	are sufficiently clever to perpetrate such schemes. But
	the partners had schedules requiring them to build
	hundreds of millions of dollars worth of assemblies yet
	they knew they wouldn't be paid for months, even
	years. The partners had to figure a way out of that
	trap. The partners resorted to all sorts of shinanigans at the level of the minute details with the ultimate effect
	of deliberately misleading <i>Boeing</i> at all levels. The latest side body join problem may be entirely encompassed
	by <i>Boeing's</i> internal communication loop. But, the entire
	program has been rife with deceptions vigorously
	advanced from low levels at the partners to low levels
	at <i>Boeing</i> over small details. This creates context for
	senior partner managers to rationalize delays to senior
	Boeing managers. The delays appear fixable to Boeing
	management because they are presented as
	quantifiable technical or commercial problems. <i>Boeing</i>
	still hasn't realized that those problems were created
	and have been nurtured as the partners means of
	controlling the schedule and thus, their cash flow. The
	problems won't get solved until the partners decide to
	let them be solved (or Boeing decides to take and pay
	for each deliverable on each partner's schedule.) The
	thing about airplanes is that they don't fly until the last
	bolt is torqued down and the last i is dotted. The devil
	really is in the details. Boeing's internal
	communications are based almost exclusively, because
	of the partner model, on communications from the
	partners. Who knows? Boeing may not be able to
	avoid making garbage out of good information. I do
	know that <i>Boeing</i> is not clever enough to make good information of the garbage that is coming in."
	mormation of the garbage that is coming in.
	By Outsider on July 10, 2009 1:27 PM
	Take it from a former Boeing employee, the culture
	does not let 'truth' rise; rather, what those silly ones at
	the top get is what they deserve, crap. Now, are all
	companies in the military-industrial complex of this type (I
	know, the concept ages me)? Well, I have worked for
	several. For some reason, <i>Boeing</i> is different; I could
	never put my finger on it. But, there was a Tech Excel program developed to allow a way to ascend career-wise
	without going into the monkey-ish stuff (yea, you, Scott
	C). That is, it was a double ladder with supposedly those
	higher up on the rungs of the TE ladder having as much
	authority (over matters, not employees) as did those who
	dance that silly dance the managers are so noted for (when
	will they wake up to the fact that raking in 10s of millions
	(Turner, you, too) doesn't make them successful in any but
	a superficial sense?). Too, one would think that a
	motivation for the program was to allow some people
	(who did not feel it an insult to deal with facts and data)
	actually look at things with proper eyes (not that mind-set
	from the back-slapping hordes - yes, so many of them as to

be very heavy organizationally). We have not heard from the TEs on the 787, that I can remember. So, was the program trashed? Anyway, we have something that we can toast to every year, even when the thing flies. We need LeeLaw to coin something new for us. 'potemkin' is old hat."	
By Uwe on July 10, 2009 2:01 PM "But why does this hit <i>Boeing</i> so much harder than <i>Airbus</i> _the_ long time distributed manufacturer Beyond the basic mechanism is it inability to span differnt cultures or the predominance of 'dumb' non engineering types in middle and upper management? What about the potentialy overreaching contract arrangements pressed through by <i>Boeing</i> ?"	
By Ray on July 10, 2009 2:04 PM "Pay attention kids. This comment: 'By Mel on July 10, 2009 1:24 PM' has more truth in it than a decade of statements by Scott Carson or Jim McNerney. Here's a poli-sci view : <i>Boeing's</i> business model for the 787 was based upon colonial logic. The idea was that the partners and vendors would behave mechanicallydoing precisely what <i>Boeing</i> wanted when <i>Boeing</i> wanted it. However, the colonial model only works if you have the ability to project force and impose your will upon the colonists. If you don't, those pesky colonists will start acting in ways that maximize their self-interest rather than the interests of the colonial masters. We've seen that from A to Z in this programand anyone who spoke the truth to <i>Boeign</i> corporate was punished. Now, there is a bureaucratic battle within <i>Boeing</i> between the McNerney camp who argue that their business model is fine but the execution was badand the experienced technical workforce (including those now in management) who believe the business model is fatally flawed."	
By Uwe on July 10, 2009 2:46 PM "For a change reader comments are a fount of insight. Describing <i>Boeing</i> as colonial is an interesting insight that jibes with my (tentative) assumption of overreach by <i>Boeing</i> in partner interaction. Essentially risksharing partners then are limited to taking a share of <i>Boeings</i> risk plus having to bear their own risk as well. This would explain why the japanese partners have been extremly reluctant to expand production capabilities beyond the initial commitments and why others have an unblemished manufacturing relationship with <i>Airbus</i> . Hubris then lies in placing blame on the partners. Does <i>Boeing</i> have a chance to understand this short term and work succesfully with equal partners on top of the engineering problems (systemic and technical) they are encountering (not only) in the 787 project?"	
Dy 1 ann 01 0 11 10, 4007 3.33 I M	

		claims by the partners of changes to the specs or in the	
		scope of work that require a 'reset' in the contract (a	
		price increase.) I would wager that this cost Boeing	
		tens of thousands of management hours, effectively	
		distracting them from issues related to building the	
		airplane. On the cost side, not only would partners	
		make themselves someone's victim to the effect that	
		their deliveries would be delayed and thus preserve	
		their cash, but also they would 'engineer' shortages of	
		something (engineering, materials, tooling, etc.) to the	
		end of becoming a pacing item in the schedule. Of	
		course, it would be made to look like someone else's	
		(preferably Boeing's) fault but the inevitable result was	
		that Boeing would show up with a suitcase full of cash	
		and a bus load of people to resolve the issue. This	
		approach has saved the partners millions on elements	
		of the program that they had budgeted for at the	
		program's outset. And, as stated above, this all made it	
		impossible for Boeing, management and otherwise, to	
		know what actually was going on. Personally, I have	
		never met a dumb Boeing or partner employee. More than	
		other large companies, Boeing people are remarkably	
		bright, honest, forthcoming and diligent. And, while there	
		were cultural challenges, I think Boeing embraced and met	
		the challenges to the effect of creating an important step	
		toward global harmony. (It doesn't make airplanes fly, but	
		they deserve credit for it.)	
		Net, I think the partner model is flawed logically - the	
		only fix would be to scrap it and try something	
		different. That said, given the partner model, I think	
		the program would be farther along if the program	
		had made its first few deliveries with less than 200	
		airplanes sold."	
		By 787 Accountant on July 10, 2009 7:39 PM	
		"I have seen several versions of 'the emperor has no	
		clothes' or the leadership is just incompetent discussion	
		lines. Maybe the best approach would be to ask how	
		could Carson and McNerney not know? Is there any	
		way possible that they could not know? Brand new	
		employees have visited the 787 line one time and have	
		been able to figure it out. Both Scott and Jim visited	
		the lines many times. For a time Carson was visiting	
		the line weekly. They know the problems and have	
		crafted exactly the system of fear needed to keep the	
		problems hidden, not from them but from the	
		shareholders and valued customers. Every morning	
		our emperors look at their naked bodies (one pasty and	
		saggy, the other artificially tanned) in the mirror and	
		go to work trying to convince people they are clothed."	
		Be and the second second and second	
		By Bull-of-the Woods on July 10, 2009 11:19 PM	
		"With 5-1/2 years of exposure to the 787 program,	
		watching all of the leadership changes (which are	
		many), no one is currently accountable for the current	
		state of the program. All of the people who set-up the	
		state of the program. An of the people who set-up the	

failed business plan and program strategy are gone.	
None are still associated with the 787 program and	
most are no longer at Boeing. See the list below:	
Alan Mulally (now at Ford) sold the 787 design and	
business plan when the Sonic Cruiser flopped. Harry	
Stonecipher (now discredited) was CEo who guided	
Mulally's plans and concepts to get board approval. Frank	
Statkus (retired after many senior management roles at	
Boeing) was VP of Tools, Technology, and Processes.	
Walt Gillette (retired after many Senior Engineering	
Management assignments at Boeing) was 7E7 chief	
Engineer and VP of Airplane Development, 787 Program.	
Mike Bair (still with Boeing) was 7E7/787 Program	
Manager then VP and General Manager, 787 Program.	
Scott Strode (still with Boeing) was 787 VP Production.	
Thus, you can't hang any of the current managers/Senior	
Executives with the core problems caused by the fouled-up	
program structure. Now you may be justified accusing any	
of the current management of being unable to make the	
current program structure function successfully. But, as	
others have stated earlier, this form of outsourcing may	
well be flawed-beyond-all-ability-to-recover (FUBAR).	
In regard to the most recent program slide, I can	
assure you that much of the workforce in Everett knew	
about the wing structure problem in general terms	
within a week of the tests being run. The fact that the	
Senior Executives 'didn't know about them' is	
intentional. If they know of matters of material	
information that can affect investment value (stock	
price) they are obliged to make it known to all – to the	
public. Thus, these senior executives don't want to	
know about big problems until they are fully	
understood and what the impacts may be. Thus, this	
information is closely managed and finessed right to its	
disclosure. Incidentally, that's why <i>FlightBlogger</i> is the	
key source of information for <i>Boeing</i> employees. It's a	
rumor until it's confirmed by <i>FlightBlogger</i> . Boeing	
Management doesn't communicate any better to the	
workforce than they do with the Senior Executives – by	
design I assert. Senior Management has known since	
day one that the Partners were in big trouble in late	
2005. I saw their status charts showing every partner	
with problems and no plan to correct them – a red	
'meatball' as overall status. Boeing people were already	
on site at their facilities propping them up to get them	
started on production. This was common knowledge along	
with the lack of cooperation and communication of the	
partners that had been well established by this time. Do	
you suppose that's why everyone that build this business	
model retired before the fat-went-into-the-fire?	
Hummmmmmmmmmmmmmmmm. So, please blame the	
right people for the mess we have. There is plenty of	
blame to go around to those from the past as well those	
that are currently responsible. It seems that today's	
management model, the so called matrix management	
model (you have two or more bosses) along with the	

rotational management concept, means that there is no one
that is responsible for anything. The day of the 'Buck-
stops-here' is long gone - along with real leadership.
And that's the real issue, with Boeing, Jon - no
Leadership."
Louderonip.
By BlueJ on July 12, 2009 4:22 PM
Jon, Great commentary and blog. As an insider I do not
see all the parts of this problem just my immediate
area. The worst is for all those working directly at Boeing
this is extremely depressing and all the cheer leading
does not go very far. We have wasted so much effort
going through panic slides one month at a time over a 2
year period that even the newbys do not trust the
schedule. To all those that have retired, this is a
different environment. And to think we used to joke
about peter principle, and now we are living it. So with the
new management training, where in this country of ours do
we have good technical leadership? I also have
compassion for those I have worked with that have
retired from management for 'health' reasons,
translate that as stress. The 787 will fly and it will be a
great airplane in service, but not out of the box ."
great amplane in service, but not out of the box.

By TheLastInspector on July 12, 2009 9:10 PM
"Jon wrote: ' <i>Boeing</i> should ask itself if McNerney's vision
has yet to become a reality.'
No one answered Jon's last sentence. The answer is
obvious—'McNerney's vision' as stated above never
became reality. But it was never meant toit was just
tanker scandal CYA talk that the company never
intended to walk. And I can personally vouch that
people who speak up about ethical concerns or internal
Boeing corruption are retaliated against severely. My
case is one of many such examples, albeit one of the
more severe. Boeing SOX IT whistleblowers have been
fired for talking to the press about SOX violations.
People in Boeing's OIG have been fired when they
refused to ignore wrongdoing in <i>Boeing's</i> antithetically
named 'compliance organizations.' So, when people
are retaliated against for reporting lawbreaking within
Boeing to Boeing senior management and/or the press,
then it should not be surprising that the same
executives punish those bringing bad news about
program issues to upper management. The 787
program is perhaps the best example of program
mismanagement. The 'program management' used on the
program was obviously fatally flawed. One comment
that rings of truth above is that these announcements
are not made until the last minute and upper managers
given implausible deniability about having known
about them prior to the announcement to protect the
value of those executive's stock options. Why are
private corporations like Boeing seemingly incapable of
reforming incompetent and corrupt management?
Government moves at exponential speed in reform

comparatively. One group of politicians doesn't work
out and they are replaced the next election at the latest.
Where is such accountability with Boeing
mismanagement?"
By Rebecca Vanderbilt on July 13, 2009 1:31 PM
"Both Jim McNerney and Scott Carson need to be
fired. Especially Scott Carson who has lost complete
control over the flight program. Carson didn't have any
understanding on how airplanes are built. Carson did
not get involve in managing the aircraft development.
This is the single worst delay by BCA. Even 747 had
only a few months day and that was a completely game
changing aircraft with new technology and design.
Telling people that the 787 delay was a result of new
tech does not fly. Why were people in the 60s, without
the aid of current technologies, can build an aircraft on
time? Leadership is a huge issue here. It this is not
resolved, Boeing might as well go under."
By waddie on July 14, 2009 2:07 AM
"I was fortunate to work in product development on many
new airplanes during my career at Boeing. During my
time there, it was populated by very strong technical
people and the top program managers were very
strong technical leaders. There was room for
disagreement and it was recognized as necessary to
listen to disenting view points as long as you had your
technical facts straight. Toward the end of my career,
there were some not so subtle changes occuring. We
had a CEO that was enamored by GE's Jack Welch
and Boeing started getting like GE in their internal
thinking i.e. 'this is the GE position and everybody get
behind it or get out.' Some executive engineering
managers started behaving that way and it there was a
'shoot the messenger' mentality that started to be
exhibited. I once heard a guy that is now CEO elswhere
say to his managment team, 'It all right to bring me news
of a problem but you better have the solution!' Let me
tell you, in airplane development that's a near impossible
task because if you had the solution, you wouldn't have
had the problem to begin with. It was the begining of a
'management by fear' culture. It didn't help when the
merger took place and all the Douglas folks showed up
and displaced long time Boeing people who, by the
way, were the ones that helped put Douglas out of
business. Harry Stonecipher was a fear motivation
manager. Even his old colleagues at GE were glad he was
at Boeing and not there. I'm not saying that Boeing was a
utopia to work at. It was anything but. It was extreemly
competitive. But it was populated by people who loved
airplanes and loved to deign and build them. I
remember during my last months at Boeing, being
interviewed by some 'special task force members' and
being presented with the 'new way' of developing
airplanes with 'risk sharing partners' who were to be

· · · · · · · · · · · · · · · · · · ·		
	responsible for major parts of the aircraft. Boeing would not audit their capabilities to do the job or monitor their work as we had in the past, to 'save money'. I thought it was nuts then and I said so. We had some very strong history that led us to do those things. (Santana said that those who ignore history are doomed by it.) They said that would be the 'new way of doing things'. The development schedules were shorter than we knew were reasonable but they would find a way to do everthing quicker. They didn't know how, but they would. You know, 'now a miracle happens' kind of thinking. Well they did it that way and the 787 Program is the result. I hate like hell to watch the venerable company that I worked for look like a bunch of bumbling clowns. It seems like everyday there's more bad news. There nothing wrong changing the way you develop airplanes IF you have the correct planning to get you to the the delivery date for the customer. But it can't come down to 'a miracle happens!' You have to have the facts and data to know you can do it. To get the facts and data, you have to spend the money developing the processes ahead of time. The program looked doomed to me from the start. The program management for the 787 was wrong from the get go. The guy in charge couldn't hit a bull in the butt with a banjo and to put him in charge of the most complex progam that Boeing ever undertook in commercial airplane development was a plum wrong decision. When the Chief Engineer retired in the middle of the development, it was my first tip off from the outside that Program was going South. It seems like it's gone down hill from there. I guess maybe O! Alan took the Ford job to get away from what started on his watch. He sold the plan to the Board probably under a great deal of pressure from Harry Stonecipher who was CEO by then. As I said, I hate to watch all this happen but it seemed so predictable from the start. Boeing needs to get back to what made them the dominant player in commercial airplane business. Eliminate man	
	undertook in commercial airplane development was a plum wrong decision. When the Chief Engineer retired in the middle of the development, it was my first tip off from the outside that Program was going South. It seems like it's gone down hill from there. I guess maybe Ol' Alan took the Ford job to get away from what started on his watch. He sold the plan to the Board probably under a great deal of pressure from Harry Stonecipher who was CEO by then. As I said, I hate to watch all this happen but it seemed so predictable from the start. Boeing needs to get back to what made them the dominant player in commercial airplane development and manufacturing for over 40	
	technically capable people who understand the airplane business. Eliminate management by fear. Tolerate different points of view when it's backed by facts and data. Audit and monitor subcontractors or partners or whatever the buzzword is for those guys that make the major subcomponents. And honor your commitments both internally and to the end user. <i>Boeing</i> was on the right track with the 777 and they got derailed on the 787. I hope they can get the train back on the track and running in the right direction again. They have the working people to do it but their management leaves some thing to be desired. Thanks for letting me	
	ramble." By Insider on July 18, 2009 9:52 PM

		Douglas's checkered past. The nickel and dimed MD-	systemi
		11 mediocrity, the useless MD JSF competitor, the out-	c
		of-control cost overruns of the C-17, and worst of all,	problem
		the scandalous MD/GD A-12 carrier stealth attack	s.
		plane. The likely (or at least hopeful) scenario is that	
		the 787winds up like the C-17, a nightmare	
		development program followed by an impressive	
		technical achievement and a profitable production	
		phase. But we can't rule anything out. The A-12 is the	
		most haunting extreme outlier: a mere Potemkin	
		Village plane. Those of us at the 7-8-07 rollout wouldn't	
		have dreamt of that comparison at the time. But who	
		knows what to believe anymore? In short, the 787 has	
		become less of an adrenaline rush of optimism, and more	
		of await-and-see story. Boeing's latest delay its fifth	
		and purchase of supplier Vought combine to prove that	
		the company's strategy of saving money from	
		outsourcing work to suppliers 'has been dwarfed by	
		the cost of remedying the damage wrought by that	
		strategy.' 'This is all seriously bad,' Aboulafia said. 'As	
		we digested the news, I paused to reflect on just what a	
		tremendous drug-like rush the 787 program once was, and	
		just what a ghastly let down it has become.' What was	
		supposed to be a category killer has turned out to be	
		even worse than the 'commercially irrelevant' Airbus	
		A380, Aboulafia said. Because, at least the A380 flies.	
		Finally, Aboulafia brings a sense of history to the	
		present: To understand how this happened, you need	
		to look back in time. A grossly oversimplified recent	
		history of <i>Boeing</i> : Twelve years ago <i>McDonnell</i>	
		Douglas effectively used Boeing's money to buy Boeing.	
		This resulted in a struggle between a faction that	
		wanted to invest in <i>Boeing's</i> future (basically the legacy	
		Boeing crowd) and a faction that wanted to invest in Boeing/r shareholdow (beeing/ly the McDerner/l	
		Boeing's shareholders (basically the McDonnell	
		Douglas leadership). The future investment faction won,	
		but at a price: the McDonnell Douglas zombie bit them	
		before it died. To sell the new plane to the board and to	
		investors, they needed to get as much cost and risk as	
		possible off Boeing's books. This resulted in a short-	
		sighted decision to trust enormous parts of the 787's	
		development and integration work to partners, without	
		due diligence to ensure that these partners were up to	
		the job. (Disclosure: I was a big fan of this approach at	
		the time, and I still think production work outsourcing	
		is a good idea.) Finally, the new Boeing also	
		disempowered the company's engineers, turning its	
		back on a decades-old management culture that didn't

"I have said it here before and I will say it again; 'We
told you so!!!' Legacy Boeing employees realized 10
years ago what Aboulafia is realizing now. 'Twelve
years ago McDonnell Douglas effectively used Boeing's
money to buy <i>Boeing</i> .' We were saying the same thing a
decade ago. Harry Stonecipher famously declared that
Boeing, 'was no longer and engineering company',
right before SPEEA went on strike for more than 40
days. SPEEA rightfully declared that they were trying
to save Boeing from it's own mis-management. It looks
like ultimately, they were unsuccessful. And again; I
wish someone would track down those truly responsible
for this mess and bit*h slap both of them; Phil Condit and
Harry Stonecipher. I guess at least Phil can be blamed for
setting the groundwork for the failure of only one aircraft
manufacturing giant. Harry was responsible for destroying
two companies. At least current management is still
following Harry's leadblame a two week strike by the
evil union for 5 different delays over two years. Talking
about covering your incompetent as*!"

"I'm hearing a lot of SNIVELING, here, these miserable
union SOB's cut their OWN throats, JUST like at GM,
demanded too much revenue out of the whole process of
building an aircraft, and the health insurance companies
used the union people to get what THEY wanted too, is
there anyone left at Boeing that enjoys building and flying
airplanes, or are they all just a bunch of corporatized,
bureaucratized, pampered, spoiled, overweight, whiny,
money-grubbing stooges? It bears keeping in mind that
cloth-and-wire really aren't that far back in history, maybe
this whole glut-thing with overpriced passenger aircraft is
a hidden godsend, Airbus with their glued-together
garbage will end up doing it to themselves, so why try
to win the race to the bottom? Build 10 EXCELLENT
aircraft per year, and stop trying to be a global mega-
mega like GM did, which was a 'zing' on their
management and their inability to keep their profit
hubris in their pants. I think Boeing should harken back
to the days of radial engines and manual levers and so
forth, and see if they can sort of re-kindle the spark that
took the aviation world on its' century-long whirlwind
development spree, figure out what went right, what went
wrong, and what their future's going to look like. Maybe
McDonnell-Douglas and whatever else the Boeing whale
ate should be regurgitated within swimming distance of
shoreBoeing IS a global mega-megaand most of those

"I hate to see great American corporations brought to
their knees because of Wall Street's predominant
culture of 'Immediate profits at any cost!' I hate to see
workers who took such pride in the fruit of their labors
forced to watch their legacy looted and scuttled by the
modern-day robber barons. And I hate to see clueless
'right to work'-ers blame the dedicated, loyal employees, who made the company great, for the
abuses and negligence of the management. "I'm hopeful
that the 787 will become everything it's hoped to be, and
that <i>Boeing</i> will learn a lesson about the costs of
outsourcing manufacture and assembly: because what's in
the future for an airplane company that doesn't build its
own airplanes and abandons its own employees, and all
their knowledge?"
Posted by mojojojo at 7/10/09 10:52 p.m.
"The relation of men of wealth to the flying problem
presents many points of similarity to that of North Pole
hunting. It would be folly to back such attempts as
business propositions, or at least it could be considered
nothing better than the very rashest speculation If wealth is to be interested on a mixed basis of
benevolence and hope of pecuniary return, it ought to
be made sufficiently clear that the latter could hardly
be considered a satisfactory insurance against finally
resting in a pauper's grave'
-Wilbur Wright to Octave Chanute Jan. 5, 1902
True then. Still true today. Bill Boeing made his fortune
in the timber business. He didn't start an airplane
company to get rich. He started an airplane company
because he liked airplanes and figured he could make a
good one. But being a good capitalist and entrepreneur,
he also succeeded at growing it into a (mostly) healthy
business. He struck a balance between passion and profitability. This is why <i>Boeing</i> has now started down
the path to failure. If the only thing you want to make
is money, you are definitely in the wrong business.
That's not some sense of misguided nostalgia. That's
just the way it is."
Posted by JanMost at 7/10/00 11:30 p.m.
Posted by IanMost at 7/10/09 11:39 p.m. Aboulafia is an idiot!!! He writes about how <i>Boeing</i> has

	n" (John	Motors			'Business as usual is over at GM,' Mr. Henderson said.	term
	Stoll &	; Edm			'Everyone at GM must realize this and be prepared to	speed.
	Sharon Terlep)	Edwar d E.			change, and fast." In a preview of a broader management	
	Terrep)	d E. Whitac			shakeup to come, Mr. Henderson said the company was scrapping a number of senior posts and has disbanded two	
		re Jr.,			committees of top executives that made key decisions for	
		Chair			the company's automotive operations. Mr. Henderson	
		man,			expects hundreds of middle managers to be let go in the	
		Gener			weeks ahead, and the company's sales and marketing	
		al			operation will be reorganized. 'Our culture to this point	
		Motors			has been an impediment,' Mr. Henderson, a 25-year GM	
					veteran, said. 'This is all about flattening the	

		
	management structure.' Mr. Henderson said he is	
	adopting some techniques used by the alliance of Renault	
	SA and Nissan Motor Co., led by Carlos Ghosn. Several of	
	GM's highest-ranking executives studied Mr. Ghosn's	
	approach in 2006 while GM's board weighed a potential	
	merger with Nissan-Renault. Mr. Henderson and his top	
	lieutenants also are planning to hit the road in August to	
	talk to dealers and consumers to gain insight into the U.S.	
	market. In the past, <i>GM</i> based much of its decision making	
	on market-research studies, focus groups and strategy	
	meetings among executives. Dealers said the company	
	needs to reconnect with consumers. Mr. Henderson also	
	plans to engage in Web chats and to field criticism and	
	suggestions on an 'Ask Fritz' Web site. GM filed for	
	bankruptcy protection June 1. Friday morning,	
	General Motors Corp.'s best assets, such as its	
	Chevrolet and Cadillac brands, were sold to a new	
	company General Motors Co. The 40-day stay in	
	bankruptcy reorganization left the company with lower	
	costs, a lighter debt load and four automotive brands	
	instead of eight. The new GM is also getting several	
	new directors appointed by the U.S. government, which	2
	now owns 60% of the company thanks to \$50 billion it	
	committed to invest in the auto maker. 'We all want to	
	win, and we are going to win,' said Edward E.	
	Whitacre Jr., the former AT&T chief executive selected	
	to serve as chairman by the Obama administration's	
	auto task force. 'I know most Americans want this	
	company to succeed [and] we certainly have the	
	fundamentals' to do so, Mr. Whitacre said. Mr.	
	Henderson has been leading GM since the late-March	
	ouster of former CEO Rick Wagoner. From his first day,	
	the 50-year-old Mr. Henderson has set a tone of urgency,	
	first by embracing the possibility of a bankruptcy filing	
	and then taking tougher actions than Mr. Wagoner	
	when it came to downsizing. The government made his	
	task easier in recent weeks when it decided to convert	
	nearly all of the money it provided GM into a 60%	
	equity stake. The United Auto Workers union,	
	bondholders and the Canadian government followed	
	suit, converting billions into sizable minority stakes in	
	the new GM. Mr. Henderson said he plans to repay the	
	government loans before the 2015 due date. In an	
	interview Friday, GM Chief Financial Officer Ray Young	
	said the company will spend the next few weeks	
	forecasting whether it needs as much as the government	
	has offered and trying to accelerate repayment of the	
	government loans. Among the first moves Mr. Henderson	
	will make will be moving longtime product czar Bob Lutz,	
	who planned to retire at year's end, from the design studio	
	to the marketing department. After building a career on	
	creating automotive hits ranging from the <i>Ford</i> Explorer to	
	Dodge Viper, Mr. Lutz, 77 years old, will return to his	
	professional roots and run marketing and	
	communications."

21 July 2009	CNN.co m "Ryanai r Slashes UK Flight Schedul e"	Micha el O'Lear y, CEO, <i>Ryanai</i> r	Firm	α (la te- en tra nt)	"Budget airline Ryanair announced plans Tuesday to slash its winter flights schedule from its main UK hub, blaming a collapse in the British tourism industry, rising airport costs and 'insane' aviation taxes. The Irish carrier currently operates 40 aircraft out of Stansted Airport, near London, but it plans to cut capacity by 40 percent to 24 aircraft by October 2009. That will mean a 30 percent drop in the number of weekly flights and a loss of 2.5 million passengers between October and March 2010, Ryanair said in a statement. Ryanair Chief Executive Michael O'Leary said the move was motivated by the refusal of BAA, which manages Stansted, to cut passenger fees despite falling traffic, including a six percent drop during June. O'Leary also criticized government plans to raise Air Passenger Duty levied on travelers by £1 (\$1.6) to £11 (\$18) on short-haul flights, calling the tax 'insane and damaging.' 'Sadly UK traffic and tourism continues to collapse while Ryanair continues to grow traffic rapidly in those countries which welcome tourists instead of taxing them,' O'Leary said. 'Ryanair's	On a (late- entrant) modular enterpri se architec ture's strategy for rapid (negativ e) short- term growth.

21 July 2009	Forbes, "Delays Drag on Boeing" (Melind a Peer)	Firm- Investo r	α	40 percent capacity cutback at London Stansted shows just how much Gordon Brown's £10 tourist tax and the BAA Monopoly's high airport charges are damaging London and UK tourism and the British economy generally.' <i>Ryanair</i> said it planned to switch capacity to countries which had scrapped tourism taxes and passenger fees, including Belgium, the Netherlands, Greece and Spain." "'787 troubles are a major cause of increasing weakness of the company's balance sheet and cash flows, since inventories should continue to increase and research and development should remain elevated until it starts delivering aircraft,' said JPMorgan analyst Joseph Nadol, adding that delays to both the 787 and the 747-8 could result in financial penalties and pressure margins."	On a modular enterpri se architec ture's systemi c problem s.
21 July 2009	Flightbl ogger, "A Month Later, Boeing Continu es Work Develop ing 787 Wing Fix" (Jon Ostrowe r)	Firm	α	"With almost a month since <i>Boeing</i> announced it was forced to ground its 787s for structural reinforcement, the company continues to work to develop, install and test a fix that can get its troubled Dreamliner into the sky after more than two years of delays. According to a senior program source: "There is good news and bad news. The good news is we know what to fix, and how to fix it. The bad news is the location is a [expletive] to get to.' While the fix is being developed and a fully revised schedule finalized for airlines, sources at both <i>Boeing</i> and partner suppliers indicate that the existing production plan has slid roughly one and a half to three months for the delivery of Airplane Ten's components to Everett, even as suppliers continue to prep parts for shipment. The slip, the sources say, allows <i>Boeing</i> to finalize and test the fix and limit the number of aircraft in final assembly required to undergo the fix in Everett. <i>Boeing</i> previously stated that any fix developed would be able to be installed no matter the location of the parts in the supply chain. A corps of <i>Boeing</i> engineers are working 80-hour weeks to design the fix that allows the 787 to fly with a robust flight envelope and achieve FAA certification with 150% of limit load on the wing, sources say. Veteran structural engineers tell FlightBlogger that the key to developing a reinforcement centers around ensuring that the loads that caused the initial problem at the site of the wing stringer caps are not redistributed elsewhere causing a further structural issue. Second, as the area is stiffened <i>Boeing</i> engineers must take great care to develop a fix that isn't susceptible to long term fatigue issues that come from the normal structural aging of the aircraft. Sources say the area that will be reinforced at the side of body is extremely tight and difficult to reach as the installation area of the fix will provide very little room to install the fasteners to secure the reinforcement. The installation of the fix may begin as early as the	On a modular enterpri se archihte cture's continu ed inability to stop process es and solve root causes of systemi c problem s.

the works, a key discussion centers on the future of 787
production and when the permanent fix is designed
into the wing to body join. Sources say a revision of
the upper part of the wing to body join is almost
certainly necessary to create a permanent long-term
solution and eliminate the time consuming installation
of the remedial fix. Boeing says there are about 40
787s in process throughout the global supply chain and
a question yet to be answered is the timing of
incorporation for the permanent fix."
By Jerry1t on July 21, 2009 7:52 PM
"I find it a disturbing account of what appears to be a
complex solution for a complex problem. After all is
said and done, it still does not manage to fit into my
mind. With all the clarity that Jon brings to the
description, it still sounds like it is unresolved and
forces engineers to work '80 hour weeks' I remember
Scott Francer saying that a handful of fasteners will
solve this problem 'in situ'. And now we are presented
with an ongoing effort to come up with a solution. I am
sure there will be more accolades about how great and
efficient this plane will be and how it will change flying
forever. But until this plane is able to fly it remains a
mythand an expensive one at that. It is still
outrageous that <i>Boeing</i> and its Parrners could not
manage to design a plane where the wings would hang
tight and enable it to fly. You think they would have
learned from <i>Airbus'</i> similar problem but clearly, they did
not. No one has been more of a fan of the 787 than I, but I
am worn out by the excuses and failures on the part of
this team to get things right. One of the key and crucial
parts of a plane and they design it inadequately. Please
do not fill this column with tales of challenges and how
this is expected. That is just 'plane' nonsense. This is
another screw up and it will cost in terms of time and
monies . All sorts of excuses will follow but that is just
sentiment. This is a another failure on the part of
Boeing and it does not leave me with any confidence
about its schedules, its solutions, its promises, etc. Until
they manage to get the 787 in the air flying it is a
project in the works and one that has been terribly
mishandled. I wish I felt better about this endeavor,
but <i>Boeing</i> and its Partners have taken alot of joy and
cost out of this and have left alot of credibility issues
still unresolved. Would Scott Carson and Scott
Francer please show us that handul of fastners at
tomorrows earnings presentation."
Be be seen and the second s
By Boeing Investor on July 21, 2009 7:59 PM
"The more I read this account, the more discouraging
it appears. There remain many challenges before a
solution is designed and installed. The article is an
attempt to bring some order and clarity to a problem that,
in truth, remains disorderly and lacking in clarity. How
very disappointing."

		 By Raoul on July 21, 2009 8:06 PM "Just as I have said before. Installation of the fix in-situ on completed aircraft will be neither easy nor cheap, and the latest confirmation illustrates <i>Boeing's</i> folly of continuing wing/body joins, rolling out, and fueling aircraft before the repair is installed. Ask anyone familiar with composite aerostructure asssembly and they will tell you one of the most difficult operations is close tolerance drilling of a titanium composite stack of materials. And they will most likely tell you that THE most difficult is back drilling into titanium to match existing close tolerance holes in the underlying composite, without damaging the existing fastener holes in the composite. By continuing joins, <i>Boeing</i> raises the danger/difficulty to new hights, by adding restricted access, entry into a confined space, and entry into at least some wet fuel cells." By Jerry11 on July 21, 2009 8:16 PM "Does Raoul's comment make sense. It seems to. Why are they fueling up the planes and readying them for flight testing when they do not have a solution to a problem for any of them yet. Would someone explain" By Boeing Investor on July 21, 2009 8:28 PM "Will be very interesting to see how Jim McNearny covers this topic at tomorrow's earnings call. Since he was unaware of it problem a few weeks ago, will he be aware of it tomorrow? His able sidekick Scott Carson may be prgrammed to be called in to conjure up some minor excuses and schedule promises." By Concerned on July 21, 2009 8:47 PM "This makes my head spin. This is a three dimensional problem that has yet to be solved." By airplanesense on July 21, 2009 9:23 PM "After reading Jon's as-usual excellent description and all the above postings, it now seems evident it is time for <i>Boeing</i> to bite the big bullet: forget the interim fix/modification, redesign the entire body join area, and build and fly only a/c with the permanent redesign, even if it means s	
		proceeds with the interim fix/mod what will it gain? Degraded a/c with the fix, reduced capability, and all	
		By JayPee on July 22, 2009 3:52 AM "Jon, I am unclear on something here. The test that ran the loads up to somewhere between 120% and 130% in April supposedly did not reveal the problem with the 'side of body' join. It appeared in some test with lower loads that occurred in late May. The test in April that went beyond	

		120% was supposedly not required for first flight. Boeing	
		claims that the 787 could have flown albeit with such a	
		small flight envelope such that it would not have been	
		worth it to fly. Here are a few questions:	
		1. Why can <i>Boeing</i> not give out the exact percentage of limit load was achieved in the April tost? Surply their	
		limit load was achieved in the April test? Surely their instrumentation should be accurate enough to measure	
		this.	
		2. Did the damage occur during the April test or	
		during the May test?	
		3. If it did occur during the April test, why did they not	
		find the damage until the later test?	
		4. If the damage actually did occur during the May test	
		(with lower loads), should not <i>Boeing</i> be totally	
		worried about such an issue? After all, this would be	
		roughly a case of fatigue failure occurring after a very	
		limited number of load applications.	
		5. Had Boeing not gone 'above and beyond' the	
		requirements for their first flight tests, could one surmise	
		that they could have had an unfortunate 'incident' with	
		their flight test aircraft?	
		Regards, John"

Street and from shareholders. They are not blameless,	
and it takes very strong management to stand up to	
them. Shareholders tend to take very short-term views,	
and that can be (and usually is) detrimental to long-	
term, high-risk development programs. In addition,	
shareholders want certainty in a world where certainty	
doesn't exist. Like any large company, Boeing's internal	
communication is not flawless, but on the other hand, I	
can easily understand that they would not want to	
share bad news with investors until they have both the	
technical facts and the business facts well understood."	
By Shareholder on July 22, 2009 11:13 AM	
"Listening to Earnings Conference callMcNearny's	
address takes 787 with stride and indicates a fix is in	
place and only implementation is the challenge. Not	
alarmed nor thwarted but indicates 'lesson's learned' I	
understand this attitude but it is a standard corporate	
coverup for failures and mistakes. Challenges always	
exist but this CEO would never own up to	
mismanagement. Its just categorized as a normal	
matter thus exculpating their ability to eliminate or	
minimize these problems. Corporate stonewalling is	
characteristic of Boeing and the present Officers are	
masters at it."	
By Edouard on July 22, 2009 11:25 AM	
"Talk to serious insiders, talk to engineers working	
with aerospace subcontractors on both sides of the	
pond, and most, if not all of them, will tell you that	
going the full plastic and full barrel option for an	
airplane of this size was the riskiest possible. If the 787	
ever flies, it will be a very average product, to the deep	
disappointment of the 50 + airlines who succombed to	
Boeing's PR. Let's hope Airbus will learn the full lesson	
of this fiasco and draw the right conclusions with regard to	
the A 350 (like beeing modest and transparent, for a	
start)."	
By Pointman on July 22, 2009 5:38 PM	
"I think if Boeing hadn't given away the wing and wing	
box assembly to overseas partners the discovery and fix	
would have been made earlier. That is the first time	
Boeing as given away that exclusive structural property.	
It's a wholly different process to walk over to the other	
side of the factory and talk with the assembly engineers	
in process- as opposed to breaking business/cultural	
obstacles to have a dialogue. I read somewhere that	
the Partners hold their own proprietary patents on	
their parts and drawings that they supply to Boeing-	
hampering quick redesign and recovery from setbacks.	
Maybe someone could clarify that information Rumors	
are running rampant all over the factory regarding	
shutdowns and layoffs in the 787 program- the wish is	
that management would be honest and level with the	
workers and investors so we're not blindsided again."	
and the second second to not be made a game	

By Paulo M (Johannesburg, RSA) on July 22, 2009 6224 PM "That someone that leaked this information belongs to the part of the Boeing Company that is precise, they know their trade, they know exactly what is going on, they know exactly how to get things to WORK, and they belong to the exactly the same culture that built the Boeing 747, the Saturn V/Apollo system, the Airbus A300, and the BA(Aérospatiale Concorde - whether or not we, the public agree with these programs. These people are engineers, they make things WORK and they are the only reason why there's still high regard surrounding Boeing and - like the general sentiment here agrees - in sharp contrast to Boeing (and Airbus) Management. Boeing's problems are the result of non-engineering people making decisions on behalf of engineering folk. Things as seemingly simple as product schedules ARE exclusively for engineers to reasonably decide - NOT Wall Street. It requires input from people of years is a pointer to the complexity involved in coordinating its manufacture and assembly. That the 787 has been the elayed is a victory in common sense to allow for normal procedures in aircraft development. Hear, hear! The people that matter are in control." By Anonymous on July 23, 2009 10:14 AM "I have to say, it's disappointing to see Jon continue to play cheerleader for Boeing. Jon is always very quick to report positive milestones such as 'rock[ing the gauntlet' but less so on negative news that shows Boeing is in disarray. Specifically, I find it unbelievable that there is no post about the fix, the program, etc. Jon's technical posts maby be of high quality, but as far as news, investigation, and commentary, in my humble opinion, he might as well be a Boeing spokesman." is used to take for the Program. Apparently there are too many KTs wandering aroud. My supervisor confirmed tha

	By Uwe on July 23, 2009 10:53 AM "To Anonymous on July 23, 2009 10:14 AM Afaik Jon started out as a professed <i>Boeing</i> fan with an investigative mind . He never went overboard in dissing rumors but tried to get information for substantiation (or not, see the delam issue short of Xmas 2008). But i have the impression that he has been consciously missled at that time. He certainly seems to have lost his innocence . I like his reporting style (though I can't really get into the 'freshly painted planes are so sexy' thing) and I like him not jumping into the rumor millrace but waiting for unsubstantiated information to condense into a more reportable presentation. Uwe"	
	By Jerry1t on July 23, 2009 11:48 AM "Ewe, I certainly understand your response and do not find it offputting in any way. I am trying to entertain the possibility that lessons have been learned and that there is an actual attempt to address the issue in the best way possible. Given that posture, I think we are hearing alot of rumors but do not truely know the extent and time frame in front of the fix. That two unindentified engineers get more credence than the President of the Company is an example of this and is unfortunate. I am only saying that we do not know the factuality yet but hope it will emerge from credible sourcesincluding the Company"	
	By SonOfEinstein on July 24, 2009 11:15 AM "It's time to focus on re-designing the joint. The interim repair will NOT suffice. It's too challenging to implement feasibly. It won't work. Scrap the current wings on ZA001 thru ZA006 and replace them with new wings from <i>Mitsubishi</i> with the newly- incorporated interface when they are ready. Tack on another year to the schedule and bite the bullet. And BTW fire Scott Carson while they're waiting for it all to happen. SoE"	
	By gorbidog on July 24, 2009 12:37 PM "I 'somewhat' agree with 'SonOfEinstein' in that <i>Boeing</i> might just have to 'bite the bullet' if this intermediate wing repair job doesn't work out as planned. Ideally, it will suffice for the test airplanes (hopefully!) but I'm quite concerned that it's not the long-term solution, and <i>Boeing</i> engineers and management obviously realize this. I have also heard rumors about a production line shutdown - and this would clearly be necessitated by the fact that <i>Mitsubishi</i> is going to have to RE-TOOL the wing mould to incorporate the PERMANENT solution for this wing-body join interface. Realistically, I don't see the 787 entering service for another two years, because it's going to take another six months for first flight (optimistically), and then roughly another	

	r	r	T	T		
1					year for flight testing. Tack on some margin of six to	
					eight months for more UN-expected issues, and you	
					have late 2011 for first deliveries, or roughly FOUR	
					years past the original estimate. But it's better to be	
					SAFE than SORRY. Now the ONLY question is, with	
					all these delays, engineering cost overruns, penalties	
					and cancellations, is this plane going to be PROFIT-	
					able? Them bean-counters better start sharpening their	
					pencils!"

	(Domini				engineer who has been briefed on the issue. 'It's definitely	ed over-
	c Gates)				a costly fix to go and do this work.' A second engineer,	promise
					who is familiar with the details of Boeing's construction	and
					method, said the fix must first be made on the nonflying	under-
					test airplane in the Everett factory. Assuming that's	delivery
					successful, it will take another month or two to install the	
					fix on the first airplane to fly. Both engineers said the	
					issue requires a thorough redesign of the plane's wing-	
					to-body join, and the necessary parts will be very	
					difficult to install on the test airplanes that have	
					already been built. The engineers' accounts differ	
					from Boeing's description June 23 when it	
					acknowledged a problem and again postponed the first	
					flight of the much-delayed plane. Dreamliner program	
					chief Scott Fancher said then that the fix would be 'a	
					simple modification' requiring only 'a handful of	
					parts.' But almost a month later, heading into today's	
					quarterly earnings report, Boeing has neither set a new	
					schedule nor outlined its planned fix of the problem.	
					The second engineer said the problem is caused by high	
					loads at the ends of the stringers on the upper wing skins.	
					Stringers are the long composite rods, shaped like I-beams,	
					that stiffen the inside of the wing skin. There are 17	
					stringers on each upper wing, all of them subject to	
					compression forces when the wings flex upward in flight.	
					At the point where each stringer ends, close to where the	
					wing and body of the plane are joined, those forces pull	
					the stringer away from the skin. During a wing-bending	
					test in May on the ground-test airplane inside the	
					Everett factory, the fibrous layers of the composite	
					plastic material delaminated at these stress points.	
					Such a separation of the material isn't likely to lead to	
					catastrophic failure of the airplane, but it would require	
					constant monitoring and potentially costly repairs by	
					the airlines. Any tear in the material would have to be	
					promptly fixed to avoid spreading of the delamination.	
					If Boeing's initial fix fails to divert enough of the load	
					away from the stress points, the delay in first flight	
					could extend beyond six months, pushing the date out	
					into 2010. 'There's no guarantee that what (Boeing) is	
					× 0/	

	doing will work,' the second engineer said. 'If the	
	testing or analysis shows it doesn't get rid of the load,	
	then the engineers are back to square one.'	
	Further delays	
	Beyond first flight, solving the structural flaw could	
	also further slow the plan for ramping up production.	
	Boeing's current focus is on an interim solution to the	
	stringer problem for the test planes that it has already built.	
	The first engineer said <i>Boeing</i> hasn't had time yet to	
	figure out at what point in production to introduce a	
	permanent redesign on all subsequent jets. 'None of	
	that is nailed down yet,' he said. 'There's no schedule.' Boeing has a large team of engineers working on the	
	analysis, the redesign and how the fix could be	
	implemented. Those engineers are focusing on a solution	
	that will send mechanics inside the wings of the assembled	
	planes to trim the ends of each upper wing-skin stringer.	
	They will create a U-shaped cutout in the end of the	
	stringer, leaving the flanges at top and bottom untouched.	
	The U-shaped cut in the stringer ensures that the load on	
	the flange away from the skin, the inner flange, will	
	transfer entirely into the strong titanium fitting at the	
	wing-body join and not into the wing skin, the engineers	
	said. The hope is that will reduce the stress point load	
	enough to prevent future delamination. The reshaped	
x	stringer ends must be refastened with newly designed parts	
	to the titanium fitting, which connects the wing stringers to	
	similar stringers on the fuselage side of the join. And the	
	design must accomplish this without creating another	
	stress point somewhere else. To reinforce the stringer	
	ends, mechanics will also add some fasteners that go	
	through stringer and skin. The 17 stringers on each side	
	don't all require the same reinforcement, but Boeing	
	wants one design fix for all, so whatever is the beefiest	
	reinforcement needed will likely be done for all the	
	stringers, said the first engineer. This retrofit will be	
	tremendously difficult to implement on the airplanes	
	already built because the mechanics will have to do the	
	tedious and meticulous work inside the confined space of	
	the wing. 'Drilling holes in titanium is difficult.	
	Drilling holes in composite is difficult. And the access will be your difficult' said the second angineer. And	
	will be very difficult,' said the second engineer. And when <i>Boeing</i> finally comes to do the job on Dreamliner	
	No. 1, it will first have to empty the fuel from the wing	
	tanks so that repair crews can work inside.	
	anno so una repair erews can work inside.	
	Previous problems	
	Excessive loads at stringer ends (known to engineers as	
	'runouts') is not something that should have struck	
	Boeing out of the blue. 'The problem with stringer	
	runouts has been identified in the past and recognized	
	as a problem,' the second engineer said. He said the issue	
	has arisen on other composite airplanes. Indeed, the first	
	engineer said the stress point at the end of the 787	
	stringers showed up as a 'hot spot' in <i>Boeing's</i>	
	and an an an and a por in boung b	

computer models before the delamination in the wing	
bend test — but for some reason it was never	
addressed. The delamination happened after the wing	
bend test reached ultimate load, which is 50 percent higher	
than the maximum load expected in service. The second	
engineer said reaching that load proves that <i>Boeing's</i>	
heavy titanium structure is as strong as it needs to be.	
However, the delamination of the wing skin could have	
begun well before that load was reached, he said. In the	
tests of the proposed fix that lie ahead, he said, engineers	
will have to inspect the stress points for delamination	
closely at every increment up to the highest loads. Boeing	
spokeswoman Yvonne Leach said the company 'will	
provide details on the technical solution in due course as	
we finalize our plans for implementation.' The company	
reports its quarterly earnings before the stock market	
opens today. In an early-morning teleconference after the	
earnings news is released, Boeing management will be	
quizzed closely by Wall Street analysts for more detail on	
the expected program delay. It's likely the executives won't	
yet have precise answers."

that I saw earlier and the pictures from <i>MHI</i> scared me. <i>Boeing</i> has forgetten how to transition stringers. This has nothing to do with unions. It has to do with the guys I knew 10 or 20 years ago who were the best in the world now being retired. You can't square off the stringers like that. The transition is critical. <i>Boeing</i> needs some real airplane builders because no real one would have made these mistakes. BTW <i>Boeing</i> has
been quoted in this paper as saying they own this part
of the design so don't blame the Tier 1s for this one. It is square on the "B" and the liers like Scott Fancher
who don't know how to build an airplane."
stagfury SPOKANE, WA July 22, 2009 at 1:32 PM "SELL!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
mukilteomanMukilteo, WA July 22, 2009 at 10:43AM"Boeing's commercial plane division started going downhill after Mulally left. It doesn't matter that he is an 'aerodynamics guy'. He is an excellent manager who knows how to run a business. Boeing made a huge mistake when they passed him over as CEO. The proof of his ability is in results. Ford may be the only major car company to not declare bankruptcy and/or take government loans. Remember how Detroit lamented the fact that he wasn't a 'car guy'? That's what took GM and Chrysler down: too many traditional 'car guys' who would not adjust to consumer tastes and could not build consensus with unions to reduce costs to be competitive."FL390 Grtr SEA Area, WA July 22, 2009 at 10:28 AM
"It sure seems like <i>Boeing</i> has been backpedaling since
the merger with McDD. McDD commercial side was a total failure warmed up obsolete technologythe MD- 11, MD-80, MD-90 and 717 should never have happened. Did the failed McDD mgmt destroy Boeing?"
 <u>spokane cougar Spokane, WA July 22, 2009 at 10:26</u> <u>AM</u> "Who is running <i>Boeing</i>? A two year old or a monkey? What a joke of a company. Everything started going
downhill once they moved to Chicago. This continues
there might not be much competition between <i>Airbus</i> and <i>Boeing</i> , as <i>Airbus</i> seems to be able to not make itself
look like a complete idiot all the time."
lifeliberal Seattle, WA July 22, 2009 at 9:46 AM "This is simply corporate greed yet again running wild. This company should be given to the workers who actually build the planes. Obama needs to step in here and take this over. If the unions owned the
company all the jobs would stay here and planes would be built on time."

 · · · · · · · · · · · · · · · · · · ·	
	CapHillMax Seattle, WA July 22, 2009 at 9:20 AM "Boeing seems to have been on the slow, downward slide ever since McDonnell Douglas execs did a reverse take-over of Boeing. It's a shame that Bill Boeing's legacy is being destroyed."
	El Diablo Blanco Ocean Beach, CA July 22, 2009 at 9:11 AM "Apparently the door seals don't even match up. Not exactly a plane I'd want to fly in 15 years down the road."
	Restore the Republic End the FED, WA July 22, 2009 at 9:09 AM "EVERYTHING in the 787 program is a clusterFk. That's what happens when you outsource major structural parts to mitsubishi and othersyou lose precision. I won't be flying in this plane."
	thunderbolt hawaii kai, HI July 22, 2009 at 9:07 AM "Boeing 787the De Havilland Comet of the 21st centuryI christen thee the Flying Mass Grave."
	JCowles Kent, WA July 22, 2009 at 8:51 AM "Doug H: 'Why were these people not identified? Were they doing this against the wishes of their employer?' Simple answers to simple questions: (1) they were not identified because they would get their hinies fired if their identities were made known; (2) they are doing it because <i>Boeing</i> has not been straight with stockholders or the public about the real seriousness of the 787's structural problems. What the "Times" is doing is what the "Washington Post" was doing in the 1970s with Watergate: investigative journalism. So you have a choice: do you trust the "Times" or do you trust
	 Boeing? Whose credibility is greater? Even MFC should see the answer to that one. JC" Bark Snohomish, WA July 22, 2009 at 8:38 AM "As for production The original ' workforce ' assemblying the 787 was mostly inexperienced kids right out of high school or their first job at <i>McDonalds</i>. <i>Boeing</i> hired them on the cheap (never works), @ \$12.50 an hour. This generation did not grow-up like my 'Baby Boomer ' generation. They were not drilling holes or building things, rather playing video games. This became a HUGH problem, causing much re-work
	and bad holes, etc. A few weeks of 'training' does not make an aerospace mechanic. It may sound simple to drill a hole, but if you are not able to 'FEEL' a drill bit going from composite to any 'metal' (or vice versa), the hole is going to be elongated or any number of other bad holes. The thing about that NOW is If you cannot drill a GOOD hole in a wide open area how is it going to be done while confined inside a wing, surrounded by various structure, etc? That said The engineering was done years ago, long before manufacturing and integration

	began in FAD. The analysis and design for the 'current'	
	Wing Box ' (which is the heart of the A/P), was proven	
	wrong after the fact via the fatigue A/P's ongoing testing.	
	As with any engineering the expertise and strengths of	
	each individual S/B evaluated by their management. It is	
	very apparent it was not done early on in this	
	development. Project Leadership was sorely lacking	
	Still is. Often when a new Program starts many people	
	are promoted out of existing programs beyond their	
	abilities = POOR Management. As for Commercial	
	President Carson I have said it before, he is not to	
	be believed. He is a mouthpiece for the powers that be	
	in Chicago and has yet to ' run ' ANY Program @	
	Boeing that did not fail. Also, he is NOT an engineer. If	
	Mulally had not gone to Ford no one would be hearing	
	from Carson. Of course the governor believes everything	
	he saysNot having a clue as she doesn't. Retired - Eng	
	32 years (consulting 2 years 787), new programs - 767,	
	777, 747-400, Peacekeeper, RSLP, ALCM, on and on	
	This is NOT a union issue SPEEA or Mechanics."	
	THIS IS INOT A UNION ISSUE OF LEA OF MICCHAINCS.	
	Axion44 Seattle, WA July 22, 2009 at 8:00 AM	
	"Between the militant and lazy union and the inept and	
	ethically challenged management it amazes me that	
	anything gets done at <i>Boeing</i> ."	
	TheWholeTruth Bellevue, WA July 22, 2009 at 7:32	
	AM	
	"Boeings profits up. Watching brainwashed neocons	
	and their mouthpieces bad mouth their American	
	brothers and sisters is sickening. Seems to me that	
	Boeing has PLENTY of cash to share with it's union	
	employees!"	
	chiptoy cost	
	bellevuezog Bellevue, WA July 22, 2009 at 7:04 AM	
	"Boeing-Best Engineers and Machinists anywhere.	
	Worst Management Ever."	
	worst management Ever.	
	111 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	
	certaindoom seattle, WA July 22, 2009 at 7:03 AM	
	"Boeing profits up Q2, 787 might not fly in 2009. Yep,	
	I'd say the same jerks that moved the headquarters to	
	Chicago are full on getting their way. Mission	
	Accomplished guys. Lets all sing the praises of modern	
	day Boeing management, outsource everything in a	
	rear-guard action to end-run the union, doesn't matter	
	if a plane or two is delayed, we'll be closing down	
	everett and renton in a few years anyway. Make all	
	that expensive labor head south where they are	
	overjoyed to work for half. And you, Unions, you	
	happy yet? Called enough strikes to prove you're boss yet?	
	Let me put it to you like this, is your goal to drive your	
	jobs out of town? Mission Accomplished at you too.	
	When I moved here 20 years ago Boeing was one of the	
	pillars of the Northwest. For a while that stayed true. What	
1 1	I see now is no longer the case. I don't know what	
	happened, but every time I run across an ex-Boeing	

	employee at some other job he's typically an outdated dinosaur, sometimes way overweight, and often does not really measure up compared to guys I work with that doen't have <i>Boeing</i> on their resume. I'm sure it just matters by which division you were in or what you did, but the big quality that <i>Boeing</i> did stand for in management as well as in employment just does seem to be eroding badly before our eyes. We need big successful businesses here. Everyone that gripes about Boeing (me at least) wants them to succeed because we all benefit when it succeeds. But seriously. This 787 is just a wake up call to the rest of us that <i>Boeing</i> might not be <i>Boeing</i> any more."
	hoarsewhisperer Seattle, WA July 22, 2009 at 6:51 AM "This is exactly what Jack Welch's GE disposable employees philosoophy has brought to U.S. manufacturing. Management are not the only people with knowledge and experience that matter, and engineers as well as the people on the line are not interchangeable parts that can be replace from anywhere on the globe without consequences. This is a great example of the Hubris in American Corporate Leadership."
	tikitrek Seattle, WA July 22, 2009 at 6:25 AM "A violation of company policy or an unofficial leak to the press. I have no idea but it seems timely to be releasing information that is too diffecult to release officially. The mistrust seems to linger because of an awareness by some or a feeling that other issues are lurking in the wood work or is it in the composite structure. They are complex issues but <i>Boeing</i> appears to suffer more by not airing the issues early enough to mitigate negative criticism."
	mrblank Everett, WA July 22, 2009 at 4:23 AM "What scares me most about the poor management and dumb outsourcing of the 787. Is the fact that no matter how hard I work or how many days in a row, I can't save there butt this time.We are going loose an American Icon, because of corporate greed, and lies. It is sad."
	johnnyo513 Milton, WA July 22, 2009 at 2:46 AM "I agree with C2H5OH whole heartely and believe me problems like this isn't just a 787 problem, the 737 has so many problems on the production line that none of them coming off the production line lately are anywhere near air worthy!! There is almost more re- work then original work being done, yet the company continues to lay off production workers while trying to keep the same production rates, only an idiot doesn't see where thats going to lead to"
	Sam Marmon Federal Way, WA July 22, 2009 at 12:52 <u>AM</u> "@takn - I know <i>Boeing</i> has an interest in what

22 Wall	Jim	Firm-	α	information it disseminates in public, but I'm concerned that what we've seen from the <i>Boeing</i> PR and management isn't open, honest, and transparent regarding the 787 program. It would seem there is a willful negligence to understand the problems or an effort to mask or minimize the magnitude of the issues. While I'm sure these engineers are violating some PRO, they are also shedding light on a program that probably deserves more scrutiny from the public and <i>Boeing's</i> investors." "Boeing Co. executives maintained Wednesday that its	On a
July Streeet 2009 Journal, "Boeing Says 787 Still Profitab le, To Update	McNer ney, CEO The Boeing Compa ny	Investo rs		much-delayed 787 program remained profitable and that the latest setback wouldn't require a major redesign. The U.S. aerospace company said it would provide an update later in this quarter on when the aircraft might fly, after shelving a first flight in June because of structural problems with the area where the wings join the body. <i>Boeing</i> Chairman and Chief Executive Jim McNerney and Chief Financial Officer James Bell were	modular enterpri se architec cture's possible understa tement
Progra m In 3Q" (Ann Keeton)				pressed repeatedly about the 787's economics on a conference call after reporting second-quarter earnings. While it has secured 850 orders for the 787, an existing delay of more than two years has forced Boeing to increase research spending and pay penalties to customers awaiting the plane. Bell admitted there were 'concerns' about the program's financial contribution, but said on the call that the company still forecasts that it would be profitable over its lifetime. McNerney said Boeing can make a 'straightforward' fix to the 787's latest setback, brushing aside reports that a solution could take months to develop. The company will also provide an update on the financial impact when it reveals a new flight and test schedule for the aircraft. Boeing on Wednesday stood by its financial outlook for full-year revenue in a range of \$68 to \$69 billion, with earnings-per-share in a range of \$4.70 to \$5.00. Bell said Boeing is managing its cash carefully, and could delay a pension payment this year, but doesn't plan to cut its dividend. Investors and analysts were stung by Boeing's sudden announcement last month that Boeing would delay the first flight of the 787 for an undetermined amount of time. While some customers have asked to defer orders on a variety of aircraft due to the global recession, McNerney said deferral requests have slowed compared with earlier this year. McNerney said Boeing doesn't see a need now to make further cuts in aircraft production, but will continue to assess the	of problem s to investor s.

As these plans firm up, the team will assess impacts on our flight test and production schedules and then determine the resulting financial impacts. While addressing this issue, we are working hard to minimize any additional impacts on the overall program effort. Postponing first flight was the right decision; given the reduced flight envelope we would have had available to us. I fully understand the desire everyone has for revised schedules for first flight and first delivery. We are working through this matter as quickly as we can but will not sacrifice quality for expediency on such an important effort. A thorough and comprehensive			
effort with an abundance of caution to ensure that no collateral issues are created by the installation process we select, particularly on airplanes already built. Once the implementation approach is determined, an aircraft modification and testing plan will follow. such an important effort. A thorough and comprehensive			
and the second processing and the second sec			
		plan will be finalized and shared later this quarter. This	
latest 787 development strongly underscores the			
importance of our drive and imperative to strengthen			
enterprise, technical and supply chain disciplines on			
our programs, both inside and outside our four walls.			
We have and will continue to make changes to our			
processes and organizations to accomplish this			
objective. We have also been implementing tactical			
adjustments to the 787 operating model with the recent			
agreement to purchase Vought's South Carolina			
operations being a key step in both optimizing work			
between Boeing and our suppliers and also bolstering			
our ability to develop and produce large composite			
structures. We expect this transaction to close in the		structures. We expect this transaction to close in the	

near future. We are learning from our lessons on this program and will not hesitate to take the steps necessary to ensure its ultimate success, even if it means redrawing some lines that were established when we first started. Despite the delay in first flight, the 787 program is moving forward with critical flight test preparations and has made some important progress. We completed gauntlet testing and taxi testing at speeds up to 130 knots on the first flight test aircraft. The airplane performed as expected and we were pleased with the results. Airplane number two has moved to the flight line and has performed engine runs. Airplanes three and four have completed power on and the team is in the process of assembling the major sections of airport number seven, the first production aircraft. Through all of our experience on this program to-date, it's important to remember that we are doing something here that has never been done before. The innovation and technology applied to this program is unprecedented in scope and in the impact it will have on commercial aviation. We remain gratified by a 787 backlog that stands strong with 850 orders from 56 customers around the world, and we continue to believe the 787 is a game changer that will add tremendous value to both our customers and our company over time. Beyond the 787, BCA continues to generate strong operating performance in a very difficult period for the industry. Deliveries remain on track for the year and the team has made good progress on productivity and cost improvements to help offset a range of market pressures that include, lower production rates, softening spares volumes at lower delivery price escalation forecast. The environment continues to be challenging in both commercial and defense markets. In April we announced a reduction to our 777 production rates starting in June 2010 and we postponed rate increases planned for the 67 and the 47. Since that time, BCA has accommodated about 70 airplane deferrals in addition to the 60 processed in the first quarter, and the backlog of deferral requests has come down this quarter. Accordingly, there has been no change in our current thinking about commercial production levels including our assessment that we can hold 737 at its current build rate. We will continue to evaluate production rates based on market conditions and customer discussions. The aircraft financing markets, while still tough, are also showing signs of gradual improvement. It has been encouraging to see U.S. capital markets begin to open up with recent double EETC offerings completed by a few U.S. airlines. We also continue to aggressively manage our infrastructure, costs and investments. As of June, we have reduced our headcount by approximately 5000 positions versus our November 2008 base line and we remain on track toward the estimated 10,000 position reductions we expect by year's end."

James Bell	
"Jim talked about the 787, but let me discuss how we	
evaluate the financial status of this program. Each	
Construction and the second	
quarter we perform a 787 gross margin accounting	
analysis. At the pre-delivery stage in the program, the	
primary purpose of this analysis is to determine if we	
believe the program is in a profit or a loss position over	
an initial quantity of airplane. Up to the point to decide	
a body issue, our assessment was that the program was	
not in a loss position. The cumulative impact of	
scheduled delays including the current one being	
assessed is obviously putting pressure on the program's	
profitability. At the same time, BCA has an ongoing	
effort to evaluate opportunities to improve efficiencies	
within our factory and across the global supply chain	
as we prepare to ramp up build rates. Both schedule	
impacts and cost improvement opportunities are being	
evaluated and upon completion they will be	
incorporated in the 787 accounting position. This will	
also include an assessment of potential financial impacts	
on our current production programs. We will update you	
on that in conjunction with the 787 schedule revision.	
Included in the company's gross inventory is \$7.9	
billion related to 787 work in process, supplier	
advances, tooling and other nonrecurring costs. Our	
gross inventories on this program has been building at	
approximately \$800 million per quarter. As we work	
through our 787 challenges, the remainder of BCA	
continues to perform very well, strong execution in the	
core production and services programs generated good	
financial results in this quarter. BCA's second quarter	
margins were 9.7%. Unit cost margins were 10.8%	
driven by 777 model and customer mix as well as lower	
supplier costs. The 777 deferred production balance	
decreased approximately \$400 million during the quarter	
which reflects favorable mix and a lower supplier cost for	
both delivered and work in process units. BCA won 57	
gross orders during the quarter including 36 737's while	
52 orders primarily 787's previously disclosed were	
removed from the order book. BCA's backlog remains	
large at \$257 billion representing greater than seven times	
current annual revenues.	
Unallocated expenses increased this quarter as compared	
to last year due to higher deferred compensation and share	
based plan expense. Somewhat offset by lower unallocated	
pension expense. We expected total unallocated expense to	
be approximately \$700 million in 2009 with other segment	
expense forecasted to be about 200 million.	
Now, let's turn to slide 8 and discuss cash flow. We	
generated \$1 billion of operating cash flow in the quarter,	
reflecting cash from earnings somewhat offset by	
continued working capital buildup on our development	
programs and timing of accounts receivables. During the	
quarter we did not acquire any of our shares, but we	
did pay approximately \$300 million in dividends. Turning	
and pay approximately to be minimum in arritability i fulling	

to slide 9; our financial strength remains solid. We ended the quarter with \$5 billion of cash in marketable securities and that's up 6% from the end of the first quarter. Debt declined during the quarter due to maturities principally at BCC. As previously announced, we expect to be using cash in the third quarter for the purchase Vought's South Carolina facility and to pay guarantees related to the Sea Launch Chapter 11 filing. In light of these and other cash demands, our primary focus is to continue aggressive management of cash flows related to our operations. We are also fortunate to have good access to the debt markets at reasonable rate. We have had a successful bond offering in March and this form of capital rising continues to be an attractive option for us. Now let's turn to slide 10. Our financial guidance remains unchanged and will be reevaluated upon completion of the 787 assessment. 2009 earnings per share is expected to be between \$4.70 and \$5 per share with revenues of 68 billion to 69 billion. The 2009 commercial delivery forecast remains between 480 and 485 airplanes. 2009 operating cash flow guidance remains at greater than \$2.5 billion, although the 787 schedule assessment will likely put downward pressure on the timing and the level of cash flows. We are still assuming 2009 pension funding of approximately \$500 million, although the amount of mandatory contributions this year is less than \$100 million. We will make a final decision on funding towards the end of this year. Total company pension expense is expected to be about \$900 million in 2009, with slightly more than that recorded at the business unit and a small offset in the unallocated segment. The R&D expense forecast is unchanged at \$3.6 billion to \$3.8 billion and capital expenditures are expected to be approximately \$1.4 billion."

Jim McNerney:

"Our priorities remain, getting the 787 on track and in the hands of our customers, continuing to reposition our defense business while extending our existing programs and expanding in the international markets, growing our services businesses, maintaining our lead in innovation technology and preserving our financial strength through productivity improvements and aggressive cash management. I do believe we will get through the current challenges and at the end we will be a fundamentally stronger company with the right products and better position to grow and improve financial performance overtime. With that said, we would now be happy to take your questions."

Cai von Rumohr (Cowen & Company):

"Yes. Thank you very much. I guess 787 is on a lot of our minds. Jim, you mentioned that the fix is straightforward, but I guess first would be with this fix, if it's straightforward, what does it imply for performance of the aircraft maintainability and service

1:6-9 Secondly theme have been all hinds of more
life? Secondly, there have been all kinds of rumors
about kind of a partial redesign of the wing, is that just
to make it easier to kind of implement this fix or is it
something broader and what kind of rough range of
timeframes could this imply?"
lim McNornov:
Jim McNerney: "Well, we have learned nothing, Cai that says this is
anything other than a local issue with a local fix. I'm
not sure where the discussion comes from that says a
major redesign of the wing is in the offing. We don't
see that. Having said that, we have been through the
analysis that confirms and predicts what happened
analytically. We have now have chosen the approach we
want to take on the fix itself in terms of the parts and their
placement to reinforce the area and we have done some
initial testing to give us a high degree of confidence that
we have got the right fix. Now we are onto putting
together an implementation plan which has some
challenges as you're moving around in very tight
spaces in the airplane and getting some things done and
that's what we are in the midst of doing. So a high degree
of confidence in knowing what to do and working
through with an abundance of caution exactly how to
do it, but with a great deal of confidence that we are on
the right path here. As to its impact on the
performance on the airplane, we don't see that. Either
performance metrics or maintainability, there is not
much weight involved. The performance of the
airplane is not impacted and therefore it's a matter of
working through this issue and getting to the other side
and getting the program back on track, and we will be
updating you as we said this quarter."
Howard Rubel (Jefferies):
"Thank you very much. I just wanted to talk for a moment
about inventories. It's appreciated that you disclosed the
size of the 787, but could you address how you're
recovering from the strike and why we're not seeing
some improved runoff and then also how is it that
you've now finally been able to or talk about the
success on the 787 in relieving some of the deferred
costs there, James?"
James Belly
James Bell: "Hey Howard. We have liquidated quite a bit of the
strike inventory we did over a billion one in first
quarter and another about half a billion this quarter.
Obviously, it's been more than offset by the increase in
inventory on our two development programs, both 787
and on our 747 programs and obviously that's been
impacted as the delivery of those units slide, but clearly
we have done that. Now, you talked about the how
we're going to relieve the inventory on 87. Obviously
we are not going to be able to do that until we start
getting into delivery and we'll have to wait until we

6	
complete the assessment of the fix to actually know when that will resume and then how those inventories will be relieved over time."	
Howard Rubel (<i>Jefferies</i>): "So we'll continue to see an inventory build for the next 18 to 24 months?"	
James Bell: "We will continue to see an inventory build until we start delivering, that is correct."	
David Strauss (UBS): "Jim, just to clarify your comments on 787, so the fix that you talk about and you identified in the press release, were you're referring to is a permanent fix or is this a temporary fix that you've identified?"	
Jim McNerney: "No. This is a fix that will both be retrofittable on airplanes that have already been built and will easily flow into the production process technically."	
<u>Robert Spingarn (Credit Suisse):</u> "Question on guidance. Why not just adjust it or withdraw it when you know there is some type of cost coming that's associated with the 787 fix or perhaps is it simply absorbable this year and more of a 2010 event?"	
James Bell: "Rob, first and foremost at Jim mentioned and I think our results reflect, the underlining engine in this company is performing well and that's predominantly the basis of our guidance, and until we really have a clearer understanding of the impact of the fix on that performance, we think it's appropriate to hold it and just make sure we disclose that to date we haven't included in it yet what, if any, impact on those numbers the fix will have."	
Robert Spingarn (Credit Suisse): "Okay, and then of the 7.9 billion in 787 inventory; what portion of that will be amortized over the delivery aircraft?"	
James Bell: "All of it."	
Robert Spingarn (Credit Suisse): "All of it? Then some of its just work in process?"	
James Bell: "Yeah, some of it is work in process, some of it is advances to supply chain which will ultimately result in work in process being delivered to us in the future, and	

then some are deferred costs like tooling, and so over the course of this program we would expect all those costs to be amortized over the deliverable units."	
Robert Spingarn (Credit Suisse): "I guess I'm talking about the latter portion that's going to be somewhat linearly equal over each delivered aircraft. So the development associated costs, the tooling, the capitalized development."	
James Bell: "Yeah, that's probably the smaller portion right now of the inventory balance, but in fact, it is the smaller portion of the inventory balance right now, but it will be amortized primarily over the bulk of the units. Now, as you know in deferred production costs, that grow as you introduce new models and there's new tooling, new effort that is a benefit to the subsequently delivered units. So that number will change over time, but it will get amortized over the deliveries."	
Ron Epstein (Banc of America-Merrill Lynch): "Jim and James, just maybe a broader question. When you step back and you look at the culture of Boeing commercial and kind of how everything played out at the air show and how news flow went on the 787. From an outsider looking in it appears that bad news doesn't flow up. Is that the case and if it is, what can you do to change that?"	
Jim McNerney: "I'll take a swing at that one. The story here is a tough program, not that news doesn't travel around our company. I do recognize, though, where your question comes from because we all sounded confident that we were going to be flying in June and pretty late in the game we sounded confident and that's because we were and it's just one of the latter tests we did just before flight turned up wrong and we found out about it right away and so this was not an issue of information flow. It's an issue of the thousands upon thousands of tests we do to confirm our analytics with static testing, in this case or other kinds of tests that bear on certification, the performance of the airplane and these literally are thousands upon thousands that one of them turned up wrong that we didn't anticipate. So the story here is not information flow. The story here is the comprehensiveness of our testing because we have got to get this airplane right. We all wish it didn't happen, we all wish that we didn't sound so confident at such a late stage, but other than this, the development of this plane was on track and feeling good about it as subsequent testing has borne out."	
Ron Epstein (<i>Banc of America-Merrill Lynch</i>): "The one piece I guess I don't understand, Jim, is the	

· · · ·		
	issue about the stringer run out; the extra stress on the stringers, particularly in a composite wing isn't really a new issue, right? I think the engineers knew it a couple of months ago other folks could actually have experienced for the composite wings. I could have predicted something like this might have happened, so I guess that's what I don't understand, I mean how the confidence could be there up till the very end and then, then it was this one test that?"	
	Jim McNerney: "The purpose of static testing is to confirm analytical models based on the material you use and the forces and stresses you put on them. By and large our analytical models are pretty good, but the reason why you do static testing is to confirm them and in this case they were not confirmed and there are lessons for us. Of course we understood stringers and wings and we do understand composite structures, but this is one where the model did not predict the behavior we should have done better and we will do better but that's what happened and we are going to as I said in my remarks we are going to continue to tighten up our engineering disciplines as we go forward and you always try to learn from these things."	
	Joe Nadol (JPMorgan): "Question for either or may be for both Jim and James. Just in the balance sheet, James thanks for the additional color you gave in your prepared comments its tough at this point to predict what the use of the cash are going to be on the absence of the 787 schedule over the next two or three years, but in terms of sources you hinted pretty strongly that you are going to go back to the bond markets in you did a successful \$2 billion or close to it offering in Q1. How much more do you think you can or want to do in terms of bond offerings? Then if you could and may be help out in terms of the rank order of alternative source of cash. How are you thinking about dividend policy in terms of the pension you have signaled that you have may be a few hundred million dollars of opportunity there not putting in, some of your discretionary contribution, et cetera?"	
	James Bell: "Yeah. You know, first and foremost, we are going to continue to have aggressive management of cash in this company and we are starting to see and I think you saw in the second quarter benefits of that. We are controlling pretty tightly any expenditure that doesn't directly support our priority which is obviously getting the 787 airplane, getting that development done and in the hands of our customers, and any other expenditure that's not going into the productivity or the production of our products we are managing very, very carefully so that's our first priority. Clearly, we do have the ability to get back in the bond	

markets and we'll probably do some of that, I don't know exactly what the optimal number is, but you'll see it and we'll let you know as we do that. We are not at a point where we are considering cutting our dividends. I want to be very clear on that. We are not there. We do have some options relative to how much we put into our pension plan and we'll take a hard look at that as we go forward and, again, we'll be very aggressive in managing our expenditures going forward and we will be very disciplined in managing the cash inflows to make sure that on delivery we are receiving the cash associated with the deliveries and making sure we stay on our, get our advances on time and for our contracts."

Joe Nadol (JPMorgan):

"Okay. Then just a clarification; you highlighted during your comments that you're obviously, look at every quarter you look at the 787 program in its entirety, whether it's in a profit or a loss position and you're going to do that after you get a new schedule. Again, just it's never been quite clear to me exactly the block size that you, under which you evaluate that. You've said repeatedly that you're going to determine that when you delivered the first airplane, but you have to have something in mind when you do this analysis every quarter, given your backlog now entered in 50 units, what sort of block are you going to use to determine that after you get a schedule together?"

James Bell:

"You're absolutely right, we haven't been clear on that and we are not going to be, Joe. We are not going to determine that until we start recording either a profit or loss on this program, but I think you got a pretty good indication knowing that we have 850 orders, then the issue is when the market looks out over the time period, we can estimate it and produce a number of airplanes. So clearly it's going to be higher than what you've seen traditionally, but until we finally have to book financials on our P&L statements, we are not going to disclose what that number is."

Joe Campbell (Barclays Capital):

"I'd like to stay on this 787 inventory and the conclusion that it's not in a forward loss position. I mean, you've got a lot of numbers, we've had a lot of delays but as far as I can tell, really the only number you've shared with us is the 8 billion that we now see this quarter in inventory and I'm wondering, there's a lot of delays, no commentary ever about, what the cumulative overrun will you know is going to be. I mean, it seems like its, 8 billion, 6 billion, 10 billion. It's hard for me to understand given all the commentary about need to pay penalties all the suppliers say you owe them each hundreds to even 1 billion. It seems like the run rate is another 800 million

a quarter, plus whatever the extra R&D is and it sounded in the comments like maybe you need other <i>Boeing</i> efficiencies to make sure this thing doesn't have a forward loss and if you're talking about \$85 billion you know, 800, 850 planes, you're talking about estimating out to 2018. I mean, how are you sure that you're not losing money on this thing?"
James Bell: "Well, clearly we've had our challenges on this program, Joe, and all you've said are things that we have to take in consideration, but the one other thing that drives most of this and which is normally the most difficult thing to estimate over time is the revenue stream. Well, we have sold 850 of these and we know we are way ahead of our competition and the market is still going to be robust over a timeframe that we think we have the ability to estimate and there are a lot of factors and a lot of moving pieces in determining that and we go through a very careful disciplined process quarterly to satisfy ourselves and our auditors that where we are relative to profitability on this program. Now again, as I mentioned in my opening remarks, this last assessment and combined with the cumulative impact of the other things you mentioned, really puts pressure on the profitability of this program, but on the other side of this, we have a new production system that allows us to really have substantial improvement beyond anything we have ever experienced in the past and then the assurance of the amount of orders. This being the best selling wide body airplane in the history of civil aviation gives us a lot of assurance that we'll have production rates going for a you know, a pretty long time and we ought to be able to harvest the productivity. Now, obviously we have to capture all of that and we'll be conservative as we have been in how we would book keep that today and we'll learn more as we go, but as you know, airplanes, 850 airplanes is a wide body program and when you think of the 777 and we have only sold a 1000 of those to-date and delivered a little over 700 of them. Again, we have seen an extraordinary improvement in performance over the life of that program that we have to figure out how to
predict given the size of the program that we have in front of us."
Joe Campbell (Barclays Capital): "It sounds like we are trying to say that this delay is local, we know the fix. You're talking about a program that's \$85 billion big if you pick these great big block sizes, you must have spent, 20 on the way to 30 before we get into production, and if we pay the you know, if we count up the penalties and the other things. I'm having a hard time trying to sort of reconciling how this little local delay is going to push us close to being

	
	James Bell: "That's not what I said. I said to you the cumulative impact of all the other schedule delays and then what" Joe Campbell (<i>Barclays Capital</i>): "Yeah, but we knew all these delays last quarter, and we weren't worried then."
	James Bell "Oh, I've never said we weren't concerned about it, Joe. I just said that when we have gone through and done our assessments, we still believe the program to be profitable. We have always been concerned with the cumulative impact of the schedule delays and the pressure it puts on costs. We also have been concerned with the delays to our customers and how that converts to penalties or settlements we have to work through with them. I've never said we weren't concerned. What I have said to you is that we have gone through a very disciplined process and quite frankly, the element that's most difficult to tie down and get high assurance on is the revenue stream and we have it on this program because of the unprecedented success of this offering. So it's not like it's not without its challenges, but so far we have determined that the program is profitable. We'll be back to you as quickly as possible with this latest assessment and see how that plays out along with the other cumulative impact of the other things and challenges we are dealing with."
	Heidi Wood (Morgan Stanley): "James I can ask then a small question on the financial implications just to understand what buckets we should put it in. The fix has been described as not costly. There's 41 planes involved, so clearly that's not what you need to update us on the financial implications, or should we be thinking about potentially higher R&D or greater working capital build or greater supplier support or customer penalty payments? Can you kind of just help us?" James Bell: "Yeah, but Heidi, I think we got to look at all of those. I
	 Teah, but Heidi, Fulfik we got to look at an of those. I don't know what the magnitude of each of those buckets would be, but clearly there would be some R&D associated with it. There would be some recurring costs element of it. If it resulted in a schedule change or slight, or adjustment, which it very well could, then we would have to obviously deal with customers as well." <u>Heidi Wood (Morgan Stanley):</u> "Jim, you talked about one of the things. When you first got on board that you and I have discussed is this cultural openness that was stressed during the 777,

where the emphasize both ability to kind of raise their hands, so their problems surfaced early, and we have had great discussions, you and I, about, the need for greater accountability and people sort of owning their problems. As you think about what's happened here, where I think there was a lot of confidence about first flight materializing and this news coming really in the eleventh hour. How does that shape your thinking about what needs to be done with respect to that balance between letting people raise their hands and discuss problems and yet balancing accountability?"
Jim McNerney: "Yeah. This one was asked when you were dropped, Heidi, but let me say it again, because you frame it in a slightly different way. The story of this delay is not about information flow or openness. This is really a story of the thousands of tests that we do all the time leading up to first flight and one surprising us. The purpose of static testing is to confirm analytical models and this is one out of a thousand tests we did, where that confirmation was not forthcoming and the flight envelope available to us was not enough to really get enough out of the first airplane's flight test. So, that's why we made the call, but even though it did not look pretty, because we were all confident that we were going to be flying the airplane in June, because everything we knew is that we were, but this outlying test result is, we had to deal with it and we dealt with it right away."
Noah Poponak (Goldman Sachs): "I'd like to dig a little deeper on 737. You gave us the 70 deferral number versus 60 in the first quarter. The 60 number you had said was about half and half narrow wide body. Can you give us the split in that 70? Then you mentioned the backlog of deferral requests being down, I mean, can you sort of size that and give us a magnitude? Is it very meaningfully down or slightly down and what kind of second half deferral number does it imply versus what we saw in the first half?"
Jim McNerney: "Again, the deferral, I don't have the plane-by-plane data here in front of me, but the deferrals were pretty much proportional across model types in terms of what we produce and also fairly proportional across geographies. So, very tough to find a model or geographic theme, this again leads me to believe that it's a broad systemic economic credit issue for some airlines that are under pressure. As to the trend, this quarter is down meaningfully. Okay? Now, I again would treat that data cautiously. The extent to which you think the economy is totally out of the woods that would be a meaningful number. The extent to which you believe that the economy remains problematic until we see long-term improvement would suggest treat it as one data point right

now, be somewhat encouraged by it, but we all want to see more."	
Itay Michaeli (Citi): "Just wanted to drill back to the earlier question on the balance sheet. You mentioned that the possibility of looking to go back to the debt market , but when you look at the full year cash flow guidance of \$2.5 billion, if you kind of hit that number, even when we assume, or bake in the thought of cash outflow, it looks like you probably end cash around the \$4 billion 'ish level at the end of the year. I know you mentioned earlier that the May meeting that you thought 2010 cash flow would be up meaningfully and the minimum cash is typically around 2 billion. So just wanted to drill a little bit more about the thought process around with that being the debt market at this time . Is it maybe just a desire to have more cash or is there meaningfully less confidence in the 2010 cash flow trajectory?"	
James Bell: "Well obviously we want to make sure that we have adequate liquidity to deal with the challenges that still lie ahead that are presented by the 787 and the other development programs we have. We also want to deal with the Vought's transaction. We are going to use a considerable amount of cash or 600 million or so of cash there to close that deal, and then the issue with Sea Launch where we had the up front take care of those guarantees and we want to make sure that we deal with all of those things and still have adequate liquidity to deal with the operational challenges that lie ahead."	
Troy Lahr (<i>Stifel Nicolaus & Company</i>): "Thanks. James, how does the <i>Vought</i> facility purchase impact your 787 profit loss analysis and are you assuming that you guys end up doing a second line?"	
James Bell: "To your last question, it doesn't assume that at all, but it does allow us to have better control over a significant element of the production process that supports the 787 and obviously our intent in going in and acquiring it is to drive better performance. So we don't know how that ultimately will turn out but the hope, the aspiration is that it would improve the performance in both cost and technical performance on the program."	
<u>Troy Lahr (Stifel Nicolaus & Company):</u> "Okay, thanks, and then on the 787 now, I mean, given the delays, how is that not impacting the 747? Because in the past you've said the 747 is delayed because you can't switch the engineers over. So, how is it that one is delayed but the other one is still on track then?"	

Jim McNerney:
"This is Jim. We are largely beyond that issue of the
engineering constraint. So these are fundamentally
independent programs now as we go forward."
David Greising (<i>Chicago Tribune</i>):
"I've got a two part question. The first is when you look
at the Vought facility purchase and you look at the
issues facing Future Combat System program, I think
if you look at them together it raises a bigger question
about the systems integrator strategy and the viability
of the kind of asset light approach that the company
adopted when launching the 787. I'd like to know, Jim,
what your view is of how viable that concept still is and
the second part of the question has to do with your own
leadership here. One of the analysts asked about
accountability and it seems that if your analytics now
can replicate the problems with that wing that was
missed early on and I would like you to comment also
on the question of your role as CEO of kind of that mix
between accountability and vision. Where do you draw
the line, well how much of it and what part needs to be
insisting on accountability and what part needs to be kind
of providing vision for where this company needs to go?"
Jim McNerney:
"As to your first question on system integration, there
is no doubt that we are drawing a line in a somewhat different place on 787, but still when taken in total is a
different place on 787, but still when taken in total is a big systems integration job with lots of partners
working together, we have chosen to bring some of it
back in house and that's what I would anticipate as
learning as you go, making practical decisions on what
you do with partners and what you do yourself. This is
a very innovative program and we are learning as we
go, but we are not going to go back to the days where
we do everything in-house. Future Combat Systems is
more a story of the government wanting to reconfigure a
specific program in a way that still leaves us with a lot of
scope, but somewhat less scope, and that's not uncommon
in government contracting to sort of go back and forth and
we are going to figure out a way to add as much value we
hope as we would have added historically. So, drawing
the lines and adjusting is really the story as opposed to
is there one theory that's always right or one theory
that's always wrong.
The accountability issue; listen, I think there are a lot
of people in this company that feel accountable for the
results of the company. As a leader you are always
trying to balance that culture with a culture of
enterprising spirit and inspiration, and I'm not sure
that one static test result is emblematic of the lack of
accountability in the company. You always want to do
better and we are going to learn from it, and we are
going to continue to drive disciplines and
accountability in this company, and engineering tools

aren't perfect, which is why you have static tests."	
Dominic Gates (The Seattle Times):	
"I have a question for Jim McNerney. I'd like to ask about	
the machinists. Recently through the Washington State	
legislators we learned that you at Boeing and you	
personally are pushing to try and get some agreement	
with the machinists that will stop the strikes that have	
hurt you so much. Now that coming out the way it did	
here, wasn't, it was seen as an implied threat, the threat not to do the second line here. It wasn't received	
very well by the machinists. Can you talk about your	
strategy for labor peace and do you anticipate any such	
agreement would come only through negotiations with	
the machinists. Do you anticipate offering some carrots	
that would go with the stick of the threat?"	
Jim McNerney:	
"The performance of this company and the role of every	
person that works for us as we strive for better	
performance is what this company is all about and we're	
not issuing ultimatums. We're trying to figure out a better	
way to work with our represented employees. We will	
always, always try to do that. You're right. The past has	
not been perfect. The IAM and the company are meeting together, trying to find new ways of working together so	
that we don't impact our customers and the	
performance of the company as badly as we have	
historically as we go through these disruptions. We're	
going to keep doing that. At the same time, the as you	
know and I think your question implied it we're going	
through an evaluation of where we put the second line of	
the 787, and we will continue a balanced evaluation there looking at Seattle, Everett as well as other places and	
come up with the best answer for the company, but as we	
go through that process, we want to work with the IAM as	
productively as we can."	
Daniel Levin (Associated Press):	
"There have been some reports suggesting that the 787	
may not fly this year, that the fix maybe more expensive	
and time consuming than initially described by Boeing. Is	
that a reasonable estimate of the time frame for the first	
flight at this point?"	
Jim McNerney:	
"Well, listen as we said before we're not in a position to	
say what the impact is on our flight test and delivery	
schedule. We have characterized the fix in the best way we	
know how, and characterized where we are in the process	
of both designing it and implementing it and we are	
entering the implementation phase right now, and when we understand that we'll have a much better understanding	
of its impact on the schedule and our financials and we'll	
be in a position this quarter to talk about those impacts."	

 Susanna Ray (Associated Press): "Jim, I am just wondering if you have enough engineering experience in your top management levels now and was it sort of shake up and new projections that were announced in December. Was that a way to address holes in that area and is there more that should be done in that area to make sure there are no further surprises?" Jim McNerney: "This company has strong engineering capability in its management. Having said that, we can always do better with our disciplines and we're always striving to do better with our disciplines, and that's a never-ending challenge particularly when you're dealing with the kind of innovation that the 787 represents. If we were just punching out aluminum airplanes, the challenge we give ourselves wouldn't be as difficult, but we're absolutely committed to lead innovation in this industry and that has its challenges, and we're fighting through them with one of the best engineering teams around." Hal Weitzman (<i>The Financial Times</i>): "First a clarification, later on in thinking that James told us that the late delay was putting pressure 787 profitability in the initial stages are and my question is, where are these pressure coming from? Are they coming primarily from penalties and settlements or the cost of 	
Jim McNerney: "I think what James said, and James you could correct me, but I think what James says was we go through a regular process that estimates to the best of our ability, the profitability on the program and which takes into account dues of unit volumes and revenues associated with that, as well as the cost and productivity we see on these programs. As you point out the costs include in our case because of some delays here, some customer settlements, some supplier impacts that impart we deal with and so there are as well as we work cost on the airplane So, we add that all up through a process that we have on a routine basis to assess our financial position and we're going to do it again with latest fix we are working on." <u>Hal Weitzman (<i>The Financial Times</i>):</u> "Where will most of the pressure come from? Will it come from the penalties or will it come from the cost of fixing the problem?"	
Jim McNerney:	

ŵ

"It's hard to predict precisely. I mean every customer arrangement is different from every other one. Every supplier arrangement is different from every other one and every engineering change or fix is different from other ones and that's why in the minds of many, we're taking too long to come up with the assessment, but it's a customized assessment every time, even though the process is routine."	
Dan Reed (USA TODAY): "Sure you've heard the general criticism that marketing, and marketing driven by financial planning, financial goal was driving the company too far ahead of where engineering was proved to be capable of taking it in terms of the timeframe. A, how did you respond to that, and B is that necessarily a bad thing, is it true?"	
Jim McNerney: "Listen, as you look back on this program, there is no doubt that the baseline was too ambitious, and it's hard for me to characterize exactly whether it was marketing ambition, or financial goals, but clearly the initial plan outran our ability to execute it. That's obvious. Now, you are right. Some of that is good, because it drives an organization and sets goals and milestones that people reach toward, but I think we got a balance wrong at beginning of this program."	
Dan Reed (USA TODAY): "How long will it take not in terms of just the 787 fix, and getting that one program, how long will it take to get the company to rebalance to that?"	
Jim McNerney: "I think with regard to the issue, you and I are talking about. It is rebalanced. In terms of base lines for future programs going forward, we've learned a hard lesson here."	
James Bell: "Operator, we have time for one last question."	
Mike Mecham (Aviation Week): "Can you help us understand at what point in the testing you were with the bend of the wing? Was it close to the nominal bend at the 100% rates, was it higher than that and also is there any implication in the actual process of making the wing? The processing of the wing, the auto [Inaudible] and that sort of things implied here or is strictly designed?"	
Jim McNerney: "Listen, this as I mentioned before is to the best of our knowledge and we've learnt nothing that says different that this is a local issue with a local fix associated with it	

			We do not see a systemic issue with the entire wing."	
			 We do not see a systemic issue with the entire wing. <u>Mike Mecham (Aviation Week):</u> "You were just a few days before first flight land. Had you passed the normal loads that you would expect on a wing or were you just getting to them. I mean, normally I think I have a certification picture clear up to the 150." <u>Jim McNerney:</u> "As you know Michael, there's a lot of parallel testing going on as you prepare for flight and in this case, it was a retesting of a result that the team questioned and the retesting showed us that we just didn't have the flight envelope we needed for first flight." <u>James Bell:</u> "Operator that concludes our earnings call. Again for members of the media, if you have further questions please call our media relations team at 312-544-2002. Thank 	
23 July 2009 <i>Times</i> <i>"Boein</i> Doesn' Know Yet How Long 787 Fi Will Take" (James Wallac)	Boeing Compa ny	Firm- Investo r	 α "On the earnings call, Barclays Capital analyst Joe Campbell asked Chief Financial Officer James Bell the question in plain English: 'Are you sure that you're not losing money on this thing?' The concern is that Boeing, despite the huge order book for 850 Dreamliners, may not be able to make enough money on each plane to recover over time all the added costs piling up: the extra research and development needed to solve the current problems, the late penalties that will have to be paid to customers and suppliers, and the cost of holding all the expensive inventory for months longer without any income. Bell disclosed that Boeing has in its inventory almost \$8 billion worth of 787 structures work — completed and partially built airplanes — for which it can receive no income until the jets are delivered to customers. He said this 787 work-in-progress inventory is growing at a rate of \$800 million per quarter. In response to Campbell, Bell conceded that the new 787 delay 'puts pressure on the profitability of this program.' 'We've always been concerned with the cumulative impact of the schedule delays and the pressure it puts on cost,' Bell said. 'We also have been concerned with the delays to our customers and how that converts to penalties or the settlements we have to work through with them." But Bell said Boeing expects to create efficiencies over the expected long production run of the 787 that will reduce costs and increase profit per plane to cover all the extra expenses. 'We still believe the program to be profitable,' Bell said. In an interview later, Campbell said that in rough numbers, using the figures released Wednesday, Boeing will have spent up to \$13 billion on inventory buildup by the time it starts delivering the 787s. If has maybe an additional \$8 billion to \$10 billion sunk into 	On a modular enterpri se architec ture's non- systemi c approac h to costs.

23 The James Firm. Fi	July	Financi al Times "Boeing Warns Dreamli ner Likely to Make Early Years Loss" (Hal Weitzm	Bell, CFO The Boeing Compa	Investo	α	 one-voice tulsa, OK July 23, 2009 at 6:31 AM "This doesn't surprise me at all. Its the result of a bad engineering culture from mismanagement. Boeing engineering has never been great. A 'good' engineer at Boeing is very bureaucratic, political, technically 20 years behind, technically limited, insular, timid, and uncreative. This proves it. And Boeing has been asking for it for years by treating engineers like crap. They drive out talent and experience and attract lowly grunts and bureaucrats. Outsourcing was a bad idea too, because Boeing engineers were in charge of the partner's engineers. Why would they want them to succeed? Instead they stifled them even more than engineers are stifled at Boeing and made things worse. Now, much of the 787 engineering is being done by the cheapest engineers they can find worldwide." LostintheGreatNorthwest Marysville, WA July 23, 2009 at 3:53 AM "Liar, Iiar. McNerney, Fancher et al are clueless. They do not know how to build an airplane. That is the tragedy. The once great company is sick. It needs leadership amputation. You need engineers would not have screwed this up." Old55 Des Moines, WA July 23, 2009 at 3:36 AM "I see this every day. Boeing upper management is a failure. Sadly I see no future for the Boeing company." "Boeing's troubled 787 Dreamliner looks unlikely to make a profit for at least two years after its first delivery, as the aircraft-maker warned yesterday the programme could make a loss in its initial stages. The manufacturer is poised to announce the details of the fifth delay to the 787 programme after discovering weaknesses in the structure where the wings join the body. Although it has repeatedly emphasised that the fault can be fixed using a relatively mior technical solution, Boeing is gearing up for significant financial implications because of the cost of solving the problem and penalties to customers. The company warned yesterday that the latest delay could	modular enterpri se architec tue's systema tic cost problem
--	------	---	--	---------	---	---	--

					solving the problem, although it promised to give that	
					information before the end of September. James Bell,	
					chief financial officer, said: 'Up to the point of the side-	
					of-body issue, our assessment was that the programme	
					was not in a loss position.' 'The cumulative impact of	
					schedule delays - including the current one being	
					assessed - is obviously putting pressure on the	
					programme's profitability.'	
					Robert Spingarn, an analyst at <i>Credit Suisse</i> in New York, said: 'It was interesting that they're finally addressing the possibility of a forward loss.' 'We've thought a forward loss is possible but do not think it would be	
					declared until the third quarter. I don't expect them to	
					book a profit on the 787 for at least the first couple of years. ' Boeing is suffering as the global economic	
					downturn hits air travel: it lost 41 orders for 787s in the	
					past three months and received only 13 new orders,	
					leaving it with firm orders for 850 aircraft. It continues to	
					face other problems: the aircraft-maker was forced this	
					month to take over a key supplier in an effort to gain	
					tighter control of the production process. The problems	
					with the 787 have raised questions about the company's	
					management. Jim McNerney, chief executive, batted	
					away suggestions that there was a lack of accountability within <i>Boeing</i> ."

2009	"Toyota	Inaba,			and the market, its new North American chief, Yoshimi	integrtat
	Lost	VP,			Inaba, said Monday. After years of growth and profits	ion of
	Touch,	Toyota			at Toyota, Mr. Inaba said, elements of complacency	an
	Executi	Motors			and arrogance infiltrated the company, which prides	integral
	ve Seur"	North			itself on being efficient and customer-oriented as well	enterpri
	Says" (Kate	Ameri ca			as constantly improving. To address this, Mr. Inaba plans an overhaul of <i>Toyota's</i> North American	se architec
	Linebau	Ca			operations. 'Our sense has been always that we listen	ture –
	gh)				to the market, we listen to customers, we listen to the	and
	8)				dealer. That element is a little bit lost,' Mr. Inaba told a	attempts
					group of reporters. He added that he is conducting an	to re-
					'overall replanning of our North American operation.' As	integrat
					the global vehicle market sunk last year, Toyota posted its	e.
					first loss in 58 years and projects to record another loss	
					for this fiscal year. In the first six months of this	
					calendar year, the company's U.S. sales fell 38%, more than the overall market's 35% decline. Last month,	
					than the overall market's 55% uechne. Last month,	

						
					Akio Toyoda, great-grandson of the company's founder,	
					took over as president as Toyota seeks to return to	
					profitability. Mr. Toyoda is emphasizing swifter	
					decision-making by local executives and seeking to add	
					more 'passion' to the company's products, Mr. Inaba	
					said. Mr. Inaba who was dispatched by Mr. Toyoda to	
					fix its biggest market says Toyota's North American	
					operations could return to profitability in the next fiscal	
					year as he seeks to reassess the company's business. He	
					said he expects U.S. light-vehicle sales to grow to about	
					12 million next year, though it will take time to return	
		_			to the 2007 level of 16 million. He expects sales this year	
					to be about 10 million. In the short term, Toyota has 'to	
					figure what to do with idle capacity,' said Aaron	
					Bragman, an analyst at IHS Global Insight. 'Toyota is	
					used to weathering ups and downs. They don't	
					necessarily react on a short-term scale. They don't lay	
					people off and shutter all the factories.' Toyota grew	
					rapidly this decade, adding factories and expanding its	
					product line in North America, home to seven of its	
					assembly plants. It opened a new plant in Canada at the	
					end of last year. But in the wake of plunging sales, many	
					of its plants aren't operating at capacity and the company	
					is faced with deciding the fate of a 25-year-old plant in	
					California that is a joint-venture with General Motors	
					Co. Mr. Inaba disagreed with the contention that	
					Toyota expanded too fast in North America. 'We were	
					having a tough time catching up with demand,' he said.	
					He stressed that the U.S. auto market 'remains the most	
					important market for Toyota.' Struggling to cope with	
					overcapacity, Mr. Inaba said the company hopes to	
					decide what to do with its California joint-venture	
					plant 'as quickly as possible.' GM said it was exiting	
					the partnership as part of its bankruptcy	
					reorganization. As part of the overall replanning process,	
					Mr. Inaba said he is evaluating what to do with a	
					partially built plant in Mississippi where Toyota	
					planned to produce its Prius hybrid. That factory was	
					indefinitely postponed last year. Restarting work on it	
					depends on how strong demand is for the Prius and	
					how the company reshuffles production to address	
					overcapacity. Prius sales have fallen after soaring last	
					year amid then-high gasoline prices. To assemble the	
					Prius in the U.S. Toyota would seek to produce some of	
					the vehicle's parts locally, he said. Mr. Inaba also said	
					Toyota wants to grab market share that GM and	
					Chrysler Group LLC lose through their restructurings,	
					though he conceded that Ford Motor Co. is best	
					positioned to benefit from the downsizing. 'We	
					certainly want a good chunk of it,' he said. 'As the dust	
					a second second a second s	
					settles down a little bit we would also like to go after	
					any incremental volume."

		 delivering from 2011. Specifing to report on at last monthly	ching
Meet	Qatar	deliveries from 2011. Speaking to reporters at last month's Paris Air Show Baker warned the carrier may cancel its	ships within a
with	Airway		modular
Boeing	S	30-aircraft 787 order if the airframer does not quickly	enterpri
Tomorr		resolve delay issues. At a media briefing in Washington	-
ow to		DC today, Al Baker says <i>Boeing</i> has responded to this warning by scheduling a meeting with the carrier. 'The	se architec
Discuss		· · ·	ture due
787 Deliveri		meeting is at their request because they are now concerned which way <i>Qatar Airways</i> will go,' Al Baker	to over-
es"		says. 'They are taking a very proactive stand with	promise
es (Brenda		Qatar Airways.' Al Baker says 'there are a few issues we	and
n Sobie)		will discuss with them' including the latest delays in the	under-
11 50010)		787 test programme and the possibility of assuming earlier	delivery
		delivery slots. He says <i>Qatar's</i> first 787 is now scheduled	denvery
		to be roughly the 50th production aircraft to roll off the	·
		assembly line, but there should be an opportunity to move	
		up as airlines ahead of <i>Qatar</i> have requested deferrals.	
		<i>Qatar's</i> first 787 was originally scheduled for delivery in	
		mid 2010, but programme delays have pushed back all	
		deliveries by at least two years. Al Baker is now asking for	
		slots in 2011 and says if <i>Boeing</i> can only offer 2012	
		deliveries it may cancel its entire order. 'If it slips into	
		2012 for delivery then we'll have to consider cancelling	
		our order," he says. 'We'll have to consider	
		[cancelling] because if there is another big slippage the	
		deliveries will be at the same we are receiving this large	
		order of A350s and the A350 mission will be very close	
		to the 787. If there's a huge overlap then why am I	
		buying two types of airplanes that are doing the same	
		mission?' Qatar has 100 A350s on order. Its 787 order is	
		for 30 firm aircraft plus 30 options. The carrier had been	
		planning to use the 787 to replace its A330s on	
		medium-haul routes and open new long-haul markets.	
		Al Baker says the A350 will be used for similar routes	
		but <i>Qatar</i> decided initially to also acquire 787s because	
		it needed additional capacity earlier. 'We'll start	
		getting the A350 during the last quarter of 2013 if they	
		are on time,' he says, 'I think there could be a six month slippage maximum, but at the same time I feel	
		more confident Airbus will deliver on time due to the	
		fact they're learning huge lessons from the mistake	
		Boeing has made. ' Al Baker believes 2011 deliveries for	
		the 787 are still feasible despite the latest delays in the	
		aircraft's first flight. He explains while aircraft number 50	
		may now not be delivered until after 2011 Qatar should be	
		able to move up to a 2011 slot because airlines which are	
		now ahead of it no longer want their 787s until after 2011.	
		'The people that are committed to the airplanes before us	
		are not taking those airplanes,' he explains.	
		He adds Qatar should be in position to receive these slots	
		because 'others that have ordered after us don't have the	
		right' to move up and take these slots. Al Baker says	
		Qatar will not accept any early production aircraft	
		because these will be heavier and will have	2
		performance limitations. But he believes Qatar can	
		move up to 2011 slots without having to take any of these	
		 early aircraft. He says last month Qatar was 'about to	

					send [Boeing] a letter of termination' but Boeing's response since his comments at Paris gives him hope the manufacturer may be able to provide the delivery slots and 'other technical requirements' Qatar seeks. 'They knew that when Qatar Airways says something it's not just talk but we will follow it up with our decision,' he says. He would not specify what new technical requirements Qatar wants Boeing to meet, explaining they are confidential and customer specific. But he says they do not involve performance guarantees because these are already specified in the original contract. 'We have very water tight performance guarantees they will have to meet or else they will have to keep on giving us cash,' Al Baker warns. He says if Qatar fails to provide the delivery slots and technical requirements it seeks the Qatar government's new aircraft leasing company could take over the order and remarket the 30 787s to other airlines. 'Or we'll just cancel it to send a message to Boeing that they shouldn't mess around with customers,' Al Baker quickly adds. The Qatar Airways chief believes Boeing knew about the delays at Paris although it did not announce them until the following week. Al Baker also criticises Boeing for not taking steps earlier to mitigate the delays. 'Boeing has	
					have been corrected a long time ago,' he claims, adding <i>Qatar</i> had a better relationship with <i>Boeing</i> when Alan Mulally was still CEO. 'I'm having a meeting with <i>Boeing</i> here [Washington, DC] tomorrow. They will have to brief me awarthy where this programme is 'Al Baker adds."	
24 July 2009	Seattle Post- Intellige ncerl, "Qatar Airways CEO Would Take Boeing CEO Job, Make 'Heads Roll' (Andrea James)	Akbar Al Baker, CEO Qatar Airway s	Firm- Custo mer	α	me exactly where this programme is,' Al Baker adds." "Boeing CEO Jim McNerney had better look out another industry CEO says he would take the job, and do better at it. Qatar Airways CEO Akbar Al Baker has not been shy about his disappointment with Boeing's delays for the 787 Dreamliner. Earlier this week, he spoke in Washington, D.C. at a media luncheon. USA Today reports: 'Unfortunately Boeing has lost its leadership,' Al Baker said. 'The mess with this (787) program could have been corrected a long time ago. If they had correctly focused management, they could have seen this coming.' When asked if he'd take the job as CEO at Boeing if it were offered to him, Al Baker said: 'I would take it and a lot of heads would roll. Just like it my airline People must deliver.'"	On adversar ial relation ships within a modular enterpri se architec ture due to over- promise and under- delivery
26 July 2009	Aviation Week "787 Schedul e Eludes Boeing" (Michae l Micham	Jim McNer ney, CEO, <i>The</i> <i>Boeing</i> <i>Compa</i> <i>ny;</i> James	Firm	α	"More than four weeks after the 11th-hour cancellation of the maiden flight of the 787, <i>Boeing's</i> leaders are not providing basic details about how the problem of a failed wing test will be corrected and when the new jet will fly. In its past 787 program slips - there have been six of them - <i>Boeing</i> has been unable to keep to schedules that gave it as much as six more months of breathing room each time. Following that scenario, the company's assurances that a new schedule will be set by the end of	On a modular enterpri se architec ture's overpro mise and

Norris)	Compa	estimating the previous goal of starting in second-quarter	
	ny	2010 will be stretched to the fourth quarter. Morgan	
	·	Stanley analyst Heidi Wood does not see them until 2011.	
		In a second-quarter earnings call last week, Boeing	
		Chairman James McNerney said the goal of program	
		managers has not changed since a failed wing test was	
		revealed a week before Boeing's previous deadline for first	
		flight. The 787 team wants a plan 'that is retrofittable and	
		will easily flow into the production process,' he said.	
		McNerney says a plan is in hand 'in terms of parts and	
		reinforcements.' It is needed to strengthen composite	
		stringers on wings already built by Mitsubishi Heavy	
		<i>Industries</i> (MHI) to prevent them from delaminating under flight loads. The stringers are delaminating where they	
		flight loads. The stringers are delaminating where they join the center wing box made by <i>Fuji Heavy Industries</i> .	
		It is not clear whether retrofits will be limited to the	
		stringers or also involve <i>Fuji's</i> center wing box. While	
		some initial tests have been run, a way to install	
		strengtheners 'in tight-fitting spaces in the airplane' is still	
		being sought, says McNerney. Boeing has indicated that	
		its suppliers have assemblies for some 40 aircraft in	
		various stages of development. How many wingsets are	
		at MHI is unclear, although Credit Suisse analyst	
		Robert Spingarn estimates there are at least 25 shipsets	
		not yet mated. Boeing hopes to buy time by strengthening	
		the wings it has while it devises a permanent solution for	
		wings still to be built. The company revealed the size of	
		its 787 investment for the first time in a second-quarter 10-Q filing with the Securities and Exchange	
		Commission that includes work in progress of \$4.4	
		billion, supplier advances of \$2.6 billion, and tooling	
		and other expenses of \$866 million - a total of	
		approximately \$7.9 billion. Jeffries & Co. analyst	
2		Howard Rubel notes that work in progress rose \$1.4	
		billion during the first half of 2009 and the other two	
		categories increased by about \$150 million. Chief	
		Financial Officer James Bell says 787 costs are growing	
		\$800 million a quarter, but asserts that 'as we work	
		through these tough challenges, execution continues	
		very well.' Wood concludes that delays are 'obviously putting pressure on the program's profitability.' The	
		profitability and cash flow of any program as large as the	
		787 are always grist for analysts' mills - but especially so	
		when they get in trouble. Von Rumohr sees cash flow	
		being stressed next year and in 2011 by the 787 delay.	
		Spingarn was not soothed by McNerney's assurances.	
		'While Boeing characterizes the wing-join issue as a	
		local problem with a local solution, we think it could be	
		time-consuming and expensive,' he says. He is looking	
		for research and development spending to grow this	
		year and in 2010, contrary to Bell's forecasts of its	
		being 'relatively flat' over the next 18 months after	

· · · · · · · · · · · · · · · · · · ·		
	growing \$110 million to \$360 million in the second	
	quarter. Looking at cash flow, Rubel estimates that	
	ZA001, the first flight-test article, has become a \$500-	
	million aircraft, and unit costs will not be driven down	
	to the \$220-million range until the 20th 787 (the 13th	
	delivered) rolls out. He chose that number because	
	change and program disruptions probably mean there	
	will be no production learning curve until then. He	
	therefore estimates that Boeing will not have its unit	
	costs fall below selling costs until the 75th airplane at	8
	the earliest and possibly as late as No. 125. Following	
	those assumptions, Rubel sees program costs reaching \$45	
	billion by the 500th aircraft. A major advantage of the	
	composite fuselage is that the 787 requires far fewer parts	
	than a traditional aluminum airplane. That was supposed	
	to provide <i>Boeing</i> with a manufacturing breakthrough that	
	would speed production. But the company already has	
	surpassed the time it took to build, flight test and	
	deliver the first 777 - its last large-fuselage aluminum	
	airplane. McNerney acknowledges that early	
	production plans were rosy scenarios. 'This is very	j.
	[much] an integration program and we are learning as	
	we go,' he told the analysts as they sought some clarity on	
	why things went wrong. Describing 'a never-ending	
	challenge,' McNerney said it was 'hard to characterize	
	whether it was marketing ambition or financial goals' -	
	rather than traditional engineering assessments - that	8
	prompted the company to set manufacturing ambitions	
	it has been unable to meet. The program is now running	6
	two years late. 'If we were just punching out aluminum	
	airplanes, the challenge we gave ourselves would not be	1
	as difficult,' says McNerney. When Boeing said it had	
	a wing problem on June 23, program managers said it	8
	would take 'a few weeks' to reset their plans. The fact	
	that McNerney was unable to go beyond that	
	assessment increased skepticism about the program.	
	'Second-quarter earnings per share beat our estimate and	l l
	the consensus estimate; but with the absence of a new 787	
	schedule, we see [the earnings call] as largely a nonevent,'	3
	said JPMorgan analyst Joseph B. Nadol. The rest of	
	Boeing's second-quarter report was largely positive,	
	especially considering the worst economic crisis since the	
	Great Depression. The company posted a 17% gain in	
	second-quarter net income and eked out a 1% sales	
	increase. It holds a \$32-billion backlog, including \$70	
	billion in defense programs, that is nearly five times	
	current annual revenues. And its earnings per share rose	
	22% to \$1.41. Airline customers deferred 70 deliveries in	
	the quarter, up from 60 in the first quarter, but the	
	company is not changing its production levels. McNerney	
	says the deferrals are spread across all airplane types and	
	there is no pattern to them other than a weak worldwide	
	economy. 'Our backlog of deferral requests is coming	6
	down right now,' he says. The goal early this year to	
	deliver 480-485 airplanes is regarded as achievable.	
	Completion of the body join on the first 747-8	

29 July 2009	at Barclay s Capital " (Robert Daniel) New York Times,	James Farley, head	Firm	α	schedule or financial impact.' The financial impact of four delays in the project and 'the costs of pre- production, technical fixes, penalties to airlines and supplier claims' add up to 'significant, but as yet undisclosed overruns,' the analysts said in a report. Because of the costs, the risk is increasing that <i>Boeing</i> will decide it must 'declare a forward loss on the 787,' they said. On the other hand, once <i>Boeing</i> gets past the startup problems and 'when, as planned in 2013, the 787 is being produced at 120 per year,' the plane 'has the potential to be the most profitable aircraft Boeing has ever had,' they said." "After a 20-year run, the <i>Ford</i> Taurus was headed for the scrap heap in 2007. The automaker planned to retire the name, and call its new sedan the Ford Five Hundred	optism On a modular enterpri
27 July 2009	Market Watch, "Boeing		Firm- Investo r	α	Freighter last week is an indication that the program is no longer tied to a loss of engineers to support the 787. Although defense budgets are under threat, <i>Boeing</i> 's operating margins rose 10.1% as revenues reached \$8.7 billion, compared with a \$7.9-billion performance last year. While company officials have declined to provide specifics of how much load the static wing was under when it failed, it is a safe assumption that the team had passed the 100% flight-load level that characterizes normal operations. Comments made by the management team indicate engineers were headed toward the 150% extreme load level needed for FAA certification. At some as-yet-unspecified point in the stress testing, <i>Boeing</i> 's predictive model did not equate with actual test results. As a way of understanding the problem, engineers apparently began retesting the wing at lower loads and learned that it was failing them, too. How close those loads were to nominal flight levels is unclear, but they apparently were well below 150%. Aside from the 787 marking commercial aviation's first composite fuselage, the program has stretched the industry's use of a global supply network beyond anything seen before. When suppliers were unable to meet earlier delivery deadlines, many suggested <i>Boeing</i> had taken the model too far. The company restructured its program management earlier, but the 787's continuing problems have raised the question of how quickly senior managers learn about production issues. 'Bad news doesn't appear to flow up,' said Bank of America/Merrill Lynch analyst <i>Ron Epstein</i> . McNerney denies that is the issue. 'This is not an issue of information flow,' he responded. 'It's an issue of them turned up wrong that we didn't anticipate.' And so the whole program is in limbo." "Boeing Co., the Chicago aerospace giant, was cut to equal weight from overweight at <i>Barclays Capital</i> . The investment bank's aerospace and defense analysts also cut	On a modular enterpri

	Ford"				money on a full-size sedan? 'This a real acid test for our	ment.
	(Bill				product strategy,' said James Farley, Ford's head of global	
	Vlasic)				marketing. Ford says it will exercise a new sense of	
					discipline with the Taurus. Rather than aiming for a	
					home-run product that sells hundreds of thousands of	
					units — and then be forced to offer incentives to	
					persuade shoppers to buy them all — Ford plans to	
					build lower numbers of the Taurus. That way, it might	
					be able to avoid steep discounts so it can turn a profit	
					on each one. If the car languishes on dealer lots, though,	
1					Mr. Mulally's fledgling turnaround could stall. The car's	
					base price of \$26,000 is higher than some competing	
1					models. Mr. Farley and other <i>Ford</i> executives readily	
					acknowledge that previous versions of the car were	
					utilitarian and hardly up to the standard of comparable	
					sedans from <i>Toyota</i> and <i>Honda</i> . But they also are	
					counting on the image of the old Taurus fading from	
					the public's consciousness. 'Its deterioration over time	
					has allowed us the freedom to write a business plan to	
					more realistic expectations,' Mr. Farley said. At its peak	
					in the late 1980s, Taurus was the top-selling car in the	
					United States with more than 500,000 sales a year. The	
					new model's targets are somewhere from 50,000 to 75,000	
					annually. 'Ultimately customers are going to judge you	
					on whether you're offering something new,' Mr. Farley	
					said. 'This car can't just be a little better. It has to be	
					demonstrably better in every respect.' The advertising	
					campaign, which begins next week on national	
					television, focuses on technology. One of the new	
					features is the 'blind spot information system,' sold as	
					an add-on, that uses radar to detect vehicles that can't	
1					be seen in the mirror. Another is the so-called 'eco-	
1					boost' engine that provides additional power without	
1					using more fuel. Ford's marketing managers spent a	
1					month last year interviewing three dozen of the car's	
					engineers to determine which features might be most	
1					compelling to potential buyers. 'The design speaks for	
1					itself, but we've got the goods to show when it comes to	
					features,' said Matt VanDyke, director of Ford brand	
1					marketing."

Far Off"	nes	We're not going to agree to a no-strike agreement.	
(Domini		They had their chance.' The voluntary layoff package	
c Gates)		announced Tuesday could save the jobs of younger	
e Guilloy		workers as those approaching retirement see an advantage	
		in volunteering to leave early. The incentives include up	
		to 13 weeks of severance pay and continued health	
		benefits for six months. In addition, workers 49 and older	12
		who volunteer will be eligible for a company pension	
		when they turn 55. Those are incentives designed to	
		appeal to those nearing retirement and who want to leave.	
		The severance pay offered is only half what a worker	
		laid off involuntarily would get. And workers with skills	
		deemed critical will not be eligible. However, a previous	
		Boeing voluntary layoff deal in 1993 offered no	
		incentives, said IAM spokeswoman Connie Kelliher. One	
		veteran Machinist said the Everett assembly plant was	
		abuzz Tuesday with talk of the deal. 'People who want to	
		leave can leave. This is a way that people with young	
		families, that the company has just gotten trained, they can	
		stay,' said the Machinist, who asked not to be named. 'It's	
		a win-win. (Boeing) is lowering its labor costs. It's good	
		for morale. It's good for the community.' Wroblewski	
		said the union has pressed for the deal since Boeing said in	
		January it intended to cut 10,000 jobs companywide this	
		year. The state has lost more than 3,000 Boeing jobs since	
		the recent peak last November.	
		Union sought deal	
		Wroblewski said discussions to improve relations will	
		continue. However, his boss, Buffenbarger, went out of	
		his way Tuesday to quash the notion that the layoff deal	
		might lead to a long-term, no-strike deal, an idea floated	
		by politicians to try to secure future <i>Boeing</i> work for the	
		region. Earlier this month, local politicians including U.S.	
		Rep. Norm Dicks, D-Bremerton, revealed Boeing is	
		pushing the union hard for a no-strike deal by the end of	
		the year. He presented one aspect of the talks as	
		effectively an ultimatum to the union: That a no-strike deal	
		would mean Everett would get a second 787 final-	
		assembly line, but that no deal would result in the line	
		going somewhere else. Dicks and Gov. Chris Gregoire	
		said Boeing needed to negotiate with the union and offer	
		something substantial in return. After those public	
		comments by the politicians, Boeing's top labor	
		negotiator, Doug Kight, laid out the barriers to any	
		long-term deal in a July 14 internal message to all Boeing	
		Commercial Airplane managers. Kight's message tacitly	
		confirmed that 'a series of discussions with union	

					leadership' is indeed focused on reaching a no-strike	
					agreement. But he also laid out why it will be hard to	
					achieve: A stumbling block for management is that in	
					the absence of a strike option, it would likely have to offer the Machinists some kind of independent arbitration	
					for disputes. 'It's important to realize that a long-term	
					labor agreement, enabled in part by some form of third-	
					party dispute resolution, would ask a great deal of both	
					sides,' Kight's letter said. 'It would be difficult for a	
					union to give up its option to strike. At the same time, it	
					would be just as difficult for <i>Boeing</i> to allow a third	
					party to make decisions that affect our competitiveness	
					and how we run our business,' the message went on. 'No	
					company could give away its ability to run its business	
					as conditions require.' Last week, in a teleconference	
					timed for the company's quarterly earnings report, Boeing	
					CEO Jim McNerney said talks are proceeding. 'The IAM	
					and the company are meeting together, trying to find new	
					ways of working together so that we don't impact our	
					customers as badly as we have historically as we go	
					through these disruptions,' McNerney said. 'We're going	
					to keep doing that.'	
					No substance	
					But Buffenbarger said there is no substance to the talks.	
					He said Boeing has refused all his suggestions of	
					independent mediators to aid the discussions. And instead of offering some enticements to the union to agree	
					to forfeit its strike weapon, he said, management has been	
					asking the union for suggestions. 'They are trying to get	
					us to bargain with ourselves,' Buffenbarger said.	
					'We've seen that tactic before. We're not buying into	
					it.' A veteran local Machinist with knowledge of the talks	
		200			said there have been meetings both in Seattle and in	
					Washington, D.C. He cautioned Tuesday that	
					Buffenbarger's position as head of the union requires him	
					to adopt an aggressive public posture. He insisted 'labor	
					peace is still negotiable.' But if that's ever to happen,	
					Buffenbarger has a clear message as to who will do the	
					negotiating. 'Boeing is making another ill-fated attempt	
					to negotiate an agreement in the wrong places with the	
					wrong people,' Buffenbarger said. 'I invite the governor, Norm Dicks and the other politicians to butt out.'"

	Bachma	ng,			Aug. 11 at Davis, Polk & Wardwell, the New York law	on
		Contlan	1		Firm approaching Execution in the next metaning Couthward	
	n)	Southw est			firm representing <i>Frontier</i> in the restructuring. <i>Southwest</i> says it would operate <i>Frontier</i> as a wholly owned	

			
	Airline	subsidiary 'for a period of time with its Airbus aircraft	
	S	and personnel.' But that period would end within	
		about two years, after which Southwest would not add	
		Frontier's Airbus jets to its all-Boeing 737 fleet.	
		Southwest's bid, if successful, would mark a tiny step in	
		the U.S. airline industry's consolidation and could swiftly	
		reorder the competitive balance at Denver, a hub for	
		United Airlines (UAUA), long the dominant carrier. Over	
		time, Frontier's domestic capacity in Denver, currently	
		about 10% of the market, would likely supplement	
		Southwest's operation incrementally, as growth warrants.	
		In the interim, Southwest would immediately become a	
		stronger competitor to United, which has a 36%	
		market share at Denver, compared with 21% for	
		Frontier and 12% for Southwest, according to the	
		Bureau of Transportation Statistics. As United has been	
		cutting capacity at Denver in response to the downturn	
		in air travel, coupled with its own efforts to curb costs,	
		Southwest has identified the market as one of its biggest	
		strategic opportunities. With Frontier the carrier could	
		easily become the largest player in Denver. If its bid is	
		successful, Southwest would also need to determine	
		whether to expand into two important airports <i>Frontier</i>	
		serves but Southwest has long avoided: Atlanta, the busiest	
		U.S. airport and a hub <i>Delta Air Lines</i> (DAL) has	
		defended staunchly; and Washington's Reagan-National	
		Airport, which has 'perimeter' constraints on how far	
		flights can operate.	
		nights can operate.	
		Less Competition, Pricier Tickets?	
		Another byproduct could be higher fares, as <i>Southwest</i>	
		culls overlapping <i>Frontier</i> flights. Competition at Denver	
		has been fierce, with <i>Southwest</i> claiming much of the	
		credit for lowering fares. Average fares from Denver	
		have fallen by over 10% in the past year, 35.5% from 2001	
		to 2009, and now stand at \$292, according to federal data.	
		Since 2001, only Long Beach, Calif.; Charlotte, N.C.;	
		Richmond, Va.; and White Plains, N.Y., have seen steeper	
		fare decreases among the top 100 U.S. airports. The	
		Frontier bid also would give Southwest entrée to	
		Mexico, where it does not yet offer flights. On a	
		conference call with reporters, Bob Jordan, Southwest's	
		executive vice-president for strategy and planning, said	
		the company is pleased about the prospects of	
		expanding into Mexico with a Frontier acquisition. 'I	
		can tell you that we are very interested in doing the due	
		diligence work in understanding the near-international	
		market,' Jordan said. 'I think that's a very exciting	
		opportunity for Southwest Airlines.' Acquiring a	
		carrier with Mexican destinations, as well as marketing	
		relationships, facility leases, and other necessary	
		infrastructure, makes it easier and less expensive for	
		Southwest to enlarge its network. The Dallas-based	
		airline has struggled to expand its services abroad, taking	
		tentative steps in recent months to develop code-sharing	
		agreements with Canada's WestJet Airlines and Volaris, a	
		agreemento mar cunuda mesoce minutes and rotaris, a

31 July 2009	Seattle Post- Intellige ncer "More and More, Invstors Place Bets Against Boeing' s Success " (Andrea James)		Firm- Investo rs	α	"When considering the health of Chicago-based The Boeing Co., what factors would you take into account? Boeing's business is coming to a point where it is being evaluated on Wall Street as either 787 Dreamliner- related or everything else, says Barclays aerospace analyst Joseph Campbell. As reported in this blog in the past couple of weeks, Boeing has several airplane programs particularly on the defense side that are doing well, on time and on budget. But bad news about Boeing's much hyped 787 tends to overshadow all that. As far as Boeing's stock is concerned, investors are increasingly betting against Boeing's success. Aerospace analyst Scott Hamilton recently posted a list of numbers showing the number of short sales on Boeing's stock from the year that the 787 was launched in 2004 through July 15, 2009. Hamilton received the data from a Wall Street analyst who pulled it off of a Bloomberg terminal, he said. The number of short sales grew from just under 10 million in January 2004 to nearly 23 million in July. When an investor buys a 'short sale' on a stock, he or she is essentially betting that the stock will go down. It's a bet against the company's success. I put the numbers into Excel, for a graphic representation, and the result is telling: Analyst Campbell says that the 787 should be viewed as a growing asset, not a liability, but also acknowledges that as long as the market is uncertain about the 787, 'Boeing shares will be volatile.'" 			"Ever since the McD coup/Chicago move, Boeing has	
			been progressively taken over by the same folks with	
			the same disease who sank McD. The 787 is brought to	
6			you by the McD team. The investors are seeing the	
			impact of their poor decision-making and are fleeing.	
			We need the current executive team to go away, we need	
			Boeing to come home. Perhaps the best part of this will	
			be when Commercial goes belly-up and gets sold off	
			because the McD side can no longer milk it to death,	
			and BCAG gets reborn as a Seattle company building	
			metal airplanes. Couldn't happen? Notice that all the	
			tooling now sits on wheels. All we need is a flat floor and	
	5		a roof. And when the IDS/McD guys run us into the	
			ground, that property in Everett will be up for a fire	
			sale."

			leadership and get some new blood at the top. The	

.

problem: the bills are now paid by legacy products produced under previous management. If the current management cannot execute a new design, then the company goes bankrupt when its existing designs become obsolete and stop selling. It's that simple. So, you know what's going to happen, now you know when. Absent a turnover in top management, you can rest assured of what the future holds."#343416 Posted by John Roger at 8/1/09 4:36 p.m. "The three whiz kids that worked at GE under Jack Welch have done nothing but harm to the companys that hired them as CEOs: Boeing, Home Depot/Chrysler and GE."
 #343421 Posted by unregistered user at 8/1/09 4:46 p.m. "#343336 got it right. Condit, who once ran the successful 777 program before becoming President and CEO, got sucked in by Stonecipher and his minions who took over so many <i>Boeing</i> corporate and commercial leadership positions. The reason <i>Boeing</i> is not making tankers today is because of now ex-con Mike Sears, who by the way ran the military side of <i>MDC</i>. That arrogant jerk proved in spades that he had no integrity and was not capable as a corporate chief financial officer. Commercial airframes for military purpose get logged as military sales. And for the idiot who said <i>MDC's</i> military book of business is saving <i>Boeing</i>, you better check again, because those products are stale and C-17, is on the edge of being discontinued. Thanks to Stonecipher, and the outdated offering of the Harrier jump jet technology in the joint strike fighter competition in 2001, <i>Boeing</i> lost out to Lockheed Martin. Again, thanks to Stonecipher <i>Boeing</i> R&D leading to the offering of the 787 was delayed for something two years. The legacy of Stonecipher and his decisions have nearly killed <i>Boeing</i> to date (ever hear the fairytale the emporer's new clothes - it could have been about Harry). Harry wanted to hear only things that reinforced his views. That meant no bad news or differing optinos. For the last 10 years, since trying to digest the <i>MDC</i> and <i>Rockwell</i> acquisitions is a company in search of its soul. There has never been a good business case made for the expensive corporate move to Chicago. Thank Stonecipher and the <i>MDC</i> contingent of the Board of Directors for that, including Condit. It's less than 300 miles from St. Louis to Chicago. McNerny got on the board because he once ran <i>GE</i> engines before going to <i>3M</i>, and only became CEO when Lou Platt (former <i>HP</i> exec.), <i>Boeing</i> Board Chairman suddenly died. Can anyone name anything that Harry Stonecipher at 18/109 5:12
p.m.

	"You idiots that always blame the IAM union workforce for <i>Boeing's</i> problem have no idea what you are talking about. I always hear that the hourly workers are paid too much money. If that is the case, how come the salary people at <i>Boeing</i> (non-union) have much higher annual	
	earnings and much better retirement benefits? The corporate media has managed to brainwash all of you fellow middle class workers into believing that it is the worker salaries that are killing the companies instead of the bad decisions that management is making. Answer	
	this, what per cent of <i>Boeing</i> operating costs goes toward hourly worker pay each year? What would be a fair number? 15% 10% ??? Actual costs to <i>Boeing</i> for the hourly workers is only 2.8%How can that be bankrupting <i>Boeing</i> ?"	
t.	#343460 Posted by unregistered user at 8/1/09 6:05 p.m. "This chart shows nothing. You need to plot this against long sales, and against general short sales in the down market since mid-2008."	
	#343468 Posted by 777mech at 8/1/09 6:27 p.m. "You can blame both <i>Boeing</i> and <i>McD</i> execs for the mess the company is in. Stonecipher and John McDonnell told Mullally that he had to bring the 787 in at 50 percent of what the 777 cost, which was \$10 billion. How can you set a limit like that 15 years later on an airplane more complex than the 777? So Mullally came up with global partnership plan. Then cut and run. "	
	#343496 Posted by Chronic at 8/1/09 8:18 p.m. "From my knothole in the fence, they quit building airplanes like they used to. They tried too many new things at the same time. They decided they were so good they did not need a certain type of integration labWrong Move! I was around during the 777 days. We had problems then but overcame and moved on. Many lessons learned but the knowledge was not carried on. I think the 787 team was like the Keystone Cops. Where did they	
	come from? Obviously not from our recent successful past. We will get there and overcome but there are so may I-told-you-so's it is just ridiculous. Too many parts farmed out then finding out those partners could not keep up with the job. We had to either supply workers to bail them out, or to buy back those partners. A real cost savings solution. What is even more ridiculous is all this being blamed on a machinists strike. I wish the ignorant would get a clue."	
	#343517 Posted by unregistered user at 8/1/09 9:28 p.m. "Ah yes. MDC CEO John McDonnell who drove them to the brink of bankruptcy, and hired Harry away from Sundstrand to find a buyer for MDC commercial and military. They couldn't compete against Boeing and Airbus for commercial planes, had their A-12	

	r	r			Avenger bomber aircraft unilaterally cancelled by	
					Secretary of Defense Cheney for huge cost overruns, lost	
					in a preliminary round of the joint strike fighter	
					competition, and screwed up their rocket business. And,

		nes;			Thursday — the day Boeing formally closed on the	
		Larry			purchase of the operation from its 787 partner, Texas-	
		Brown			based <i>Vought</i> — to decertify the Machinists union at the plant. That will likely trigger a wate that could put	
		, IAM			the plant. That will likely trigger a vote that could oust	

legislat	the union two years after it organized the factory.	
ive and	Because of discontent in the Charleston work force over	
politic	the contract the IAM agreed to there last November,	
al	that move has a good chance of success. If the	
directo	decertification goes through, Everett will be competing	
r	against a nonunion facility for the second 787 line.	
	Larry Brown, IAM legislative and political director, said	
	the union is working with <i>Boeing</i> to improve relations. He	
	said the union proposed to help <i>Boeing</i> be more flexible	
		I
	in its production by deploying machinists to a mixed	
	assembly line that could roll out either 787s or 777s,	
	according to demand. 'Boeing already has the tools,	
	the facilities and the experienced workers in place to	I
	open the second 787 line here,' he said. Brown said the	
	union hopes to raise the level of trust sufficiently so	
	that the contract negotiations in 2012 don't end in	
	another strike. 'The only possible guarantee of no-strike	
	when our current contract expires is for Boeing and the	
	Machinists union to be committed to negotiating a	
	settlement and not a strike,' Brown said. 'We have time	
	to build the kind of relationship we need to make that	
	happen.' In contrast, <i>Boeing's</i> Fred Kiga, vice	
	president of state and local government relations,	
	reiterated that management wants a long-term, no-	
	strike agreement and wants it in place well before the	
	current contract ends. 'I don't believe we have until	
	The second	
	2012,' said Kiga in an interview. 'We at the Boeing	
	Company have a sense of urgency about finding	
	production stability.' Kiga said choosing a final-	
	assembly site somewhere other than Everett would, in	
	the event of a work stoppage at one plant, give Boeing	
	an alternative to keep its jets rolling out. In his speech	
	at the conference, Kiga decried the '20-year pattern of	
	labor disputes and strikes' with the IAM and expressed	
	optimism about the current talks with the union, which	
	he called 'long overdue.' 'We intend to continue the	
	conversation,' Kiga said. 'We have an opportunity. We	
	have seized it We're hopeful we can take the risk of	
	labor stoppages out of the equation.' 'Nobody wants to	
	participate in the decline of the aerospace industry in	
	Washington,' he said. Politicians at the Lynnwood	
	summit encouraged the two sides to come to an agreement,	
	though they offered advice gingerly because last week	
	IAM international President Tom Buffenbarger in an	
	interview asked politicians to 'butt out' and leave	
	negotiations to the union. The summit's keynote speaker,	
	U.S. Rep. Norm Dicks, D-Bremerton, said the people of	
	Washington and their elected representatives have a	
	serious stake in the outcome, but conceded that only the	
	union leadership and <i>Boeing</i> management can get it done.	
	'The Hatfields and the McCoys have to stop feuding,'	
	said Dicks. He said the loss of a second 787 line could	
	well lead later to the loss of an assembly plant for a new	
	jet to replace the 737 toward the end of the next decade.	
	Dicks said the outcome of the IAM/Boeing talks could	
	prove to be 'Washington's finest hour or the most dismal

3 Aug. 2009	Telegra ph, "Senior Profits Hit by Boeing Dreamli ner Delay" (Jonatha n Liew)	Mark Rollins , CEO, Senior	Firm- Suppli er	α	setback and a loss of national leadership."" "The company reported a pre-tax profit of £21.1m in the six months to June, down from £27.2m in the same period last year, which it blamed on weak land vehicle and business jet markets, the residual impact of last year's <i>Boeing</i> strike and de-stocking by customers. The 787, for which <i>Senior</i> supplies air ducts and other parts, is already two years late and has been delayed five times by <i>Boeing. Senior</i> estimate it would increase sales by around 12pc and its commercial aerospace revenue by around 50pc, with each plane worth around \$800,000 (£473,000) to the company. Mark Rollins, Senior chief executive, said that although he did not expect the 787 to be ready for another six months, <i>Boeing's</i> delay would not adversely affect the company in the long-term. He added: 'We have phenomenally good relations with them and usually have the inside track, but they've generally gone quiet for everybody on the 787s, so we're reliant on their public statements.' 'But we are talking with <i>Boeing</i> about what else they could give us, so we may win some extra work because of the delay.'"	On a modular enterpri se architec ture's low trust

On a modular enterpri se architec ture's low trust
6 Aug. 2009	<i>USA</i> <i>Today</i> "From Dreamli ner to Lost Military Deals, Problem s Nag <i>Boeing</i> " (Dan Reed)		Firm	α	"This was to be <i>Boeing's</i> summer of triumph. Dozens of its groundbreaking 787 Dreamliners were supposed to be in commercial airline service around the world by now, changing the nature of global air travel. A family of ultra- high-tech spy satellites made by <i>Boeing</i> (BA) was to be in the heavens, reading the license plate numbers of the USA's vilest enemies from 150 miles up. Profits from regular launches of commercial satellites from a floating launch pad on the equator were supposed to be rolling in. The Air Force was to take delivery of a fleet of new air-to- air refueling tankers based on the <i>Boeing</i> 767. But none of that is happening this summer. And some likely never will. 'Every aircraft, and every defense program <i>Boeing</i> is involved in is having problems, " says Scott Hamilton, an independent aircraft manufacturing and sales analyst and consultant. " <i>Boeing</i> is, quite simply, a mess right now. And I say that as an unhappy shareholder." This is quite a turnaround for <i>Boeing</i> , which is America's largest exporter. Barely a year ago, the company was doing well. Or so it seemed. Its stock traded at a 52-week	

	high of \$68.75. It boasted an unprecedented backlog of	
	firm orders for jetliners worth well over \$350 billion,	
	including more than 900 for Dreamliners, the fastest-	
	selling plane in history. It was coming off two straight	
	years of sales victories over Europe's Airbus. Both the	
	revolutionary 787 and the 747-8 extension of the venerable	
	Boeing 747 jumbo jet were moving toward their first	
	flights. Its defense and space business seemed to be	
	booming. Then came last fall's costly 58-day strike by	
	production workers at <i>Boeing's</i> Commercial Airplane	
	division that delayed delivery of dozens of planes. That	
	was followed by a fourth major setback for the 787 and	
	rapid deterioration of the economy that destabilized	
	Boeing's airline customers worldwide. A growing number	
	of less-publicized setbacks took place in the company's	
	defense and space business. Some were related to	
	changing program priorities and shrinking budgets under a	
	new president and Congress. Others resulted from	
	Boeing's failure to perform to expectations.	
	annen ann an thairmeana baoine. Recruichean ann ann an thair thair ann ann ann ann ann ann ann ann ann an	
	787 becomes 'Nightmareliner'	
	The Chicago-based company still managed to report a	
	modest first-quarter profit this year, then a large \$998	
	million second-quarter profit, up 17% from the second	
	quarter of 2008. But industry analysts are fretting about	
	bloated inventory costs, sagging cash flow, increased	
-	borrowing and mounting cancellations of orders. They	
	also worry about defense contracts that have been scaled	
	down, lost or threatened because of Boeing's inability to	
	deliver on its promises. Take, for instance, Boeing's role	
	as systems integrator of the Army's ambitious Future	
	Combat Systems program, the Pentagon's second-biggest	
	weapons development program. It has been scaled back	
	partly because of poor performance. Analysts also are	
	expecting Boeing to swallow a charge against earnings	
	of up to \$500 million related to the June 22 Chapter 11	
	bankruptcy filing of the Sea Launch commercial satellite	
	launch joint venture. <i>Boeing</i> owns 40% of heavily	
	indebted Sea Launch. Companies in Norway, Russia and	
	Ukraine own the rest. On June 23, <i>Boeing</i> delivered its	
	most disquieting news yet. Ground testing of the 787	
	Dreamliner had revealed a structural failure in the world's	
	first jetliner made mostly of composite materials rather	
	than aluminum and steel. The discovery of 36 tiny weak	
	points where the wings join the fuselage forced a last-	
	minute scuttling of the 787's first flight. It was the fifth	
	time in two years that Boeing had to tear up its 787 test	
	and delivery schedules. Worse, officials still can't say	
	for sure when the project will get back on track, though	
	they hope the plane will fly by year's end. Industry	
	analysts were particularly peeved that this latest delay	
	came less than a week after Boeing executives had	
	assured them at the Paris Air Show that the 787's first	
	tlight would be before the end of June Wage who'd	
	flight would be before the end of June. Wags, who'd already been calling the Dreamliner the 7-LATE-7'	
	already been calling the Dreamliner the 7-LATE-7,' came up with an even more scathing nickname: The	

'Nightmareliner.' So when Boeing executives hosted a	
conference call on July 22 to talk about the company's	
better-than-expected second-quarter profit, the tone of the	
conversation was anything but celebratory. Investors	
instantly picked up on the analysts' concerns. Boeing's	
shares, which already had fallen 35% since last August,	
dropped another 2.4% to \$42 that day and another nickel	
the day after that. Wednesday the stock closed at \$44.03.	
Analyst Brent Miller, who follows Boeing for Gradient	
Analytics in Scottsdale, Ariz., says the tone of the call	
'was very negative, and the market's response was very	
tepid' because 'management is starting to lose	
credibility.'	
Trying to turn a corner	
<u>Trying to turn a corner</u> That's damning criticism for any company, but	
especially for <i>Boeing</i> , which had recently appeared to	
have its act together after years of costly failures and	
misdeeds. Veteran industry analyst Richard Aboulafia of	2
the <i>Teal Group</i> says that in the years following <i>Boeing's</i>	
1997 merger with old rival McDonnell Douglas, the	
company developed a habit of failing to deliver on	
grand promises to win big defense contracts. At the	
same time, <i>Boeing's</i> name was dragged through the	
mud by a series of embarrassing ethical lapses by key	
executives. The list of improprieties was long. But most	
notably, former CFO Michael Sears ended up in prison	
for trying to win the Air Force tanker contract by	
offering a high-paying job to the Pentagon decision-	
maker. Two former chairmen were shown the door in	
2003 and 2005, the latter, Harry Stonecipher, for a	
national headline-grabbing extramarital affair with	
another Boeing officer. Jim McNerney, a former 3M	
CEO and onetime head of General Electric's successful jet	
engine division, was hired in mid-2005 to clean up	
Boeing's mess. And, seemingly, he did. The straight-	
arrow McNerney got high marks in his first three years	
at Boeing's helm for changing the company's culture,	
streamlining its organization and cutting costs. The share	
price's run to record levels was viewed as evidence McNerney had <i>Boeing</i> back and headed for a long run	
of big profits. But McNerney also was riding on the	
back of the promised riches of the Dreamliner. The	
feather-light plane made of strong composites is billed as	
20% more fuel-efficient and 30% less expensive to	
maintain than its metal-skinned ancestors. For travelers,	
Boeing says, it will be the most comfortable ride ever. Its	
promise created a near-stampede by airlines scampering to	
Seattle, home of Boeing Commercial Airplanes, to place	
orders. By last fall, Boeing had more than 900 orders	
worth \$135 billion to \$160 billion in revenue over the next	
decade. The number of orders is now down to 850, as	
airlines, upset by the delays or unsure whether they can	
afford the planes, have begun canceling. Although that's	
still a record number of orders for an airplane that hasn't	
been certified to fly, the financial damage is an	

				estimated \$9 billion to \$10 billion. And the question isn't whether there'll be more cancellations, but how many? Reaction to the latest bad news on the 787 has been disappointment and consternation. 'Management not knowing about these problems until the last minute is horrible because it means engineering information isn't flowing upward through the organization. That's scary,' Miller of <i>Gradient Analytics</i> says. 'But what's more scary is management knowing, and not telling. I just don't know which it is.' Several analysts, including at <i>Barclays, Oppenheimer, Credit Suisse and Gradient</i> , have downgraded their ratings of <i>Boeing's</i> securities or target stock prices. Even McNerney acknowledges <i>Boeing</i> blundered by putting sales of the 787 ahead of engineering. 'Clearly the initial plan outran our ability to execute it,' he told analysts in the July 22 conference call. 'We've learned a hard lesson here.' But the chief source of <i>Boeing's</i> summer of discontent, the Dreamliner, also represents the company's path to success — if it	
6 Aug. 2009	The New York Times "Inside G.E., a Little Bit of Enron" (Floyd Norris)	Firm- Investo rs	α	can get the plane flying. Carol Levenson, a bond analyst at <i>GimmeCredit</i> in New York, says <i>Boeing</i> has time to get the Dreamliner fixed. 'Their credit quality is still pretty good,' she says, 'so they can borrow money to make up the damage this is doing to their industrial balance sheet.' And <i>Barclays Capital's</i> Joseph Campbell, one of the analysts who has lowered his <i>Boeing</i> ratings, nevertheless says the 787 will be a big winner for <i>Boeing</i> once it gets airborne. 'When the 787 is being produced at 120 a year,' he wrote in a new assessment, '(it) has the potential to be the most profitable aircraft <i>Boeing</i> has ever had.'" "'A decade ago, <i>General Electric</i> was the shining star of American business. Its longtime chief executive, Jack Welch, was named manager of the <i>century</i> by <i>Fortune Magazine</i> , and its stock seemed always to go up. It ran a bewildering array of businesses but somehow always managed to make the expected profits. That record was viewed as proof of superior management, and the battle to succeed Mr. Welch in 2001 was watched all over the business universe. When a winner emerged, the losers quickly were hired to run other major companies. <i>G.E.</i> is different now. The stock has fallen and the aura has dissipated. This week <i>General Electric</i> agreed to pay \$50 million to settle a suit filed by the Securities and Exchange Commission that said the company fiddled with its books repeatedly early in this decade. In at least one case, that allowed it to preserve its reputation for making the numbers. Some of the details are eerily reminiscent of <i>Enron.</i> As is customary in such settlements, <i>G.E.</i> neither admitted nor denied the charges. But it sounded contrite. 'The errors at issue fell short of	On a modular enterpri se architec ture's use of "strategi c misinfor mation" or "strategi c deceptio n"
				our standards, and we have implemented numerous remedial actions and internal control enhancements to prevent such errors from recurring,' said a company statement. Another view of <i>G.E.</i> 's accounting standards emerged a few years ago in a book written by a man who

a seminary. James Martin may be the only Jesuit priest	
with a degree from the Wharton School of the University	
of Pennsylvania. 'The primary task of my first job was to	
issue very long, monthly statistical reports,' he wrote in	
his book, "'n Good Company: The Fast Track From the	
Corporate World to Poverty, Chastity and Obedience.'	
'The first month,' he recalled, 'I informed one executive	
that our results were coming in low" because of losses	
in overseas operations. 'So what?' replied the	
executive. 'Just reverse a few journal entries.'	
Corporate headquarters, he explained, would come down	
hard on them if they missed the numbers. Another boss	
told him he was 'taking those accounting courses way	
too seriously.' The S.E.C. complaint makes it sound as if	
those days came back, assuming they ever left. It tells of	
corporate accountants discovering misstatements and	
secret side deals, and of more senior executives telling	
them to sign off on the books anyway. It outlines four	
separate violations, two of which it says descended to the	
level of fraud. It is notable how this investigation came to	
be. Post-Enron, the commission used its authority to look	
at $G.E.$'s books to figure out whether there were violations	
in the area of so-called hedge accounting, which	
determines whether companies can avoid reporting profits	
and losses from a variety of derivative securities. The	
commission evidently found three violations, two in hedge	
accounting and the other in an Enronesque scheme to	
inflate profits with fake sales. 'It was like peeling an	
onion,' said David P. Bergers, the director of the Boston	
office of the S.E.C., as one accounting issue led to	
another. The fourth violation appears to have been	
reported by G.E. All have been fixed in restatements.	
While it may seem odd to view the government as an	
underdog, it was. G.E. says it spent \$200 million on	
outside lawyers and accountants in dealing with the	
investigation. By contrast, the S.E.C.'s entire annual	
enforcement budget, spread over thousands of inquiries	
and investigations, was less than \$300 million when this	
investigation began in 2005. You can be sure that $G.E.$	
spent a lot of time arguing that the amounts involved, only	
a few hundred million per violation, were not really	
material to a company its size. There may be more to	
come. The S.E.C. said that its investigation of G.E. was	
over, but it did not say that about any of the accounting	
officials at the company, or any of the people at KPMG,	
<i>G.E.</i> 's longtime auditor. <i>KPMG</i> 's role is interesting. The	
complaint indicates that unnamed accounting officials at	
G.E. failed to provide important information to KPMG,	
but $G.E.$ says that information was later given to the	
auditors. The S.E.C. filing says that on one of the hedge	
accounting issues, the KPMG auditors consulted the	
accounting firm's national office. But when push came to	
shove, and the question was whether to approve	
accounting that the S.E.C. now says was clearly wrong,	
and the state how sugs has clearly wrong,	

	the local auditors signed off without telling the national	
	office what was going on. Could it be that the local	
	auditor feared the national office experts would have	
	backbone, and force him to anger a very important	
	client? A KPMG spokesman declined to discuss any	
	aspect of the case. This all took place in January 2003,	
	days before G.E. was to announce its annual profits for	
	2002, Jeff Immelt's first full year as chief executive.	
	Had G.E. not fudged the accounting, it would have	
	missed its profit forecast by \$200 million. Not since	
	1994 had G.E. failed to make the numbers. You may	
	recall something similar happened at Arthur Andersen	
	when it was auditing Enron. In that case, the local	
	auditors chose to ignore the national office. It is easy to	
	have some sympathy for G.E. on the hedge accounting	
	issues. The rules are devilishly complicated, and the	
	accounting penalties for a small deviation can seem	
	excessive. For good reason, the rules are being rewritten.	
	But that sympathy vanishes when considering the	
	accounting alchemy that G.E. used to make its	
	numbers at the end of 2003. In a move reminiscent of	
	Enron's Nigerian barges deal, it 'sold' some railroad	
	locomotives to banks, with side letters and verbal	
	promises to assure the banks they could not lose	
	money. That enabled G.E. to book profits early and	
	make the numbers. The banks, facing S.E.C. actions	
	for doing similar deals with Enron, asked G.E. to	
	reassure them that KPMG knew about the side deals	
	and concurred with the accounting. The banks had	
	reason to be worried, given that G.E. executives had asked them not to refer to the side deals in documents	
	seen by auditors. At G.E., a spokeswoman, Anne Eisele,	
	told me that it was wrong to think these violations were	
	'indicative of some larger problem in G.E.'s overall	
	culture, its finance function or compliance practices.	
	G.E. is committed to the highest standards of	
	accounting and good corporate governance. We are	
	confident in our controls and culture, which have been	
	made even stronger through the process that we've just	
	completed.' It is interesting to compare the G.E. and	
	S.E.C. versions of the locomotive deal. In a company	
	filing in 2007, G.E. said 'several individuals in our rail	
	business and in our capital markets group engaged in	
	intentional misconduct that misled those responsible	
	for accounting oversight.' It added that the accounting	
	oversight team failed to adequately review the	
	transactions. The S.E.C.'s complaint makes it sound as if	
	the matter was thoroughly aired inside G.E. in 2002, when	
	it was first used, and again in 2003. The corporate audit	
	staff challenged the accounting in 2002, but was overruled	
	by a 'senior accountant,' the S.E.C. said. G.E. added that	
	the amounts involved were so small that they were not	
	material, 'less than 0.2 percent' of the company's total	
	revenue or profits each year. The S.E.C. says the fudges	
	caused quarterly profits of the G.E. Transportation	
	Systems business to be overstated by as much as 40	
	A REAL PROPERTY AND A DESCRIPTION OF A D	

10	Flightbl	Firm-	α	percent. All those numbers are accurate. Tricks to take profits in the wrong quarter, as in this case, are not likely to change annual earnings very much, particularly for the conglomerate. I doubt anyone at <i>G.E.</i> thought at the time it would have been immaterial if the company missed its profit forecasts. I called Father Martin, now an editor at America magazine, a Jesuit publication, and asked him to read the S.E.C. complaint and call me back. He did. 'Little of this is surprising,' he said. 'I was sometimes asked to squirrel away 'excess earnings' in fake accounts with made-up names, to be used when earnings were down in later months,' he said. One such account was called 'Plug.' Ms. Eisele, the <i>G.E.</i> spokeswoman, declined to comment on Father Martin's book. Much has changed at <i>G.E.</i> since Father Martin was hired. The long paper spreadsheets that he used have been replaced by computers. Some of the financial instruments involved in <i>G.E.</i> 's hedge accounting violations had not been invented. But some things, it appears, never change."	On a
Aug. 2009	ogger, "A30X to be Assemb led at XFW in Return for A350 Launch Aid" (Jon Ostrowe r)	Labor	&β	Deutschland (German) and later confirmed by Flight, <i>Airbus</i> will fully assemble the successor to A320, currently dubbed the A30X, in Hamburg. This news comes as the German government and <i>Airbus</i> are working out final terms for for €3.3B in A350 launch aid. Currently, A320 family production is primarily based in Hamburg and Tianjin, while part of the A320-200 is built in Toulouse then flown to Hamburg for finishing. Let us, for a moment look beyond the obvious - and ongoing - debate about the merits/legality of launch aid, and try to examine this deal through a different, possibly overlooked lens. This long term deal addresses key questions about the future growth and expansion of <i>Airbus</i> . It's not surprising that Hamburg would be the final assembly site, but the deal largely closes the book on any debate about final assembly operations at <i>Airbus</i> for almost a generation to come with A30X not set for service entry until at least 2020. If we examine this through a broader strategic lens, with the involvement of national stakeholders, <i>Airbus</i> has gained labor stability and industrial predictability, with a distinct political subtext attached. Yet, perhaps it's an appropriate point of juxtaposition to the relationship between <i>Boeing</i> and its stakeholders, the IAM and SPEEA. We are just months away from the selection of a second 787 final assembly line as <i>Boeing</i> weighs its options as perceived stability vs. perceived instability. One viewpoint says that setting up a second line in Everett would introduce additional instability because of the risk of future strikes and delivery disruption. On the flipside, a native and experienced workforce with extensive widebody assembly experience is an asset not to be discounted. For a site outside of Everett, stability would be found in removing the labor obstacle by setting up a second line in a right to work state. On the	modular industry blogger' s newfou nd integral point of view.

The unions are winning the strikes but losing the wars as their numbers shrinking. <i>Boeing</i> lost a billion dollars over the last strike. <i>Boeing</i> lost \$700 million in the 2005 strike over less than a \$90 million difference which the union got at the end of the strike anyways. Now instead of working towards a longer term solution, <i>Boeing</i> is willing to spend an additional billion dollars (my estimate for building and tooling) to open a second line elsewhere. Some business sense needs to be injected into the process. Perhaps, instead of demanding a no strike clause, <i>Boeing</i> should ask, of the union and themselves, what would it take to sign a 30 year contract? Perhaps they more in common than we think."	On an
					By Paulo M (Johannesburg, RSA) on August 11, 2009 1:13 AM "Very good. In fact, excellent. This point of view would seem to indicate that <i>Boeing</i> is far more predisposed to the idea of cost - particularly labour, as you so rightly point out - and for obvious reasons. In my opinion, it would be a mistake for it seek out production sites other than those in Washington without making some sort of peace with the unions. As far as I know, <i>Boeing</i> has had far more industrial action taken against it by unions in the past decade than in the preceding 50 years combined. Perhaps the	
					demonstrated the challenges, and high cost, of setting up a greenfield site. Ultimately, for <i>Boeing</i> and <i>Airbus</i> , steadily growing the business means the predictability of future costs, made all the more predictable by stability. Decision-making on issues like the location of aircraft final assembly operations will be driven by this motivation. Yet does the push-pull dynamic between <i>Boeing</i> and its unions, vis-a-vis the selection of final assembly, add to the long term stability and predictability of <i>Boeing's</i> business? If <i>Boeing</i> is facing a potential forward loss on 787, then ensuring predictable future costs is essential to the future of the company. The question then becomes, how does <i>Boeing</i> , as well as its unions seek stability and predictability for the future, then perhaps both sides should take a page from its competitor's playbook."

r						pass the buck to the dealership. They stayed actively	
						involved. I made suggestions for carving out a better deal. They made productive counter-offers. There was never a no in the negotiations. They wanted to make it work and in the end it did. I'm fully aware that this is not a normal life experience and I'm not somebody with access to the golden gates of global icons either. As a professor of entrepreneurship at Boston University I always stress the importance of leading by example, respecting everyone around you, exhausting all solutions before saying no and consistently doing the unexpected. This is how you win people over and become a great leader. Not only does Alan Mulally have a big fan, but he also has a new customer."	
	11 Aug. 2009	The Seattle Times "Boeing Charlest on Worker s to Vote on Machini sts Decertif ication " (Domini c Gates)	Mark Blondi n, IAM nationa 1 aerosp ace coordi nator	Firm- Emplo yees	α	"Production workers at <i>Boeing's</i> newly acquired assembly plant in Charleston, S.C., plan to vote Sept. 10 on a petition to get rid of the Machinists union. At a National Labor Relations Board hearing in Charleston this morning, the company and the International Association of Machinists (IAM) agreed to the vote. A decision to decertify the IAM at the Charleston facility could influence whether <i>Boeing</i> will move future airplane assembly work there, including a second production line for its new 787 Dreamliner. If the vote succeeds, nonunion <i>Boeing</i> Charleston will compete directly with the unionized Everett plant for the new 787 work. That raises the specter for the Puget Sound region of <i>Boeing</i> developing for the first time a major final assembly site on the East Coast that could siphon off production work on future airplanes. The petition that sparked the vote was filed by Dennis Murray, a quality inspector at the Charleston plant unhappy with the way the union forced through a weak contract last November without significant consultation with employees. 'I want people to have a fair voice in what happens to them,' said Murray. 'That's the position a union traditionally fights for. In this case, it's the workers fighting against the union to achieve that.' The union was not immediately able to say how many workers in the bargaining unit of almost 300 employees pay dues. Murray claimed more than 75 percent support for his petition among the workforce, based on his own canvassing for signatures. In the weeks ahead, the company will make its preference clear to the workforce: <i>Boeing</i> management wants rid of the union at the plant. Company labor relations spokesman Tim Healy said managers will share 'facts and data' with the workforce outlining the differing treatment of unionized and nonunion workers at <i>Boeing</i> . 'We'll tell them we prefer to deal with our employees directly, without an intermediary,' Healy said. IAM national aerospace coordinator Mark Blondin said the Charleston workforce has the right to ch	On a modular enterpri se architec tue's adversar ial relation ship with labor.
						'Facts don't lie,' said Blondin. 'Boeing does not treat nonunion workers well.' Last month, Boeing bought the Charleston assembly plant, which builds the composite	

plastic aft fuselage for the Dreamliner, from Texas-based	
Vought. The Charleston operation had been plagued	
with startup problems, partly due to the inexperienced	
workforce. In addition, the long delays in the 787	
program left Vought with no income stream and a	
requirement for further hefty investment it was unwilling	
to make. To secure control of its supply chain, <i>Boeing</i>	
stepped in with a \$580 million purchase, plus the	
And the second	
forgiveness of loans to Vought that bring the total cost to	
\$1 billion. A major obstacle the union must overcome	
before the September vote is resentment among the	
Charleston workforce over the contract the union	
signed last November. The contract delivered a meager	
annual raise of 1.5 percent, with a possible merit bonus	
of up to 2 percent determined by managers. The union	
ratified that contract in a last-minute, barely	
publicized "emergency meeting" with only 13 people	
present, to meet a one-year deadline. Murray was one	
of the workers incensed by that tactic. The Boeing	
acquisition offers a new opportunity to revisit the	
decision. 'The contract with Vought did not live up to	
many of those members' expectations,' Blondin	
conceded. 'Not everybody got to vote.' But he said the	
rushed vote was necessary because the company had	
dragged out negotiations deliberately to try to oust the	
union. He pointed out that the contract, however weak	
economically, secured recall rights for those workers	
being laid off. He said the union now has a right to	
improve the contract. 'We've got a great track record in	
negotiating contracts,' Blondin said. 'The leverage will	
depend on the people and how strong they want to be.'	
The labor showdown in Charleston is happening against a	
backdrop of ongoing, tense negotiations between <i>Boeing</i>	
and the IAM in the Puget Sound region. Last fall, the	
IAM signed a new four-year contract here after a two-	
month strike. Since then, the company has mounted an	
unprecedented behind-the-scenes campaign to reopen	
that contract and win a long-term no-strike agreement.	
Boeing chairman Jim McNerney forcefully conveyed that	
message to Washington state political representatives,	
including Gov. Chris Gregoire and Rep. Norm Dicks (D-	
Bremerton), in a meeting in Washington, D.C., in March.	
He told the politicians that union relations would be a	
major factor in the decision about where to locate a second	
787 production line; the head of the 787 program said the	
decision may be made before year-end. In July, following	
the announcement that Boeing was buying the Charleston	
plant, Dicks and Gregoire publicly called for both the	
company and the union to make concessions, reach an	
agreement and secure future Boeing airplane work for this	
region. Talks between the union and the company have	
been ongoing, though the union insists that it still has	
received no formal proposal of a no-strike agreement. At	
a conference in Lynnwood last week, <i>Boeing</i> vice	
president Fred Kiga said that creating a second final-	
assembly site outside the Puget Sound region would offer	
asseniory site outside the ruget sound region would offer	

13 Aug. 2009 Blows	din	α & β	the company the opportunity to continue production in the event of a work stoppage here. But industry analysts are skeptical that <i>Boeing</i> would make the second 787 assembly line decision based on the union issue alone. Creating an assembly line in Charleston would require substantial investment in tooling and buildings. And, the lack of an experienced workforce in the area would inevitably bring added risk to a program already more than two years behind schedule. The IAM's Blondin doubts that <i>Boeing</i> would risk further delays by placing new 787 work outside Puget Sound. 'Is <i>Boeing</i> making an emotional decision or an economic decision?' Blondin asked rhetorically. Still, if <i>Boeing</i> is insistent on radically reducing its vulnerability to labor unrest, a win in the Sept. 10 vote in Charleston would certainly provide the company extra leverage.'' "NOT a lot has gone right for <i>Boeing</i> recently. After declaring to the world at the Paris air show in June that its chronically delayed 787 Dreamliner would take to the air before the month was out, executives were forced to announce an indefinite postponement of the high-tech aircraft's first flight only days later because of a problem with the wing mounting. The company also seems to have been hit harder by cash-strapped airlines cancelling orders than its main rival, <i>Airbus</i> . But <i>Boeing</i> is anticipating a triumph in the next few weeks when the World Trade Organisation (WTO) comes to a preliminary decision on a complaint made by America nearly five years ago about subsidies given to <i>Airbus</i> by European governments. In 2004 at the urging of Harry Stonecipher, <i>Boeing's</i> boss at the time, America terminated a 1992 agreement with the European Luncin regulating government support for the commercial-aircraft industry and initiated a WTO dispute- settlement procedure. The agreement had capped European launch aid for new airliners at 33% of all development costs on condition that the money was repaid at an interest rate that at least covered the cost of the governme	On moduli and integra enterpo se archite ture's differin g approa h toward the govern ment stakehe der.
-----------------------------	-----	-------------	---	---

				proposed A350, a potential competitor to both the American firm's highly successful 777 and larger versions	
				of its new lightweight all-composite 787. Whereas Boeing	
				felt it was betting the company on the 787, it believed that	
				Airbus could develop its rival aircraft with far less	
				financial risk and lower capital costs. In addition to a	
				claimed cumulative benefit of more than \$100 billion from	
				launch aid over 20 years, Boeing says that Airbus has also	
				been the recipient of other handouts including funding for	
				roads and runways it relies on and soft loans from the	
				European Investment Bank. Boeing puts the combined	
				value of all the subsidies Airbus has received at \$205	
				billion. Europe's response was to lodge a counter-	
				complaint alleging that Boeing gets an array of subsidies	
				from different American agencies ranging from	
				America's space agency, NASA, to the Export-Import	
				Bank of the United States (known as "Boeing's Bank")	
				as well as tax breaks from several states. Europe puts	
1				Boeing's subsidy haul at only \$24 billion over the past two	
1				decades and up to 2024, but says that using America's	
				methodology, the figure would be nearer to \$305 billion.	
				Europe also complains that <i>Boeing</i> has received launch	
				aid from Japan, where large parts of the 787, including	
				most of the wing, are made. It estimates that up to \$7	
				billion-worth of government aid of one kind or another	
				has gone into the 787. The boss of Airbus, Tom Enders,	
				describes the 787 as the most heavily subsidised civil	
				aircraft in history. Airbus also notes that since 1992 it	
				has paid governments 40% more than it has received	
				from them, thanks to interest and royalties on	
				successful designs developed with state aid. In an	
				average year it repays about \$500m. The WTO's ruling	
				on Europe's complaint should come within the next six	
				months. It would not be surprising if both complaints were	
				upheld, at least in part. Both parties say they are willing to	
				negotiate a new deal limiting subsidies and making those	
				that remain more transparent. That would send out a	
				message to other countries (Russia and China) wanting to	
				muscle in to the large commercial aircraft market. But	
				both sides also want to see who comes out of the WTO	
				process worst before starting talks. Unfortunately, there	
				will be plenty of opportunities to escalate hostilities in the	
				meantime. In the next few weeks European governments	
				are expected to agree to give some €3.5 billion (\$5 billion)	
				in launch aid for the A350. Boeing describes it as a	
				'provocative' move, but an Airbus spokesman says the aid	
				is not in doubt and that Europe will not be 'intimidated'.	
				Another bone of contention is the battle between <i>Boeing</i>	
				and Airbus, with its partner Northrop Grumman, to supply	
				America's air force with its next fuel tanker—a contract	
				won by <i>Airbus</i> last year which is being fought over again	
				after <i>Boeing</i> protested. The grounds for further complaint,	
				and thus the opportunities for inflicting mutual damage,

Peter Mandelson, Europe's trade commissioner before becoming govern ment Mandelson, Europe's trade commissioner before becoming in the biggest, most difficult and most expensive in WTO bistory. This first ruling is a potential thunderbot that could ignite a damaging trade dispute between America and Europe at a time when both economies need to present a united front on trade, to prevent a slice towards protectionism. The origins of the dispute lie in America's decision, at Boeing's prompting, to withdraw in 2004 from a 12-year-old bilateral agreement with Europe governing trade in large civil aircraft. The agreement banned direct production and sales subsidies, but let governments continue to fund money into new aircraft projects. It permitted both repayable direct state aid (the European approach) covering up to a third of all development costs, known as launch aid, and indirect state aid (the American approach) woverer, says it expected the deal to lead to a gradual reduction in subsidies to the A380, the subergimed basing however, says it expected the days to achieve the avered A300. Auterication is that it is a subsidie distort competition. But although the subsidies that dirbaw the dispute the days of the domestic industry's sales volume. Boeing abowarde to shield is 777 and the asynetimed dispute that a subsidies distort competition. But although the subsidies that dirbaw the form of the A380, the superipmod heagined to bring	1					
Win" aircraft industry (for which read Airhus). The United Inter's States alleges that this support was worth \$200 billion over g approace for yotcors. In a few months the WTO will rule on a conter-chain by the European Union that Boeing received about \$24 billion in subsidies over the past two decades as well the the as large, non-repayable benefits from military and space contracts. Both rulings are subject to appeal. Peter ment Mandelson, Europe's trade commissioner before becoming in Gorion Brown's minister for everything, described the dispute as the biggest, most difficult and most expensive in WTO history. This first ruling is a potential thunderbot that could ignie a damaging trade dispute between America's decision, at Boeing's prompting, to withdraw in 2004 from a 12-year-old bilateral agreement with Europe governing trade in large civil aircraft. The agreement banned direct production and sales subsidies, but let governments continue to funnel money into new aircraft projects. It permitted both repayable direct state aid (the Auropean approach) if limited to 3% of the domestic industry's sales volume. Boeing, however, says it expected the deal to lead to a gradual reduction in subsidies to Airbus. When this failed to materialise, it withdrew. What caused its patience to run out? Two things: the success of Airbus in achieving rough market share parity at the end of the 1990s, and resentment over launch aid for the A330. A Larget-rich environment Boeing is right to argue that all subsidies distort competition. But although the subsidies to whork is received and subsidies to you? Airbus had repaid 40% more than it had been given. Nor has the effect of the subsidies received by both firms been anti-competitive. Beeing and Airbus fight like rats in a sack for every sale, with the consequence that aritines have been able to buy cheaper and better aircraft thas if one firm had been dominant. Two other points shoud		One			America's (for which read Boeing's) complaint against the	se
States alleges that this support was worth \$200 billion over 20 years. Whatever the outcome—and Boeing is confident of victory—this will be only the first stage of a lengthy process. Both rulings are subject to appeal. Peter Mandelson, Europe's trade commissioner before becoming dorton Brown's minister for everything, described the dispute as the biggest, most difficult and most expensive in WTO bistory. This first ruling is a potential thunderbolt that could ignite a damaging trade dispute between America and Europe at a time when both economies need to present a united front on trade, to prevent a slide towards protectionism. The origins of the dispute lie in America's decision, at Boeing's prompting, to withdraw in 2004 from a 12-year-old bilateral agreement with Europe governing trade in large civil aircraft. The agreement banned direct production and sales subsidies, but let governments continue to funnel money into new aircraft projects. It permitted both repayable direct state aid (the American approach) covering up to a third of all development costs, known as launch aid, and indirect state aid (the American approach) if limited to 3% of the domestic industry's sales volume. Boeing, however, says it expected the deal to lead to a grandual reduction in subsidies to <i>Airbus</i> . When this failed to materialise, it withdrew. What caused its patience to run out? Two things: the success of <i>Airbus</i> in achieving rough market- share parity at the end of the 1990s, and resentment over launch aid for the A380, the superjumbo designed to bring to an end the long reign of the 747. Boeing also wanted to shield its 777 and new 78 from "unfair" competition in the form of <i>Airbus</i> 's launch-aid-supported A350. <u>A target-rich environment</u> Boeing is right to argue that all subsidies distort comp	1	Can				Contraction of the second second
 20 years. Whatever the outcome—and Boeing is confident g of victory—this will be only the first stage of a lengthy process. In a few months the WTO will rule on a counterclaim by the European Union that Boeing received about 524 billion in subsidies over the past two decades as well the govern contracts. Both rulings are subject to appeal. Peter Mandelson, Europe's trade commissioner before becoming derived in the stakehol (Gordon Brown's minister for everything, described the dispute as the biggest, most difficult and most expensive in WTO history. This first ruling is a potential thunderbot that could ignite a damaging trade dispute between America and Europe at a time when both economies need to present a united front on trade, to prevent a slide towards protectionism. The origins of the dispute is in America's decision, at Boeing's prompting, to withdraw in 2004 from a 12-year-old bilateral agreement with Europe governing trade in large civil aircraft. The agreement banned direct production and sales subsidies, but let governments continue to funnel money into new aircraft projects. It permitted both repayable direct state aid (the European approach) covering up to a third of all development costs, known as launch aid, and indirect state aid (the European approach) fi limited to 3% of the domestic industry's sales volume. Boeing, however, says it expected the deal to lead to a gradual reduction in subsidies to <i>Atrbus</i>. When this failed to materialise, it withdrew. What caused its patience tor uno ut? Two things: the success of <i>Atrbus</i> in achieviar' competition in the form of <i>Airbus</i>'s launch-aid-supported A350. <u>A target-rich environment</u> Boeing is right to argue that all subsidies distort competition. But afthough the subsidies that <i>Atrbas</i> receives are different from <i>Baeing</i>'s, they are not necessarily much worse. At least they are transparent—and Europe claims that by 2007 <i>Airbus</i> had repaid 40% more than it habeen given. Nor has the effect of the subsidies re		Win"				and the second
of 'victory—this will be only the first stage of a lengthy process. In a few months the WTO will rule on a counter- claim by the European Union that Boeing received about \$24 billion in subsidies over the past two decades as well as large, non-repayable benefits from military and space contracts. Both rulings are subject to appeal. Peter Mandelson, Europe's trade commissioner before becoming Gordon Brown's minister for everything, described the dispute as the biggest, most difficult and most expensive in WTO history. This first ruling is a potential thunderbolt that could ignite a damaging trade dispute between America and Europe at a time when both economies need to present a united front on trade, to prevent a slide towards protectionism. The origins of the dispute lie in America's decision, at Boeing's prompting, to withdraw in 2004 from a 12-year-old bilateral agreement with Europe governing trade in large civil aircraft. The agreement banned direct production and sales subsidies, but let governments continue to funnel morey into new aircraft projects. It permitted both repayable direct state aid (the European approach) covering up to a third of all development costs, known as launch add, and indirect state aid (the American approach) cover, says it expected the deal to lead to a gradual reduction in subsidies to Airbus. When this failed to matrialise, it withdrew. What caused is patience to run out? Two things: the success of Airbus in achieving rough market- share parity at the end of the 1990s, and resentment over launch aid for the A380, the subsidies distort competition. But atthough the subsidies distort competition. But atthough the subsidies distort competition. But atthough the subsidies that Airbus receives are different from Boeing's, they are not necessarily much worse. At least they are transparent—and Europe claims that by 2007 Airbus had repaid 40% more than it had been given. Nor has the effect of the subsidies received by both firms been anti-competitive. into new aircraft projects. It permitted both repayable direct state aid (the European approach) covering up to a third of all development costs, known as launch aid, and indirect state aid (the American approach) if limited to 3% of the domestic industry's sales volume. Boeing, however, says it expected the deal to lead to a gradual reduction in subsidies to Airbus. When this failed to materialise, it withdrew. What caused its patience to run out? Two things: the success of Airbus in achieving rough market-share parity at the end of the 1990s, and resentment over launch aid for the A380, the superjumbo designed to bring to an end the long reign of the 747. Boeing also wanted to shield its 777 and new 787 from "unfair" competition in the form of Airbus's launch-aid-supported A350. A target-rich environment Boeing's, they are not necessarily much worse. At least they are transparent—and Europe claims that by 2007 Airbus had repaid 40% more than it had been given. Nor has the effect of the subsidies received by both firms been anti-competitive. Boeing and Airbus fight like rats in a sack for every sale, with the consequence that airlines have been able to buy cheaper and better aircraft than if one firm had been dominant. Two other points should be borne in mind. The first is that it is out of date to see					-	
direct state aid (the European approach) covering up to a third of all development costs, known as launch aid, and indirect state aid (the American approach) if limited to 3% of the domestic industry's sales volume. <i>Boeing</i> , however, says it expected the deal to lead to a gradual reduction in subsidies to <i>Airbus</i> . 12	Flighth	Eim		riskiness of large commercial-aircraft projects has forced even <i>Boeing</i> to create extended international supply chains. Second, the aircraft-makers' subsidies pale by comparison with those doled out by governments on both sides of the Atlantic in the past year. Leaving aside the trillions of dollars spent on preventing financial collapse, industrial subsidies of a kind almost certainly illegal under WTO rules have mushroomed. <i>General Motors</i> alone has been propped up to the tune of \$55 billion. If America and Europe were to go to war over subsidies now they would find what military planners call a 'target-rich environment'. Both sides should therefore hold their fire until the WTO rules on Europe's complaint. Then, putting further litigation to one side, they should head for the negotiating table. The aim should be to secure a new deal along the lines of the old agreement, but this time with an explicit goal of phasing out the most egregious subsidies within a reasonable period. The alternative of an escalating tit-for- tat trade dispute between Europe and America does not bear thinking about."	
13 Aug. 2009	Flightbl ogger, "Breaki ng: Structur al Flaw Halts Producti on of <i>Alenia</i> 787 Sections (Jon Ostrowe r)	Firm- Suppli er	α	"Alenia Aeronautica has halted production of two major 787 structural components due to wrinkles in the fuselage skin caused by manufacturing flaws in subcomponents of the one-piece composite barrel, according to a letter obtained by FlightBlogger. The letter's subject: 'SECTION 44 and 46 STOP WORK ORDER FOR BARREL' details a correspondence between Jay Campbell, sr. manager for supplier management for the 787 fuselage supply chain, James E. Simmons section 44/46 sr. engineering manager and Ciro Occipinti of Alenia Aeronautica in Naples, Italy. The letter, signed and dated June 23 on Boeing letterhead, was sent the same day Boeing announced the latest delay in the program citing a need to reinforce the side of body structure. Boeing and Alenia Aeronautica did not respond to multiple requests for comment. The status of production at Alenia's Grottaglie facility remains unknown at this hour. This structural issue, sources say, appears entirely separate from the wing fix. Section 44 and 46 are two of the four major structural components that comprise the integrated center fuselage. Section 44, a bonnet section, sits directly on top of the center wing box (section 45/11) while section 46, a complete barrel, is joined to the aft part of the center wing box. Campbell and Simmons explain the justification behind the production halt as 'related to stringer edge steps' causing wrinkles in the skin of the fuselage that were larger than previously 'demonstrated during the [preproduction verification] PPV on these components.' Stringer edge steps, as one veteran composite engineer explains, comprise the stacks of the composite fibers that make up the longitudinal structure that is cured and bonded to the skin of the fuselage barrels to give it its strength. The letter goes on to detail the recommendations for the proper step height of each layer of composite fiber, plus or minus	On a modular enterpri se architec ture's over- promise and under- delivery

a given tolerance. The letter says that the guide for	
building fuselage stringers includes a note that says that	
step heights beyond a given a specified tolerance 'will	
lead to significant degradation of the structure.' The	
tolerances and dimensions of the stringer were specifically	
outlined in the letter and are not included in this report due	
to the proprietary nature of the information. However, the	
letter continues: 'Boeing engineering evaluations of the	
cross-sections provided by <i>Alenia</i> demonstrate that	
negative margins exist in the line 7-19, and line 20 and on,	
configurations for section 46. Line 5 and 6 are still under	
evaluation. While efforts are underway to refine that	
analysis, it is doubtful that the negative margins will be	
recovered, and that repair of at least line 7-29 will be	
required.' Of those 25 shipsets, four have been	
delivered to final assembly in Everett, Wash, eight are	
undergoing center fuselage integration at Global	
Aeronautica in Charleston, S.C. and the remaining 13	
are in Grottaglie, Italy. Each 787 barrel section contains	
80 stringers that run the length of the fuselage. The letter	
did not detail what portion of the 80 would require repair.	
The size of the edge steps on the stringers, the letter says,	
were increased first on 'line 5 when Alenia began using	
the GFM stringer manufacturing cell at Grottaglie.' Line 5	
refers to Airplane Five or ZA005, the first General	
Electric GEnx powered 787, that entered final assembly in	
January of this year. Sections 44 and 46 were delivered by	
Alenia for integration at Global Aeronautica in April	
2008. <i>GFM</i> is a company that does milling, cutting,	
routing and forging of various materials, including	
composites components. During the manufacturing	
process, the composite stringers are fabricated in a clean	
room, loaded onto the preformed mold, or mandrel, then	
are wrapped in a preset amount of carbon fiber tape. After	
lay-up, which is done by a robotic wrapping machine, the	
mandrel is bagged and moved to the autoclave for high	
temperature curing. <i>Boeing's</i> instructions in the letter to	
Alenia was to complete any carbon fiber placement	
currently underway, but not to begin any additional	
bonding or curing of barrels. According to the letter,	
specifications were authored to control the height of the	
'edge step' as a result of what was learned during	
preproduction verification (PPV). The letter states that	
Alenia determined it 'cannot comply with the	
requirement' and had requested 'that the step height	
control provisions be eliminated.' Boeing concluded that	
'based on the structural analysisthis is unacceptable'	
because the wrinkles 'represent a risk of a major	
repair to every unit that is built without engineering	
coverage.' Boeing's conclusions on this structural	
analysis were conducted on two scrapped barrel sections	
identified as being from Airplane 15 section 46 and	
Airplane 20 section 44. 'Sections cuts from the scrapped	222
AP15 barrel show wrinkle geometry well in excess of	
those found during the PPV.' Adding that the	
specification 'does not allow wrinkles in the skin, and	
i i i i i i i i i i i i i i i i i i i	

 -
the existing effects-of-defects data does not sufficiently
characterize the structural performance of wrinkles of
this magnitude.' Boeing has yet to provide a revised
schedule, known internally Z18, that dictates the 787
production and delivery schedule to suppliers and airline
customers. The company has said a revised planning
schedule will be available by the end of September. This
structural issue appears to not affect the first flight
planning for ZA001 through ZA004, but it is yet unknown
if delivery planning of the early production aircraft will be
impacted while this issue is being resolved."
impacted withe this issue is being resolved.

"The question should be, instead, given the current
- · · · · · · · · · · · · · · · · · · ·
mismanagement team, what cannot go wrong on the
program. These negative margins are likely just more
fallout from Boeing's decision to design the 787 to zero
safety margins. As pressure to save weight gets greater
with later line numbers to meet performance
guarantees, look for more problems cropping up. Its
disturbing to me, even though I was the one who originally
exposed that Boeing was designing the 787 to zero safety
margins, that these problems are coming so often and the
plane in many months from even flight tetsting that will
undoubtable expose many more problems, both with
structures and systems. Thanks to Jon for giving
investors the news they need when Boeing has
demonstrated it won't, if the news is potentially
negative in nature to the stock price. Their rosy coloring
of the bad news on the program in their last minute they
can hold the news from investors is troubling, and their
many announcements proven false even more so (schedule
of the program, etc.)."
of the program, etc.).
By quiet guy on August 17, 2009 3:52 PM
"I work at one of the 'suppliers' for the 787. I have also
worked with <i>Alenia</i> on the Tanker and on the F-35. The
incompetence of Alenia is very well known. It is
amazing to me that <i>Boeing</i> would continue to use these
guys as a supplier. As many previous posters have said,
it all boils down to money. The Bean counters have run
amok. They give zero credence to quality and the skills
of longtime workers and engineers. That doesn't count
any more, Program decisions are strictly driven by
cost. There is however no feedback as to real costs
when these low bidders screw up. Boeing has
completely lost its way!! Regarding Alenia and the
wrinkles, this problem occurred on ship 7 and up
because of the weight redesign. The skin ramps were
steeper due to a reduction in the basic skin thickness.
The 'Other' South Carolina supplier has seen these
problems and fixed them via the MRB system from the
onset. Regarding ridiculous schedules. Who was the
idiot that decided to roll out this plane on 7/08/07? As
one of these suppliers trying to meet this goal, we found
it totally impossible to spool up our supplier base. This
in terms impossible to spool up our supplier base. I lis

New machine					airline.	
New machine					N	
					New machine	

·····		
	According to Boeing's order - signed by Jay Campbell, a	
	senior manager of the 787 fuselage-supply chain, and	
	James Simmons, senior engineering manager for the two	
	defective sections — the problem was introduced into the	
	manufacturing process in the building of airplane No. 5	
	when Alenia began using a new machine to build the	
	stringers at its 787 facility in Grottaglie, Italy. 'Boeing is	
	making every effort to work with Alenia to resolve these	
	issues,' the order states. 'Until the issues have been	
	resolved, this stop-work order will be in effect.' The	
	order states that the wrinkles are big enough that Boeing's	
	defects analysis 'does not sufficiently characterize the	
	structural performance of wrinkles of this magnitude.'	
	The order also cites a <i>Boeing</i> technical manual cautioning	
	that stringer-edge steps higher than 0.04 inch, compared	
	with the specification of 0.015 inch, could 'lead to	
	significant degradation of the structure.' Gunter said	
	the deviations found in the <i>Alenia</i> structures are not that	
	large. The order states ' <i>Alenia</i> has determined that they	
	cannot comply' with <i>Boeing's</i> requirements and	
	requested the step-height tolerances be relaxed. But	
	Boeing decided that 'this is unacceptable in that the	
	subsequent bow wave skin wrinkles represent a risk of	
	a major repair to every unit that is built.' The long-	
	term fix, Gunter said is to let <i>Alenia</i> continue to build	
	the stringers exactly as it has done, and to redesign the	
	-	
	skin at the wrinkle points by adding extra plies of	
	carbon fiber to make it stronger. 'Changing the	
	stringers is difficult,' Gunter said. 'The easier solution	
	is to strengthen the skin by adding plies.' Boeing will	
	do that on all Dreamliners as they are built from airplane	
	No. 30 forward, Gunter said. As for fixing the barrels	
	already produced, Gunter said it amounts to 'putting a	
	patch over the top' of the wrinkled skin. 'The	
	modification is relatively easy to make and requires no	
	special access,' she said. Responsibility for the flaw	
	appears to lie with Alenia, although Boeing declined to	
	assign blame. The stop-work order specifically states that	
	the assemblies built in Grottaglie do not meet <i>Boeing's</i>	
	specification. <i>Alenia</i> representatives in Italy did not	
	respond to e-mail requests for comment before publication	
	time. Gunter said the fuselage skin wrinkling is an	
	entirely separate problem from the one <i>Boeing</i> recently	
	acknowledged. On the day the stop-work order was	
	issued, 787 program chief Scott Fancher publicly	
	explained that first flight was being postponed because of	
	a problem with the upper wing join, not the fuselage.	
	Fancher described a localized separation, or delamination,	
	of the layers of composite fibers in a very specific area:	
	'specifically limited to the upper portion of where the	
	wing and side-of-body join.' But he said the problem was	
	limited to that area. 'This is not a problem that extends	
	out the wings or down into the aircraft,' Fancher said	
	June 23. Since then, Boeing elaborated on its 787 problem	
	most extensively in a teleconference call with Wall Street	
	analysts July 22, the day it announced its second-quarter	

Firm-Suppliers	α	earnings. Boeing CEO Jim McNerney spoke at length about the upper wing join problem, again as a localized issue, and with no mention of the fuselage skin. Gunter said Boeing did not mention the problem because it was not considered a big deal. 'It's really a fairly routine occurrence. It didn't have an impact on the budget or the schedule,' she said. 'things come up regularly in a development program and we just deal with them.' 'It does not have a material impact on the program in terms of either schedule or cost,' Gunter said. Boeing has promised to come up with a new schedule for first flight and delivery by the end of September.'' "'My recent post about Boeing's leak that it had shut down Alenia, one of its suppliers in Naples, Italy, encouraged several people close to the company to contact me. One of these people, who requested to remain anonymous, told me he spent two years working as a consultant with the 787 program across several of Boeing's systems and manufacturing organizations. While I have only exchanged emails with him and spoken to him once, his concerns about the 787 program seem plausible. And he estimates that the 787's problems could take at least another two years to solve. How so? My source told me that there are significant problems with a number of systems for the 787- news of which has so far not reached the public. The delays to date have been blamed on a variety of ills including suppliers not meeting deadlines, an insufficient number of fasteners, a machinist strike, problems where the wing attaches to the fuselage and most recently, fuselage skin wrinkling. But I was stunned by his claim that several of the systems which are being made by Hamilton Sundstrand (HS) a United Technologies (UTX) subsidiary are not working. He identified the the 787's Environmental Control System (ECS), which is intended to pressurize the aircraft, as a particular problem. He says he believes there is not a technological solution to the problem. When I asked Boeing for comment, a spokesperson	On a modular enterpri se architec ture's over- promise and under- delivery . 		which is causing problems where the wing attaches to the fuselage and most recently, fuselage skin wrinkling. But I was stunned by his claim that several of the systems which are being made by Hamilton Sundstrand (HS) a United Technologies (UTX) subsidiary are not working. He identified the the 787's Environmental Control System (ECS), which is intended to pressurize the aircraft, as a particular problem. He says he believes there is not a technological solution to the problem. When I asked Boeing for comment, a spokesperson said, 'The 787's systems are working, including the environmental control system that	leadersh
		development program.' A Hamilton Sundstrand spokesperson told me that he had no knowledge of such problems. However, my source told me he spoke just yesterday with an engineer employed by a current Boeing partner who confirmed that this problem has not been solved. In addition to the ECS problems, he says that the 787's electrical system has not lived up to expectations and several redesigns are necessary before the aircraft enters into service. I don't know what my source's motivations would be for providing this information, but given all the delays and leaks, I thought it worth reporting.	

		1	1	1	There is a deeper problem with the 707 and that has to	
					There is a deeper problem with the 787 and that has to do with <i>Boeing's</i> management style. As I wrote in my book, <i>Boeing</i> has a long history of command-and- control leadership where top executives tell everyone else what to do. Under its new CEO, Jim McNerney, Boeing had adopted a so-called Transformational Leadership (TL) approach which empowered workers to make decisions, have ownership, and to take responsibility for success and/or failure. TL was behind <i>Boeing's</i> radical decision to outsource 60 percent of the 787 design and manufacturing to its suppliers. In the past, <i>Boeing</i> had given its suppliers very detailed specifications. But with the 787, <i>Boeing</i> let the suppliers do the design and manufacturing. The first manager of the 787, Mike Bair, was a transformational leader. Bair took the blame for the 787's delays and <i>Boeing</i> replaced Bair with Pat Shanahan from <i>Boeing's</i> defense unit. As such, <i>Boeing</i> reverted back to its old command-and-control style of leadership. My source claims that when <i>Boeing</i> spent three days in the spring of 2008 with HS, the supplier of the 787's electrical systems, <i>Boeing</i> issued orders to its supplier about how it wanted HS to fix the problems. Rather than listen to what HS thought would work, Shanahan's team issued orders. And according to my source, HS agreed to what Shanahan wanted even though it did not believed that his ideas or time-line would work. This story, if true, is deeply troubling because it suggests that <i>Boeing</i> could be panicking and reverting back to its old style of working but this time without sufficient technical know-how to make the right decisions. If <i>Boeing</i> is suffering from this deeper management problem, delivering the 850 787 Dreamliners that the airlines have ordered is going

		Comm ercial			considerably more than the \$2.5 bilion which you have written off. Can you give us any color into what are	
		Airpla			the issues that were resolved during the period."	
		nes			James Polli	
					<u>James Bell:</u> " productivity improvements and some operating	
					model adjustments that we think will be appropriate	
					going forward. In the analysis, we found we did not have a forward reach. Now, I'm not telling you that we	
					had \$2.5 billion worth of cushin, but that analysis	
					determined that we were not in a loss position."	

		<u>Joe Campbell (Barclays Capital)</u> : (time = 17:00) "But if you took \$2.5 billion out, effectively if you weren't in a forward loss before the charge, the charge effectively gave you \$2.5 billion more profit later, by expensing it now and taking it out so I'm just doing the arithmetic to conclude that the cushin must have exceeded \$2.5 billion before the write-off, if you didn't have a forward loss even without the write-off. I am just trying to understand it."	
		James Bell: "You don't understand it. That's not the right conclusion. Your first part of the conclusion is correct, obviously writing it off, taking the charge gives us more cushin. It does not assume that you had \$2.5 billion of cushin prior to the write-off."	
		Joe Campbell (Barclays Capital): "How could that be? I'm just I don't follow that, I mean if you took \$2.5 billion out and you were not in a forward loss, even had you not taken it out, then I don't see why you wouldn't have more than \$2.5 billion before."	
		James Bell: "We did the assessment first with it in. We left the test airplanes in the program accounting quantity and did the assessment first, determined that we weren't in a reach, then we went through and did the analysis on those three airplanes and determined that we needed to re-classify the inventory."	
		Joe Campbell (Barclays Capital): "I am sorry, so now you have at least \$2.5 billion. O.k. Great, thanks very much."	
		<u>Howard Rubel (<i>Jeffries & Co.</i>):</u> (time = 18:50) "Why should we have confidence in this schedule?"	
		Jim McNerney: "We have a high degree of confidence in the fix and the time it will take."	
		Pat Shanahan: "I'm feeling good about where we are."	
		Ron Epstien (<i>BofA Securities</i>): (time = 25:45) "What triggered the recognition that the three airplanes weren't commercially viable? Couldn't you have made that decision maybe six months ago? What triggered that now?"	
		<u>James Bell:</u> "We got information that the customers didn't want the first six airplanes over the course of the first part of	

	this year. We got all that information togetherright about now."	
	<u>Heidi Wood (Morgan Stanley):</u> (time = 27:30) "Question for you James. Based on the revised schedule and other assumption updates, and you also talked about operating model changes, based on lessons learned, I am wondering if you are telling us in an indirect way that R&D is going to be going up and that you might be taking some of the development of the derivatives from the suppliers. Can you sort of flesh that out, and if so, how much of the derivative content would you be taking back or describe what would be going back in house."	
	James Bell: "Heidi, I wouldn't go that far. I would say to you that we will be looking at the R&D effort going forward and how to better balance the plan we had previously to one that gives us what we feel better control and better efficiency, better efficient utilization of our technology resources on our derivative models, so we are going through that balance, we have made an assumption to as to what that would mean to what we have had in the past, but I wouldn't go so far as to saying that we just take everything back and redraw the lines but we have on an ongoing basis, over time had experiences here that we have learned from and we've tried to figure out how to utilize those experiences to improve the performance of the program going forward, to improve our discipline, our control over it, and as we come to some concrete assumption as to how we're going to do that, we include in our normal quarterly update of profitability on this program. And that's what you're seeing."	
	Heidi Wood (Morgan Stanley): "But James, I just want to understand from the suppliers side, I mean they've been struggling with – call it – four or five years of no cash on the program, and they think that there are bills for re-work and re- engineering, and in some ways maybe the only way to make up the added expense was to seek better economics on the derivatives. So in some respects are you putting the burden of the forward loss more onto the shoulders of the suppliers?"	
	James Bell: "No, we're not."	
	Heidi Wood (Morgan Stanley): (laughter)	
	James Bell: "You asked and I gave you an answer. We're not. Basically what I said we aere doing is we're looking at	

	how we can make this operating model better for both us and our supply chain and make this program more successful as we figure out how to manage this program better going based on our experience and the lessons we've learned, and that's what we are going to do. But this is not intended to shift any burden to our supply chain this is intended to make the performance on this program stronger for both us and our supply partners."
	Joe Nadol (J.P.Morgan): (time = 30:00) "My question is about the predictive enginerring model. It failed you on the wing-body join, it failed you I believe last year on the wing box. Have you changed the model? Have you decided to discard it and just what are you doing?"
	<u>Pat Shanahan:</u> "We'll let see. The models still remain credible. So there isn't a fundamental change in how we look at composite design.
	Joe Nadol (J.P.Morgan): "Well have you changed the models such that what actually happened now shows up as what would have been predicted?"
	Pat Shanahan: "Absolutely. In the original model, there was a condition that we did not evaluate. The update has that condition modeled. We feel very comfortable now, designing to those models."
	Joe Nadol (J.P.Morgan): "What was the condition?"
	Pat Shanahan: "Well, it was a stress condition that we found in our side- of—body in our test fixture."
	Joe Nadol (J.P.Morgan): "O.K. So you have complete confidence that now that this one change has made the model work for every other structural aspect of the aircraft?"
	<u>Pat Shanahan:</u> "Well, that's two questions. So the first question : I have absolute confidence that the analysis, the modeling and the design associated with the side of body will work.
	<u>Cai Von Rumohr (Cowen and Company):</u> (time = 33:00) "Can you tell us about 787 production rates?"
	Jim McNerney: (whispering to James Bell) "It's the same ramp as the prior schedule."

							_
					James Bell: "It's the same ramp as the prior schedule." <u>Samuel Pearlstein (Wells Fargo Securities)</u> : (time = 36:00) "Can you share with us the assumptions of forward losswhat kind of order of magnitude you are using? <u>James Bell:</u> "Uh, No. What I can say is that we have sold over 800 airplanes, which usually on a wide-body program at this stage of its production life, we've normally sold a hundred. So you can kind of get a sense of where we're going."		
					<u>Myles Walton (Oppensheimer & Co.):</u> (time = 37:30) "Could you compare the \$2.5 billion charge to R&D to the R&D spent to date on the program?"		
					James Bell: "Obviously this is a significant increase to R&D spent on the program."		
					<u>Myles Walton (<i>Oppensheimer & Co.</i>):</u> "But the \$2.5 billion, is it 25%?"		
					James Bell: "We don't tell ya. We've told you how much BCA has spent on R&D ove the years but we have not, we don't specifically give out what's on this program. Suffice it to say that it is a significant increase to what we spent today."		
					Jon Ostrower (Flight): (time = 44:00) "The 787 has been in a crisis state over the past two years. How has this affected your leadership?"		
					Scott Carson: "Obviously it has been a challenge, and we have taken steps a number of times to strengthen the team where we thought the team needed adjustment based on the lessons we were learning. We have obviously done a lot more outreach and coordination with our supply base, than we had initially. But I would say the team has held up very well to the challenges having <i>Boeing</i> be as large as it is, with as much capability across the enterprise as we have, we have been able to reach out and strengthen the team by bringing people in from IDS and other locations within <i>Boeing</i> . I think the team today is as strong as it has ever been and has held up well to the challenges."

31 The Aug. Boeing 2009 Company y website, Memos to Employ ees from Flightbl ogger	Chair man and CEO, <i>The</i> <i>Boeing</i> <i>Compa</i>	Firm	α	 Boeing Commercial Airplanes President and CEO Scott Carson announced today that he will retire from the company at the end of the year. Boeing Chairman, President and CEO Jim McNerney has named Jim Albaugh, 59, to Carson's leadership role at Boeing Commercial Airplanes (BCA), Both appointments are effective Sept. 1. 'Thanks to his leadership and operational experience, Boeing Commercial Airplanes has performed extremely well in a tough business environment and remains positioned solidly for continued market success,' said McNerney. Message to Employees from Scott Carson "Today I am announcing my retirement from Boeing. My decision is tied to many factors, but perhaps the most important reason for me was resetting the schedule on the 787. With this baseline in place the new leader will have a clear path forward. I also know that you will give Jim the same outstanding support and world-class effort that you have demonstrated to me over the past three years. I wish you every success and thank you from the bottom of my heart for the journey we have taken together. Sincerely, Scott Carson" Message to Employees from Jim Albaugh "To this day, I believe Boeing did more to change the 20th century than any other company on Earth. Over the past 90 years, Boeing has led the way in commercial aviation. Boeing is truly an iconic company and I believe we have the opportunity to change the 21st century just as we have changed the last one. The 787 is the starting point. In its soul, Boeing has always been and remains an engineering company. As an engineer I look forward to learning from and working with you. Working with the world's premier commercial airplane company team as we prepare to fly two revolutionary airplanes - the 787 and 747-8 - is an opportunity of a lifetime. And today we are facing significant issues on our two major development programs. Going forward I believe we have three imperatives: flawless execution, profitable growth and improve efficiency. I know we have the rig	On leadersh ip changes in a modular enterpri se architec ture.

I. Feedback on Research

The following appendix summarizes the written (not spoken) feedback that the author has received from participants involved in critiquing and co-developing the theory. The participants have included executives in organizations comprising the primary sample, professors, graduate students and other executives who challenged the theory's internal validity (by proposing plausible rival hypotheses), external validity or generalizability and parsimony. Having taken into account their feedback over the past seven years, and continuously iterating and updating the theory, the following comments summarize the level of "fit" with their empirical experience.

Custom Executive Education at Fortune Global 100 Companies Executive Feedback

"Ted, thank you again for your time with us and our leadership team. The breadth of your talents continues to amaze me. You are helping guide us down a path that represents the most significant (and most difficult) transformation this company has been through. This is shaping up to be one for the history books and you are playing a pivotal role. I imagine it won't be long before Porter is replaced by Piepenbrock in business schools. Cheers..."

Director of Business Strategy Fortune Global 100 Company

- "You may be in some ways... bigger and more important than our [leadership] team... based on your many achievements." (Chairman, President & CEO)
- "Ted, thank you... I learned a lot. We need to find a way to have more time as these are important issues for us to grapple with." (President & CEO)
- '[Because of 'Red-Blue'] we are going to re-evaluate our whole business, our understanding of the industry, what our competitor does and what it takes to be successful.' (President & CEO)
- *'Tremendous.' 'Fascinating.' 'Meaningful and impacting.' 'This is our future.'* (President, CEO; VP Business Strategy & Marketing; VP, CFO)
- 'Ted was among the best speakers we have ever had, and his topic was extremely relevant to us.' (President, CEO)
- 'Ted's 100,000 foot view of our industry allowed me to see for the first time a 100-year history of where we've been and where we're headed. It helped me so much to move forward with new understanding and conviction.' (Chairman of the Board)

- "Your presentation and subsequent questions reflect a deep understanding of our markets and competitive environment. Your expertise, enthusiasm and energy are refreshing and very welcomed. I shared several of your top-level observations with [our Chairman and CEO] who was intrigued. Thank you again." (SVP, Business Development & Strategy)
- "Expanding our comfort zones is what it will take to win. Count me in." (SVP, Business Development & Strategy)
- "Ted, enjoyed the meeting and conversation. Look forward to future meetings." (SVP, COO)
- "Our leadership team values the time we spent with you and the learning that has taken place. You have challenged our thinking, and encouraged us to mature our strategies. I am looking forward to seeing you again very soon." (VP/GM)
- "i can't tell you how much I enjoy the time we are able to spend together. it really helps remove the cobwebs from my brain and to re-energize me. i hope we are able to continue our learning together and to continue expanding the size of the circle." (VP/GM)
- "I can't thank you enough for your active involvement and encouragement. It really does help to know you are working so hard to bring new thinking (and action) into the place." (VP/GM)
- "i really enjoy our meetings because i leave thinking about a lot more important, and complex, issues than i did when i arrived." (VP/GM)
- "Great learning today... you are a very good teacher." (VP/GM)
- "Thanks ted. As always, it was good to see you and to get the old brain engaged." (VP/GM)
- "i'd say the outcome was a major opportunity for us to move forward. it gave me hope. ted....thanks for helping us learn." (VP/GM)
- "ted, thanks for staying in touch. i miss our discussions and the learning that has gone along with those sessions." (VP/GM)
- "as usual, our time together was too short. i always learn a lot and our discussions provide a welcomed time for me to think about our future." (VP/GM)
- "I wanted to let you know how much I enjoyed our lean enterprise discussions. I look forward to continuing the conversation." (VP/GM)
- "I think the world of Ted and the work he has been doing." (VP/GM)
- "Everybody [on the Leadership Team] thinks it's beneficial to continue to use Ted." (VP Business Strategy & Marketing)

- 'Many thanks for taking the time with us to share your thoughts and insights. I hope there are opportunities going forward for us to continue to share and learn.' (VP, CFO)
- "I think we're in for several interesting sessions Ted and hopefully some real progress. Thanks!" (VP, CFO)
- "Great perspective and review. Thanks." (VP, CFO)
- "Ted, our "red v. blue" strategy is number one on our strategic agenda for 08. We need to pull the team together to discuss how we'll rollout the discussions/data for the leadership team--time is of the essence. Thanks for your support!" (VP, HR)
- "Thanks, Ted always a pleasure. We're making progress look forward to our next session." (VP, HR)
- "Ted really enjoyed the time with you and the team. Look forward to future discussions!" (VP, HR)
- "We had a good session with our Leadership Team, and Ted... is critical to our efforts." (VP, HR)
- "Nice to meet you. Very thought-provoking stuff." (VP, Strategic Management)
- "Ted has a gift, passion and provocative vision that reaches people. We are privileged to learn and partner with him." (VP, Strategic Management)
- "Ted, thanks for staying close to us, believing in us... and pushing us. You are making a difference! (VP, Strategic Management)
- "It warms my heart to see the team finally get the traction we needed. You told us from the very beginning to go slowly and that it would take a long time. I wasn't sure if the team was going to have the emotional resilience they needed to be successful, but they did and I love them for it. I cannot thank you enough for believing in us and believing that a little strategy team could help drive such significant change. Now you have senior leadership to drive and lead this. Wow. Don't ever give up on us. We just might surprise you :)" (VP, Strategic Management)
- "I always enjoy the dialog and exchange of thoughts, ideas and concepts. Sure hope we can get this moving..." (VP, Finance)
- "Ted I thought we had a rich conversation during the meeting and I look forward to working with you in the future." (VP, Finance)
- "Thank you for your years of contribution to [our company] and myself. I know how much you have helped me grow as a person and hopefully as a leader." (VP/GM)

- "Thank you Ted. Inspiring to learn from you a usual. The whole team, even those who were quiet received a lot of energy from the dialog. I look forward to the next engagement." (VP/GM)
- "Your presentation was outstanding and it really got me thinking." (VP)
- "Ted, the magic you add to the equation for the leadership team, renewed my confidence that we can pull this off. To see that same spark of confidence energized among those who are leading was fantastic." (Director, Business Strategy)
- "You are an integral part of this team and I cannot envision us pulling this off without your continued participation." (Director, Business Strategy)
- "Ted, the level of your commitment to help us succeed is astounding." (Director, Business Strategy)
- "Thank you for your tireless efforts continuously nudging the system in the right direction." (Director, Business Strategy)
- *"Ted, thanks again for your tireless support of the team and [the company]."* (Director, Business Strategy)
- "It was really helpful, as usual, to have your insight and guidance during such tense times." (Director, Business Strategy)
- "Your help in growing our understanding of the system and how to facilitate change is incredible for me. My head is in the game and I'm enthused. I don't think I ever thought we'd get to this day, this soon. I totally understand we have a long way to go, but still... It's impressive. I've mentally recommitted to this, knowing it will continue to be hard but that we can be agents of change. Thanks again. We couldn't do this without you." (Strategy Analyst)
- "Ted, i would like to thank you again for all the time and effort you have invested in me. i hope you can see the immense impact it has had... and i'll always be grateful. i've had so many kind words from the team regarding my leadership and support and i know that wouldn't be possible without all that you have invested in me. With the deepest gratitude...' (Strategy Analyst)
- "I want to thank you for your leadership. You have always helped me to find my True North and have been the one leader who has never let us down." (Strategy Analyst)
- "I am so grateful for your guidance and leadership and for supporting me in my toughest times." (Strategy Analyst)
- "Thanks again for your guidance and leadership." (Strategy Analyst)

- "Ted, I wanted to thank you for everything you have done for me and the team. You have had and continue to have a profound impact on my life and the way I see things – and I am grateful for that. Thank you again for continuing to help me personally. You are truly extraordinary and I am grateful to have the opportunity to work with you." (Strategy Analyst)
- "You have this extraordinary ability to turn every situation, no matter how difficult, into an opportunity. You truly embody this notion of finding the potential in all things. It is a rare and beautiful thing to see." (Strategy Analyst)
- "I want to say thank you. Thank you for your continued support as a part of our team. Thank you for always helping us become better leaders. I hope you know that we consider you part of the our family." (Strategy Analyst)
- "Thank you for continuing to coach us in the learning process. Your contributions to the team are appreciated. Also, thank you for your commitment to us. I look forward to continued engagements." (Strategy Analyst)
- *"Thank you for the privilege to work and be a part of a team with you."* (Strategy Analyst)
- "Your work on enterprise architecture is right on!" (Strategy Analyst)
- "Your work /research has been inspirational, and I highly value both the substance/content as well as the way you approach to have meaningful dialog." (Strategy Analyst)
- "This is a major change in our strategic direction. Your ingenuity, articulate presentation, teamwork, and patience have paid off after years of steady approach in sharing the enterprise architecture. Congratulations and thank you! Hope you'll be back here soon and we can discuss more in depth!" (Strategy Analyst)
- "It was a very thought-provoking session. Thanks for taking the time and look forward to further discussions." (Strategy Analyst)
- "I attended your presentation at the Lean conference. My one word evaluation 'Brilliant.' Thank you for your 100K ft level analysis!" (Analyst)
- "As always, you have stretched my thinking and I think have set the stage for our continued discussions. Ted, thanks for helping us to see clearer and for your passion on the subject. Its contagious!" (Director, Strategic Initiatives)
- "I found our discussion fascinating and feel your knowledge of [our company] incredibly valuable. I would like to keep a dialog open between us and work towards establishing opportunities for you to share your wisdom with us." (Director, Career Development)

- "Your dissertation is the most compelling, comprehensive explanation of business and management I have seen. I recognize that it is much more than just business and management but I'd run out of bytes trying to list all the disciplines that are encompassed." (Strategy Analyst)
- "I wanted to congratulate you on influencing and shaping how corporations and all of the stakeholders think about sustainable competitive advantage... perhaps even allow us to fundamentally reconsider how and why the corporation exists." (Strategy Analyst)
- "Ted, I just wanted to say how much I appreciate you taking the time to chat. As I said before, it was incredibly illuminating. I've spent the last several days feeling a bit like Moses coming down from the mountaintop with a new found clarity." (International Industry Blogger)

"We appreciate the thinking and originality of your research and the energy you bring to the world of executive learning. Thank you for the time that you spend with us, Ted."

Gay Haskins Dean, Executive Education Saïd Business School, University of Oxford

"Ted's lecture at our executive education programme went over splendidly."

Prof. Rafael Ramirez Professor of Management, HEC School of Management, Paris Fellow in Strategic Management, Saïd Business School, University of Oxford

- "Subject matter was outstanding. I found the subject matter a key element of our mission success."
- "Data was dynamite, great story for us to learn. Very knowledgeable presenter, he mentioned lots of things from Wharton."
- "A fascinating insight into what may lie behind successful companies. It made me consider own business strategy & question our approach to short & long term gain."
- "Astoundingly compelling thesis and seductively presented. Sampling this work in, say, another two or three years would be interesting to get a better view of 'Redness' and 'Blueness' and perhaps taking 'Red' attributes into a 'Blue market'."
- "Very thought provoking. Lots to think about and learn."
- "Main points:
 - o good 'out-of-the-box' analysis of underlying long term performance.
 - o high energy impact.
 - o knowledgeable of subject matter with good real world examples."
- "Good connection to our company- very relevant and great discussion over dinner. Would like to do more with the rest of our company on the 'Red Blue' debate."
- "Ted's material was excellent. The 'Red vs. Blue' contest is very relevant to our business environment."

- "Provided a set of strong concepts that challenge the way things may be viewed. My thought is how in an established organisation can you achieve the 'Red' outcomes?"
- "Provocative: this tension of 'Blue' vs. 'Red' companies is worth further exploration. And is the best state being both?"
- "The red/blue concept is awesome and should continue as part of this course."
- "We needed a whole day on this to get the benefit."
- "Very interesting."
- "Lots of information; extremely interesting. Good session, and overall enjoyment."
- "Enjoyed the content and delivery."
- "Wish we had more time on this."
- "Very good although 'very fast' presentation. 'Red vs. Blue' comparison quite revealing. Needed quiet reflection to understand what had actually been presented."
- "Very stimulating. Excellent content."
- "Excellent material. Great value."
- "Very interesting need more time."
- "Very thought provoking. Many lessons here."
- "Very thought provoking analysis. Completely different perspective from anything I have seen before. It will be interesting to see how we evolve, knowing this data exists."
- "Obviously extremely knowledgeable."
- "Very interesting concepts, though provoking. I would have enjoyed spending more time on this and understanding the 'integral' business type further."
- "Very provocative. Good energy. Very lively and engaging discussion."
- "Good material which stimulated thought. Could have debated for hours!"
- "Super speed!!"
- "A little quick needed to spend much more time on this. Red/Blue interesting concept but requires more time."

- "Massive amount of material."
- "Outstanding!"
- "Ted was incredibly able to think at pace, however it needed more time and slower pace to review the outcome and the impact to [our company]."
- "Excellent model and concept which is very relevant to us."
- "Excellent topic."
- "I really enjoyed the fast paced, in-depth and interactive module."
- "Unbelievable real food for thought we are blue. A high speed journey, could have spent all day."
- "Content was excellent. I would have liked the session to be extended."
- "Very interesting."
- "Overall I found Ted's session incredibly mentally stimulating; however, it may have been useful to dedicate more time to this session."
- "Very eye-opening discussion with some useful links to what we do. Ted discussed his subject with passion!"
- "Ted has a massive knowledge on the subject."
- "An eye-opener of a session! A longer session could have been beneficial."
- "Great content and discussion."
- "Very intriguing subject, rich in content and discussion and energetically put across!"
- "Very thought provoking."
- "High velocity information transfer! Red and Blue meta-models will allow me to advance a critical debate within the business relating to entering a new market."
- "Much learning and interesting subject matter."
- "Thought-provoking."
- "Very interesting, we could have spent longer on this topic."
- *"Fascinating stuff."*

- "Red/blue concept was illuminating."
- "Very bright individual with a good story to tell."
- "Very interesting proposition."
- "Thought provoking presentation."
- "Ted had some incredible information."
- "The red/blue concept was good."
- "Very good concepts."
- "Very good material."
- "The 'blue' and 'red' models were interesting."
- "Worth hearing for longer."
- "It really challenged us to think differently about what we are doing."
- "A lot to take in!"
- "Top notch!"
- "Good message."
- "Very compelling opens up the aperture."
- "Brilliant mind."
- "Great content."
- "Fascinating. Ted is always thinking. For me more time is required on this!"

"Congratulations on the excellent presentation you made. I'm so thankful that I was invited to attend your session. You could hear a pin drop...we were spellbound, hanging on every word. Listening to you was like being in the presence of a great 'business prophet'. You will be known as a da Vinci of the 21st century. You have the ability to engage an audience around a very challenging and compelling subject, even inviting others to participate in the process of discovery and debate. Your sincerity, humility, and competence were so refreshing."

> Dr. Rita Murray CEO, Performance Consulting Group, LLC

- "Mr. Piepenbrock has a masterful understanding of a very complex business model and is able to present this information is an understandable manner."
- "Ted Piepenbrock shared a wealth of information that inspired excellent questions, discussions and hopefully actions from all of us. I feel very privileged to have been in the company of respected members of the leading industries in the country. It was an affirmation to me that leaders of industries really do care, respect and seek out each other to exchange ideas and knowledge to work toward a common goal of succeeding."
- "I was fortunate to attend your event. I was very impressed with the depth of information you shared. I have a burning desire in me to understand why there is such a difference from companies like Toyota, Airbus and Southwest to all the rest. Your presentation was very enlightening and inspiring; and presented with such passion that I feel very privileged to have been able to partake in this type of forum. Thank you for sharing your years of experience and knowledge gathering."
- "Very well done and researched. Ted has a high level of energy and was very engaging."
- "Excellent content. Thought provoking. Immediately started dissecting my own company based on these values and criteria."
- "Your talk was very interesting. If one of your goals is to be thought-provoking, you have succeeded."
- "Nice job, Ted! Clearly knowledgeable and passionate on the subject."
- "Wonderful work. The delivery was exceptional."
- "This is my first experience with MIT and I thoroughly enjoyed it. I would welcome the opportunity to partake in future events."

- "I enjoyed the day very much. Ted is an outstanding speaker!"
- "So much info. so little time! Interesting, interesting, interesting stuff!"
- "Love the concepts."
- "Good data."
- "Very good material being shared fact based."
- "Very good session. I learned a lot of strategy for future opportunity."
- "Presenter was nimble and able to bring up slides to support the emerging conversation."
- "Would look to schedule a presentation of this material for Senior Leadership."
- "The content was informative and was a positive learning experience, somewhat different than what was expected."
- "First time I have seen this concept."

"This is either the work of a madman or a genius – and at this point, I am inclined to think that it is the latter."

Dr. Michael Hammer Author: Reengineering the Corporation Time Magazine's "25 most influential individuals" Professor, MIT; Associate Fellow, University of Oxford, Saïd Business School

- "Ted's work is the stuff that ground breaking business books are made of."
- "Ted is exceptional, truly outstanding and consistently exceeds very high expectations. He is a superb speaker and a brilliant analyst of strategy in the broadest sense. He is very mature and has a great deal of experience interacting with senior executives. In many ways his work and thinking have gone beyond my own...."
- "Ted has developed an excellent mastery of the business strategy and organization behavior literatures and would be an invaluable colleague."
- "The class enjoyed your presentations very much. Your lectures received more positive feedback than any other speaker! They really appreciated your work."
- "Your work is very well perceived and helped to inform the broader set of attendees as to the value of the kind of enterprise research we are doing. It definitely helped to differentiate us from the typical "lean" research."
- "You had a most impressive presentation. The implications of your work could be significant. Keep up the great work ... and the passion....."
- "You must have done an outstanding job at the symposium, since I've heard several people mention your work."
- "Ted, I believe there is a great story to be told. You can have a great life doing what you are doing the way you are doing it."
- "Things went GREAT with Ted today! Where can I start???? I have been blown away with Ted's class today. It was meant to stop at 4 but it went on up until 6.30pm with at least 10 hardcore listeners until the end. I have been blown away. A really good presentation.. and it was nice to see how his research has evolved in two years."
- "I think the speaker series is a great addition to the content of the course. This was especially the case with Michael Hammer and Ted Piepenbrock's talk."
- "Other concepts I found particularly interesting were Hammer's Process Enterprise and Piepenbrock's Modular versus Integrative."

- "Ted Piepenbrock's lectures on integrated and modular enterprises helped me build on the principles that Prof. Charles Fine introduced in his book, Clockspeed."
- "One speaker that I found particularly interesting was Ted Piepenbrock. I found that he gave a fresh perspective on different types of enterprises."
- "I thought that Ted Piepenbrock's presentation was a fascinating study in modular versus integral enterprises and how that underlying structure of the enterprises slates it for making or taking the market. Though I am taking a strategy course at the Sloan School, Ted's spin on strategy was thought provoking and challenging to the simple frameworks that we use on the Strategy course. I realized that in many of my courses at Sloan, we do not take into account all aspects of the enterprise but instead focus on various sections. Ted's research opened me to the idea of how organizations may be forced to significantly reinvent or die due to the company architectures and the state of the industry. It is tempting to continuously improve when a serious re-architecture is needed as Ted Piepenbrock pointed out."
- "To understand architecture one needs to understand the political and cultural dimensions of leadership and architecting, as Ted Piepenbrock described. And to facilitate a process of reflection and organizational development, one must be able to diagnose the larger structural forces generating interpersonal challenges, as well as contribute intelligently to visioning and rearchitecting conversations. Within academia, the process orientation has fallen by the wayside with the conclusion of Argyris, Schon, and Schein's academic careers, and the structural orientation is resurgent. The class, with the possible exception of Ted Piepenbrock's presentations, swung too far in this structural direction."
- "With Ted Piepenbrock's research/executive education efforts at [Fortune 100 company], the audience is the Board of Directors, who are trying to make architectural decisions about their enterprise. Ted's role is not to be an outside architect; rather he is operating as a kind of facilitator in the board's own thinking about its architecture. He does, however, carry out his own research in the firm – this gives him credibility with that audience and helps him elucidate the key choices and consequences facing them in their architecting (i.e., modular versus integral enterprise). It is, I would argue, more sophisticated in its understanding of enterprises as enacted systems and enterprise architecture as a practice that requires embedding. This isn't to say that implementation will be successful – Ted himself thinks it will be near impossible for a modular enterprise to become integral. But he is putting the possibility of implementation at the center by locating architects and audience in the same, very powerful people and using himself and his expertise as provocation and facilitator."
- "I attended your lecture on Boeing & Airbus I and found your presentation fascinating. This is a fascinating topic for me and it will be great to become more educated in the concepts."
- "I find your research on Red and Blue companies fascinating."
- "Your lecture on Blue vs. Red companies, was one of the best and most interesting lectures I had while at MIT. I think there are a lot of good lessons I can use throughout my career."
