

### 3. Laplace Transform

#### 3A. Elementary Properties and Formulas

**3A-1.** Show from the definition of Laplace transform that  $\mathcal{L}(t) = \frac{1}{s^2}$ ,  $s > 0$ .

**3A-2.** Derive the formulas for  $\mathcal{L}(e^{at} \cos bt)$  and  $\mathcal{L}(e^{at} \sin bt)$  by assuming the formula

$$\mathcal{L}(e^{\alpha t}) = \frac{1}{s - \alpha}$$

is also valid when  $\alpha$  is a complex number; you will also need

$$\mathcal{L}(u + iv) = \mathcal{L}(u) + i\mathcal{L}(v),$$

for a complex-valued function  $u(t) + iv(t)$ .

**3A-3.** Find  $\mathcal{L}^{-1}(F(s))$  for each of the following, by using the Laplace transform formulas. (For (c) and (e) use a partial fractions decomposition.)

a)  $\frac{1}{\frac{1}{2}s + 3}$       b)  $\frac{3}{s^2 + 4}$       c)  $\frac{1}{s^2 - 4}$       d)  $\frac{1 + 2s}{s^3}$       e)  $\frac{1}{s^4 - 9s^2}$

**3A-4.** Deduce the formula for  $\mathcal{L}(\sin at)$  from the definition of Laplace transform and the formula for  $\mathcal{L}(\cos at)$ , by using integration by parts.

**3A-5.** a) Find  $\mathcal{L}(\cos^2 at)$  and  $\mathcal{L}(\sin^2 at)$  by using a trigonometric identity to change the form of each of these functions.

b) Check your answers to part (a) by calculating  $\mathcal{L}(\cos^2 at) + \mathcal{L}(\sin^2 at)$ . By inspection, what should the answer be?

**3A-6.** a) Show that  $\mathcal{L}\left(\frac{1}{\sqrt{t}}\right) = \sqrt{\frac{\pi}{s}}$ ,  $s > 0$ , by using the well-known integral

$$\int_0^{\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}.$$

(Hint: Write down the definition of the Laplace transform, and make a change of variable in the integral to make it look like the one just given. Throughout this change of variable,  $s$  behaves like a constant.)

b) Deduce from the above formula that  $\mathcal{L}(\sqrt{t}) = \frac{\sqrt{\pi}}{2s^{3/2}}$ ,  $s > 0$ .

**3A-7.** Prove that  $\mathcal{L}(e^{t^2})$  does not exist for any interval of the form  $s > a$ . (Show the definite integral does not converge for any value of  $s$ .)

**3A-8.** For what values of  $k$  will  $\mathcal{L}(1/t^k)$  exist? (Write down the definition of this Laplace transform, and determine for what  $k$  it converges.)

**3A-9.** By using the table of formulas, find: a)  $\mathcal{L}(e^{-t} \sin 3t)$       b)  $\mathcal{L}(e^{2t}(t^2 - 3t + 2))$

**3A-10.** Find  $\mathcal{L}^{-1}(F(s))$ , if  $F(s) =$

a)  $\frac{3}{(s-2)^4}$       b)  $\frac{1}{s(s-2)}$       c)  $\frac{s+1}{s^2-4s+5}$

### 3B. Derivative Formulas; Solving ODE's

**3B-1.** Solve the following IVP's by using the Laplace transform:

- a)  $y' - y = e^{3t}$ ,  $y(0) = 1$       b)  $y'' - 3y' + 2y = 0$ ,  $y(0) = 1$ ,  $y'(0) = 1$   
 c)  $y'' + 4y = \sin t$ ,  $y(0) = 1$ ,  $y'(0) = 0$       d)  $y'' - 2y' + 2y = 2e^t$ ,  $y(0) = 0$ ,  $y'(0) = 1$   
 e)  $y'' - 2y' + y = e^t$ ,  $y(0) = 1$ ,  $y'(0) = 0$ .

**3B-2.** Without referring to your book or to notes, derive the formula for  $\mathcal{L}(f'(t))$  in terms of  $\mathcal{L}(f(t))$ . What are the assumptions on  $f(t)$  and  $f'(t)$ ?

**3B-3.** Find the Laplace transforms of the following, using formulas and tables:

- a)  $t \cos bt$       b)  $t^n e^{kt}$  (two ways)      c)  $e^{at} t \sin t$

**3B-4.** Find  $\mathcal{L}^{-1}(F(s))$  if  $F(s) =$  a)  $\frac{s}{(s^2 + 1)^2}$       b)  $\frac{1}{(s^2 + 1)^2}$

**3B-5.** Without consulting your book or notes, derive the formulas

- a)  $\mathcal{L}(e^{at} f(t)) = F(s - a)$       b)  $\mathcal{L}(t f(t)) = -F'(s)$

**3B-6.** If  $y(t)$  is a solution to the IVP  $y'' + ty = 0$ ,  $y(0) = 1$ ,  $y'(0) = 0$ , what ODE is satisfied by the function  $Y(s) = \mathcal{L}(y(t))$ ?

(The solution  $y(t)$  is called an *Airy function*; the ODE it satisfies is the *Airy equation*.)

### 3C. Discontinuous Functions

**3C-1.** Find the Laplace transforms of each of the following functions; do it as far as possible by expressing the functions in terms of known functions and using the tables, rather than by calculating from scratch. In each case, sketch the graph of  $f(t)$ . (Use the unit step function  $u(t)$  wherever possible.)

- a)  $f(t) = \begin{cases} 1, & 0 \leq t \leq 1 \\ -1, & 1 < t \leq 2 \\ 0, & \text{otherwise} \end{cases}$       b)  $f(t) = \begin{cases} t, & 0 \leq t \leq 1 \\ 2 - t, & 1 \leq t \leq 2 \\ 0, & \text{otherwise} \end{cases}$   
 c)  $f(t) = |\sin t|$ ,  $t \geq 0$ .

**3C-2.** Find  $\mathcal{L}^{-1}$  for the following: a)  $\frac{e^{-s}}{s^2 + 3s + 2}$       b)  $\frac{e^{-s} - e^{-3s}}{s}$  (sketch answer)

**3C-3.** Find  $\mathcal{L}(f(t))$  for the square wave  $f(t) = \begin{cases} 1, & 2n \leq t \leq 2n + 1, n = 0, 1, 2, \dots \\ 0, & \text{otherwise} \end{cases}$

a) directly from the definition of Laplace transform;

b) by expressing  $f(t)$  as the sum of an infinite series of functions, taking the Laplace transform of the series term-by-term, and then adding up the infinite series of Laplace transforms.

**3C-4.** Solve by the Laplace transform the following IVP, where  $h(t) = \begin{cases} 1, & \pi \leq t \leq 2\pi, \\ 0, & \text{otherwise} \end{cases}$

$$y'' + 2y' + 2y = h(t), \quad y(0) = 0, \quad y'(0) = 1;$$

write the solution in the format used for  $h(t)$  .

**3C-5.** Solve the IVP:  $y'' - 3y' + 2y = r(t)$ ,  $y(0) = 1$ ,  $y'(0) = 0$ , where  $r(t) = u(t)t$ , the ramp function.

### 3D. Convolution and Delta Function

**3D-1.** Solve the IVP:  $y'' + 2y' + y = \delta(t) + u(t-1)$ ,  $y(0) = 0$ ,  $y'(0^-) = 1$ .

Write the answer in the “cases” format  $y(t) = \begin{cases} \cdots, & 0 \leq t \leq 1 \\ \cdots, & t > 1 \end{cases}$

**3D-2.** Solve the IVP:  $y'' + y = r(t)$ ,  $y(0) = 0$ ,  $y'(0) = 1$ , where  $r(t) = \begin{cases} 1, & 0 \leq x \leq \pi \\ 0, & \text{otherwise.} \end{cases}$

Write the answer in the “cases” format (see 3D-1 above).

**3D-3.** If  $f(t+c) = f(t)$  for all  $t$ , where  $c$  is a fixed positive constant, the function  $f(t)$  is said to be *periodic*, with period  $c$ . (For example,  $\sin x$  is periodic, with period  $2\pi$ .)

a) Show that if  $f(t)$  is periodic with period  $c$ , then its Laplace transform is

$$F(s) = \frac{1}{1 - e^{-cs}} \int_0^c e^{-st} f(t) dt .$$

b) Do Exercise 3C-3, using the above formula.

**3D-4.** Find  $\mathcal{L}^{-1}$  by using the convolution: a)  $\frac{s}{(s+1)(s^2+4)}$  b)  $\frac{1}{(s^2+1)^2}$

Your answer should not contain the convolution  $*$  .

**3D-5.** Assume  $f(t) = 0$ , for  $t \leq 0$ . Show informally that  $\delta(t) * f(t) = f(t)$ , by using the definition of convolution; then do it by using the definition of  $\delta(t)$ .

(See (5), section 4.6 of your book;  $\delta(t)$  is written  $\delta_0(t)$  there.)

**3D-6.** Prove that  $f(t) * g(t) = g(t) * f(t)$  directly from the definition of convolution, by making a change of variable in the convolution integral.

**3D-7.** Show that the IVP:  $y'' + k^2y = r(t)$ ,  $y(0) = 0$ ,  $y'(0) = 0$  has the solution

$$y(t) = \frac{1}{k} \int_0^t r(u) \sin k(t-u) du ,$$

by using the Laplace transform and the convolution.

**3D-8.** By using the Laplace transform and the convolution, show that in general the IVP (here  $a$  and  $b$  are constants):

$$y'' + ay' + by = r(t), \quad y(0) = 0, \quad y'(0) = 0,$$

has the solution

$$y(t) = \int_0^t w(t-u)r(u) du ,$$

where  $w(t)$  is the solution to the IVP:  $y'' + ay' + by = 0$ ,  $y(0) = 0$ ,  $y'(0) = 1$  .

(The function  $w(t-u)$  is called the **Green's function** for the linear operator  $D^2 + aD + b$ .)
