Let's take a walk through memory lane for a moment...

# In the Beginning....

There were some strange observations by some very smart people.

Image by MIT OpenCourseWare.

Image courtesy NASA.

# In the Beginning....

The weirdness just kept going.

Image removed due to copyright restrictions. See the image here: <http://icanhascheezburger.com/2007/06/02/im-in-ur-quantum-box/>.

# It Became Clear...

...that matter behaved like waves (and vice versa).

And that we had to lose our “classical” concepts of absolute position and momentum.

And instead consider a particle as a wave, whose square is the probability of finding it.

$$\Psi(\mathbf{r}, t) = A \exp[i(\mathbf{k} \cdot \mathbf{r} - \omega t)]$$

But how would we describe the behavior of this wave?

# Then, $F=ma$ for Quantum Mechanics

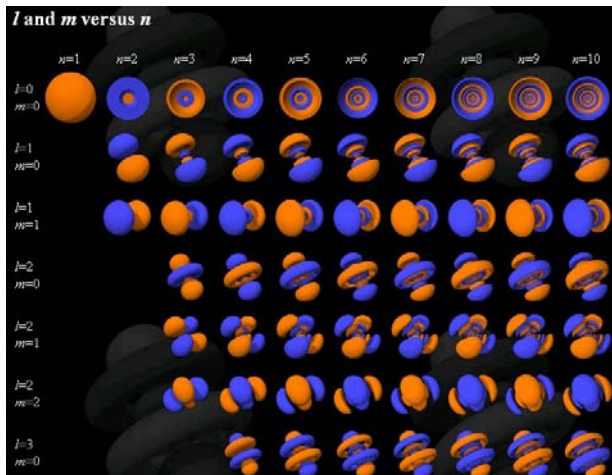

Image by MIT OpenCourseWare.

$$\left[ -\frac{\hbar^2}{2m} \nabla^2 + V(\vec{r}, t) \right] \psi(\vec{r}, t) = i\hbar \frac{\partial}{\partial t} \psi(\vec{r}, t)$$

# It Was Wonderful

It explained many things.

**BUT...**

# Nature Does $> 1$ electron!

It was impossible to solve for more than a single electron.

Enter (stage left) computational quantum mechanics!

But...

# We Don't Have The Age of the Universe

Which is how long it would take currently to solve the Schrodinger equation exactly on a computer.

So...we looked at this guy's back.

Screenshot of article removed due to copyright restrictions; see the article online:  
<http://blogs.discovermagazine.com/loom/2009/05/23/sigmas-from-shoulder-to-shoulder-science-tattoos/>.

And started making some approximations.

# The Two Paths

$\Psi$  is a wave function of all positions & time.

$$\left[ -\frac{\hbar^2}{2m} \nabla^2 + V(\vec{r}, t) \right] \psi(\vec{r}, t) = i\hbar \frac{\partial}{\partial t} \psi(\vec{r}, t)$$

Chemists (mostly)

4 Lattice Types

Bravais Lattice	Parameters	Simple (P)	Volume Centered (I)	Base Centered (C)	Face Centered (F)
Triclinic	$a_1 \neq a_2 \neq a_3$ $\alpha_{12} \neq \alpha_{23} \neq \alpha_{31}$				
Monoclinic	$a_1 \neq a_2 \neq a_3$ $\alpha_{23} = \alpha_{31} = 90^\circ$ $\alpha_{12} \neq 90^\circ$				
Orthorhombic	$a_1 \neq a_2 \neq a_3$ $\alpha_{12} = \alpha_{23} = \alpha_{31} = 90^\circ$				
Tetragonal	$a_1 = a_2 \neq a_3$ $\alpha_{12} = \alpha_{23} = \alpha_{31} = 90^\circ$				
Trigonal	$a_1 = a_2 = a_3$ $\alpha_{12} = \alpha_{23} = \alpha_{31} < 120^\circ$				
Cubic	$a_1 = a_2 = a_3$ $\alpha_{12} = \alpha_{23} = \alpha_{31} = 90^\circ$				
Hexagonal	$a_1 = a_2 \neq a_3$ $\alpha_{12} = 120^\circ$ $\alpha_{23} = \alpha_{31} = 90^\circ$				

7 Crystal Classes

Bravais

The most common Bravais lattices are the cubic ones (simple, body-centered, and face-centered) plus the hexagonal close-packed arrangement. *...why?*

# Reciprocal Lattice & Brillouin Zone

Associated with each real space lattice, there exists something we call a **reciprocal lattice**.

The reciprocal lattice is the set of wave-vectors which are commensurate with the real space lattice.

It is defined by a set of vectors  $a^*$ ,  $b^*$ , and  $c^*$  such that  $a^*$  is perpendicular to  $b$  and  $c$  of the Bravais lattice, and the product  $a^* \times a$  is  $1$ .

# Reciprocal Lattice & Brillouin Zone

It is defined by a set of vectors  $\mathbf{a}^*$ ,  $\mathbf{b}^*$ , and  $\mathbf{c}^*$  such that  $\mathbf{a}^*$  is perpendicular to  $\mathbf{b}$  and  $\mathbf{c}$  of the Bravais lattice, and the product  $\mathbf{a}^* \times \mathbf{a}$  is  $\mathbf{1}$ .

In particular: 
$$\mathbf{a}^* = \frac{\mathbf{b} \times \mathbf{c}}{\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}}$$

Brillouin

Image from Wikimedia Commons,  
<http://commons.wikimedia.org>.

$$\longrightarrow \mathbf{a}^* = \frac{\mathbf{b} \times \mathbf{c}}{\mathbf{a} \cdot \mathbf{b} \times \mathbf{c}} \longrightarrow$$

inverse lattice (FCC)

# The Brillouin zone

inverse lattice

The Brillouin zone is a special unit cell of the inverse lattice.

# The Brillouin zone

Brillouin zone of the FCC lattice

# Bloch's Theorem (Take 2)

Reciprocal lattice vectors have special properties of particular value for calculations of solids.

Remember that we write the reciprocal lattice vector:

$$\mathbf{G} = 2\pi n \mathbf{a}^* + 2\pi m \mathbf{b}^* + 2\pi o \mathbf{c}^*$$

We added the 2 simply for convenience, and the  $n$ ,  $m$ ,  $o$ , are integers.

Now consider the behavior of the function  $\exp(i\mathbf{G}\cdot\mathbf{r})$ .

# Bloch's Theorem (Take 2)

$$\begin{aligned}\exp(i\mathbf{G} \cdot \mathbf{r}) &= \exp\left[i(2\pi n\mathbf{a}^* + 2\pi m\mathbf{b}^* + 2\pi o\mathbf{c}^*) \cdot (\alpha\mathbf{a} + \beta\mathbf{b} + \gamma\mathbf{c})\right] \\ &= \exp\left[i(2\pi n\alpha + 2\pi m\beta + 2\pi o\gamma)\right] \\ &= \cos(2\pi n\alpha + 2\pi m\beta + 2\pi o\gamma) + i \sin(2\pi n\alpha + 2\pi m\beta + 2\pi o\gamma)\end{aligned}$$

As  $\mathbf{r}$  is varied, lattice vector coefficients  $(\alpha, \beta, \gamma)$  change between 0 and 1 and the function  $\exp(i\mathbf{G} \cdot \mathbf{r})$  changes too.

However, since  $n$ ,  $m$ , and  $o$  are integral,  $\exp(i\mathbf{G} \cdot \mathbf{r})$  will always vary with the periodicity of the real-space lattice.

$$e^{i\vec{G} \cdot \vec{R}} = 1 \quad \longrightarrow \quad \psi(\vec{r}) = \sum_j c_j e^{i\vec{G}_j \cdot \vec{r}}$$

automatically periodic in  $\mathbf{R}$ !

# Bloch's Theorem (Take 2)

The periodicity of the lattice in a solid means that the values of a function (e.g., density) will be **identical** at equivalent points on the lattice.

The wavefunction, on the other hand, is periodic but only when multiplied by a phase factor.

This is known as Bloch's theorem.

NEW quantum number  $k$  that lives in the inverse lattice!

$$\psi_{\vec{k}}(\vec{r}) = e^{i\vec{k}\cdot\vec{r}} u_{\vec{k}}(\vec{r})$$

$$u_{\vec{k}}(\vec{r}) = u_{\vec{k}}(\vec{r} + \vec{R})$$

# Periodic potentials

Results of the Bloch theorem:

$$\psi_{\vec{k}}(\vec{r} + \vec{R}) = \psi_{\vec{k}}(\vec{r}) e^{i\vec{k} \cdot \vec{R}}$$

$$|\psi_{\vec{k}}(\vec{r} + \vec{R})|^2 = |\psi_{\vec{k}}(\vec{r})|^2$$

charge density  
is lattice periodic

if solution  $\psi_{\vec{k}}(\vec{r}) \longrightarrow \psi_{\vec{k}+\vec{G}}(\vec{r})$  also solution

with  $E_{\vec{k}} = E_{\vec{k}+\vec{G}}$

# Periodic potentials

# Structural properties

Forces on the atoms can be calculated with the Hellmann–Feynman theorem:

$$\frac{\partial E_n}{\partial \lambda} = \int \psi_n^* \frac{\partial \hat{H}}{\partial \lambda} \psi_n d\tau$$

For  $\lambda$ =atomic position, we get the force on that atom.

Forces automatically in most codes.

# Structural properties

finding the

# Structural properties

finding the  
stress/pressure  
and the bulk  
modulus

$$p = -\frac{\partial E}{\partial V}$$

$$\sigma_{\text{bulk}} = -V \frac{\partial p}{\partial V} = V \frac{\partial^2 E}{\partial V^2}$$

# Calculating the band structure

## 3-step procedure

1. Find the converged ground state density and potential.
2. For the converged potential calculate the energies at **k-points along lines**.
3. Use some software to plot the band structure.

## Kohn-Sham equations

$$\left[ -\frac{\hbar^2}{2m} \nabla^2 + V_s(\vec{r}) \right] \phi_i(\vec{r}) = \epsilon_i \phi_i(\vec{r}),$$

$$V_s = V + \int \frac{e^2 n_s(\vec{r}')}{|\vec{r} - \vec{r}'|} d^3 r' + V_{XC}[n_s(\vec{r})],$$

$$n(\vec{r}) = \sum_i |\phi_i(\vec{r})|^2$$

# Calculating the DOS

## 3-step procedure

1. Find the converged ground state density and potential.
2. For the converged potential calculate energies at a **VERY dense k-mesh**.
3. Use some software to plot the DOS.

## Kohn-Sham equations

$$\left[ -\frac{\hbar^2}{2m} \nabla^2 + V_s(\vec{r}) \right] \phi_i(\vec{r}) = \epsilon_i \phi_i(\vec{r}),$$

$$V_s = V + \int \frac{e^2 n_s(\vec{r}')}{|\vec{r} - \vec{r}'|} d^3 r' + V_{XC}[n_s(\vec{r})],$$

$$n(\vec{r}) = \sum_i |\phi_i(\vec{r})|^2$$
