

# **Lean Aircraft Initiative Plenary Workshop Program Instability**

**March 5, 1997**

Presented by:  
Eric Rebentisch

- **Background**
- **Executive Board actions**
- **Data sources**
- **Policy recommendation topics**
- **Supporting data**
- **Summary**

- **Program Instability research objectives:**
  - Identify primary sources of instability
  - Measure instability-related cost premium
  - Investigate strategies to avoid instability or mitigate its impact
- **Focus to date at program and project level**
- **Data collected from government and contractor sources**

## **November 1996 Executive Board Actions**

---

- **Validate survey findings**
  - PEO/PM briefings
  - Accuracy of cost growth segregation
- **Compare findings with previous CBO research**
- **Develop policy change recommendations and present at April 1997 LAI Executive Board**

## ***General Response From PEOs and PMs***

---

- **Program Instability research presented to PEOs, PMs**
  - 2 USAF PEOs (BG Reiter, Mr. Schulte)
  - 26 PMs in 22 programs/projects at ASC, ESC, Redstone
- **Positive response overall**
- **Value in multi-service perspective**

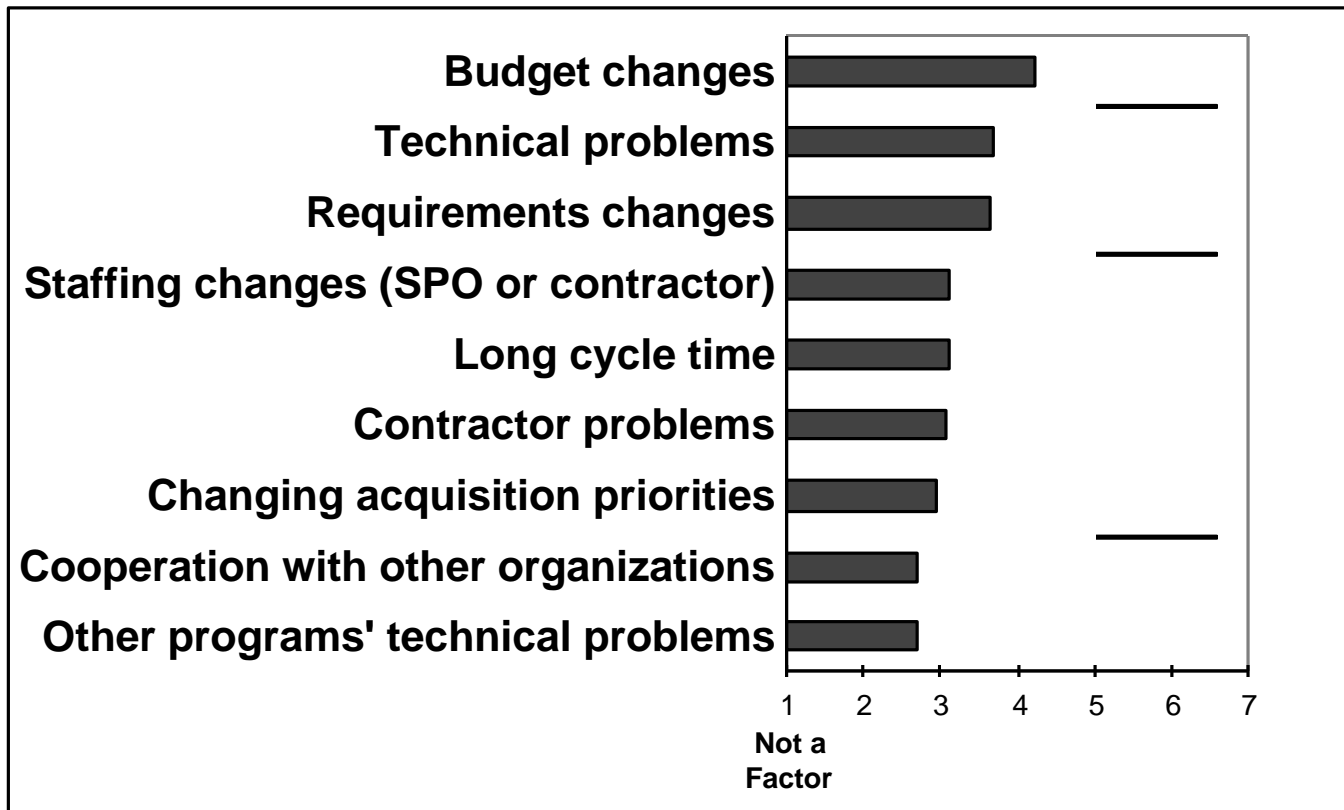

## Government Survey

- **500 surveys distributed**
  - ASC, ESC, NAVAIR, ATCOM, Redstone
  - Distribution complete
- **153 returned to date**
  - 55 SPO/PMOs represented

## Contractor Survey

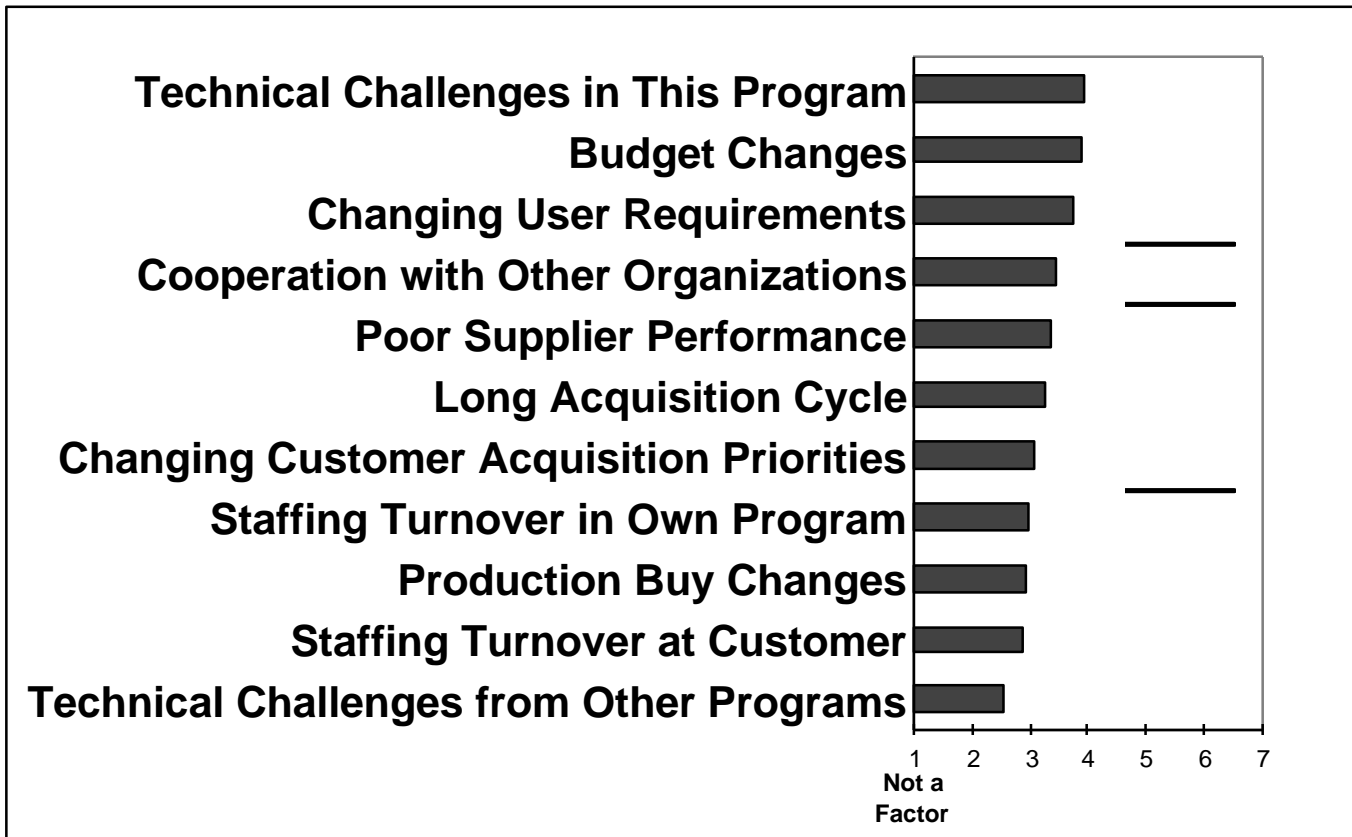

- **300 surveys distributed:**
  - 53 programs identified in SPO survey
  - Additional programs in LAI member companies
- **106 returned to date**
  - Prime and subcontractors contractors

# Government PM Ratings of Program Instability Sources

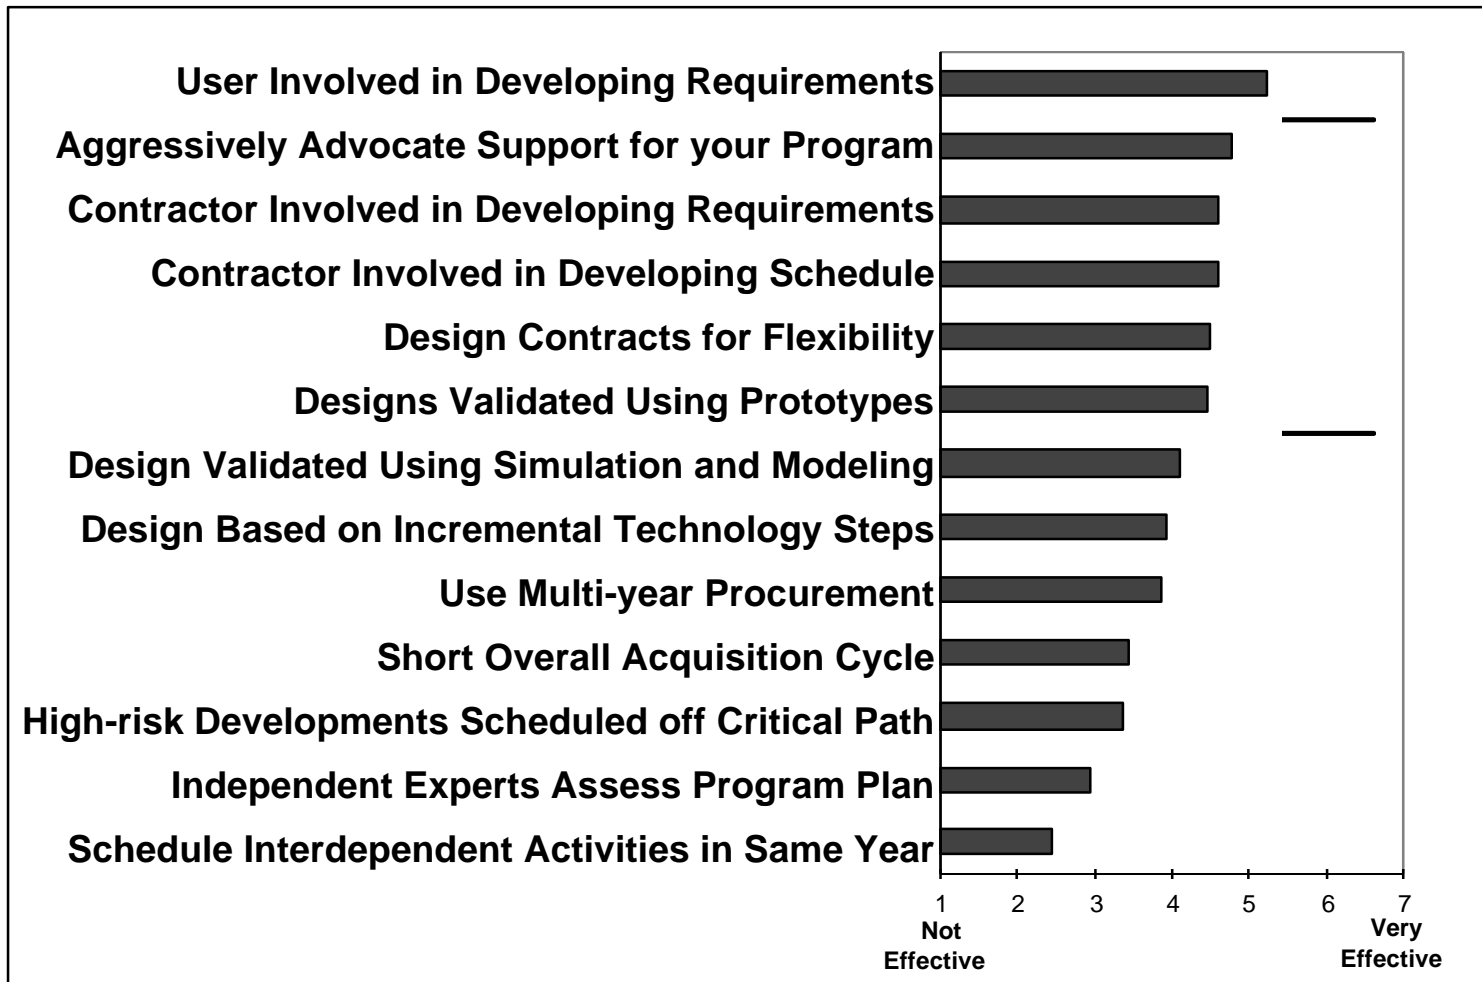

# Contractor PM Ratings of Program Instability Sources

# Contractor PM Ratings of Instability Mitigation Strategies

# ***Instability Sources Summary***

---

---

## **SPO and Contractor survey similarities:**

**Same 3 sources of program instability in top tier grouping:**

- Budget changes**
- Technical problems**
- Requirements changes**

**Common sources of instability in second tier grouping:**

- Problems with other organizations**
- Long acquisition cycle**
- Changing acquisition priorities**

# Elements of Cost Growth

Preliminary - For Discussion Only

- **Cost growth (average annual)**

	<u>Government</u>	<u>Contractor</u>
– Budget changes	2.2%	1.8%
– Technical difficulties	2.4%	2.7%
– Changes in user requirements	2.5%	2.7%
– Other sources	0.3%	0.8%
– Total	7.4%	8.0%
- **Case studies of government programs underway to validate cost growth estimates.**

# ***Primary Program Instability Research Findings***

---

- **6 principal themes**
  - **Budget stability**
  - **Technology risk management**
  - **Requirements generation and stability**
  - **Program staffing continuity**
  - **Stakeholder participation in program planning and execution**
  - **Training in avoiding/mitigating program instability**

- **Funding instability accounts for ~1/3 of average annual cost growth (2.2%)**
  - PEOs and PMs generally support findings
  - Interactions between budget stability, technical problems, and requirements changes may understate overall cost impact of budget changes
- **Other issues:**
  - Focus to date at program level
  - Acquisition community perspective on problem only
  - Potential additional research:
    - Budget build-up process
    - Other stakeholders' contributions and perspectives

# ***Technical Risk Management***

---

- **SPO Survey**
  - Top-rated instability mitigation strategies:
    - Management reserve in program plan
  - On/under budget programs rate as more effective instability *mitigation* strategies:
    - Use 3-D modeling, CAM, computer-aided scheduling tools
  - On/under budget programs rate as more effective instability *avoidance* strategies:
    - Use incremental technology steps, plan high-risk developments off critical program path
- **Contractor survey:**
  - Top-rated instability mitigation strategies:
    - Management reserve in program plan
    - Use computer-aided scheduling tools, 3-D modeling, CAM

# Technical Risk and Program Performance

Program Characteristic	Over Budget	On/under Budget
Product technology advance	More revolutionary programs	More evolutionary programs
Technical advance required in key subsystems	More new development	More non-developmental
Character of key enabling technologies	More military-unique	More commercial
Advance in underlying enabling technologies	More change — less current	Less change — more current
OTS/NDI value content (%)	34%	51%
Total Development Time	65 months	42.5 months
“Fast Track” program status (Fast Track/Not Fast Track)	—	4.7x more likely to be “fast track”
Total Program Budget (\$M)	\$4,447	\$1,018
Impacted by Program Instability	More instability	Less instability

**On/under budget programs represent “smaller, faster, cheaper” system approach**

# ***Requirements Generation and Stability***

---

- **Requirements changes the largest single source of cost growth overall (2.5%)**
  - Largest component of cost growth in programs with largest cost over-runs
  - Requirements changes-related cost growth increases through system life cycle
  - The source of greatest savings in on/under budget programs
- **User involvement universally cited as critical to program success by PEOs and PMs**
  - Potential additional research:
    - Role of user in requirements generation
    - Best practices from other industries on user involvement

- **On/under budget programs have (compared with cost overrunning programs):**
  - **More staff continuity:**
    - 43% vs. 17% original staff since program start
  - **Fewer program managers:**
    - 2.5 vs. 3.8 program managers since program start
  - **Finding persists while controlling for differences in program length**
- **PEOs/PMs support need for more staffing continuity at all levels**
  - **Existing rules are often overridden**

# ***Stakeholder Participation***

---

- **SPO survey:**
  - **Top-rated instability avoidance strategies:**
    - User involved in developing requirements
    - Aggressively advocate support for your program
    - Contractor involved in developing requirements
    - Contractor involved in developing schedule
  - **Top-rated instability mitigation strategies:**
    - Users involved in decision-making
  
- **Contractor survey:**
  - **Top-rated instability avoidance strategies:**
    - Open, frequent communication with customer
    - Contractor involved in developing requirements
    - Aggressively advocate support for your program
    - User involved in developing requirements

## ***Training in Instability Management Practices***

---

- **Instability avoidance and management a stated priority in program management guidelines**
- **Wide range in responses in PM evaluations of instability avoidance and mitigation strategies suggests potential uneven realization of goal**
- **No specific data from surveys to provide additional insight into training effectiveness or requirements**

- **Survey data on program instability collected, validated through practitioner review**
- **Policy focus team identified most promising areas for policy change recommendations**
