Part II – Quantum Mechanical Methods : Lecture 7

Advanced Prop. of Materials: What else can we do?

Jeffrey C. Grossman

Department of Materials Science and Engineering
Massachusetts Institute of Technology

Part II Outline

theory & practice

1. It's A Quantum World: The Theory of Quantum Mechanics
2. Quantum Mechanics: Practice Makes Perfect
3. From Many-Body to Single-Particle; Quantum Modeling of Molecules
4. From Atoms to Solids
5. Quantum Modeling of Solids: Basic Properties
6. Advanced Prop. of Materials: What else can we do?

example applications

7. Nanotechnology
8. Solar Photovoltaics: Converting Photons into Electrons
9. Thermoelectrics: Converting Heat into Electricity
10. Solar Fuels: Pushing Electrons up a Hill
11. Hydrogen Storage: the Strength of Weak Interactions
12. Review

Lesson outline

- Review some stuff
- Optical properties
- Magnetic properties
- Transport properties
- Vibrational properties

Review: inverse lattice

Schrödinger
equation

certain
symmetry

quantum
number

hydrogen
atom

spherical
symmetry

$$[H, L^2] = HL^2 - L^2H = 0$$

$$[H, L_z] = 0$$

$$\psi_{n,l,m}(\vec{r})$$

periodic
solid

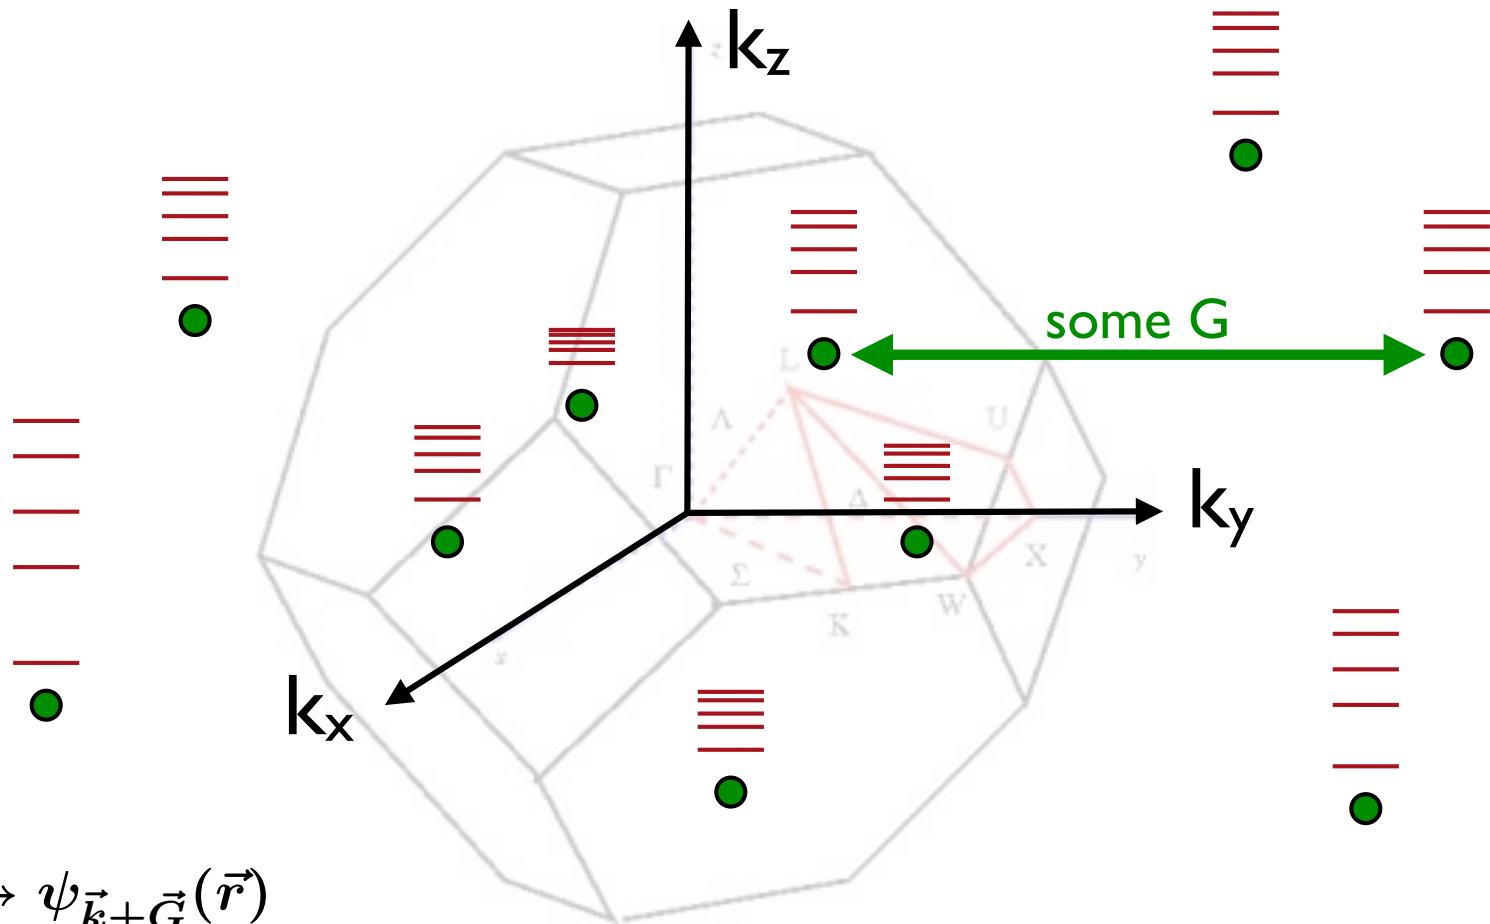

translational
symmetry

$$[H, T] = 0$$

$$\psi_{n,\vec{k}}(\vec{r})$$

Review: inverse lattice

$$\psi_{\vec{k}}(\vec{r}) \longrightarrow \psi_{\vec{k}+\vec{G}}(\vec{r})$$

$$E_{\vec{k}} = E_{\vec{k}+\vec{G}}$$

Review: The band structure

Silicon

k is a continuous variable

Review: inverse lattice

$$\psi_0(\vec{r} + \vec{R}) = \psi_0(\vec{r})$$

periodic over unit cell

$$\psi_{\vec{G}/2}(\vec{r} + 2\vec{R}) = \psi_{\vec{G}/2}(\vec{r})$$

periodic over larger domain

Review: inverse lattice

choose certain
k-mesh e.g. $8 \times 8 \times 8$
 $N=512$

number of
k-points (N)

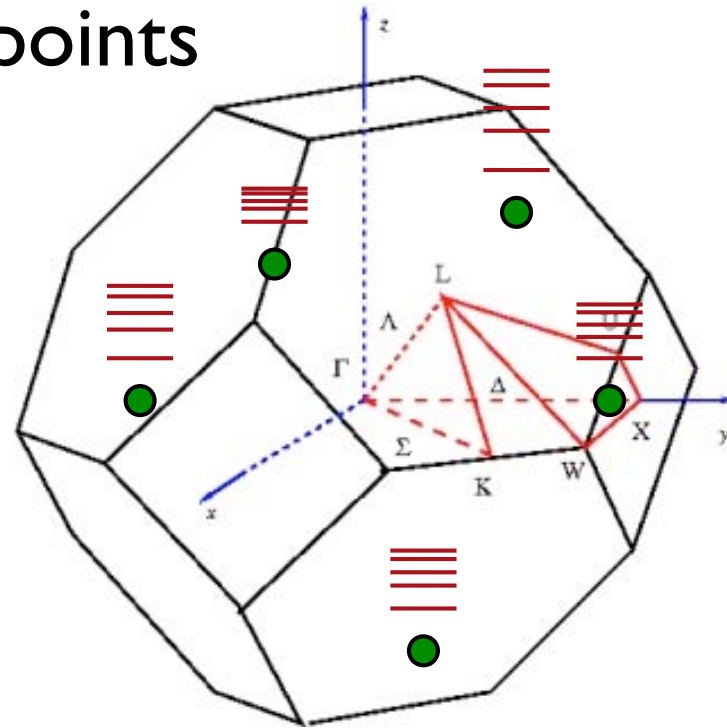

unit cells in
the periodic
domain (N)

Review: inverse lattice

Distribute all electrons over the lowest states.

N k-points

You have
(electrons per unit cell)*N
electrons to distribute!

Structural properties

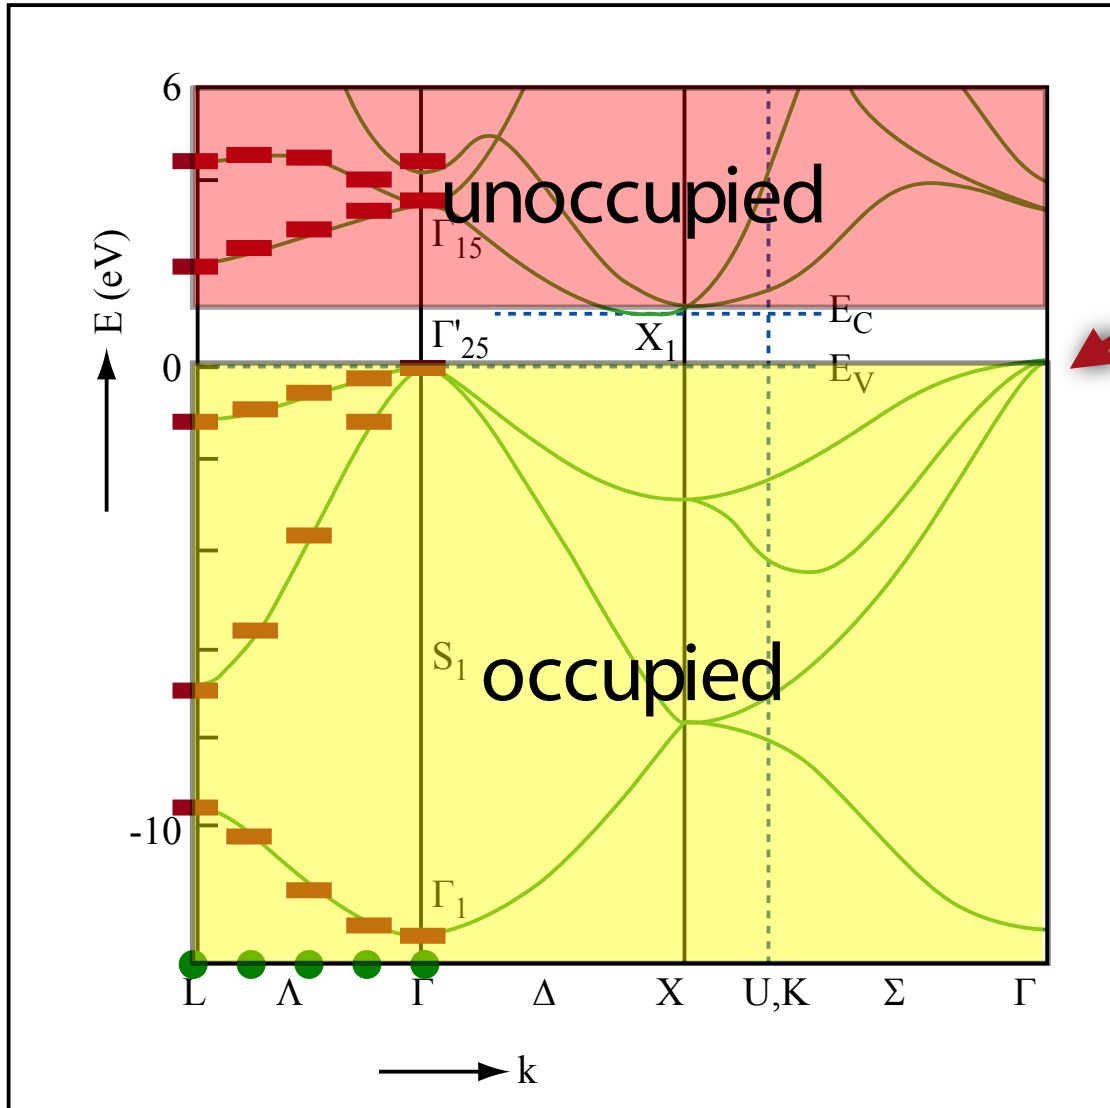

finding the
stress/pressure
and the bulk
modulus

$$p = -\frac{\partial E}{\partial V}$$

$$\sigma_{\text{bulk}} = -V \frac{\partial p}{\partial V} = V \frac{\partial^2 E}{\partial V^2}$$

The Fermi energy

Fermi energy

each band can hold:

$2N$ electrons and you have
(electrons per unit cell)* N

or

two electrons and you have
(electrons per unit cell)

Electrical properties

silicon

Are any bands crossing the Fermi energy?

YES: METAL

NO: INSULATOR

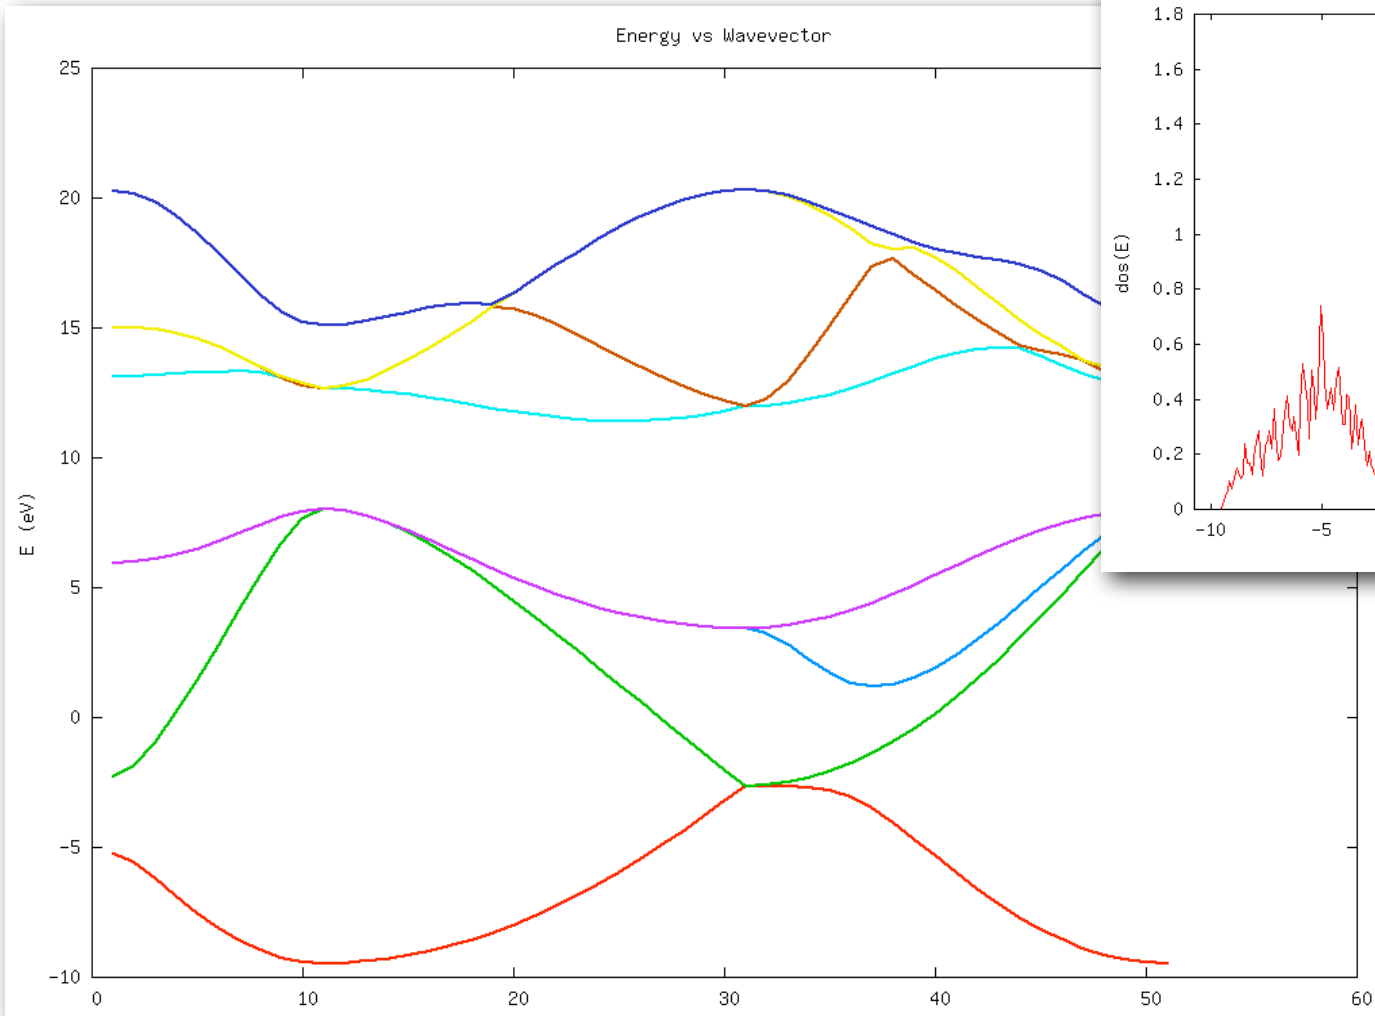

Fermi energy

Number of electrons in unit cell:

EVEN: MAYBE INSULATOR

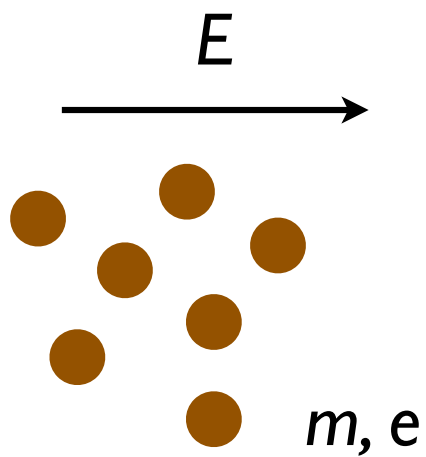

ODD: FOR SURE METAL

Electrical properties

**diamond:
insulator**

Electron Transport

E-field

$$\frac{dv}{dt} = \frac{eE}{m} - \frac{1}{\tau}v = 0$$

$$v = \frac{e\tau E}{m}$$

At equilibrium

$$j = nev = \frac{ne^2\tau}{m}E \equiv \sigma E$$

Electric current

Electrical conductivity

$$\sigma = \frac{ne^2\tau}{m}$$

Electron Transport

Calculating σ from band structure

$$\sigma = e^2 \tau \int \frac{d\mathbf{k}}{4\pi^3} \left(-\frac{\partial f}{\partial E} \right) \mathbf{v}(\mathbf{k}) \mathbf{v}(\mathbf{k})$$

Fermi function

$$\mathbf{v}(\mathbf{k}) = \frac{1}{\hbar} \nabla_{\mathbf{k}} E(\mathbf{k})$$

Curvature of band structure

Simple optical properties

$$E = h\nu$$

photon has almost
no momentum:
only vertical transitions
possible
energy conservation and
momentum conservation apply

Silicon Solar Cells Have to Be Thick (\$\$\$)

It's all in
the band-
structure!

Please see graph at http://www.tf.uni-kiel.de/matwis/amat/semi_en/kap_2/illustr/si_banddiagram.gif.

Simple optical properties

Magnetism

Origin of magnetism: **electron spin**

An electron has a magnetic moment of μ_B , Bohr magneton.

Spin up

n_{\uparrow}

Spin down

n_{\downarrow}

$$\mu = \mu_B (n_{\uparrow} - n_{\downarrow})$$

Magnetization

spin-polarized calculation:
separate density for electrons with spin

Integrated difference between up and down
density gives the magnetization.

Magnetism

In real systems, the density of states needs to be considered.

bcc Fe

$$\mu = \mu_B \int^{E_F} dE [g_{\uparrow}(E) - g_{\downarrow}(E)]$$

Quantum Molecular Dynamics

...and let us, as nature directs, begin first with first principles.
Aristotle (Poetics, I)

$$F=ma$$

Use Hellmann-Feynman!

$$\frac{\partial E_n}{\partial \lambda} = \int \psi_n^* \frac{\partial \hat{H}}{\partial \lambda} \psi_n d\tau$$

Carbon Nanotube Growth

Water

Henry Cavendish was the first to describe correctly the composition of water ($2 \text{ H} + 1 \text{ O}$), in 1781.

He reported his findings in terms of **phlogiston** (later the gas he made was proven to be hydrogen) and **dephlogisticated** air (later this was proven to be oxygen).

Cavendish was a pretty neat guy.

A University dropout, he also compared the conductivities of electrolytes and expressed a version of Ohm's law.

His last major work was the first measurement of Newton's gravitational constant, with the mass and density of the Earth. The accuracy of this experiment was not improved for a century.

Water

Which of the following is the correct picture for H₂O?

Cool water site: <http://www.lsbu.ac.uk/water/>

Classical or Quantum?

Please see the second table at http://www.science.oregonstate.edu/~hetheriw/astro/rt/info/water/water_models.html.

More than 50
classical
potentials in use
today for water.

Which one is
best?

Mg⁺⁺ in Water

Important Differences!

Vibrational properties

lattice vibrations
are called: **phonons**

What is the frequency of this vibration?

Vibrational properties

animated phonons on the web

<http://dept.kent.edu/projects/ksuviz/leeviz/phonon/phonon.html>

- sound in solids determined by acoustical phonons (shock waves)
- some optical properties related to optical phonons
- heat capacity and transport related to phonons

Summary of properties

structural properties

electrical properties

optical properties

magnetic properties

vibrational properties
